HEARINGS
BEFORE THE
COMMITTEE ON FINANCE
UNITED STATES SENATE
ON THE PROPOSED
TARIFF ACT OF 1921
(H. R. 7456)

SCHEDULE 2
EARTHS, EARTHENWARE, AND
GLASSWARE

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE

1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman.*

PORTER J. McCUMBER, North Dakota.
REED SMOOT, Utah.
ROBERT M. LA FOLLETTE, Wisconsin.
WILLIAM P. DILLINGHAM, Vermont.
GEORGE P. McLEAN, Connecticut.
CHARLES CURTIS, Kansas.
JAMES E. WATSON, Indiana.
WILLIAM M. CALDER, New York.
HOWARD SUTHERLAND, West Virginia.

FURNIFOLD M. SIMMONS, North Carolina
JOHN SHARP WILLIAMS, Mississippi.
ANDRIEUS A. JONES, New Mexico.
PETER G. GERRY, Rhode Island.
JAMES A. REED, Missouri.
DAVID I. WALSH, Massachusetts

LEIGHTON C. TAYLOR, *Clerk.*
W. B. STEWART, *Assistant Clerk*

NOTE.

Believing the greatest demand for the Tariff Hearings before the Senate Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.

Dyes Embargo.

Schedule 1.—Chemicals, Oils, and Paints.

Schedule 2.—Earths, Earthenware, and Glassware.

Schedule 3.—Metals and Manufactures of.

Schedule 4.—Wood and Manufactures of.

Schedule 5.—Sugar, Molasses, and Manufactures of.

Schedule 6.—Tobacco and Manufactures of.

Schedule 7.—Agricultural Products and Provisions

Schedule 8.—Spirits, Wines, and Other Beverages

} combined.

Schedule 9.—Cotton Manufactures.

Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.

Schedule 11.—Wool and Manufactures of.

Schedule 12.—Silk and Silk Goods.

Schedule 13.—Papers and Books.

Schedule 14.—Sundries.

Schedule 15.—Free List.

Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk.*

SCHEDULE 2.

EARTHS, EARTHENWARE, AND GLASSWARE.

TILE.

[Paragraph 202.]

STATEMENT OF S. F. WILLIAMSON, REPRESENTING WILLIAMSON & MESSINGER, PHILADELPHIA, PA.

Senator McCUMBER. Mr. Williamson, state for the record your full name, your address, and whom you represent.

Mr. WILLIAMSON. S. F. Williamson, of the firm of Williamson & Messinger, 1208-1210 Ridge Avenue, Philadelphia, Pa.

We are not manufacturers of tile, but we distribute tile to the building trade and others. We desire to call your attention to paragraph 202 of H. R. 7456, which is now before your committee, and in which we are specially interested.

This paragraph among other things specifies tiles, unglazed, except pill tiles and so-called quarries, or quarry tiles valued at not more than 40 cents per square foot, 8 cents per square foot, but not less than 35 nor more than 50 per cent ad valorem.

For some time we have been trying to build up a demand in the trade for a so-called plastora red tile, of which a sample is herewith submitted. This is a very cheap tile, manufactured in England; is unglazed and is used in the construction of cheap fire places and hearths, also very largely as floors in engine and boiler rooms. Its average foreign market price is about 17 cents per square foot in England. There is no tile manufactured in America which is exactly similar to the English plastora red tile. The nearest comparable tile of American manufacture is a much better tile valued at about 40 cents per square foot.

Senator WATSON. Is this sample that you have here encaustic tile?

Mr. WILLIAMSON. No; an encaustic tile would be of a better color. It is simply an unglazed tile; that is all you can call it.

Under paragraph 202 the duty that would be imposed on the imported English plastora red tile would be 8 cents per square foot, provided 8 cents per square foot would be not less than 35 nor more than 50 per cent ad valorem. As 8 cents per square foot is equal to one-fifth of 40 cents, that is to say 20 per cent of the American price of the nearest comparable tile of American manufacture, the rate of 35 per cent ad valorem would automatically apply. Thirty-five per cent of 40 cents would be 14 cents duty per square foot, as against the English open-market price of 17 cents per square foot, or a little over 80 per cent ad valorem on the foreign selling price.

In other words, it means that the duty on this tile would be 14 cents per square foot, a little over 80 per cent.

Senator SMOOT. You object to the ad valorem rate named?

Mr. WILLIAMSON. Yes. It really makes it prohibitive; it is out of the question.

Senator WATSON. Are you a manufacturer or an importer?

Mr. WILLIAMSON. We are really dealers. We take large contracts for hotels and buildings of that kind, and we install this tile when we get it. At times we sell a little of it to jobbers, but most of it is brought over for our use.

Senator WATSON. Is most of that which you use imported?

Mr. WILLIAMSON. No; we have not been able to bring it over to any extent on account of the duty. I do not suppose we have used 10 per cent of the foreign article.

Senator WATSON. Can you not get all you want in the United States?

Mr. WILLIAMSON. Yes; we can, with the exception of this tile here [referring to the sample tile].

Senator WATSON. What is there peculiar about that tile?

Mr. WILLIAMSON. It is really a very crude, cheap article, put together in a crude way, and there is nothing made here in this country that really compares with it, except this tile which is superior in almost every way.

This particular tile here was provided for in paragraph 85 in the Payne-Aldrich Tariff Act at the rate of 4 cents per square foot. In paragraph 72 of the Underwood-Simmons Tariff Act of October 3, 1913, the duty was provided at the rate of $1\frac{1}{2}$ cents per square foot. That is the duty that prevails to-day.

What I am trying to call your attention to is that the duty on this article is a cent and a half to-day, and as provided for in this bill it would go up from a cent and a half to 14 cents.

The statistics of importation, as published by the Department of Commerce in its monthly summary for June, 1921, do not segregate the importations of tiles, but carry the same under the general heading of "earthenware and crockeryware not decorated or ornamented." The importation of this class of tile has, however, been negligible. The importations by our firm for the last year amounted to less than \$10,000, and practically nothing in previous years.

We submit that a duty of 14 cents per square foot, equivalent to 80 per cent ad valorem of the English selling price, is prohibitive. It is also out of proportion to the duty of 3 cents per square foot but not less than 20 per cent ad valorem placed upon the so-called quarries or quarry tiles, enumerated at the close of paragraph 202. That is this tile here [referring to the sample]. The duty proposed on this is 3 cents per square foot, a far better article and a much more expensive article, and on the other about 14 cents.

Senator DILLINGHAM. You say "on this." One reading the record will not know what is meant by that.

Mr. WILLIAMSON. On this red unglazed tile the duty would be 14 cents per square foot. On the quarry tile it is practically left alone; it is hardly changed any from the present duty, that which prevails now, which is probably—well, I am not sure about the duty which prevails now, but what they say here about quarry tile is 3 cents per square foot, but not less than 20 per cent ad valorem.

The 20 per cent ad valorem amounts to about 3 cents, or it might amount to 4 cents. What I am trying to explain is that the duty on the tile here that is far more serviceable and more durable and used for many more purposes is so low—that is, 3 or 4 cents—compared to what is asked for on this particular tile here.

We therefore submit that as tiles, unglazed, of this character have been assessed with specific duties in both the tariff acts of 1909 and 1913, the same principle should be adhered to by your committee when revising paragraph 202 of H. R. 7456. If it is the desire of your committee to follow as closely as may be the rates prescribed under the Payne-Aldrich Tariff Act of 1909 rather than those enumerated in the Underwood-Simmons Tariff Act of October 3, 1913, we have no objection to your placing a rate of 4 cents per square foot upon tiles, unglazed, thereby following paragraph 85 of the Payne-Aldrich Tariff Act of 1909.

Senator WATSON. It was 18 cents per square foot under the Underwood bill.

Mr. WILLIAMSON. You will find that that is glazed tile. This is specified under "unglazed."

We think that the duty ought to be specific and so much per square foot rather than ad valorem, particularly if the American valuation plan is to be used, because we would never know where we were, owing to the fact that we would probably be paying a duty on an article here that is not similar.

Senator WATSON. Do you import any other tiles except that kind?

Mr. WILLIAMSON. Yes; we import some white glazed tile. That is about all I have to say about this unglazed tile, just to show you that there is something wrong about the duty there—asking a rate of 14 cents.

Senator SMOOT. Would you object if we put the Payne-Aldrich rate in here?

Mr. WILLIAMSON. No; we could bring this tile in then, but we cannot bring it in under any such rate as 14 cents. It is prohibitive and out of the question, because the tile can not be compared to the American product.

Senator SMOOT. Then, if we take out the provision here, "but not less than 35 nor more than 50 per centum ad valorem," that would make it satisfactory?

Mr. WILLIAMSON. Yes; that is at 4 cents per square foot. It is now specified at 8 cents.

Senator SMOOT. If you had 4 cents per square foot the other provision would not be objectionable to you?

Mr. WILLIAMSON. No. We would be satisfied with a specific duty of 4 cents per square foot.

We also desire to call your attention to "white glazed wall tiles." This glazed wall tile is a standard article, well known and extensively used in bathrooms, corridors, or halls, and for various other building purposes. This glazed tile would also carry a duty of 8 cents per square foot, but not less than 35 nor more than 50 per cent ad valorem under paragraph 202.

White glazed wall tiles of American manufacture are classified in the trade as first quality, valued approximately at 50 cents per square foot; standard quality 40 cents per square foot, and commercial quality 25 cents per square foot.

There are three grades known throughout the country, and those are the prices which they charge. Some white glazed wall tiles have been imported from Belgium and Germany to this country, but they are unsatisfactory. I think last year was the only year I know of when any was brought over, and that was not on account of the price; it was simply because tile was not available; they were unable to manufacture in this country, and we had to go abroad and get what we could. We have now a lot of German and Belgian tile in our place that we can not sell at any price; the quality is too poor.

Senator SMOOT. The same objection applies to that that you have stated with reference to the other items?

Mr. WILLIAMSON. Yes. English tile that comes over here is of a better grade and is probably more nearly equal to the standard grade, but we feel that the duty should be specific and so much per square foot without any ad valorem, because it would be confusing; we would not know where we were in taking contracts, and the duty is high enough. It will be seen that the tile industry in this country is very firmly established. The exports in 1919 were over a million dollars compared to probably \$40,000 or \$50,000 of imports.

Considering that the tile industry is firmly established and can no longer be considered an "infant industry" for the reason that the imports of foreign tile are almost negligible, as shown by the Tariff Information Survey, prepared by the United States Tariff Commission, clearly indicating "that the domestic manufacturing industry manufactures sufficient tile to supply the entire domestic demand," and that prior to the war the excess of exports over imports amounted annually to some six hundred thousand to eight hundred thousand dollars, it would seem that the exorbitant rate of 14 cents per square foot on white glazed wall tile valued at not more than 40 cents per square foot, is not only prohibitive, but is not necessary for the protection of the domestic tile industry.

We would, therefore, suggest a straight specific duty of 5 cents per square foot, following the Underwood-Simmons Tariff of 1913 or a rate not to exceed 8 cents per square foot, following the Payne-Aldrich Tariff Act of 1909.

That is about all I have to say about it. I tried to explain that the tile manufacturers here have shipped out of the country as high as a million and a quarter dollars' worth of tile. In one year I believe there was a little over one hundred thousand dollars' worth of tile that came in. I think that was in the year 1914. Why they would need any such duty as that which is prescribed here is beyond my comprehension.

Senator McCUMBER. Do you import tile?

Mr. WILLIAMSON. Yes, sir.

Senator McCUMBER. From where?

Mr. WILLIAMSON. We have brought some from England and some from Belgium; very little from Belgium on account of the quality; it will not answer in this country at all. There was some brought over last year, as I explained a while ago, on account of the scarcity of tile. The dealers then would use anything they could get their hands on; but that is not the case now; they are now after quality.

Senator McLEAN. How much is used in this country?

Mr. WILLIAMSON. Do you mean how much was manufactured?

Senator McLEAN. Yes; what is the value of it?

Mr. WILLIAMSON. The tile manufactured during the last six or seven years ranges from five to seven million dollars, I think.

Senator SMOOT. In 1917 it was \$6,821,221.

Mr. WILLIAMSON. Yes; something like that.

STATEMENT OF ADOLPH GRANT, NEW YORK CITY, REPRESENTING ADOLPH GRANT & CO.

The CHAIRMAN. Where do you reside, Mr. Grant.

Mr. GRANT. Fifty-five West Forty-fourth Street, New York City.

The CHAIRMAN. What is your business?

Mr. GRANT. We are tile contractors and importers.

The CHAIRMAN. Do you manufacture tiles?

Mr. GRANT. Not at all.

The CHAIRMAN. You speak as an importer, then?

Mr. GRANT. As an importer and as a contractor.

The CHAIRMAN. What do you want in reference to this bill?

Mr. GRANT. We want three changes made.

Senator DILLINGHAM. To what paragraph are you referring?

Mr. GRANT. I am referring to paragraph 202.

The CHAIRMAN. What do you want, Mr. Grant, on that?

Mr. GRANT. We want the substitution of a flat-foot duty in the place of an ad valorem. We want a differentiation between the various kinds of tile, and we want some protection against the lumping of second-class goods into this country.

The first point I wish to bring up is the ad valorem proposition. Under the provisions of this bill goods will be taxed on an ad valorem, but that ad valorem will be on the similar American products.

I do not think consideration has been given to the fact that there are three grades of prices, ranging from 50 to 25 cents per square foot. There is no provision that I can see in the bill to prevent any European manufacturer from getting in cahoots with the American importer and bringing in 50-cent stuff and paying a duty on the 25 per cent ad valorem.

Senator SMOOT. First, you object to the clause "but not less than 35 nor more than 50 per cent ad valorem;" that is, ad valorem on all tiles, glazed and unglazed, at 8 cents per square foot, but not less than 35 nor more than 50 per cent ad valorem?

Mr. GRANT. I do not want any ad valorem in it at all.

Senator SMOOT. You object to that limitation of 35 per cent?

Mr. GRANT. I do. I object to any ad valorem. I think there ought to be a square-foot price.

Senator WALSH. How much would you make that price?

Mr. GRANT. On different tiles different amounts, Senator.

Senator WALSH. Give us the language you would like to have incorporated in this bill?

Mr. GRANT. I would not undertake to incorporate it in language; I will simply give you my ideas about it.

Senator SMOOT. Do you object to the 8 cents per square foot?

Mr. GRANT. No; that is a good provision, except I think in certain grades it should be higher.

Senator SMOOT. In the Payne-Aldrich bill it was 4 cents and in the present law it is 8 cents. Now, do you object to that 8 cents?

Mr. GRANT. I do on certain grades of tile, because I think it should be higher on some grades and lower on others, dependent on the amount of competition that exists between the foreign manufacturer and ourselves.

Senator McLEAN. Have you a brief stating what you do want?

Mr. GRANT. I have not. I can state it here in just a few minutes. We have three grades of tile—two of them for the wall and two for the floor. The tiles that go into the wall are of two classes—bright finish and dull finish. We have the greatest competition on the wall tile, bright glazed. That should receive the greatest amount of protection, because that is what the American factory needs. It is what is used in the greatest quantity in this country, and I would suggest at least 10 cents per square foot for it, with the additional proviso that no foreign manufacturer be permitted to bring into this country any tile at a lesser price than the best price for the best quality of goods prevailing in his own country at the time the shipment is made, which would obviate the possibility of the dumping which we are up against right now, particularly in connection with German and Austrian goods of an inferior grade. It does not affect me at all.

Senator WATSON. Where do you import from?

Mr. GRANT. The only importation we do is a small amount from England. We have imported considerable glazed tile from England also.

Senator WATSON. I understood you to say that you were an importer.

Mr. GRANT. We are, primarily speaking, contractors. We buy from the manufacturer and erect in place.

Senator WATSON. Do you buy the foreign product or the American product?

Mr. GRANT. We buy both. It is not to our advantage, nor to the advantage of the industry in general, to permit British, French, Belgian, and particularly German or Austrian manufacturers to come in here and undersell our products.

We come now to the second grade of wall tile, which are egg-shaped finish, and which are not made in this country. There is nothing made in this country that equals them. That class of tile is used very small, and almost entirely in private residences. It is not used in commercial work to any extent. It is a more expensive tile and takes the 8 per cent ad valorem rate because it is over 40 cents per foot. We are not protecting the American industry by putting it on, and we are not getting any tariff for the United States Government, because we will not be able to bring it in at that price. It means that a man building a house at the cost of \$10,000 or \$15,000 will not have the advantage of using that tile in his residence. He will have to take something else. Under those conditions we would like to see, simply for the purpose of revenue, an 8 cents per square foot duty on that tile. The present rate is 5 cents.

Senator DILLINGHAM. You say there is practically no such thing used in America?

Mr. GRANT. There is no duplicate of it. There are map-finished tiles made in America; but the manufacturers do not like to make them.

Senator WALSH. Is there a demand for that grade of tile in America?

Mr. GRANT. Very little; such as there is the American manufacturers will not make.

Senator WALSH. If it were used would it be used generally?

Mr. GRANT. Not in extensive work. It is essentially a thing for man's own home.

The other suggestion is with reference to the floor tile. There is so very little competition, except in the unglazed red, that almost any duty would do. The ad valorem ought to come off because of the difficulty I stated earlier.

Senator WATSON. Are you interested in all these kinds of tiles?

Mr. GRANT. Referring to a great many of them there, Senator, do not think there is any such animal any more. I do not know where the wording of that came from, but I never heard of a pill tile, and there are some other things stated in there that are not used any more, such as embossed, friezes, etc.

Senator WATSON. The bill covers tiles, unglazed, glazed, ornamented, hand painted, enameled, vitrified, semivitrified, decorated, encaustic, ceramic mosaics, flint, spar, embossed, gold decorated, grooved, and corrugated. Do they make all those?

Mr. GRANT. If they do I have never seen them in the last 10 years, a great many of them.

Senator WATSON. Which ones do they make the most of?

Mr. GRANT. The 6 by 3 glazed tile that you see in bathrooms, the same shape of tile, but of an entirely different finish.

Senator WATSON. Which kind do you sell the most of?

Mr. GRANT. Ninety-nine and a fraction per cent of them are white glazed tile, and that is the stuff that we want the American manufacturer protected on.

Senator WATSON. And the most of what you sell is the American product?

Mr. GRANT. Absolutely. We have not imported any bright glazed tile in this country for years. The only time we tried to bring it in was when there was a tie-up during the war, and we could not get any of it then. There are great floods of British, Belgian, and Austrian tiles hitting this market. They are glazed tiles, but we would not use them; it is rotten stuff. You can bring them in and any inspector will tell you that they are rank. At 25 per cent you are not giving the American manufacturers the real protection that they need. I hold no brief for the American manufacturer. I am simply stating what I believe to be in the best interests of the industry.

Senator SMOOT. You say you know nothing about pill tile?

Mr. GRANT. No. It may be something of a trade name. I do not know of it.

Senator SMOOT. It has been used in every tariff bill since 1884.

Mr. GRANT. Probably in 1884 they were in demand, but to-day we do not use them.

The CHAIRMAN. There are a number of antiquities in a tariff bill.

Senator SIMMONS. A great many of these things are not produced in the United States now, but they may be in the future.

Mr. GRANT. They will never be used in the lifetime of this bill.

The CHAIRMAN. Is that all, Mr. Grant?

Mr. GRANT. That is all, unless there are some questions that the members of the committee wish to ask me.

**STATEMENT OF D. A. CABLE, REPRESENTING THE UNITED STATES
ROOFING TILE CO., PARKERSBURG, W. VA.**

Mr. CABLE. My name is D. A. Cable, of Canton, Ohio. I represent the United States Roofing Tile Co., Parkersburg, W. Va.

Senator SMOOT. To which paragraph are you going to address yourself?

Mr. CABLE. To paragraph 202.

This [referring to exhibit] is a sample of our product. We ask for a tariff on quarry tiles the same as is given under the Payne-Aldrich Act of 1909; in other words, we ask that the last two lines of paragraph 202 be changed to read as follows: "or quarry tiles, red or brown in color, 5 cents per square foot, but not less than 25 per centum ad valorem." Under the Payne-Aldrich law the tariff was 45 per centum ad valorem, which, when reduced to American valuation would give us an equivalent of 25.29 per cent. The law as it now stands reads "20 per cent ad valorem."

Senator SMOOT. Would you object to having the words "red or brown in color" stricken out?

Mr. CABLE. We would not object.

The 5 cents per square foot we ask for as a stabilizer. As large quantities of tile come into this country we will be forced to reduce our price, the amount of duty as applied to the incoming tile will then be reduced, and our price will again be reduced. We ask for 5 cents per square foot duty in order that we may have protection through the number of years that this law will in all probability be in effect.

Senator SMOOT. No one can tell how long that law will be in effect but I do not think it will be many years.

Mr. CABLE. During that time we feel we should have a minimum of 5 cents per square foot as a tariff on this product.

We also ask that a technical change be made, in that in lines 1 and 18 the word "so-called" be stricken out. I might add that our company is the only company engaged exclusively in the making of quarry tiles in the United States and that it is an infant industry. Quarry tiles have been produced in this country in quantity only during the last 10 years.

Senator McLEAN. Just what are quarry tiles?

Mr. CABLE. This is a sample of 6 by 6 tile. They are flooring tiles.

Senator McLEAN. Then, why are they called "quarry" tiles?

Mr. CABLE. That name was given to them in Europe a number of years ago. I do not know just why. It is a trade name. They are made in general in sizes of 4 by 4, 6 by 6, and 9 by 9. This [indicating] is the 6 by 6 size.

Senator DILLINGHAM. What is the sense of striking out the word "so-called"? Is the name so well established that it does not need that?

Mr. CABLE. Yes. All the tiles that come into this country under the last two lines of this paragraph are in competition with all the tiles included under the paragraph. The entire tile industry should be protected by putting an adequate tariff on quarry tiles.

I mailed a brief to the committee which I wish to withdraw and submit in lieu thereof the brief which I have here.

Senator SMOOT. It will be so ordered. Is there anything else?

Mr. CABLE. Nothing, unless there are some questions.

**LET OF D. A. CABLE, REPRESENTING THE UNITED STATES ROOFING TILE CO.,
PARKERSBURG, W. VA.**

Quarry tiles are defined as "unglazed, vitrified flooring tiles made from natural ~~ys.~~" There are seven small plants now in the United States making this product. ~~ese~~ plants are located all over the United States.

The United States Roofing Tile Co. is the only company exclusively engaged in the production of quarry tiles. This company began operation in 1914. The business ~~s~~ operated at a loss, and not until 1918 were we able to make expenses. By reason of the World War, the importation of quarry tiles from Europe dropped about 50 per cent, thus permitting these plants to get a start. Quarry tiles have been made in Germany, England (Wales), Holland, and Belgium for many years. They are manufactured in Europe and this country in various sizes and shades, but are chiefly red and brown in color, and the standard sizes are 4 by 4, 6 by 6, and 9 by 9.

Quarry tiles are used for floors in corridors, hospitals, cold-storage plants, power houses, restaurants, sun parlors, schools, and many other places.

Great skill is required to manufacture these quarry tiles in order that they may have uniform shade of color and size, and that losses in manufacture be low so that the product can be sold cheaply.

PROPOSED TARIFF WILL NOT PROPERLY PROTECT QUARRY TILE MANUFACTURERS IN THE UNITED STATES.

The yearly reports of the Bureau of Foreign Commerce and Navigation, issued by the Department of Commerce, show that from the year ending June 30, 1913, to the year ending June 30, 1920, the value of quarry tiles imported into this country was twice the value of all other imported tiles combined. Because of the fact that approximately 95 per cent of these quarry tiles come within the low tariff classification of the present act, we respectfully request that our industry receive protection equal to the Payne-Aldrich Act of 1909. This committee should bear in mind that all quarry tiles imported into this country not only enter into competition with the quarry-tile manufacturers here, but also all other tile manufacturers in the United States; and, therefore, the rate on these quarry tiles should be such as to protect all tile manufacturers irrespective of classification.

TARIFF LEGISLATION.

The first act, so far as I can ascertain, that protected quarry tiles was the Payne-Aldrich law of 1909, which carried a provision of protection on quarry tiles to the extent of 45 per cent ad valorem. That act, in part, reads "so-called quarries or quarry tiles, 45 per centum ad valorem." This naturally was based on foreign valuation, but it would be equal to a present tariff of 31.03 per cent on an American valuation, exclusive of overhead and freight, or, inclusive of overhead and freight, 25.29 per cent.

Under the Underwood Act of 1913 the tariff on quarry tiles was reduced so that the law now reads "so-called quarries or quarry tiles, 20 per centum ad valorem."

Under the present bill, as it now stands, the protection is only 3 cents per square foot, but not less than 20 per cent ad valorem, that portion of paragraph 202 of the bill reading, "so-called quarries or quarry tiles, red or brown in color, 3 cents per square foot, but not less than 20 per centum ad valorem."

The proposed tariff bill is 5.29 per cent less than the last Republican protective tariff law.

CONCLUSION.

The manufacture of quarry tiles in the United States is practically a new business—an infant industry. In Wales, England, and other countries their manufacture has been going on more than a hundred years.

The purpose of this bill is twofold—revenue and protection—both equally important. To properly protect the tile industry for the many years to come that this law may be in existence it is necessary to give a rate at least equal to the last Republican law. So as to permit quarry-tile manufacturers to continue in business and properly compete with foreign producers, there should be a rate, in our opinion, of a specific duty of 5 cents per square foot, but not less than 25 per cent ad valorem.

The minimum protection of 5 cents per square foot is necessary because as foreign competition compels reduction in price of local manufacturers the import duty would also gradually be reduced unless this 5 cents per square foot stabilizer is added; otherwise, if there should be a huge supply of product on hand in Europe shipped

into this country, our local plants will be compelled to reduce the wholesale selling value in the United States, and as this value is reduced so will the amount of tariff and protection be reduced likewise; and it is, therefore, very important that a fixed amount of duty per square foot be established.

**STATEMENT OF W. A. REVIS, REPRESENTING WM. H. REVIS (INC.),
NEW YORK CITY.**

MR. REVIS. The tariff on quarries defines "quarries" as "red and brown." Gentlemen, here is a red quarry [exhibiting sample to the committee].

The same clay that will make a red quarry, burned harder will make a blue quarry; a different clay will make a buff quarry, and another clay will make a gray color. The colors, red, brown, buff, blue, and gray are made by the domestic quarry manufacturers in the United States, and also imported in the same colors. Why should the definition of "quarries" be merely red and brown? This tariff, gentlemen, is not a tariff on quarries, but a tariff on some quarries, namely, red and brown, and leaves other quarries to seek another classification. We urge, gentlemen, the words "red and brown" be stricken out of the present tariff.

Senator CURTIS. And make it apply to all.

BRIEF OF W. A. REVIS, REPRESENTING WM. H. REVIS (INC.), NEW YORK CITY.

The firm I represent has for many years imported red unglazed tiles, made in Wales and known as adamantine tiles. Their cost to-day at an Atlantic seaport is 26½ cents per square foot. They bear a duty of 5 cents per square foot. The similar and competitive domestic tiles are the so-called semivitreous unglazed, which sell for 41 cents per square foot, with a packing charge of 2½ cents, total 44 cents and a fraction. The duty on adamantines will therefore be 16½ cents, or an increase of 225 per cent. This brings their cost 43½ cents per square foot, and prohibits further importation.

PORTLAND CEMENT.

[Paragraph 203.]

STATEMENT OF WILLIAM J. O'BRIEN, BALTIMORE, MD., REPRESENTING THE PORTLAND CEMENT INDUSTRY.

The CHAIRMAN. Will you state your name to the committee?

Mr. O'BRIEN. William J. O'Brien.

The CHAIRMAN. Where do you live?

Mr. O'BRIEN. I live in Baltimore.

The CHAIRMAN. Are you in the cement business?

Mr. O'BRIEN. I represent 83 of the 88 cement companies in the United States.

The CHAIRMAN. What is your business?

Mr. O'BRIEN. I am an attorney.

The CHAIRMAN. Where are the cement people?

Mr. O'BRIEN. Some of them are here.

The CHAIRMAN. Do you speak for all of them?

Mr. O'BRIEN. I speak for 83 of the 88 companies in the United States.

The CHAIRMAN. Will you please go on, Mr. O'Brien.

Mr. O'BRIEN. Mr. Chairman, the request of the industry—that is the companies that I represent—is that they receive the same tariff protection they did under the Payne-Aldrich bill, and that

is 8 cents per hundred pounds including the weight of the package, 28 cents per hundred pounds for other than Portland cement, and 28 per cent ad valorem. However, we attach practically no importance to the two latter figures, because there is very little of that cement imported into the country. It is principally the Portland cement.

Senator McCUMBER. Why should that not be specific? Do you know of any reason why it should not?

Mr. O'BRIEN. I do not see any reason why it should not be a specific duty. It is negligible at best. We are asking for the restoration of the Payne-Aldrich rates. They were cut down, as I have pointed out, in the bill that the committee is now considering.

Inasmuch as there are some figures which I desire to submit to the committee, I have taken the liberty of making a few notes, not a brief, and I think I can best cover the ground by just reading those.

Senator McCUMBER. Let us cover the other point first.

Mr. O'BRIEN. Yes, sir.

Senator McCUMBER. Your request is for the restoration of the Payne-Aldrich rates?

Mr. O'BRIEN. Which was 8 cents per 100 pounds on Portland cement.

Senator McCUMBER. Yes; but that was on the importing price, and not on the American value. Do you want 8 cents on the American valuation?

Mr. O'BRIEN. In answer to that I might say——

Senator McCUMBER (interposing). Or do you want its equivalent?

Mr. O'BRIEN. We want its equivalent, and we have not yet calculated what its equivalent would be, but the experts of the committee can do that.

Senator CALDER. What is the duty under the present law?

Mr. O'BRIEN. Cement is on the free list.

Senator SMOOT. Under the Payne-Aldrich bill it was 20 per cent.

Mr. O'BRIEN. Ad valorem, but 8 cents per hundred pounds on Portland cement.

Senator CALDER. Have you the figures indicating what the importations have been under the present law?

Mr. O'BRIEN. I have. I am going to give those to you in a moment.

I will give you first the size of the industry and some few figures which I think will prove interesting. The Portland cement industry in this country is a most important one. It operates 115 plants with a production in 1920 of 100,302,000 barrels. In the same year the shipments aggregated 96,329,000 barrels, and there was an over-production in the year 1920 approximating 4,000,000 barrels.

Senator CALDER. You mean the shipments throughout the country?

Mr. O'BRIEN. Throughout the country. I will divide that in a moment and show what the exports were.

The rated capacity of the plants totals about 149,000,000 barrels. The capital invested in the industry is substantially \$310,000,000, and there are employed 36,500 men in and about the mills. These men are paid \$61,500,000, an average yearly compensation of nearly \$1,700, or about \$5.60 a day, counting 300 working days to the year.

The plants in the industry are located in nearly every section of the country, several being on the Pacific coast, 31 near the Canadian border, 10 in the States bordering Mexico, and a large number adja-

cent to the Atlantic seaboard. There were imported into the United States in 1920, 502,785 barrels of the value of \$1,230,140, as is shown by Table No. 3 in the brief submitted to the Ways and Means Committee of the House of Representatives.

Senator CALDER. Have you a record indicating where that came from?

Mr. O'BRIEN. The major part of that came from Canada. I have not distributed it among all of the countries, because of that 502,785 barrels 499,479 came from the Canadian side.

Senator CALDER. Have you any figures indicating how much went into Canada?

Mr. O'BRIEN. I have; I will give you those in a moment.

In that year 381 barrels came from Mexico, and 505 barrels came from Germany.

Now, in 1920 we exported 2,985,810 barrels of the value of \$10,055,369, and of these exports 31,486 barrels of the value of \$125,834 went to Canada.

Senator CALDER. Where did the rest go?

Mr. O'BRIEN. The rest went principally to South America, practically all of it. Some little went to the West Indian Islands, the West Indies, but the rest went to South America. None of it went to Europe.

The year 1920, from the standpoint of production, was the largest in the history of the industry, production increasing 19,230,924 barrels over 1919. The shipments that year were the largest in the history of the industry. They increased only, however, 11,732,384 barrels over 1919, so we had an increase in production of 19,230,924 barrels and an increase in shipment of 11,732,384 barrels, showing an increase of production over shipments of 7,498,540 barrels. That was the condition that confronted the industry in the very largest year of its production and its shipment.

I might say briefly, as to the Canadian situation, that Canada imposes a tariff of 8 cents per hundred pounds on cement, which is equivalent to 30 cents and 4 mills a barrel. There was a 20 per cent ad valorem duty on sacks, 2 per cent sales tax, covering the cement and container, making in all a duty of 56 cents and 4 mills, in addition to which there is a dumping duty not to exceed 15 per cent.

There are 31 plants in the country, scattered along the northern border, which are in proximity more or less to the Canadian line. The capacity of these plants is far more than sufficient to take care of the territory that they serve, and consequently that territory is particularly vulnerable to that Canadian competition. I understand that a very large plant is being erected just across the lake from Detroit, which will have a large capacity, and they will be able to ship cement at a very low transportation rate right across the lake into Detroit, Toledo, Cleveland, Buffalo, and all that territory.

I might remark that the capital of the industry invested in Michigan is something over \$15,000,000, and the production is about 6,000,000 barrels a year.

Senator SMOOT. The importations in the past have not hurt you very much have they.

Mr. O'BRIEN. The importations from Canada, Senator, have to some extent affected the situation in Michigan and along that northern line, being last year approximately 500,000,000 barrels.

Senator CALDER. Your statement seems to me to be that you only imported about one-half of 1 per cent of total production and exported about 2 or 3 per cent.

Senator McCUMBER. You mean 500,000, do you not?

Senator SMOOT. You said 500,000,000 barrels.

Mr. O'BRIEN. I meant 500,000 barrels.

Senator CALDER. Your production was 100,000,000 barrels, and our imports were 500,000 barrels.

Mr. O'BRIEN. The exports in 1920 were approximately 3 per cent of the production.

Senator CALDER. While your imports were only one-half of 1 per cent.

Mr. O'BRIEN. Yes, sir; about one-half of 1 per cent.

Senator CALDER. Under the Fordney bill, as sent over to us, you get about 10 per cent on cost of production in the way of protection?

Mr. O'BRIEN. Approximately that.

Senator CALDER. Do you mean to ask us for more than that?

Mr. O'BRIEN. We are asking for 8 cents per 100 pounds.

Senator CALDER. And last year you only had about one-half of 1 per cent importations of your total production.

Mr. O'BRIEN. You are speaking of Canada?

Senator CALDER. Yes.

Mr. O'BRIEN. If that were to remain stable, then there would be no reason for asking that; but the Canadian imports are gradually increasing. For instance, if my memory serves me, in 1918 there were approximately 10,000 barrels coming in from Canada; in 1919 there were about 31,000 barrels; and in 1920 there were 500,000 barrels.

Senator McLEAN. That was probably consumed near the border, was it not?

Mr. O'BRIEN. That was consumed more or less near the border, but it affected the market in New York and Ohio and Michigan, and more particularly in the latter State.

Senator McLEAN. You produce it as cheaply as Canada does, do you not?

Mr. O'BRIEN. Not quite, for the reason that labor is cheaper in Canada. In northwestern Canada it is very much cheaper, and the California, Oregon, and Washington markets are subjected to the effects of the cheap labor in western Canada, which is Hindoo and principally Chinese.

Senator CALDER. You point out that your imports from Canada seemed much larger last year than formerly?

Mr. O'BRIEN. Very much larger.

Senator CALDER. Was that not attracted through the unusually high prices that you got?

Mr. O'BRIEN. That is quite possible.

Senator CALDER. And when you get back to what most of us think the normal prices will that not right itself?

Mr. O'BRIEN. It may and it may not, Senator, for this reason. The rated capacity of the present Canadian mills is very largely in

excess of their consumption, and consequently if they operate at anything like capacity they will have a very large surplus that they must get rid of somewhere. Now, they simply ship it across the border, because there is no protection and no reason why they should not do it.

Then I want to point out the fact that there is a very large cement mill projected, property all purchased and ready, or no doubt will be in a few months, to go into operation, which will have a large capacity, and which is located directly across the border, with no rail freight rates at all.

Senator CALDER. The fact remains with the unusual demand in this country and the high prices obtained, with the needs of the country, only one-half of 1 per cent was imported when imports were free.

Mr. O'BRIEN. That certainly applies so far as 1920 is concerned.

Senator CALDER. Now you are getting 10 per cent, and you ask us to increase it. We are giving you 5 cents a hundred pounds.

Senator McLEAN. That is \$1 per ton.

Mr. O'BRIEN. That is less than the Canadian duty and, of course, it is manifestly less than will afford an adequate protection against German cement, provided they should begin to ship into this market.

Now, I might say—my time is short—that in regard to this German cement, of course you gentlemen all know the cartel system. The Germans put for export a certain per cent of their production into the cartel and ship into countries where they desire to build up the trade, at any price at all.

Senator CALDER. Have you taken the trouble to inquire as to the imports in June, 1921?

Mr. O'BRIEN. Up to June, 1921?

Senator CALDER. The month of June.

Mr. O'BRIEN. I do not think I have those figures, but I can tell you the importations from the 1st of January to the 30th of June, including June.

Senator CALDER. What were they?

Mr. O'BRIEN. They were 683,342 barrels, and the imports to June 30 were 45,235 barrels.

Senator CALDER. For the first six months of this year?

Mr. O'BRIEN. Yes, sir.

Senator CALDER. For June the record here shows only 6,230 barrels.

Mr. O'BRIEN. That is quite possible, but these figures were taken from the Geological Survey for the period covering January 1 to June 30.

Senator CALDER. Imports?

Mr. O'BRIEN. Imports and exports.

Senator SMOOT. Do you want 7 cents for the bulk, the same as the Payne-Aldrich bill, instead of 4 cents as provided in this bill?

Mr. O'BRIEN. For the sake of balancing the schedule——

Senator SMOOT (interposing). I want to get at what you want. In paragraph 205 it refers to "white nonstaining Portland cement." Are you interested in that?

Mr. O'BRIEN. We are not interested in that.

There was one point I thought was quite essential that I would like to call your attention to. In the discussion that took place, a

understand it, in the House, there seemed to be an impression that the cement industry in the United States had made enormous profits in the year 1920, and I want from the facts and from the figures as I have them to disabuse the minds of this committee of that impression.

The average factory price for the year 1920, taking the industry as whole, as shown by the Geological Survey, was \$2.02. The cost of production in the year 1920, so far as we have been able to gather it, and we have made a very exhaustive, earnest, and consistent effort to do it, was \$2.019. Therefore, in so far as the manufacturer is concerned, the profit to the industry in 1920 was only 6 per cent on the invested capital, which is included in this item of cost of production.

It is true that cement, as you gentlemen know, sold at all kinds of prices throughout the United States in 1920; that is, to the consumer. I myself know in some of the cities where cement sold at \$8 a barrel and sometimes higher.

Senator CALDER. And I know in some cities where the manufacturer got some of the increase.

Mr. O'BRIEN. Well, Senator, I can not speak for the individual companies. That is, of course, manifestly impossible, but I do know that the industry as a whole received only that average factory price, and that was the average cost of production.

Senator McCUMBER. Do I understand the companies were able to make 6 per cent on their investment on about 1 mill profit per barrel?

Mr. O'BRIEN. You misunderstand me, Senator. In this item of cost of production 6 per cent on the invested capital was included. I have the items here going to make up that cost. I will not trouble you with them unless you would care to have them.

Senator SMOOT. Put them in the record.

Mr. O'BRIEN. I will do that. I would like to have the privilege of filing a brief.

The CHAIRMAN. You may file any brief you desire.

The CHAIRMAN. The witnesses will all have the opportunity to correct the record after it is transcribed and printed.

BRIEF OF WILLIAM J. O'BRIEN, BALTIMORE, MD., REPRESENTING THE PORTLAND CEMENT INDUSTRY.

Portland cement is produced from a mixture of clay and lime rock materials in such proportions that the various components will combine to form the desired complex silicates. This is the product commonly known as cement in the building trades. It is uniform in composition and properties and for this reason is used in all work where uniform hardness and compressive strength of the finished product are important factors.

Portland cement, generally mixed with sand gravel (concrete), is one of the most important and popular construction materials. It is claimed that no other single product, with the exception of iron and steel and possibly copper, has been of more service in the development of modern structural work. It is used ordinarily in the heaviest character of construction, such as dams, conduits, retaining walls, and piers and, when reinforced with steel, in bridges and buildings of nearly every character. As a road-building material it is unsurpassed, and for durability it stands alone. In addition to the above uses it now, as the result of a campaign of education, holds its place on the farm, and for the building of silos, barns, culverts, aqueducts, water troughs, and the like it is thoroughly satisfactory.

Portland cement has gained in favor and use at the expense of its rivals. It has almost entirely replaced the wooden and, in many instances, the brick sidewalk and competes with iron and clay in the manufacture of sewer pipe.

The Portland cement industry has become a most important one, in that it operates 115 plants, with a production in 1920 of 100,302,000 barrels. In that year the shipments were 96,329,000 barrels, and there was an overproduction of 3,973,000 barrels. The rated capacity of the plants is 149,782,000 barrels. The capital invested is \$310,000,000. There are 36,500 men employed in the mills, who are paid \$61,500,000 an average yearly compensation of nearly \$1,700, or about \$5.60 a day (300 working days to the year).

The following table will show the gradual increase of production of Portland cement in the United States from 1900 to 1918, inclusive:

Portland cement produced in the United States.

Year.	Quantity (barrels).	Value.	Year.	Quantity (barrels).	Value.
1900.....	20	\$6 25	1911.....	37	\$66,248.75
1901.....	25	12 50	1912.....	56	87,015.00
1902.....	44	20 78	1913.....	31	92,537.50
1903.....	73	27 19	1914.....	70	81,780.00
1904.....	31	23 19	1915.....	07	73,885.00
1905.....	12	33 67	1916.....	98	100,947.00
1906.....	24	52 86	1917.....	02	125,670.00
1907.....	90	53 51	1918.....	63	113,448.50
1908.....	12	43 79	1919.....	78
1909.....	31	52 54	1920.....	00
1910.....	51	68 00			

The production and shipments for 1919 and 1920, together with the average factor price per barrel, are shown in the following table:

Portland cement produced and shipped in the United States, 1919 and 1920, by district.

The United States possesses practically inexhaustible supplies of clays, lime rock, and fuel, which are so distributed that domestic plants can efficiently serve all parts of the country. Keen competition within the domestic manufacturing industry has resulted in the construction of very large plants, where every labor-saving device can be profitably utilized. The Portland cement industry has probably attained a greater degree of concentration than obtains in the case of other building materials. The large amount of capital required to equip a cement plant, the uniform character of the product, and the advantage of the wider market have kept the number of cement producers low. There were only 113 producers of cement in 1916, as contrasted with over 3,000 brick and tile manufacturers, 4,000 stone quarries, and over 10,000 lumber mills. Under present operating conditions a cement plant, in order to be profitable, must be located close to two of the three necessary raw materials—clay, lime rock, and fuel. The Lehigh district of eastern Pennsylvania and western New Jersey is still the most important producing center. Here are located all necessary raw materials, and transportation facilities, both rail and water, are unexcelled. The Lehigh district formerly produced upward of 70 per cent of the domestic supply of cement, but although the actual production from this locality has increased, the percentage has decreased to less than 26 per cent of the total, due to developments elsewhere.

Portland cement plants are located in nearly every section of the country, several being on the Pacific coast, 31 near the Canadian border, 10 in the States bordering Mexico, and a large number adjacent to the Atlantic seaboard. The total capacity is considerably greater than the as yet developed demand in the United States.

There was imported in 1920 into the United States 502,785 barrels, of the value \$1,230,140, as is shown in the following table:

Imports of Portland cement, 1920, by months.

Month.	Barrels.	Value.	Month.	Barrels.	Value.
January.....	25	\$113	August.....	55,516	\$162.3
February.....	116	713	September.....	53,200	158.0

Peru.....	105,223	281,756	120,335	368,370	107,466	\$25,000
Other countries.....	430,276	1,344,000
Total.....	2,252,446	5,912,166	2,463,573	7,513,389	2,985,810	10,650,000

In 1921, to June 30, the exports were 683,342 barrels and the imports were 45,000 barrels.

Imports from Canada do not begin until later in the year. Last year they commenced in August. The cement is used principally in road building, and this year there was a very late start.

In 1920 we exported 2,985,810 barrels of Portland cement, of the value of \$10,055,000. Of these exports 31,486 barrels, of the value of \$125,834, went to Canada.

The year 1920, from the standpoint of production, was the largest known to the industry, production increasing 19,230,924 barrels over 1919. Shipments, also the largest in its history, increased, however, only 11,732,384 barrels over 1919, showing an increase in production over shipments of 7,498,540 barrels.

Exports for the year 1920 amounted to 2,985,810 barrels, which are included in the 96,329,000 barrels shipped during the year 1920. It is therefore plain that approximately 97 per cent of shipments were for consumption in domestic trade and only 3 per cent, or almost a negligible quantity, for export trade.

These figures reveal the startling condition which the industry faces now. Shipments are falling off, for in the year of largest distribution the industry produced some 3,971,000 barrels.

There is very little building being done of a general character. The industry had to depend largely upon road construction, with some municipal work. The

practically all open-air work and will be over by November, after which the industry faces a period of stagnation until late spring.

PRICES AND COST OF PRODUCTION IN 1920.

The average factory price per barrel in 1920 was \$2.01 (United States Geological Survey Press Bulletin No. 466). The average cost of production per barrel was \$2.02. This cost is made up as follows:

Rock.....	\$0. 21
Silica sand.....	. 0199
Gypsum.....	. 0493
	<hr/>
	. 2792
Labor.....	. 1623
Supplies.....	. 1277
Fuel.....	. 5362
Power, light, and water.....	. 3141
	<hr/>
Total direct cost (per million barrels).....	1. 4195
Mill overhead.....	. 1022
Reserve, taxes, insurance, depreciation (depreciation, 6 cents per barrel)...	. 0891
	<hr/>
Total bin cost.....	1. 6108
Shipping expenses.....	. 0854
Selling expenses.....	. 0813
General and administration.....	. 0863
	<hr/>
	1. 8393
6 per cent on invested capital at rate of \$3 per barrel of output.....	. 18
	<hr/>
Total cost.....	2. 0193

In the above item, "Rock, 21 cents," is included the cost of labor in the quarry, which is a very large portion of that item. The item "Labor" given above is simply the labor in the mill and does not include labor in the quarry, nor laboratory, office, superintendence, etc.

The increase in the cost of coal in 1920 over that in 1919 was approximately \$300,000, or 30 cents a barrel on a million-barrel output. The proportion of coal in the above average cost of \$2.02 per barrel for 1920 was about \$0.8113, or in dollars on 1,000,000 barrels, \$811,300; in 1919 the cost of coal was \$0.5154, or on a million barrels \$515,400.

Figures from the Geological Survey indicate that the industry realized in 1920 a factory price for the 96,329,000 barrels distributed of \$2.01 per barrel; whereas in 1919 the factory price realized was \$1.71. a difference of practically 30 cents a barrel. It is therefore obvious that the manufacturer of cement disbursed all of the increase in price received from the sale of his product in payment of increased coal bills, and so far as the manufacturer is concerned he should not be accused of profiteering, since the net result of all price increases obtained in 1920 was immediately paid out for coal, and practically his margin of profit for 1920 was about the same as in 1919; in other words, the profit was that which was included in the cost of production, to wit, 6 per cent on invested capital.

It is true that the consumer of cement was charged a variety of prices, but it is safe to say that except in rare instances the manufacturer obtained no advantage from any excessive price paid.

The present average factory realization price is \$1.75. The present average cost of production is \$1.73 (including 6 per cent on invested capital).

Wages have been reduced from an average in 1920 of \$5.60 to an average of \$4.48.

THE CANADIAN SITUATION.

For a number of years the Canadian Government has maintained a duty on cement imported into Canada amounting to—

	Cents.
8 cents per hundred pounds.....per barrel..	30. 4
20 per cent ad valorem duty on sacks (4 sacks, 25 cents=\$1).....do....	20. 0
2 per cent sales tax (cement, \$2 per barrel; sacks, \$1 per barrel=\$3).....do....	6. 0
	<hr/>
Total.....	56. 4

There is also a "dumping duty" provided for as follows: "Imports into Canada invoiced at prices less than the fair market value of such articles when sold for consumption within the country whence exported to Canada are liable to a special 'dumping duty' equal to the difference between the selling price to the Canadian purchaser and the fair market value for home consumption. Such additional duty is, however, in no case to exceed 15 per cent ad valorem."

The present value of the Canadian dollar is approximately 87½ cents in United States currency.

In 1918 there was exported to Canada 10,305 barrels of Portland cement, of the value of \$32,813, and in 1919, 12,415 barrels, of the value of \$42,969.

In 1919 there was imported from Canada 1,443 barrels of Portland cement, of the value of \$3,333, and in the first 10 months of 1920 there was imported 429,411 barrels of the value of \$1,060,645. The entire importation for 1920 being 499,479 barrels.

It is quite evident that the imports of Portland cement from Canada are rapidly increasing, and it is also obvious that some forces are operating to curtail shipments from the States. Conceding that the American manufacturer is as alive and wide awake as his Canadian competitor, we must assume that the Canadian duty on exports is the factor in this curtailment of business and that the Canadian industry is building up and expanding under this protection.

We are advised by manufacturers in the Northwest that the present Canadian tariff excludes them from the Alberta and British Columbia markets.

In addition to this protective tariff the American manufacturer is at a disadvantage as compared with his Canadian competitor in the factor of labor, which is cheaper in Canada. In the western Provinces Chinese labor is used to a considerable extent, and manufacturers in that district report that the wages of these Chinese laborers are from 40 to 60 per cent less than the wages paid to the laborers in the cement industry in the State of Washington.

There are 31 Portland cement plants scattered along our northern border, and there are 20 plants in proximity to the line in Canada. The capacity of the American plants is more than sufficient to take care of the needs of their territory, and consequently there is no necessity, from a market standpoint, for the importation of Canadian cement. The capacity of the Canadian mills is far greater than the consumption in the States is, or is likely to be, for some time to come. Consequently there is an ever-present inducement for these mills to dump cement across the border.

A large cement mill is about to be erected near Windsor, across the river from Detroit. There is no surrounding market in Canada to absorb the product of this mill, and its output will, therefore, be sold in the United States.

Freight rates from the Canadian mills to the waterfront are low, much lower than in the United States, and water transportation is cheap. The Canadian mills can therefore, sell their product at a price lower than can the American producer, without loss, in all of the cities on the Great Lakes. The capital invested in the industry in Michigan is about \$15,000,000. There are 10 mills with an annual capacity of 5,080,000 barrels. These mills, however, never operate at more than 60 per cent of their capacity, the demand never having called for a greater production. Their market is particularly vulnerable to Canadian competition, due to a lower cost of manufacture and cheaper transportation. An advantage in freight rates to all of the towns in northern New York and New England makes it difficult for our manufacturers to meet their competition. In addition to the benefits enumerated, Canadian manufacturers enjoy special advantages in shipping facilities. Our manufacturers, especially for shipments within the United States, are obliged to use American bottoms, manned by American labor, the cost of operation of which is very much above the cost of operating foreign bottoms. The Canadian manufacturer has been permitted to make use of these cheap foreign facilities for access to our markets, and a protective tariff prevents our retaliating by using the same facilities for the shipment of cement into Canada.

In brief, the advantages enjoyed by Canadian manufacturers on the basis of 1 barrel of Portland cement are: (a) A duty of 30.4 cents; (b) an extra dumping duty (not to exceed 15 per cent); (c) a reduced labor cost amounting to one-third in central and eastern Canada, with a much greater advantage in western Canada, where Chinese labor is employed; (d) low freight and coastwise rates; (e) difference in exchange. 7 cents.

CONDITIONS ON THE MEXICAN BORDER.

The present duty on Portland cement imported into Mexico is 1 cent Mexican per gross kilo, payable in Mexican gold, or about 90 cents United States gold per barrel. A kilo is 2.2 pounds and a barrel of cement is approximately 180 kilos, or 396 pounds.

The consul's fee is 3 per cent of the invoice. In addition to the above tax, the Mexican government also collects 1 peso, Carranza money, for each Mexican gold dollar paid duty. This is to recall the Carranza paper money. When this duty was put into effect the Carranza paper money was worth approximately one-half cent per peso (dollar), but now has risen to about 10 cents on the peso (dollar). There is also collected a municipal tax of 2 per cent of the duty at port of entry.

The custom-house broker charges a fee of from \$10 to \$15 per car, depending on the size of the car. He will charge in addition to his regular fee from \$25 to \$30 per car to cover fumigation, inspection, switching charges, transfer of load, stenographer's charge for making out bills of lading, and toll charges back and forth across the international line, which makes his total charge for a car, depending upon its capacity, from \$35 to \$40 per car.

There are eight mills in California and Texas in proximity to the Mexican border and two mills in Alabama which could easily be affected by Mexican shipments. The capacity of these mills is greater than the demand for cement in the territory they serve. We are informed that several of the Mexican mills have been rehabilitated and a new one recently constructed at Hidalgo-Nuevo Leon, which is favorably rated to make shipments into Texas. We are advised that peon labor is employed in the manufacture of cement in all of the Mexican plants and that this labor is materially cheaper than in the States, due to its low standard of living. If the American manufacturer was forced to meet this competition, it would inevitably be reflected in the scale of living of American workmen employed in the border plants.

The Mexican manufacturer enjoys an advantage in freight rates, inasmuch as the rates from the Mexican mills to the border are relatively lower than the rates from the border to points in Mexico. There is also a decided advantage at present in the difference in exchange, the Mexican gold dollar being worth 50 cents and the Mexican silver dollar being worth 54 to 56 cents in United States money.

CALIFORNIA.

There are eight Portland cement mills in California, representing an investment of \$35,000,000, and in 1920 they produced 6,995,000 barrels of Portland cement. These mills have never operated to capacity and, therefore, are quite able to take care of any demand in their territory.

They are exposed to the competition of the Canadian mills, which in the western portion of Canada employ Chinese labor and enjoy exceptionally low freight rates to the coast. As heretofore pointed out, shipping facilities favor Canadian shippers, who can make use of foreign bottoms with cheap labor and low operating cost. The production of cement in western Canada is rapidly increasing, and the danger of dumping cement in the ports of Washington, Oregon, and California is an imminent one.

Owing to the foreign exchange situation and the cheap ocean freights from Europe, cement being carried practically as ballast, it is likely that a considerable quantity of cement may be shipped here from Europe to be sold at whatever price it will bring. We are informed that one cargo of cement arrived at San Pedro a short time ago, and some time later the steamer *George Washington* arrived at San Pedro bringing 8,000 barrels of Swedish Portland cement to be sold on the market at any price obtainable. This affords an excellent example of dumping in this country by European manufacturers.

It is not at all unlikely that China and Japan may ship cement to the ports of our western coast. In the Hawaiian Islands to-day Japanese cement is being quoted at 10 cents per barrel less than Pacific coast brands, due to the difference in labor and freight rates.

SHIPMENTS FROM EUROPE.

A superficial consideration of the conditions in Europe to-day might lead one to think that there was little or no danger of European manufacturers being able to undersell our cement producers in their own markets or dump Portland cement in our ports. Upon a closer analysis of the situation, we find that practically none of the great cement-producing districts in Europe have suffered the ravages of war. Their plants are intact, their labor is cheap; ocean tonnage is abundant; rates are low—almost to the point of collapse—and exchange is greatly in their favor.

Prior to the war Belgium and Germany were selling Portland cement in South America and in the West Indies at 75 cents a barrel under American cements, and German cement was delivered at Galveston at 90 cents a barrel, including freight and duty. Therefore, it is not at all improbable that a considerable quantity of cement may be sent here in the near future from Europe.

When you consider the cost of production of cement in Germany in its relation to the selling price of said cement in the United States you will realize that even their peculiar cartel syndicate the cost of production may have but little relation to the selling price.

Under the cartel system manufacturers of cement in Germany allot to the cartel a certain portion of their product, approximately 20 per cent. This cement is for export only. It is charged to the cartel at cost, or oftentimes below cost, so the cartel is in position to dispose of it at practically any price it may see fit. The reason the manufacturer is willing to do this is because it enables him to operate his plant at capacity thereby obtaining as low a production cost as is possible. It enables him to retain his organization and to perfect it by continued operation. Therefore he is willing to allow approximately 20 per cent of his production to go to the cartel at a nominal price as he can make up any loss he may sustain thereby on the sale of the balance.

Heretofore for a number of years the German cartels have been operating largely in the South American markets, but owing to the universal depression there is practically no market in South America at this time; therefore, we may look for the export of German cement into our ports and markets.

Assuming that the German factory cost is equal to the American cost (and, of course, we know that it is very much lower, since in the matter of wages alone the American cement worker is paid \$4.48 a day as against about \$1 a day in Germany), the American manufacturer not having a cartel through which to distribute his exports, he must add his selling, general, and administration expenses, and interest on invested capital amounting in a million-barrel factory to 31 cents a barrel. Hence it is apparent that a tariff which does not at least equalize this item gives no real protection to the manufacturer, which he needs to the extent of at least 8 cents a hundred pounds, or 8 cents a barrel, as provided in the Payne-Aldrich bill.

The following letter was recently received by the Portland Cement Association from Carl Brockstedt, of Hamburg:

"Being on the outlook for high-class firms in your country with which I conduct business in my specialty, high-class German cement Portland, I am glad to receive the name and address of your honorable firm from the chamber of commerce of your city, and therefore I take the liberty to present myself to you as sole exporter of the products of several of the first syndicates of cement Portland of Germany.

"I beg to submit you my offer as follows, and I should be glad if we could do business in my specialty.

"I offer you my high-class German cement Portland, ware of the syndicates of your country—conforme to the German normes for the favorable price of marks: 16.75 per barrel f. o. b. Hamburg, incl. all charges. The cement is embalmed in strong barrels in the weight of 170 ko net and 180 ko grosse, grosse for net.

"Terms of payment: Placing of an irrevocable and divisible letter of credit at a banking corporation, Commerz-u. Privatbank, A. G. Hamburg, payment against shipping documents.

"Here inclosed kindly find the analysis, and with this same mail you will receive a sample of my cement, so that you can make your examination.

"As for the rest, I should be glad if you would be interested for my ware and any business could be done."

If German and other European exporters were considering the sale of Portland cement in the United States, it would be logical for them to endeavor to make commercial connections, but not to ship cement into the United States until after the enactment of the tariff bill, as such shipments would be a strong argument for a higher tariff and would be used by the United States manufacturers for such purpose.

SUMMARY.

There are 88 manufacturers of cement in the United States. Eighty-three of these manufacturers, whose aggregate product amounts to something like 95 per cent of the total production, are associated for educational and research purposes in the Portland Cement Association, which association is represented by the committee filing this brief. The members of the association have voted overwhelmingly in favor of a protective tariff on cement and have instructed this committee to petition the Finance Committee of the Senate for such a duty.

The Portland cement industry is a large one, employing as it does 36,500 American workmen. The industry is particularly vulnerable to foreign competition, and there is nothing to prevent under all the circumstances the extensive dumping of cement by foreign manufacturers in our Atlantic or Pacific ports or along our northern or southern borders. Your committee believes that the various companies comprising the industry, no matter where located, are entitled to be protected against foreign competition.

tion to the extent of being enabled to sell their own product at a fair and reasonable price in their own markets and thus be able to maintain a suitable standard of wages that will enable their workmen to live in the manner in which American workmen are entitled to live.

¶The industry is not requesting a high protective duty. It is not even asking for a tariff that would equalize the duty on imports into Canada; but it does request this committee to amend section 203 of H. R. 7456 so as to provide a duty on Roman, Portland, and other hydraulic cement of 8 cents per 100 pounds, including weight of barrel or package, and in bulk a duty of 7 cents per 100 pounds.

Paragraph 204 provides a duty of 5 cents per hundred pounds on limestone, crude or crushed, but not pulverized; and paragraph 207 provides a duty of \$1 per ton on clays, or earth unwrought or unmanufactured, including common blue clay, etc.

It would seem that if ordinary limestone, crude or crushed, was to be protected by a duty of 5 cents per hundred pounds and ordinary common blue clay was to be protected by a duty of \$1 per ton, Portland cement, requiring a great deal of labor in its manufacture and made almost entirely of limestone and clay, should carry a relatively higher duty than was provided in the House bill.

**STATEMENT OF HAL H. SMITH, DETROIT, MICH., REPRESENTING
THE HURON PORTLAND CEMENT CO.**

The CHAIRMAN. Mr. Smith, you may state your full name to the committee.

Mr. SMITH. Hal H. Smith.

The CHAIRMAN. Where do you reside?

Mr. SMITH. In Detroit, representing the Huron Portland Cement Co.

The CHAIRMAN. What is your business?

Mr. SMITH. My business is manufacturing.

The CHAIRMAN. Do you speak on cement?

Mr. SMITH. I desire just for a moment to direct particular attention to the Canadian situation that has developed here.

The CHAIRMAN. We have had a little of that.

Mr. SMITH. I am speaking for the Michigan companies, into whose territory the entire 500,000 barrels, roughly speaking, of last year's importations came from Canada. Right across the Canadian border, in plain view from the windows of our offices, they are beginning the erection of a large cement plant and the construction of a steel plant near the town of Windsor, Ontario. They can move their cement across the Detroit River for 10 cents a barrel, which is about one-third of what we can move our cement from the town of Wyandotte, 12 miles below Detroit on the American side. Their labor cost is about 20 to 25 per cent less than our labor cost on the American side, judging from the variance between the labor costs of the Canadian plants as they stood last week at 25 cents for rough labor, which is the major part of the labor in cement plants, as compared with ours of 40 cents an hour.

Their raw material is cheaper. Our raw material is some distance from the plant, and Canadian raw material is cheaper. If we should move our cement into Canada, the distance to their large consuming center would be about 100 miles. Cement coming in from Canada is practically limited in a way for its immediate distribution to the large cities along the Canadian border, and this 500,000 barrels that came in last year came into the territory of Buffalo, Cleveland, and Detroit, being devoted largely to city contracts in those communities. Of course, the business in that territory is necessarily larger than in the agricultural territory, but it will roll back upon

the interior Michigan plants the production which they have been selling in the border cities.

Now, in the production of cement, our costs are somewhat higher than their average costs. Our labor cost is higher.

Senator SMOOT. What are you asking for?

Mr. SMITH. I am asking, as Mr. O'Brien did, for the Payne-Aldrich rate. There is some significance in this tariff bill in regard to the related articles of clay and limestone, which get a tariff of 5 cents per hundred. I am talking about clay and crushed limestone. Lime gets 10 cents. It costs twice as much to produce cement per barrel or ton as it does to produce either clay or limestone, and the plant investment would have to be five times as much. Yet the clay and the limestone sells in our territory for about \$1 a ton and gets \$1 a ton tariff, and lime is 10 cents or \$2 a ton and sells at \$12 in our territory. Judging by the comparison of those related articles, some of which are used in our production as raw materials, a tariff of one-half that rate upon the manufactured material is certainly out of line.

Of course, there are other variances in Canada which affect the situation, which are more or less temporary, like the rate of exchange.

The major point I desire to impress upon you is that the problem, so far as our industry is concerned, is a substantial one in Michigan. We have 12 plants with a production in 1920 of 5,000,000 barrels and a capacity of 7,000,000 barrels, an invested capital of \$16,000,000, employing 3,000 men, with a pay roll of \$4,500,000. The injection of this new competition with a more favorable relationship to our principal consuming centers, like Detroit, is the factor that we fear, and it is more immediate and more dangerous to us than anything that can be gleaned from the record of the Geological Survey as to the amount of importations.

Senator CALDER. The cement manufacturers of Michigan manufactured 5,000,000 barrels last year?

Mr. SMITH. Yes, sir.

Senator CALDER. How much of that was exported to Canada?

Mr. SMITH. Practically none. We might have moved a little from the head of the Lakes, but there was practically none.

Senator CALDER. And last year they did a large business?

Mr. SMITH. They did a large business last year.

Senator CALDER. Your manufacturers in Michigan belong to a central organization of cement manufacturers?

Mr. SMITH. Some of them do, not all of them. They belong to the Portland Cement Association, which is a national association.

Senator CALDER. Does your organization attempt to fix the prices?

Mr. SMITH. Not at all. The National Portland Association is an association that studies costs and methods of production.

Senator CALDER. They exchange sale prices with each other, do they not?

Mr. SMITH. No, there is no exchange of sale prices. There is an exchange of information as to methods of production, and the major purpose of the association, as I understand it, and as we employ it, is the development of advertising for the promotion of the use of cement.

Senator CALDER. Do you attempt to control the distribution of it in selling only to dealers?

Mr. SMITH. Not at all. So far as my own company is concerned, we sell 90 per cent of our product direct to the consumer. Maybe that is a little high. I would say 80 to 90 per cent.

Senator McLEAN. How do your prices now compare with a year ago?

Mr. SMITH. Prices a year ago in Michigan, speaking of the average prices, ranged from two and a half to three dollars. It never went over three. The price now is \$1.70 net.

Senator CALDER. Do you sell cement cheaper to a dealer than to a consumer?

Mr. SMITH. There has been at times a small discount as between the dealer and consumer.

Senator CALDER. It is the practice in the East to sell cheaper to the dealer than to the consumer, even if the consumer wished to buy the same quantity as the dealer.

Mr. SMITH. The dealers in our territory are limited largely to small dealers in the small towns. Our principal business is with contractors and with municipalities.

Senator DILLINGHAM. Will you repeat what you said about the relative cost of labor in your mill and the one across the river in Canada?

Mr. SMITH. We compared that upon the basis of our rough labor. The Canadian mills are now paying 25 cents an hour, according to the report secured last week from Toronto.

Senator DILLINGHAM. There is nothing but a river between you?

Mr. SMITH. A river and 100 miles or so.

Senator DILLINGHAM. How do you account for the difference in the cost of labor in that short distance?

Mr. SMITH. I think it has been deflated much more in Canada than it was in the United States. We were not able to force it down in Michigan. Michigan is perhaps a high-wage State, on account of the automobile industry, but the fact is that the unions are very much stronger in the United States than in Canada and they have an insistent propaganda in the cement industry and others in Canada at the present time to hold the manufacturing cost down so they can compete with us.

Senator DILLINGHAM. What was the cost of your labor previous to the war?

Mr. SMITH. Previous to the war? Now it is 40 cents, and it probably averaged at that time 22½ cents or 25 cents.

Senator DILLINGHAM. Has there been any reduction in your establishment of the price of labor since peace?

Mr. SMITH. Oh, yes. We paid as high as 55 and 60 cents during the war, and we are now down to 40. In other industries, like the automobile industry in Detroit, they paid their rough labor 60 and 75 and 80 cents. There has been a considerable deflation, but not so much as in Canada, judging from the reports of the manufacturers.

Senator SMOOT. Is that all?

Mr. SMITH. I think that is all.

LIME.

[Paragraph 204.]

STATEMENT OF WILLIAM E. HUMPHREY, WASHINGTON, D. C. REPRESENTING THE NATIONAL LIME ASSOCIATION AND THE LIME MANUFACTURERS OF THE PACIFIC COAST.

Senator SMOOT. Give your full name to the stenographer.

Mr. HUMPHREY. My name is William E. Humphrey. I represent the National Lime Association and the lime manufacturers of the Pacific coast. I am here asking an increase in the rate over the House bill. I am asking that the rate be increased so that the Canadian manufacturer will have to pay the same rate to get into our markets that the American manufacturer has to pay to sell in the Canadian markets.

Senator SMOOT. On crude, or crushed but not pulverized—what do you want?

Mr. HUMPHREY. I have it here already written out [handing papers to Senator Smoot].

For the National Lime Association I want to ask the privilege of filing a brief.

Senator SMOOT. You have that privilege.

Mr. HUMPHREY. The time that I shall occupy to-day will be in relation to the situation in the Pacific Northwest entirely.

Senator WATSON. What paragraph of the bill is it in which you are interested, Mr. Humphrey?

Mr. HUMPHREY. Paragraph 204, page 27, of the bill.

I want briefly to call the attention of the committee to the situation in the Pacific Northwest.

Most of the lime that is manufactured in this country on the Pacific coast is manufactured on San Juan Island, which lies out near the Strait of Juan de Fuca. The principal foreign competitor is the Pacific Lime Co., situated at Blubber Bay, in British Columbia. Geographically, so far as reaching the market is concerned, there is practically no difference. The Canadian company is in as good a position to reach American markets as is the American company.

Up until about 1914 there was very little competition from the foreign manufacturer in the lime industry in our portion of the country. At that time or along about that time the Pacific Lime Co. established its plant at Blubber Bay. It went over across the line for two purposes: First, so it could use cheap foreign tonnage to get into American markets, and, secondly and principally, so it could use cheap Chinese labor to produce its material. By the use of these advantages they have practically destroyed the American lime industry in the State of Washington.

The difference in wages between the American and Chinese labor is great. The Chinese never receive more than 50 per cent, and in many instances not more than 33½ per cent as much as American labor performing the same work.

I have a table here that I have prepared and that I will insert with my remarks showing the wages paid by the British Columbia manufacturer and by the American manufacturer, by the hour and by the day, and you can see from this comparison that they pay from 30 to 60 per cent of the wages paid by the American producer.

I have here a letter from the president of the largest lime manufacturing plant on the Pacific coast, and he sums the situation up in paragraph. I just received the letter the other day, and I will take the time of the committee to read one paragraph from it:

We know now, of course, what the House did with regard to lime. I am greatly disappointed that they gave us so low a rate of duty in the new bill. It is wholly inadequate and strikingly unfair. At the present market price on both sides of the ocean our lime would pay a duty to enter the Canadian markets of practically 65 cents per barrel. Under the new Fordney bill the rate of 10 cents per 100 pounds would mean 20 cents per barrel upon their lime coming into the United States from British Columbia. In other words, we are required to pay 65 cents per barrel under existing laws to enter the Canadian market, while our Congress is proposing to let them flood our markets with Chinese-made lime at a duty of 20 cents per barrel. This is so strikingly unjust and unfair that I can not properly characterize it. I sincerely hope you may be able to get a very important increase in the duty at the hands of the Senate committee. If they would give us a rate of duty which would be equivalent to that which we would have to pay to go into British Columbia, it would be more like it, though even that would not represent all the difference which exists. Their cost of manufacture is from 40 to 60 per cent less than ours. Their freight is considerably less than ours. In addition to both these advantages, the rate of exchange is now about 10 per cent. Such a situation is simply intolerable. I am reliably informed that the Chinese and Hindus are now working all over British Columbia at common labor at \$1 per day for 10 hours' work. It would require a duty of at least \$1 per barrel, or 50 cents per hundred pounds, to equalize the difference in wages alone. That same difference would apply to the cost of their barrels, etc.—

All our lime on the Pacific coast, I would say by way of interpolation, is shipped in barrels, and that is a very substantial part of the cost of production. They employ Chinese in the production of the barrels the same as they employ them in the lime manufacture—

and on top of that they would have the difference in freight rates by reason of the lower cost of operating British vessels, and they would have the 14 per cent or 15 per cent difference in exchange. I can not see how an American Congress, having in mind the duty of protecting any American product, would permit such inequity to go uncorrected.

By the use of foreign tonnage they have invaded the markets of California and also Hawaii and taken them largely from our producers. I desire to call the committee's especial attention to this, that while the amount of lime that comes into the country is comparatively small, owing to the fact that when you are some distance from the source of supply the freight rates are a factor in its cost, because the commodity is so bulky in proportion to its value, in years past, as far as I can get the figures, more than 50 per cent of all the lime that has been imported into this country has come into the Washington district. It practically all comes from this one company; and as a result to-day, while this company over in British Columbia sent something like 100,000 barrels of lime into our markets, our plants are running less than 10 per cent capacity. The Roach Harbor Lime Co., which has a capacity of 450,000 barrels, is producing only 50,000 barrels at the present time.

Senator SMOOT. The importations, I see, only amount to one-fifth of 1 per cent.

Mr. HUMPHREY. That is what I say. It practically all comes in at one spot. About 200,000 barrels come into the United States out of a production of about 30,000,000, as I recall.

But I call your attention to the fact that it is all at one spot. It is like an Indian war. It may not affect the whole country, but it wipes

out the community in which it is centered. That is exactly what has happened in my State, so far as this lime industry is concerned.

Senator SIMMONS. Are the Chinese and Hindus employed to any considerable extent in other industries than the production of lime?

Mr. HUMPHREY. Yes, sir; in a good many industries. They are employed, for instance, in the lumber industry and in the shingle industry, with certain restrictions. There are certain Crown lands where they do not permit them to be employed. I could not undertake to give you the details, but I would not want it understood that they are employed without any restrictions. They are employed in the lumber and shingle industry very extensively, in the shingle industry particularly.

Senator WATSON. How many miles is it from where your lime industry in the State of Washington is located to where the one in Canada is located?

Mr. HUMPHREY. It is, by water, I think about 200 miles. The American plant is right at the line. The foreign one is on a bay, so by using foreign tonnage the Canadian lime has a distinct advantage in the markets of California and Hawaii.

Senator WATSON. How long has this competition been on between Canada and the United States?

Mr. HUMPHREY. Since the Underwood bill, in 1914. The Underwood bill only gave 5 per cent protection.

Senator DILLINGHAM. What protection does Canada charge?

Mr. HUMPHREY. I am glad you asked me that. I want to call your attention to it. On the lime itself it is 17½ per cent. On the container it is 17½ per cent. The container usually amounts to almost the same as the lime. The war tax is 7½, freight tax 2½ per cent, making a total of 45 per cent.

Senator WATSON. What effect has it had on the production in Washington?

Mr. HUMPHREY. It has reduced it. The Roach Harbor Co. has a capacity of 450,000 barrels. They are producing but 30,000 barrels. Our factories in the State of Washington are 80 per cent down and will be, because this company over in British Columbia is so protected that even if we had the power we could not cross over to fight them. They pile the lime up there and whenever the opportunity comes they dump it on our market until they break the market, and then they immediately raise the price.

This corporation of which I spoke, the Pacific Lime Co., sold a lot of their lime to one wholesaler in Seattle for 90 cents a barrel with specific instructions that he was to use it when necessary to break the market. He did not use it that way, so they claimed, and he got in trouble about it and they would not sell him any more lime.

The Pacific Lime Co. has also gone to the American producers and offered if they would pay them a certain amount to stay out of the market. They are simply commercial pirates. They practice every means known to crush out competition. They went over to British Columbia for the express purpose of capturing the Pacific coast markets in this country. Less than one-third of their production goes into the Canadian market. They saw their opportunity and went over there because they could get cheap Chinese labor and cheap foreign ships and for no other reason.

I can not understand why an American Congress, when they are careful about restricting Chinese labor, which we all approve, will admit the product of Chinese labor to come over and drive our manufacturers out of the business. That is exactly what is happening.

Senator SMOOT. Canada does not employ Chinese labor, does she?

Mr. HUMPHREY. British Columbia does. Practically all of the work in the lime industry is done by Chinese.

Senator SIMMONS. This competition of which you speak would only affect the border States, would it not?

Mr. HUMPHREY. It would only affect the coast. They could not possibly get back into the interior.

What I have stated is what we have already experienced. We know exactly what has happened; 60,000 barrels went into San Francisco alone from this British Columbia company, and every barrel represented just that much wages taken away from Americans. And the American consumer does not get his lime any cheaper. They make no pretense that they do that. As quickly as they break the market, as they have done in coal and shingles and everything else, they put up the price. Under the administration of Mr. Redfield the Department of Commerce sent an investigator out there, and he reported that he could not find any consumer that would say he had profited by this flood of British Columbia lime.

One other point I want to emphasize. It may be that they will claim that the British Columbia lime is of a higher grade. That is not true. That is simply advertising. It is not a fact. I say that without any reservation whatever, because the test made by the Government and by our agricultural colleges and the best chemists in the country all contradict that statement. The fact about it is that the lime produced both on San Juan Island and that produced by this British company are the highest grade of lime in the world. They are about equal in that respect.

Senator WATSON. What per cent do you think you ought to have?

Mr. HUMPHREY. I have given that to Senator Smoot. I did not know how to figure it myself, and I have had it figured for me. What we want is to have the same protection that the Canadian has against us. That is what we are asking for. I think we are asking only for what we ought to have when we demand that we be protected from that cheap Chinese labor and the advantage of that foreign tonnage. We want and expect that our Government will give the American manufacturer the same protection that the Canadian gives to our competitor in that country.

Senator SMOOT. Your brief will be filed?

(The statement submitted by the witness to Senator Smoot is as follows:)

MANUFACTURE OF LIME—COMPARISON OF CONDITIONS IN CANADA AND UNITED STATES.

1. *Disadvantages of American manufacture.*—Labor cost, 40 to 60 per cent; use of foreign ships by Canada, 15 per cent; exchange, 15 per cent.

2. *Labor.*—Wages paid¹ in British Columbia: Chinese coopers, \$4 for 10 hours, or 40 cents per hour; Chinese fireman and boiler stokers, \$3.85 per day; Chinese common workers in mines, \$2.82 per day; common Chinese workers, 25 cents per hour.

Wages paid in the United States: American coopers, \$8 to \$10 for 8 hours, or 87 cents to \$1.25 per hour; American firemen and boiler stokers, \$7 to \$9 per day; American

¹ Canadian manufacturers use Chinese labor almost exclusively. American manufacturer uses none.

common worker in mines, \$5 to \$7 per day; American common workers, 50 cents to 75 cents per hour.

3. *Tariff and taxes imposed on imports by Canada.*—Lime, 17½ per cent; containing 17½ per cent; war taxes, 7½ per cent; freight tax, 2½ per cent; total 45 per cent.

4. *Rate of duty in House bill.*—Limestone, 5 cents per hundred pounds; lime, 10 cents per hundred pounds, including weight of barrel or package; hydrated lime, 12 cents per hundred pounds, including weight of barrel or package.

5. *Duty required to equalize conditions between Canadian and American manufacturers.*—Lime in cooperage, 50 cents per hundred pounds gross weight; lime in bulk, 40 cents per hundred pounds; hydrated lime, 40 cents per hundred pounds gross weight; limestone, broken or crushed, in bulk, 15 cents per hundred pounds; ground limestone in bags, 7½ cents per hundred pounds; ground limestone in bulk, 5 cents per hundred pounds.

BRIEF OF W. E. HUMPHREY, REPRESENTING THE LIME MANUFACTURERS OF THE PACIFIC COAST.

If this Nation fails to give to the lime manufacturers of this country the same protection that the Canadian Government gives to the lime manufacturers in that country then this Nation does not deserve the respect and confidence of the American citizens and this is all that the American manufacturers of lime on the Pacific coast ask. They ask only that their Government place them on an equality with the Canadian manufacturer. If the American manufacturer was satisfied with less than this, if they demanded less than this, they would be less than American and unworthy of the traditions of their country. The House bill falls far short of giving any such protection to the American manufacturer.

This brief will be devoted to the conditions on the Pacific coast.

CONDITIONS IN THE PACIFIC NORTHWEST.

Most of the lime manufactured on the Pacific coast is produced on the San Juan Islands in the State of Washington. These islands border on the Straits of Juan de Fuca, that forms a portion of the Canadian border. The largest competing foreign company is the Pacific Lime Co., on Blubbers Bay, British Columbia. So far as physical conditions are concerned for reaching American markets, the British Columbia company is on practically equal terms with the American producer.

ADVANTAGES OF THE FOREIGN MANUFACTURER.

The foreign manufacturer has three distinct advantages over the American producer in controlling American markets:

1. The foreign manufacturer uses foreign cheap ships, with cheap Chinese crews to carry this foreign lime to American markets. American manufacturers are forbidden by law to use these foreign ships, and yet the American people have squandered billions in an attempt to get an American merchant marine.

2. To-day the American manufacturer is handicapped by the difference in exchange amounting to approximately 15 per cent.

3. Greatest of all, the Canadian manufacturer employs almost exclusively Chinese labor and pays for such labor less than half than the American manufacturer, immediately across the international boundary line, pays for identically the same work.

RESULT OF THESE ADVANTAGES TO THE FOREIGNER.

The lime industry on the Pacific coast since the present tariff law has gone into effect has been almost destroyed. This industry is to-day running less than 10 per cent capacity. The Roache Harbor Lime Co., the largest plant on the Pacific coast with a capacity of 450,000 barrels annually, is producing about 30,000 barrels a year. This company, situated on one of the beautiful San Juan Islands, had for years supported one of the most prosperous communities in the Nation, giving employment to some 500 men and maintaining some 1,500 people, but these people have seen their work and their wages taken from them and given to the Chinese just across the border, so near that they could almost hear the fires in the foreign furnaces. This happy community has been almost completely wiped out of existence by this prevalence of cheap Chinese labor. The entire industry on the Pacific coast is doomed unless Congress gives relief in the coming tariff bill from the Canadian manufacturer that employs almost exclusively Chinese labor.

THE PRESENT TARIFF.

The present tariff is 5 per cent on lime. Limestone is free. The provision of the House bill in reference to lime is as follows:

“Limestone (not suitable for use as monumental or building stone), crude, or crushed but not pulverized, 5 cents per 100 pounds; lime, not specially provided for, 5 cents per 100 pounds, including weight of barrel or package; hydrated lime, 12 cents per 100 pounds, including weight of barrel or package.”

Tariff and taxes imposed on imports by Canada.

	Per cent.
Lime.....	17½
Container.....	17½
War taxes.....	7½
Freight tax.....	2½
Total.....	45

DUTY REQUIRED TO EQUALIZE CONDITIONS BETWEEN CANADIAN AND AMERICAN MANUFACTURER.

Lime, in cooperage, 50 cents per hundred pounds gross weight; lime, in bulk, 40 cents per hundred pounds gross weight; hydrated lime, 40 cents per hundred pounds gross weight; limestone, broken or crushed, in bulk, 15 cents per hundred pounds; round limestone, in bags, 7½ cents per hundred pounds; ground limestone, in bulk, 5 cents per hundred pounds.

If the above rate was given, the American manufacturer would only receive the same rate of protection now received by the Canadian manufacturer. This would still leave the Canadian manufacturer the advantages of which I have spoken, of foreign cheap ships, of exchange, and of cheap Chinese labor.

DIFFERENCE IN WAGES PAID IN CANADA AND UNITED STATES.

It is impossible to get with detailed exactness the wages paid by the British Columbia lime manufacturers. They naturally do everything possible to prevent this information from reaching their American competitors. It is certain, however, that the Chinese workmen is not paid one-half as much as the American workmen performing the same labor. It is also certain that the labor cost of production in British Columbia of a barrel of lime is less than one-half what it is in the United States. It is an insult to common sense for the Pacific Lime Co. to attempt to deny, as they have done, that Chinese labor is no cheaper than white labor. If not, why does this company employ the Chinese? They certainly do not prefer Chinese labor for patriotic or humanitarian reasons. It must be remembered that all lime on the Pacific coast is shipped in barrels. The cost of the barrel is a very large part of the cost of production. The work of producing the barrel in the woods and in the shop is done almost exclusively by Chinese labor. Common Chinese labor is now employed throughout British Columbia at \$1 per day for 10 hours' work. The following table is approximately correct, showing the difference in wages paid by the British Columbia and the American lime manufacturers:

Wages paid.¹

In British Columbia:

- Chinese coopers, \$4, 10 hours, 40 cents per hour.
- Chinese firemen and boiler stockers, \$3.85 per day.
- Chinese common workers in mines, \$2.82 per day.
- Common Chinese workers, \$0.25 per hour.

In the United States:

- American coopers, \$8 to \$10, 8 hours; 87 cents to \$1.25 per hour.
- American firemen and boiler stokers, \$7 to \$9 per day.
- American common workers in mines, \$5 to \$7 per day.
- American workers, \$0.50 to \$0.75 per hour.

¹ Canadian manufacturer uses Chinese labor almost exclusively. American manufacturer uses none.

ACTIONS OF THE FOREIGN COMPANY.

The Pacific Lime Co., at Blubbers Bay, is the main competitor of the American manufacturer on the Pacific coast. This company claims that it is entirely owned by Americans. If so, it would be distinctly to the credit of the company to conceal the fact rather than to parade it. This company went to British Columbia, not to supply British Columbia markets, but to capture the Pacific coast markets of the United States. Everything necessary could be secured in the United States except cheap labor and cheap ships. This company located in British Columbia solely because there it could employ cheap Chinese labor and cheap foreign ships in supplying American markets. This company has resorted to dumping in order to break the market; it has offered to stay out of the American market if the American manufacturer would pay it an agreed tribute; it has published misleading and false advertising; in fact, it has resorted to every form of known commercial piracy. It has been twice fined for attempting to evade the duty on lime shipped into this country. During the war the lime manufacturers of the Pacific coast, both in British Columbia and the United States, formed an association for the common good. This British Columbia company withdrew from this association in great indignation because, representing the American manufacturers of the Pacific coast, I asked of the American Congress an increase in the tariff on lime. This same foreign company had the unmatched impudence to send a representative to appear before the Ways and Means Committee of the American Congress, asking that their foreign interests be protected. Whether they will parallel this intolerable insolence by appearing before this committee in asking consideration of the country whose flag they have left and to which they pay no taxes, for the sole purpose of employing cheap Chinese labor to compete with American labor, remains to be seen.

PURITY OF PRODUCT.

This foreign company makes no pretense that its products sell to the American consumer at less than American lime. It claims that it gets into the American markets by the superiority of its products. It is absolutely untrue that their product is better than the American product. This can be stated without any reservation whatever. It is demonstrated by the chemical analysis of the Bureau of Standards and by the Agricultural College of the State of Washington, and by eminent private chemists. This company gets into the American markets, not because of the superiority of its product, but by dumping, by misleading advertising, and by other methods of commercial piracy already mentioned.

SMALL AMOUNT IMPORTED.

It is strenuously urged by this foreign company, invading American markets with its cheap Chinese-produced products, and its sympathizers, that the amount of importation is small. This is true, but the amount of injury is not small. The effect is concentrated at the border. Owing to the bulk of lime compared with its value, freight rates furnish an absolute protection when it is to be sent any great distance by rail. But in the Pacific Northwest the contact is direct and deadly where they can use cheap foreign ships to reach our market. The amount imported is about 200,000 barrels annually. More than one-half of all the importations come into the market of the lime producers of the State of Washington. It means to them destruction.

Suppose that the amount imported on the Pacific coast does not amount to more than 100,000 barrels annually. This amount is constantly increasing, and whether small or large, it means just that much work and that much wages taken from American labor and given to Chinese labor across the line and working under another flag. No one familiar with the situation will honestly contend for a moment that the importation of this foreign product in any way benefits the American consumer. What a howl would go up if some manufacturer on the Pacific coast, if the law permitted, should place Chinese in his factory and because of this cheap labor begin to drive out of the market his competitors. Every publicity lover in Congress would be exhausting his patriotic vocabulary about it. But we permit a company claiming to be owned by American capital to go into British Columbia and do the same thing in a more iniquitous fashion and look upon it with perfect complacency. True, the amount of importation is small. So was Custer's little force small compared with the entire Army, but its extermination was the extreme calamity that could befall it. The lime industry on the Pacific coast is not large, but that does not take from it the right to live. This industry is under the flag. If it were large and the same conditions existed and Congress refused immediate relief, the party that did it could not survive. Because it is weak is no justification for the extermination of the

dustry for the benefit of a foreign corporation that employs cheap Chinese labor and that owes no allegiance or obligation to this country.

FINALLY.

We do not permit Chinese to come into this country as laborers. This policy meets the universal approval of the American people, but if the Chinese laborers were to come here and perform their work, we would at least sell them something while they were working; they would at least spend some of their wages in this country. Why, then, should we permit the far greater economic infamy by permitting a foreign corporation just at our border to employ cheap Chinese labor and send the result of that labor into the American markets, taking that much work and that much wages from American labor?

I refer the committee for further discussion of this subject to the hearing before the Ways and Means Committee on the pending House bill, the statement of the Battle Chamber of Commerce, Schedule B, page 312, and to the exhaustive and convincing statement of John S. McMillin, Schedule B, page 412.

KEENE'S CEMENT.

[Paragraph 205.]

**STATEMENT OF W. A. REVIS, REPRESENTING WM. H. REVIS (INC.),
NEW YORK CITY.**

Mr. REVIS. Senator Penrose, I ask for a repetition on behalf of myself and on behalf of Mr. Cousins—myself an importer and Mr. Cousins the user of my cement.

The CHAIRMAN. You are an importer of cement, are you?

Mr. REVIS. Yes, sir.

The CHAIRMAN. Where do you reside?

Mr. REVIS. 140 West Forty-second Street, New York City.

The CHAIRMAN. Proceed.

Mr. REVIS. The proposed tariff on Keene cement is on the different grades, six in number, from \$1.77 per ton to \$4.68 per ton. The proposed duty increases the rate from \$5 a ton to \$14 a ton on the different grades, an increase averaging 200 per cent. The Payne-Aldrich bill was from \$3.50 to \$10 on the same grades of cement, or the rate is an increase over the former Payne-Aldrich bill of 50 per cent.

The CHAIRMAN. Let me add that every one of these papers will be carefully examined, if not by the committee—and I take it many of the committee will examine them—by the large number of Government experts here attached to the work of the committee. So that you need not be afraid your statements will not be thoroughly studied. Proceed, Mr. Revis.

Mr. REVIS. The cost of our imported Keene cements laid down in the most advantageous place in America is equal to the manufacturer's price of the domestic, which naturally includes his profit. Going inland, or going to other ports than New York City, the most favorable for freight rates, increases the balance against the importer. When we go to Chicago, the freight rate is \$6.40 a ton, and the adverse balance is double that.

Also the expenses of the importer and the profits of the importer, which according to the instructions to the appraiser would be at least 16 per cent, must be added to the adverse balance against the imported cement.

Gentlemen, the domestic cement, in our opinion, needs no protection, and a higher tariff of the present will mean a cessation of imports and brings the Federal Government no revenue.

Senator SMOOT. You are speaking only of Keene cement?

Mr. REVIS. Yes, sir.

Senator CURTIS. From where do you get your Keene cement?

Mr. REVIS. From England.

The CHAIRMAN. What percentage of the imported article is used in this country?

Mr. REVIS. A comparatively small percentage and that for a special purpose. Mr. Cousins will answer that question thoroughly.

Senator CURTIS. It is used principally in the larger cities?

Mr. REVIS. I take it; yes, sir.

Senator CURTIS. It is utterly impossible for us to transport the Keene cement we produce in our country to the eastern cities and meet the cement imported from England and Sicily.

Mr. REVIS. It is more than possible. The selling price of your cement is about the same as the cost of the imported.

Senator CURTIS. The cement you import is still produced by prison labor in Sicily?

Mr. REVIS. My cement is produced in England. I know of no Keene cement coming from Sicily. Our cement was never produced by prison labor.

Senator SMOOT. You made the statement that the rates in this bill were higher than in the Payne-Aldrich bill?

Mr. REVIS. Yes, sir.

Senator SMOOT. The rates do not show it; that is all I want to say.

Mr. REVIS. I beg to differ, Senator.

Senator SMOOT. You can follow this as I read it and see if we differ, and we might as well have it:

Keene cement, valued at \$10 a ton or less, \$3.50 per ton—

This is the ordinary value—

Keene cement or other, of which gypsum is the component material of chief value, valued above \$10 and not above \$15, \$5 a ton.

The proposed rate is "\$14 a ton or less, \$3.50." So that is a decrease?

Mr. REVIS. That is the American valuation.

Senator SMOOT. Specific duties have nothing to do with American valuation. American valuation does not figure on specific duties at all. So there is not an ad valorem duty, and the statement you have made you must admit now is wrong.

Mr. REVIS. The cost, gentlemen, of the domestic is about the same in the home market as the cost of the foreign in this market, and there is no difference—

Senator CURTIS (interposing). Tell me what it costs per ton to land Keene cement down in New York?

Mr. REVIS. Something like \$9.02; that is the freight alone.

Senator CURTIS. What I asked you was, what the total cost is—

Mr. REVIS. From \$27.32 to \$56.43.

Senator CURTIS. What is it selling at?

Mr. REVIS. It is selling at from about \$40 to \$80 a ton.

Senator CURTIS. Do you know what the freight is from Kansas to New York on Keene cement?

Mr. REVIS. \$9.30 per ton.

BRIEF OF W. A. REVIS. REPRESENTING WM. H. REVIS (INC.), NEW YORK CITY.

In our statement on the proposed tariff for Keene's cement we will confine ourselves to figures to show that it is very excessive—to the practical extinction of imports. We give you the amount of duty per ton on each grade of our cement derived from the present tariff, and compare same with the amount of proposed duty, and show the proposed duty to be higher than the former Payne-Aldrich tariff, after which seems to be modeled:

Grade.	Present rate.	Proposed rate.	Rate in Payne-Aldrich Act.
No. 2.....	\$1.77	\$5.00	\$3.50
No. 1.....	1.88	5.00	3.50
Coarse.....	2.48	5.00	3.50
Fine.....	3.60	10.00	5.00
Medium superfine.....	4.36	14.00	10.00
Extra superfine.....	4.68	14.00	10.00

The proposed duty is therefore about 200 per cent higher than the present, and is 100 per cent higher than imposed by the tariff bill of 1901. When the committee discussed the tariff law, which is now in force, it abandoned a specific and graduated scale of duty for an ad valorem duty. It also reduced the duties to one-fourth of the amounts required by that scale.

Importations have rapidly declined since 1913, and a return to still harsher requirements than then prevailed seems, in our opinion, unnecessary.

If there is a need of a higher tariff for revenue at the present time, the costs of these goods and their packing have a little more than doubled since 1913, and therefore the revenue derived from each ton of imported cement is to-day twice as much as it was when the present tariff was enacted.

Comparative costs of imported and domestic Keene's cement show that for protection the domestic cement needs no duty whatsoever. We give you below the home market price of the principal brands of imported Keene's cement, plus necessary expenses in laying same down at the port of New York, which is the nearest and cheapest market in the United States, with the wholesale price, which includes the manufacturer's profit in the same market:

Grade.	Imported cost per short ton.	Expenses to New York.	Total.	Domestic grade.	Wholesale in New York per short ton.	Less bags returnable, \$3.
No. 2.....	\$17.75	\$9.57	\$27.32			
No. 1.....	18.83		28.40	Regular.....	\$27.70	\$24.70
Coarse.....	24.08		33.65			
Fine.....	36.01		45.58	Fine.....	30.97	27.97
Medium superfine.....	43.60		53.17	Superfine..	53.20	50.20
Extra superfine.....	46.86		56.43			

These figures show that with the exception of the fine grade, which costs 50 per cent more, the costs of imported Keene's at the home market, plus the expenses of transporting same to New York, without duty, is practically the wholesale price of the domestic cement in the same market. For ports other than New York additional costs by freight charges of from \$1.77 to \$7.19 per ton of 2,000 pounds must be added. For inland markets freight charges still further handicap the importer. For instance, the freight to Chicago costs \$6.70 per ton, and since the longer freight haul of the imported cement means a shorter haul from the domestic factory for their product, the adverse balance against imported cement is double the freight charges every mile inland.

According to the above figures the domestic Keene's cement needs no protection. The cost to the importer is never less, and generally much greater than the wholesale price of the domestic cement, at any place in the United States. Before the importer can do any business, there must be added to make a comparative wholesale price a "reasonable addition for profits and general expenses," which for purposes of appraisal according to your rules would be "not less than 16 per cent."

On a proper basis of comparison, therefore, the cost of imported Keene's cement is at least 16 per cent higher than those of the domestic article under the most favorable conditions of comparison.

The fact is that the cheaper grades of the imported cement have not been able to survive present conditions, and their importation has about ceased. It is only the better and more expensive grades that can be brought into this country, and that because of qualities which make them marketable in spite of the high cost. They are now imported in small quantities only, and any such duty as the amounts proposed will doubtless mean their extinction as imports also.

We submit, therefore, that on the basis of cost the domestic Keene's cement needs no protection, and that a higher tariff than the present will mean a cessation of imports, and bring the Federal Government no revenue.

The inference was made when I was before your committee that Sicilian labor was used in connection with the making of imported Keene's cement. Cafferata & Co. is an English concern, composed of native-born Englishmen. All of the English Keene's cement is made from gypsum quarried or mined in England and is manufactured by English union labor. Sicilian or any foreign labor is not and to our knowledge never has been used in the manufacture of English Keene's cement, which is the only kind imported in recent years.

STATEMENT OF H. A. COUSINS, REPRESENTING H. A. COUSINS & CO. (INC.), ARTIFICIAL MARBLE OR SCAGLIOLA, NEW YORK CITY

The CHAIRMAN. Will you state your full name to the committee?
Mr. COUSINS. Henry A. Cousins.

The CHAIRMAN. Where do you reside, Mr. Cousins?

Mr. COUSINS. Five hundred and twenty four West Twenty-fifth Street, New York City.

The CHAIRMAN. What is your business?

Mr. COUSINS. Manufacturer of scagliola or artificial marble.

The CHAIRMAN. Will you state briefly your views on this question?

Mr. COUSINS. The cement known as Keene cement, the imported kind, is used exclusively for the manufacture of artificial marble. We have not found up to the present that any domestic cement has been able to fill our requirements.

Senator CURTIS. Have you ever tried the Kansas cement?

Mr. COUSINS. Yes, sir.

Senator CURTIS. It has been admitted in the last hearings that the Kansas cement answered the purpose.

Mr. COUSINS. No; scagliola or artificial marble can be made from plaster; it can be made from many materials; but good quality material can only be made at the present from the English cement. That cement has qualities and characteristics which none other have been able to equal, either in this country or in other countries in Europe. I have traveled extensively in an endeavor to find it.

Senator CURTIS. What States have you obtained Keene cement from and tried it out?

Mr. COUSINS. Generally speaking, the manufacturers of domestic Keene's cement come to me as an expert—I might say I have had 46 years' experience in this—for information and points on which to improve their Keene's. I have made many tests and researches.

Senator CURTIS. I do not doubt that. I am asking what States in the Union you have used Keene's cements from?

Mr. COUSINS. Principally from Kansas.

Senator CURTIS. Have you had any from Louisiana or Georgia?

Mr. COUSINS. No; I could not say as to the sources of gypsum but the Keene cement I have used has been made at Peoria, Ill., where

there was one concern; and another concern some years ago started in Long Island City.

Senator CURTIS. Go ahead with your statement.

Mr. COUSINS. I would say that the scagliola business is an industry which is an important aid to modern building methods, and it is one, moreover, that does not compete with any American product. The price of imported Keene cement has doubled since the war, which fact, with the cost of labor, threatens the absolute extinction of this industry.

Since the introduction of the artificial marble business in this country, about 33 years ago, we have conferred with and cooperated with many of the American manufacturers in an endeavor to obtain a cement which would fill our requirements, but in spite of the expenditure of much time and capital no concern has yet succeeded in putting in the market a cement capable of superseding this for our purposes. We are as dependent upon the imported cement as we ever were.

It must be plain to every one that we would not pay the high price if we could get something that would give us steady supply and a good article. That is another drawback to the use of the imported, that the shipments are very erratic and irregular. We have not, for instance, had a shipment within the last nearly six months to this country.

It should be understood that while there is good Keene cement made in this country, it is made for a plastering purpose, and is used practically exclusively for that. It is favored more than other kinds, more than the English kinds by plasterers, but it does not fill the requirements for artificial marble.

Senator SMOOT. You are not objecting to this protection on artificial marble, are you?

Mr. COUSINS. There is no protection on artificial marble. We do not import except that we are the indirect importers; we do not import directly.

Senator SMOOT. It is not put on the free list, is it?

Mr. COUSINS. It is not mentioned, I believe, in the tariff.

Senator SMOOT. It falls in the basket clause.

The CHAIRMAN. Is there any imported?

Mr. COUSINS. No.

The CHAIRMAN. I mean, any artificial marble?

Mr. COUSINS. None.

The CHAIRMAN. That comes in competition with the home product?

Mr. COUSINS. Absolutely none.

The CHAIRMAN. You build it up wherever the requirement is?

Mr. COUSINS. We build it up wherever the requirement is.

I would say, again, that the amount of Keene cement imported into this country is so small that it does not seem to warrant the application of so drastic rates.

Senator CURTIS. There was a good deal of it imported under the Payne-Aldrich bill, was there not?

Mr. COUSINS. Not a great quantity compared to the home production.

Senator CURTIS. Is it not a fact that before the Payne-Aldrich bill was passed you could import Keene's cement and lay it down in New York at \$15 a ton, and you sold your Keene's cement at \$95 a ton?

Mr. COUSINS. You must understand, Senator, I have never been interested in the importation or sale of Keene cement of any kind. I am a buyer.

Senator CURTIS. I am telling you what occurred, that is all.

Mr. COUSINS. The Keene cement that you mentioned was of the lower grades of English cement, which were also at that time used for plastering purposes; since then the increase in cost has shut them out of the market.

Senator SMOOT. The amount of importations does not show they are shut out at all; for instance, 1919, Roman, Portland, and hydraulic—

Mr. COUSINS (interposing). This is not a hydraulic cement.

Senator SMOOT. Then I would have to deduct that from the others to find out exactly what they were. I could not tell exactly, but the importations of all these cements have increased greatly.

Mr. COUSINS. That may be, but not the Keene, as you will find, Senator.

Senator SMOOT. All of them. The hydraulic cement, Portland, and Roman have increased from a value in 1919 of \$51,063 up to \$964,807 in 1921.

Mr. COUSINS. That is entirely different.

Senator SMOOT. But take all of the others, which includes Keene cement, and that has increased; all the others are about the same in 1919 as 1921.

Mr. COUSINS. I think you will find since 1913 the average importations have been about 500 tons—the total importations into this country.

Senator SMOOT. The tons are not given, but the values are \$524,709 in 1919 and \$523,376 in 1920.

Mr. COUSINS. I may say, moreover, before we dismiss the subject of the cheaper grades of English cement, that I have never bought those grades, because they are not useful for my purpose. I buy only the more expensive grades, what is known as the coarse and super and extra super. Those sell very high as compared with the domestic. The material that it is made up into—this kind of a thing [exhibiting sample to the committee].

It is possible to produce samples looking as good or better out of plain gypsum or imported cement, but in practical work it is impossible to carry on business and give satisfaction with the domestic. I wish it were otherwise.

BRIEF OF H. A. COUSINS, REPRESENTING H. A. COUSINS (INC.), ARTIFICIAL MARBLE OR SCAGLIOLA, NEW YORK CITY.

I appear before your committee as the representative of the users of imported Keene's cement; that is, as representative of the artificial marble manufacturers' industry which depends absolutely on this material. An industry, moreover, which is an important aid in modern American building methods and one which does not compete with any American product.

The price of imported Keene's cement has more than doubled since before the war, and this fact, with the even greater advance in cost of labor, threatens the speedy extinction of the industry. We are therefore alarmed by the prospect of a still further increase in the cost of this material on which we must depend for the manufacture of artificial marble of good quality.

Since the introduction of the artificial marble business in this country, about 20 years ago, we have conferred with and cooperated with many American manufacturers in an endeavor to obtain a cement which would fill our requirements, but in suc-

the expenditure of much time and capital, no concern has yet succeeded in putting on the market a cement capable of superseding the English for our purposes; we are dependent on the imported cement as we ever were.

It must be patent to everyone that we would not pay the high price demanded for the imported if we could get an American cement which would fill our requirements at a lower cost, as besides higher cost we are subject to a very uncertain supply. For instance, not a shipment of foreign Keene's has been made to this country during the last six months.

It should be understood that while American Keene's is excellent for plastering purposes, is generally favored by plasterers, and is largely used by my concern for special plastering, it does not fill our requirements for artificial marble.

English Keene's, on the other hand, is not so highly favored for plastering, even if the high cost were not taken into consideration. It has, however, many qualities or characteristics which are necessary for the production of first-class artificial marble. We therefore consider any barrier to its importation as a blow to an industry which has become a necessity to American building methods and to the specially skilled men who are dependent on it.

We can not, as would be the case with any of the staple trades, raise the price of our product in proportion to the rise in cost of materials to us, as the cost of our product is already much higher than domestic marble, which is the only material with which we might be expected to compete, and the price we are obliged to charge is nearly equal to that of the imported marbles.

The selling price of imported cement is so high as compared with the domestic that there is no competition on that point. The imported retains a market solely on account of its valuable qualities not obtainable in the American.

Practically the entire importation of Keene's cement of the finest grades is used in the manufacture of artificial marble, and more of it could be used for the same purpose obtainable.

The small amount of Keene's cement imported into this country—some 500 tons a year—does not warrant the application of so drastic a rate.

There is no domestic Keene's cement having the qualities required for the production of high-class artificial marble.

The English Keene's cement has special qualities which make it essential for the manufacture of artificial marble or scagliola.

Confusion seems to exist in the minds of certain Senators regarding the peculiar qualities of Keene's cement and its differentiation from hydraulic and other cements, with which it was mentioned in a question by a Senator intended to show that Keene's cement imports had increased during recent years. This is absolutely erroneous regarding Keene's cement, which must not be classed as a hydraulic cement, and which was not subject to the general increase quoted.

The quantity of imports of Cafferata's Keene's cement, which is the principal of the brands regularly imported, is as follows for the years 1913 to 1920:

	Tons.		Tons.
13	1,260½	1917.....	344½
14.....	737½	1918.....	108
15.....	403½	1919.....	77
16.....	495	1920.....	157

GYPSUM.

[Paragraph 205.]

STATEMENT OF WILLIAM M. CHADBOURNE, NEW YORK, N. Y., REPRESENTING IMPORTERS OF RAW GYPSUM.

Mr. CHADBOURNE. Gentlemen of the committee, I appear for the following: Connecticut Adamant Plaster Co., New Haven, Conn.; Rock Plaster Corporation, New York City; J. B. King & Co., New York City; Newark Plaster Co., Newark, N. J.; Higginson Manufacturing Co., Newburgh, N. Y.; New Red Beach Plaster Co., Boston, Mass.; Charles Hart, trustee for Keystone Plaster Co. of Chester, Pa. Mr. Neyle Colquitt, who represents Mr. Priddy, an importer of raw gypsum for agricultural purposes, has allowed me his time.

Senator SIMMONS. What is the paragraph in which you are interested?

Mr. CHADBOURNE. Paragraph 205. What we want is that raw gypsum be permitted to come in free of duty. We have no objection at all to the levying of such duty as the committee shall see fit upon manufactured gypsum. The Fordney bill places a duty on raw gypsum of 25 cents a ton, a specific duty.

Senator WATSON. What is it now—free?

Mr. CHADBOURNE. It is 10 per cent ad valorem, which amounts to about 15 cents a ton, under the Underwood bill. Gypsum, as you may know, is used in the making of cement, and particularly for plaster, gypsum blocks, and as a fertilizer. In short, it is used for building materials and for agriculture.

Senator SIMMONS. They use it extensively in growing peanuts.

Mr. CHADBOURNE. Precisely, Senator, and it is used extensively in New England as a fertilizer.

About 3,000,000 tons, or somewhat over that, of raw gypsum are used per year in the United States. About 300,000 tons are imported. That imported raw gypsum comes almost wholly from Nova Scotia and New Brunswick, from mines owned or controlled by American capital.

Gypsum is an article which is not of very great value in proportion to its bulk, and, accordingly, it must come from near-by sources. A very large part of the gypsum consumed on the Atlantic seaboard comes in the raw shape from Nova Scotia to these mills that I have described, and is there made up into the manufactured product. About nine-tenths of the value of the manufactured product is the result of the labor applied to it by American workmen in American mills.

It seems to me that the situation with respect to raw gypsum is very much like that with respect to fuel oil. As you will recall, President Harding sent a special message to the House asking that fuel oil for New England and the Atlantic seaboard which had to come by sea from the nearest market, namely, Mexico, be placed on the free list.

This question of the duty on gypsum becomes particularly important to the great States of the Northeast—New England, New York, Pennsylvania, New Jersey. You have your problem here in Washington because of the housing situation. The housing situation is a very serious one, as Senator Calder's committee has reported. I may say that a much larger percentage of plaster goes into dwelling houses than goes into the large commercial buildings.

So it seems to us that this committee should recognize the need of keeping the cost of new building construction down as low as possible.

The other day in the new revenue bill they provided that loans by building and loan associations, where the income return was not over \$500—which would mean loans of not over \$10,000—should be exempt from taxation, for the very purpose of encouraging new building construction.

There is one other phase of this duty that I want to call especially attention to, and that is that it is a very wasteful duty to collect. The duty is 25 cents a ton. That means an inspector and a weightman must go to the mill, perhaps from New York to Newburgh, where the gypsum is landed from barges or from schooners. They spend the

ing there and they spend time there and they spend time coming back. I doubt very much if of the gross duty of 25 cents collected the Treasury is netted much more than a very small fraction, or not much over half when it comes into the Treasury.

In addition to that there is this further point——

Senator SMOOT. Who gave you that information, Mr. Chadbourne? I think that is exaggerated greatly.

Mr. CHADBOURNE. Senator, that is something that of course is very difficult to get accurate figures on, but if you have a barge——

Senator SMOOT. Well, just let it pass. The invoice price is taken on those things.

Mr. CHADBOURNE. There has to be a good deal of time spent in weighing a cargo of gypsum. It may be at some distance from the place where these men are located.

Senator SIMMONS. Does it come in in bulk?

Mr. CHADBOURNE. Oh, yes. This gypsum is broken up, just as it is quarried in Nova Scotia, and is worth about \$1.50 a ton. It comes down in barges and schooners.

There is another feature of this matter that is of even greater importance, and that is the added cost to the importer by reason of having to weigh this very cheap material. His barge or his schooner must wait until they can get an inspector, which may be a day or two. This all comes out of the man who wants to put up a house. It is put on the consumer. The schooner must lie there or the barge must lie there until an inspector and a weighman can be obtained. This consumes a day or a day and a half or two days. In the meantime, he is paying the wages of his men, and the expense of holding the boat. There is also double handling. He has got to put it on the scales, weigh it, and take it off the scales. As a result, there is a considerable extra charge, so that you can not tell how much is added to the cost to the consumer in order to give a comparatively small sum to the Government.

The opposition to this raw gypsum going upon the free list comes from but a single producer in this country. None of the other producers except this one object to it. The objector is a gentleman in Virginia, in the western part of the State, who produces, as near as I can learn, about 50,000 tons a year. He comes here and objects to this. His company seems to be prosperous. The reports of the department show that all of these gypsum companies are prosperous. There is going to be a great demand for gypsum for building purposes. In order to increase his profits he is willing to penalize the great States of the Northeast, the great industrial communities which need housing badly and where lack of housing is producing a great deal of social unrest and bolshevism because people are crowded into houses where there is no room for them and where we are doing everything we can to increase the housing accommodations.

In short, this duty, if it is imposed, will come out of the two classes of the community who least should be called upon to bear it at this time. It will come out of the farmer and it will come out of the renter and will have a direct effect upon what they must pay for their living accommodations and for what they raise.

In closing I want to call the attention of the committee to one thing in the matter of definition. In the Payne-Aldrich bill and in the Underwood bill, and, so far as I can learn, in all the previous tariff

bills, the distinction that has been drawn is that crude gypsum is distinguished from calcined gypsum—that is, it was immaterial whether the gypsum was run through a crusher before it was dumped into the boat for easy handling, or whether it was taken in great blocks. But in some way, I do not know how, in the Fordney bill the distinction was drawn between crude gypsum and ground or calcined gypsum.

Senator SMOOT. That is exactly the wording in the Payne-Aldrich bill.

Mr. CHADBOURNE. I stand corrected. I was informed that the distinction was between crude and calcined——

Senator SMOOT. The wording is just exactly the same in the Payne-Aldrich bill as it is in this, and the rates were 30 cents on crude, \$1.70 a ton on ground or calcined.

Mr. CHADBOURNE. I may say that the rates have been coming down progressively. In the Dingley bill they were 50 cents a ton. It was recognized that this great section of the United States must draw its gypsum products from outside the United States. It seems to us that free raw gypsum is a recognition of the principle of cheap raw materials for New England, New York, Pennsylvania, New Jersey and these other States.

Let me say that the amount involved so far as revenue goes is inconsiderable—I think, about \$44,000 was collected in 1920. I do not know how much more it has added to the cost of the article to the consumer because of these incidental expenses in handling, which I am informed are considerable.

Senator SMOOT. Is that on a basis of 10 per cent?

Mr. CHADBOURNE. On a basis of 10 per cent ad valorem; yes, sir. On the basis of 25 cents per ton it would be seventy to seventy-five thousand dollars.

Senator WATSON. What do you suggest?

Mr. CHADBOURNE. Our suggestion would be free raw or ground gypsum, and \$1.40 a ton, or any sum you wish to put on it, upon the manufactured or calcined gypsum.

Senator WATSON. Plaster rock or gypsum, crude?

Mr. CHADBOURNE. Free.

Senator WATSON. And for calcined?

Mr. CHADBOURNE. \$1.40 a ton. I would strike out the word "ground," because that does not mean manufactured. It costs a few cents to run this through a rock crusher.

Senator SMOOT. It has been administered in that way in the past and we have never had any trouble at all. Just as soon as a change is made somebody is going to carry it on to the courts.

Mr. CHADBOURNE. Except, Senator Smoot, if you will pardon me, it does add considerable to the cost of handling to ship raw gypsum in great blocks, and if it is more economical to be able to use great quantities by running the raw gypsum through the crusher before it is dumped into the barge or the schooner——

Senator WATSON. What do you say about the rest of it—or are you interested in the rest of it?

Mr. CHADBOURNE. You can make it \$2.80 a ton if you choose.

Senator WATSON. You are not interested in Portland cement?

Mr. CHADBOURNE. No, sir; I have a brief prepared, and I would like to submit a short supplemental brief.

This attitude, we submit, is selfish in the extreme and fails completely to take into consideration the pressing requirements of the country as a whole. The crying need of the great industrial communities of New England, New York, and New Jersey for additional housing should not be sacrificed at the behest alone of a small southern producer in Virginia whose production as compared with the production of raw gypsum in the United States is infinitesimal, particularly when its objection is wholly based on the importation into Norfolk each year of 10,000 tons of raw gypsum to be used for fertilizer purposes.

SUPPLEMENTAL BRIEF.

Leave was granted to file this supplemental brief upon two points not covered in the main brief, but taken up in the oral argument. These two points are:
a) The duty upon raw gypsum is a wasteful duty to collect.
b) As a matter of classification the distinction should be between uncalcined and calcined gypsum.

THE DUTY UPON RAW GYPSUM IS A WASTEFUL DUTY TO COLLECT.

Raw gypsum is a product of small value in comparison to its bulk and weight, being worth at the present time about \$1.50 a ton. In order to collect the duty a proportionately heavy expense is imposed upon both the Government and the importer and ultimately comes out of the consumer.
Raw gypsum is brought from Nova Scotia and New Brunswick in steamers, schooners, and barges of from 500 to 3,500 tons' capacity. Upon arrival at destination the steamers, barges, and schooners must be held without unloading until the Government inspector and weigher arrives. The points at which the raw gypsum is unloaded are generally at a distance from the offices of the Government officials, and considerable time is frequently consumed in going back and forth. Owing to press of other matters sometimes happens that it is impossible to secure the immediate attendance of the weigher and inspector, causing the steamers, schooners, and barges to lie idle for a time, thus involving additional expense.
The necessity of weighing this cheap and bulky material is also an expensive item for the companies. The raw gypsum must be taken from the vessels and placed on the scales, and after the weighing process has been completed must be taken off the scales and dumped into bins or other receptacles.
Thus, it will be seen that a substantial part of the duty collected is expended by the Government in the process of collection, as contrasted with the more economical collection of duty on more costly articles. Moreover, the extra cost of handling incurred by the weighing and the expense of the delays incident thereto are both added to the cost of the material to the consumer. Accordingly, the net duty recovered by the Government is but a fraction of the extra cost to the consumer entailed in levying any duty at all.
It should also be noted that in the process of manufacture there is a 16 per cent reduction in weight, owing to the driving off of that amount of water. Of course, the duty has been paid on this water.
The sums raised through the tariff on raw gypsum are comparatively small. For the years 1915 to 1920, inclusive, the amounts of raw gypsum imported and the duties collected are as follows:

Year.	Raw gypsum imported.	Gross duty collected.	Year.	Raw gypsum imported.	Gross duty collected.
	<i>Tons.</i>			<i>Tons.</i>	
.....	264,104	\$31,630.80	1918.....	152,934	\$17,695.90
.....	313,251	37,230.80	1919.....	76,954	9,254.80
.....	242,723	27,695.20	1920.....	297,407	40,000.00

About

Under section 205 of the Fordney bill the revenue received would, upon an assumed annual importation of about 300,000 tons, approximate \$75,000 a year. In view of the small amount of duty collected and the expense to the consumer of levying it, raw gypsum, we submit, should be placed on the free list.

CHEAP IMPORTED RAW GYPSUM IS ESSENTIAL TO THE EXISTENCE OF AN IMPORTANT AMERICAN INDUSTRY.

The great bulk of raw gypsum imported from Nova Scotia is manufactured in the United States into various forms of plaster. This gives employment to a large number of American workmen who are directly dependent for their livelihood upon cheap imported raw gypsum. Nine-tenths of the value of the plaster manufactured from the imported raw gypsum is the result of the work of American labor employed in American factories; that is to say, the plaster in its manufactured form has 10 times the value of the raw gypsum rock in its quarried state. From this it follows that a duty upon the imported raw gypsum seriously interferes with an important domestic industry employing large numbers of American workmen. It would be most unfortunate if at this time Congress should do anything which would tend to increase unemployment in this country.

THE ATTITUDE OF AMERICAN PRODUCERS TOWARD PUTTING RAW GYPSUM ON THE FREE LIST.

The American importers of raw gypsum from Nova Scotia took up last year with the American producers the matter of placing raw gypsum on the free list. No objection to such a course was raised by any of the American producers with the exception of a small company in Virginia with an annual production of about 50,000 tons a year the Southern Gypsum Co., of North Holston, Va. Consequently when the recent hearings were had before the Ways and Means Committee there was no opposition to the request of the gypsum manufacturers of New York, Connecticut, and New Jersey that gypsum be put on the free list, except from the Southern Gypsum Co. represented by Mr. West.

The reason why there is no opposition from the other producers of raw gypsum in this country is that the demand for raw gypsum occasioned by the demand for building materials will in the next few years absorb all of the raw gypsum that can be produced in this country as well as that which can be imported. Accordingly the American gypsum producers, with the exception of the Southern Gypsum Co., have taken a patriotic stand in support of the movement to reduce the cost of building materials by not opposing the application of the New York, Connecticut, and New Jersey manufacturers to have raw gypsum put on the free list.

It should further be noted that the opposition of the Southern Gypsum Co. to the putting of gypsum on the free list arises from fear of competition in the manufacture of gypsum used as a fertilizer and not from the competition of raw gypsum to be used for building purposes. None of the raw gypsum imported from Nova Scotia which is shipped to Norfolk, Va., or the southern ports is used for building purposes. What the Southern Gypsum Co. is really objecting to is that the small quantity of about 10,000 tons of raw gypsum is annually shipped to Norfolk, Va., from Nova Scotia to be used for fertilizing purposes. Accordingly, the Southern Gypsum Co. is really seeking legislation which will increase the burdens of the farmers, who are already prostrate economically.

NO OBJECTION TO TARIFF ON MANUFACTURED GYPSUM.

We desire to emphasize the point that all we ask for are free raw materials; that is, free raw gypsum. Manufactured gypsum (calcined plaster, plaster of Paris) should bear a duty sufficient to protect the American workman, and we advocate the imposition of duties sufficiently heavy to accomplish this purpose.

TO SUMMARIZE.

To reduce the cost of building materials, it is essential to put imported raw gypsum on the free list. The producers of 98 per cent of the raw gypsum mined in this country are willing that this be done, and they have indicated their willingness by not appearing at the hearings of the Ways and Means Committee in opposition to the request. One Virginia company producing 2 per cent of the normal annual production of raw gypsum in this country appears and objects and asks that the duty be raised from the 15 cents a ton (10 per cent ad valorem under the present tariff) beyond the duty of 30 cents a ton proposed by the Payne-Aldrich bill to 50 cents a ton (see p. 345, printed minutes of Ways and Means Committee, Bulletin No. 4 of hearings, Schedule B). Since the hearings the Southern Gypsum Co. is, we are advised, demanding that the duty be raised to \$1 a ton or more than three times the Payne-Aldrich bill and nearly seven times the present duty.

This attitude, we submit, is selfish in the extreme and fails completely to take into consideration the pressing requirements of the country as a whole. The crying need of the great industrial communities of New England, New York, and New Jersey for additional housing should not be sacrificed at the behest alone of a small southern producer in Virginia whose production as compared with the production of raw gypsum in the United States is infinitesimal, particularly when its objection is wholly based upon the importation into Norfolk each year of 10,000 tons of raw gypsum to be used for fertilizer purposes.

SUPPLEMENTAL BRIEF.

Leave was granted to file this supplemental brief upon two points not covered in our main brief, but taken up in the oral argument. These two points are:

- (a) The duty upon raw gypsum is a wasteful duty to collect.
- (b) As a matter of classification the distinction should be between uncalcined and calcined gypsum.

THE DUTY UPON RAW GYPSUM IS A WASTEFUL DUTY TO COLLECT.

Raw gypsum is a product of small value in comparison to its bulk and weight, being worth at the present time about \$1.50 a ton. In order to collect the duty a proportionately heavy expense is imposed upon both the Government and the importer and ultimately comes out of the consumer.

Raw gypsum is brought from Nova Scotia and New Brunswick in steamers, schooners, and barges of from 500 to 3,500 tons' capacity. Upon arrival at destination the steamers, barges, and schooners must be held without unloading until the Government inspector and weigher arrives. The points at which the raw gypsum is unloaded are generally at a distance from the offices of the Government officials, and considerable time is frequently consumed in going back and forth. Owing to press of other matters sometimes happens that it is impossible to secure the immediate attendance of the weigher and inspector, causing the steamers, schooners, and barges to lie idle for a time, thus involving additional expense.

The necessity of weighing this cheap and bulky material is also an expensive process for the companies. The raw gypsum must be taken from the vessels and placed on the scales, and after the weighing process has been completed must be taken off the scales and dumped into bins or other receptacles.

Thus, it will be seen that a substantial part of the duty collected is expended by the Government in the process of collection, as contrasted with the more economical collection of duty on more costly articles. Moreover, the extra cost of handling entailed by the weighing and the expense of the delays incident thereto are both added to the cost of the material to the consumer. Accordingly, the net duty recovered by the Government is but a fraction of the extra cost to the consumer entailed because any duty at all is levied.

It should also be noted that in the process of manufacture there is a 16 per cent reduction in weight, owing to the driving off of that amount of water. Of course, the duty has been paid on this water.

The sums raised through the tariff on raw gypsum are comparatively small. For the years 1915 to 1920, inclusive, the amounts of raw gypsum imported and the duties collected are as follows:

Year.	Raw gypsum imported.	Gross duty collected.	Year.	Raw gypsum imported.	Gross duty collected.
	Tons.			Tons.	
1915.....	264,104	\$31,630.80	1918.....	152,934	\$17,695.90
1916.....	313,251	37,230.80	1919.....	76,954	9,254.80
1917.....	242,723	27,695.20	1920.....	297,407	40,000.00

About.

Under section 205 of the Fordney bill the revenue received would, upon an assumed annual importation of about 300,000 tons, approximate \$75,000 a year.

In view of the small amount of duty collected and the expense to the consumer of collecting it, raw gypsum, we submit, should be placed on the free list.

AS TO THE CLASSIFICATION.

Section 205 of the Fordney bill levies a duty of 25 cents per ton on plaster rock and gypsum, crude, and \$1.40 per ton if ground or calcined. The language is as follows: "Plaster rock or gypsum, crude, 25 cents per ton; if ground or calcined, \$1.40 per ton."

Under the tariff act of 1913, Schedule B, section 74, a duty of 10 per cent of valorem was levied on "Plaster rock or gypsum, crude, ground or calcined."

We urge that the language above quoted from the Fordney bill be changed to read as follows: "Gypsum, calcined, \$1.40 per ton."

And we urge that a new paragraph be introduced in the free list to be worded as follows: "Plaster rock or gypsum, crude, ground."

The reason we urge this change is this: In order to load the vessels and handle crude gypsum most effectively, it is found desirable to break it into small pieces, as by grinding, thus making it possible to use mechanical devices instead of hand labor in loading and unloading.

The only possible use to which raw ground gypsum can be put is that of a fertilizer. For all other uses raw gypsum must first be manufactured (calcined). In building construction manufactured (calcined) gypsum plays an important part in such products as wall plaster, casting plaster, plaster boards, partition blocks, roof tiles, floors, etc.

Accordingly, this merely mechanical subdivision of raw gypsum by grinding, carried out (in the case of raw gypsum destined to be manufactured) purely to make its handling more economical and thus reduce its price to a finished article. It should not shift the gypsum so treated from the raw material category.

**BRIEF OF NEYLE COLQUITT, REPRESENTING CHARLES W. PRIDDY & CO.
NORFOLK, VA.**

The Southern Tariff Association, purporting to represent some 58 of the major thousands of industries in the South, has filed with your committee a schedule of tariff rates which they desire on various commodities, including within which is the request for a tariff of \$1 per ton upon crude gypsum, or land plaster. This is more than six times the present duty and more than three times the duty under the Payne-Aldrich tariff bill.

We would respectfully direct the attention of your committee to the fact that the Southern Gypsum Co., of North Holston, Va., is the only producer of crude gypsum which is a member of this association.

And that the said Southern Gypsum Co. is the only producer of crude gypsum who has asked for any tariff at all upon crude gypsum.

Further, that the Southern Gypsum Co. does not produce more than 2 per cent of the crude gypsum produced in the United States.

And, further, that the remaining 98 per cent of the trade has made no request for any tariff whatever upon crude gypsum.

Further, that the present tariff on gypsum amounts to about 15 cents per ton.

That land plaster, or crude gypsum, is used for fertilizer and for building material.

That any advance in the tariff on gypsum will cause a consequent advance in the price of crude gypsum within the United States as a fertilizer and as a building material, which expense must be borne by the farmer, laborer, and builder.

That crude gypsum is used in its native state as a fertilizer, particularly for peanuts, and frequently it is spread without mixing with any other material.

As some 400 pounds are used to the acre, it now costs the farmer about 3 cents additional as a result of the tariff for each acre; under the rate suggested by the Southern Gypsum Co., it would cost the farmer about 20 cents additional per acre.

As shown by the statistics prepared by the Department of Commerce, the importation of gypsum is not more than 10 per cent of the production within the United States.

Moreover, the gypsum is brought in in its crude state from Nova Scotia by American vessels and American crews.

We submit that there are but eight producers of crude gypsum east of the Allegheny Mountains (85 per cent of the raw gypsum produced in the United States is mined west of the Alleghenies and does not reach the Atlantic seaboard in any quantity) and that only one of these producers is asking for tariff, and we suggest that an analysis of the letters thus received will show that they come from one locality and not from the producers themselves.

We submit that the request for a tariff amounts in its last analysis to a request that Congress penalize the farmer and home builder to the extent of \$400,000 per year.

order to protect one producer on the 3,000 to 4,000 tons of plaster which he sells for agricultural purposes in the eastern part of Virginia and North Carolina. We submit that the opposition of this one company to the putting of gypsum on the free list arises from fear of competition in the manufacture of gypsum used as a fertilizer, and not from the competition of raw gypsum, to be used for building purposes. None of the raw gypsum imported from Nova Scotia which is shipped to northern ports is used for building purposes. That this plaster rock is at the present time the only fertilizing ingredient imported into this country that is subject to any duty. The statistics of the Treasury Department show that there were imported last year 407 tons of crude gypsum, valued at \$445,500, upon which an import duty of \$550 was paid. We respectfully submit that agriculture and house building are sorely in need of encouragement and that any tax now levied on land plaster means an additional burden to the farmer and the house builder.

PUMICE STONE.

[Paragraph 206.]

STATEMENT OF F. L. GOETZ, VICE PRESIDENT JAMES H. RHODES & CO.

Mr. GOETZ. My subject is paragraph 206, revision of 1921, pumice stone, unmanufactured, valued at \$15 or less per ton, two-tenths of 1 cent per pound; valued at more than \$15 per ton, three-tenths of 1 cent per pound; wholly or partly manufactured, four-tenths of 1 cent per pound; manufactures of pumice stone or of which pumice stone is the component material of chief value, not specially provided for, 5 per cent ad valorem.

Congress, by amendment afterwards, increased the rate of wholly or partly manufactured to fifty-five one-hundredths of 1 cent per pound. Unmanufactured pumice stone is our raw material. We import from Italy and grind it into powdered pumice stone of various degrees of coarseness by means of American labor and American grinding machinery.

We respectfully petition for a tariff not to exceed 65 cents per ton on unmanufactured pumice stone, which is practically the rate of duty paid at present, since under the act of 1913 unmanufactured pumice stone pays 5 per cent ad valorem and the value in Italy has been \$13.50 per ton for the past year.

Any increase in the duty on the unmanufactured grinding rock would serve only to increase the price to the consumer, because there is no pumice stone produced in the United States or elsewhere that can replace the Italian pumice stone, as evidenced by the many letters submitted by important users to the Ways and Means Committee, some of which letters were printed in the published hearings of the Ways and Means Committee.

Senator SMOOT. As I understand it, you want 65 cents a ton, no matter what the value of it is?

Mr. GOETZ. Yes, sir.

Senator McLEAN. How much is it worth a ton?

Mr. GOETZ. In 1913 it was worth only \$7.50 a ton.

We do not ask for free raw materials. If the duty is changed to a specific duty of 65 cents per ton, the Government will then obtain a revenue of 73 per cent over that obtained in 1913, in consequence of the value having been \$7.50 per ton in 1913.

Under the Payne bill the rates were as follows: Unmanufactured valued at less than \$15 per ton, 30 per cent ad valorem (30 per cent of the value then of \$7.50 per ton was \$2.25); valued at \$15 per ton or more, $\frac{1}{4}$ cent per pound; wholly or partly manufactured, three-eighths of 1 cent per pound, or \$7.50 per ton.

Under the Payne bill, ad valorem duties were, of course, assessed on the basis of the value in the country of export.

The following illustrates the rate of duty paid at present on unmanufactured and manufactured pumice stone under the act of 1913 compared with the proposed rates under the revision of 1921. It also shows the percentage of increase (per ton):

Unmanufactured (per ton), 1913, 65 cents equals 5 per cent ad valorem; 1921, \$6 equals 45 per cent ad valorem; \$5.35 increase equals 23 per cent.

Manufactured (per ton), 1913, \$5; 1921, \$11; increase, \$6, or 120 per cent.

It will be noted from the foregoing illustration that under the revision of 1921 a rate of \$6 per ton is shown, the reason being that the cheapest unmanufactured pumice stone that comes into this country is grinding rock, and with a present cost of \$13.50 per ton f. o. b. Lipari, Italy, it will be readily seen that the American valuation will exceed \$15 per ton, thereby causing the crude grinding rock to take a rate of three-tenths of 1 cent per pound. No pumice stone which comes into this country will be eligible for classification under the two-tenths of 1 cent per pound rate.

In any event you may be sure that the Italian exporter will increase his price on unmanufactured pumice sufficiently to cause the American grinder to pay the three-tenths of 1 cent rate and the Italian exporter will thereby reduce the differential between the landed cost of the raw material and the goods manufactured in Italy, to the detriment of the American grinder of pumice stone and to the advantage of the Italian grinder of pumice stone.

We call attention to the percentage of increase in the duty on raw material as compared with the percentage of increase in the duty on pumice stone ground in Italy by Italian labor and machinery. Comment seems scarcely necessary.

The amount of unmanufactured pumice stone imported during the period between October 1, 1919, and October 1, 1920, was 10,961 tons. We should say that fully 95 per cent of the unmanufactured was grinding rock.

Senator REED. How much did you say?

Mr. GOETZ. 10,961 tons.

Senator WATSON. When?

Mr. GOETZ. During the period October 1, 1919, to October 1, 1920.

There is some pumice stone that is unmanufactured that comes in and that is resold again in the state in which it is imported, but it is a very small proportion of the amount of importation of unmanufactured pumice stone.

Therefore the amount of pumice stone that is imported is rather limited, and at any rate of duty it would not be a source of great revenue to the country. While we do not ask for free raw material we think that 65 cents a ton, which represents 73 per cent over what the Government obtained in revenue in 1913, is fair to the Government and will not work a hardship on the consumer of pumice stone.

Senator WATSON. You are Mr. Goetz?

Mr. GOETZ. Yes.

Senator SIMMONS. How do you spell your name?

Mr. GOETZ. G-o-e-t-z.

Senator WATSON. Just what is it you do? I did not quite understand.

Mr. GOETZ. We import pumice stone as it is dug from the mines in Italy. It is packed in bags and shipped over to our plant. We crush the stuff, dry it, grind it, and run it through silk into 15 different degrees of coarseness, and then ship to industries that use pumice stone as an abrasive in polishing and rubbing and finishing.

Senator WATSON. You import the raw material and manufacture a finished product which is used in other industries?

Mr. GOETZ. Yes, sir.

Senator WATSON. Where is your plant located?

Mr. GOETZ. At the Bush Terminal, Brooklyn.

Senator WATSON. Are there any plants of like nature in the United States?

Mr. GOETZ. There are four besides ourselves.

Senator WATSON. They import also?

Mr. GOETZ. They do exactly what we do.

Senator WATSON. Is all the unmanufactured pumice stone that comes to the United States from Italy?

Mr. GOETZ. Yes. Italy is the world's supply. Pumice stone is produced in California. Brand & Stevens, who produce that pumice stone, appeared before the Ways and Means Committee and attempted to have the tariff increased about 3,000 per cent; that is, to have it advanced from 65 cents to \$20 a ton. The subject is very fully covered in the form of information they supplied and the information supplied, and Mr. Garlow, of Meade, Kans., who is a very large producer of pumice stone and who, in 1908, was our opponent, and whose theory was that we should keep out Italian pumice stone, has since realized that the American pumice stone is not competitive to the Italian pumice stone. The trade that uses Italian pumice stone does not and will not use American pumice stone.

I refer to the brief of Mr. Garlow, president of the National Silica Pumice Co. and representing the largest production of American pumice. His appearance before your committee in 1908 was based upon a theory similar to that of Brand & Stevens. After 10 years of actual producing experience in the pumice business, Mr. Garlow now states in his brief that protection for American pumice is entirely unnecessary. This shows the difference between the experience of

Mr. Garlow and the theory of Brand & Stevens.

Senator REED. What page is that on?

Senator WATSON. Has he bought into your industry?

Mr. GOETZ. Absolutely not.

Reference is made to it in Schedule B, page 481.

At that time Mr. Garlow represented the Cudahy Packing Co. They now use pumice stone in their product known as Dutch Cleanser. It is suitable for that, but it is not suitable for industries who make finished product.

Senator WATSON. The Tariff Commission says it is for ordinary requirements a satisfactory substitute for ground Italian pumice. That is not so, is it?

Mr. GOETZ. That is not so, so far as the finishing industry is concerned.

Senator WATSON. When it says "ordinary requirements," it means industry, does it not?

Mr. GOETZ. It might mean hand soaps and Dutch Cleanser, but it is not used on technical work and for things like pianos, silverware, artificial teeth, plate glass, celluloid, and such things.

Senator REED. Don't you think that this American pumice stone ought to be protected against pauper stone?

Mr. GOETZ. Ought to be protected against what?

Senator WATSON. Pauper stone.

Mr. GOETZ. Pauper stone?

Senator WATSON. Yes. P-a-u-p-e-r stone.

Mr. GOETZ. Oh!

I think this, that if the industries in the United States require certain raw material to do their work, and if that raw material is obtainable only in one country of the world, we should not deny American manufacturers that raw material, especially while that raw material is available to the American manufacturers' competitors, the foreign manufacturers. That policy would enable the foreign manufacturers of silverware, pianos, plate glass, celluloid, and metal of all kinds, etc., to produce a superior article at a lower cost than the American manufacturers.

Senator REED. I wanted to get your point of view.

Senator McCUMBER. Is there anything further you wish to state?

Mr. GOETZ. Simply this: Mr. Laughlin, representing Brand & Stevens, a California producer, is in the room at present, and in his testimony he will have the advantage of having heard my testimony. What opportunity am I to have to make rebuttal to his testimony?

Senator McCUMBER. We will have to decide that later. If something new comes up during his testimony, you may make application to be heard again. I think that will be taken care of.

Mr. GOETZ. Thank you very much.

STATEMENT OF ROBERT LAUGHLIN, PROFESSIONAL MINING ENGINEER, BUFFALO, N. Y.

Mr. LAUGHLIN. I am speaking on paragraph 206 about pumice stone.

Senator DILLINGHAM. Do we have your name?

Mr. LAUGHLIN. My name is Robert Laughlin, and I am a professional mining engineer; residence, Buffalo, N. Y.; representing Brand & Stevens, of Pasadena, Calif., and New York, and W. Agar, of San Francisco, Calif.

Senator SMOOT. Can you state briefly just what you want?

Mr. LAUGHLIN. Yes, sir; we are asking for a tariff of 1 cent a pound, plus the present tariffs as incorporated in the Fordney bill, except for crude or unmanufactured pumice stone; we would like that part increased from 0.2 cent a pound to 1 cent a pound.

Senator WATSON. Are you an importer?

Mr. LAUGHLIN. No, sir; I am a miner.

Senator WATSON. Where are your mines located?

Mr. LAUGHLIN. In California. I might say, Senator Watson, that formerly the people I represented had mines in California, Utah, Arizona, Nevada, and Oregon. The mines left to-day are in California, as the rest ceased to operate.

Senator SMOOT. Wholly or partly manufactured, what do you want on that?

Mr. LAUGHLIN. One cent a pound, plus the rates incorporated in the present tariffs proposed by the House.

Senator SMOOT. One cent extra?

Mr. LAUGHLIN. Yes, sir; our arguments are advanced along the same general lines as those on magnesite, zinc, tungsten, etc.

Senator SMOOT. Finished products, you want 1 cent extra on that, too, do you?

Mr. LAUGHLIN. That is 26 ad valorem; we want 1 cent plus 26 to protect American manufacturers.

Senator WATSON. Why did those other mines cease to operate?

Mr. LAUGHLIN. They could not sell profitably.

Senator WATSON. Was it foreign competition that did it?

Mr. LAUGHLIN. Foreign competition did it.

Senator SIMMONS. When did they cease to operate?

Mr. LAUGHLIN. I haven't the exact date, Senator Simmons, but it was subsequent to the armistice.

Senator SIMMONS. Was there any great increase in the imports as compared with the prewar imports after the armistice?

Mr. LAUGHLIN. There has been an increase. Our normal consumption is between ten and eleven thousand tons. I think the last fiscal year showed 10,960 tons.

Senator SIMMONS. I want you to tell us about the increase in importations. You said that the increase in importations had run some of the mines out of business. I want to know when this began and what the amount of the increase was.

Mr. LAUGHLIN. I can not give you the figures on that, Senator.

Senator SIMMONS. Are the imports any greater now than they were before the war?

Mr. LAUGHLIN. Senator, my figures are divided here between the different classifications. It would take some time to get at the total.

Senator SIMMONS. What is the total?

Mr. LAUGHLIN. What is the total?

Senator SIMMONS. I have it for 1920. The quantity of imports in 1920 was 10,379 tons. The value was \$123,778. I am trying to find out what it was before the war. You say that the increase in imports has destroyed your industry. In 1918 the imports were 3,900; in 1917, 7,205.

Senator WATSON. Are you giving the value or the tons, Senator Simmons?

Senator SIMMONS. I am giving the quantity—the tons. In 1916 it amounted to 8,850 tons.

Senator WATSON. Is this unmanufactured pumice stone?

Senator SIMMONS. Unmanufactured; yes.

So that in 1916, as is shown here, it amounted to 8,850. In 1920 as I have said, it was 10,379. That does not seem to be a very great increase during that period. When did these mills close down?

Senator WATSON. I notice here in the tariff report that in 1913 the imports of wholly or partially manufactured pumice stone amounted to 3,845,000 pounds; in 1917, to 7,796,000 pounds; and in 1918, to 3,238,000 pounds. The partially manufactured imports may have had something to do with that.

Senator SIMMONS. This was unmanufactured that I was speaking of. I would like you to tell us when these mills closed down.

Mr. LAUGHLIN. They are not mills, Senator Simmons, except that the mill is coincident to refining stone as it comes out of the mines.

Senator SIMMONS. I understand that the mines closed down and that the mills connected with the mines closed down at the same time. When did that happen?

Mr. LAUGHLIN. The last mine closed down in, approximately November, or possibly January, 1920.

Senator SIMMONS. January, 1920?

Mr. LAUGHLIN. Around that time. I am not sure as to the exact date.

Senator SIMMONS. You think that was because of the increase in imports?

Mr. LAUGHLIN. Absolutely; yes, sir.

Senator SIMMONS. What is the production in this country? I am asking that question because the amount of imports seemed to be very small.

Mr. LAUGHLIN. I would like to make a distinction there, Senator, if I may.

Senator SIMMONS. They did not seem to increase so much, according to this, since 1915. In 1915 the imports were about 2,000 tons less than in 1920.

Mr. LAUGHLIN. Our system of statistics classifies in one class deposits which are not the natural pumice deposits but pumisite, which is produced in Nebraska, Kansas, and in the Dakotas. That is lumped by the Department of Commerce and given out in the pumice stone statistics when it does not properly belong in the pumice stone statistics. Pumisite is used as a cleaner, and is mined with a steam shovel at a cost of about \$1.50 per ton.

Senator SIMMONS. You are not able to give those figures, are you?

Mr. LAUGHLIN. I can not separate the lump from the other.

Senator SIMMONS. Can you approximate it?

Mr. LAUGHLIN. Our big production is probably not over five or six thousand or now would not be over four thousand tons a year. That is about what it would be.

Senator SIMMONS. So that your imports have been a little bit more possibly?

Mr. LAUGHLIN. They have been doubled. There are certain imported grades that we do not produce in this country. During the submarine campaign those imports were largely stopped and American stone substituted. The point I am trying to make, Senator, is that the imported stone that comes from Italy is laid down at the Atlantic seaboard c. i. f. at a price less than our transcontinental freight haul.

Senator SIMMONS. Where are your plants located?

Mr. LAUGHLIN. On the Pacific coast.

Senator SIMMONS. Did you say on the Pacific coast?

Mr. LAUGHLIN. Yes.

Senator SIMMONS. What does it cost to transport a ton from the mine to the Atlantic seaboard?

Mr. LAUGHLIN. Approximately \$25 a ton.

Senator SIMMONS. \$25 a ton?

Mr. LAUGHLIN. Yes, sir.

Senator SIMMONS. And you want a tariff, as I understand it, that will cover that difference in transportation; that is, comparing the ocean transportation with the rail transportation?

Mr. LAUGHLIN. That is what we are asking for; yes, sir.

Senator SIMMONS. Then you think it would be fair and just to allow the people in the territory east of the Mississippi to pay the railroad cost of \$25 a ton? What do you think about the consumers?

Mr. LAUGHLIN. There are not 25 tons used during the course of a year on the whole Pacific seaboard. The plants and the consumption are east of the Mississippi River.

Senator SIMMONS. What is the ocean rate?

Mr. LAUGHLIN. We have not checked it for a number of years. The last time we checked it up it was——

Senator SIMMONS. What is the ocean transportation from Italy?

Mr. LAUGHLIN. Oh, from Italy?

Senator SIMMONS. Yes. Didn't you say that it comes from Italy?

Mr. LAUGHLIN. All, I believe.

Senator SIMMONS. Well, I was asking for the ocean transportation rate from Italy to the Atlantic seaboard.

Mr. LAUGHLIN. I do not know what it is at present. I would have to translate that from shillings. I imagine, however, that it is about \$6 or \$7 a ton.

Senator SIMMONS. You think the people living on the eastern seaboard should be compelled to pay \$25 a ton freight as against \$6 or \$7 in order to stimulate your industry? That is your proposition, is it?

Mr. LAUGHLIN. Yes.

Senator SIMMONS. How many people are employed in your mine?

Mr. LAUGHLIN. At the present time, do you mean?

Senator SIMMONS. Yes, sir.

Mr. LAUGHLIN. About five.

Senator SIMMONS. How many are employed in the entire mining industry there?

Mr. LAUGHLIN. I would say about five people.

Senator SIMMONS. Only five people?

Mr. LAUGHLIN. At the present time; yes.

Senator SIMMONS. I am talking about labor.

Mr. LAUGHLIN. That is all our mines have had for a year and a half.

Senator McLEAN. Senator Simmons, they are closed.

Senator SIMMONS. How many were employed when the mines were in operation?

Mr. LAUGHLIN. I should say that each mine would run about 40 or 50 men to a unit.

Senator SIMMONS. That would amount to how much?

Mr. LAUGHLIN. Not over 300 for our production.

Senator SIMMONS. Is your industry expanding?

Mr. LAUGHLIN. Has it expanded?

Senator SIMMONS. Would it expand?

Mr. LAUGHLIN. We do not think it would expand to a production of over 4,000 or 5,000 tons a year, except as the eastern consumption expanded.

Senator SIMMONS. There are only 300 people employed, you say, and the users are on the Atlantic seaboard. In order to maintain these plants you want them to pay the difference between the ocean rate of \$6 and the transcontinental rail rate of \$25?

Mr. LAUGHLIN. Senator, we are asking for a freight rate that will allow us to sell pumice stone——

Senator SIMMONS (interposing). But we are not dealing with freight rates.

Mr. LAUGHLIN. I mean a differential that will give us the opportunity to compete.

Senator SIMMONS. That is what I think you want.

Mr. LAUGHLIN. We want a differential so that we can meet the Italian stone in fair competition.

Senator SMOOT. Have you a brief that you desire to file?

Mr. LAUGHLIN. I have, Senator.

Senator SMOOT. Is there anything else you wish to say?

Mr. LAUGHLIN. I would like to develop this reply.

Senator SMOOT. You want to equalize the freight rates?

Mr. LAUGHLIN. The Senator has intimated, if I understand him, that we are asking the American consumer to pay the difference between the freight rate we are compelled to pay and the freight rate that has been increased and doubled and raised 25 per cent by the Interstate Commerce Commission——

Senator SIMMONS. What would be the effect?

Mr. LAUGHLIN. I am trying to illustrate the fact that the American consumer does not pay that difference.

Senator McLEAN. What is the cost by water?

Mr. LAUGHLIN. By the time we pay dock charges, tolls, and other charges, our railroad freight figures up about the same as the Panama Canal rates.

Senator WATSON. Where is the largest consumption?

Mr. LAUGHLIN. On the Atlantic seaboard.

Senator WATSON. And the production is in the far West?

Mr. LAUGHLIN. The production is in the volcanic regions.

Senator WATSON. Suppose the imports were entirely shut off, could you supply the home demand?

Mr. LAUGHLIN. We did during the war.

Senator WATSON. You supplied the home demand, did you?

Mr. LAUGHLIN. We supplied all the demand that was made.

Senator WATSON. Did the demand decrease during the war?

Mr. LAUGHLIN. It increased very rapidly during the submarine campaign. At the end of the war it dropped off.

Senator WATSON. There was a time when there were no imports from abroad, was there not?

Mr. LAUGHLIN. There was a time when the imports of pumice were prohibited on account of shipping conditions, but there was some stone that came in.

Senator WATSON. During that time, notwithstanding that it increased, you supplied the demand?

Mr. LAUGHLIN. Yes; we did.

Senator SIMMONS. That does not conform to the statistics that I have just read, which were for the period during the war. During the war period there was more imported than was produced in this country. The embargo did not work; there was no embargo as to that. It came in in larger quantities during the war than it had been coming in before the war. The witness said a while ago that they did not think they could expand production in this country over 5,000 tons.

Mr. LAUGHLIN. I said under present economic conditions; at least that is what I intended to say.

Senator SIMMONS. To what extent could you expand under different economic conditions?

Mr. LAUGHLIN. I have no idea.

Senator SIMMONS. You were able to supply the demand before the war, were you?

Mr. LAUGHLIN. No, sir.

Senator SIMMONS. You did supply it during the war?

Mr. LAUGHLIN. To a large extent we did.

Senator SIMMONS. If the mills were running on full time, you would not be able to supply the domestic demand, because in 1920 10,000 tons came in. In 1917 over 8,000 tons came in.

Mr. LAUGHLIN. In 1917 there was a much larger demand on account of war orders. The very fact that under the tariff act of 1909 the western miner could not compete with the Italian stone is evidence that we could not compete under the proposed act.

Senator SIMMONS. You are not producing now more than 3,000 tons?

Mr. LAUGHLIN. We are not producing a ton a year now.

Senator SIMMONS. If the mills were running, you could produce that?

Mr. LAUGHLIN. Yes.

Senator SIMMONS. You said a while ago that you could not expand over 5,000 tons.

Mr. LAUGHLIN. Yes.

Senator SIMMONS. Then you changed it and said under present economic conditions. If you were protected, how much could you expand?

Mr. LAUGHLIN. I do not know.

There is another point I would like to call attention to. It has been insinuated that the tax, or, rather, that the duty, that we would like to have on this small amount will ultimately be a tax on the consumer. We have asked for a duty which will allow us to compete with the seaboard at approximately a cost of 2 cents a pound.

Senator SIMMONS. That is \$40 a ton?

Mr. LAUGHLIN. And out of that we will pay \$25 for freight rates and tax.

Senator SIMMONS. \$25 for the freight rates. That would be \$65 altogether?

Mr. LAUGHLIN. That would be \$40 altogether, or \$15 a ton to us at the mine.

Senator SIMMONS. I am talking about the consumer. You would add 2 cents to the cost of production. Of course you would also add the freight to the coast.

Mr. LAUGHLIN. I mean 2 cents a pound out of which the freight is prepaid to the Atlantic seaboard by us.

Senator SMOOT. Briefly state what you want.

Mr. LAUGHLIN. Here is a sample that I bought yesterday from a druggist. It is an ounce and three-quarters of manufactured pumice stone. I paid for it at the rate of \$1.20 a pound, as against a production cost of 3 cents.

Senator SMOOT. There is not much of it used in that way.

Mr. LAUGHLIN. These are the only samples I was able to buy. Here is a sample of the ground pumice stone. I paid for that at the rate of 80 cents a pound, which proves that the consumer does not profit by giving the Italian stone a monopoly.

Senator SIMMONS. What do you sell pumice stone for?

Mr. LAUGHLIN. On continuous production we could market it at the mine for between \$12 and \$15 a ton. The Italian stone has been largely produced by convict labor. That was so in the past. I do not know whether it is true now. We pay our lowest man \$4 a day and feed.

BRIEF OF ROBERT LAUGHLIN, REPRESENTING BRAND & STEVENS, NEW YORK CITY.

In the interests and on behalf of the pumice-stone miners and producers of the United States we respectfully solicit your careful consideration on the following amendment concerning paragraph 206 of bill H. R. 7456, which states—

“Pumice stone, unmanufactured, valued at \$15 or less per ton, two-tenths of 1 cent per pound; valued at more than \$15 per ton, three-tenths of 1 cent per pound; wholly or partly manufactured, four-tenths of 1 cent per pound; manufactures of pumice stone or of which pumice stone is the component material of chief value not specially provided for, 26 per centum ad valorem.”

During the hearings held by the Ways and Means Committee of the House on the tariff revision, we, together with the producers of magnesite, graphite, tungsten, etc., appealed for an adequate increase in tariff and were given a generous amount of time both because of the infancy of our industry and because of its intimate relation with war-time activities. Mr. Fordney, chairman and spokesman of the Committee on Ways and Means, recognized our need for such protection. On page 9 of his report to accompany H. R. 7456 he states:

“In the schedule, as elsewhere in the bill, special consideration has been given to products of new industry fostered by the recent war. The following articles in the earthenware schedule fall in this category: Magnesite brick, pumice stone, graphite, chemical porcelain, chemical glassware, and optical glass. The committee has recommended rates which it believes will continue the manufacture of these articles in the United States.”

Our first effort will be to show that the proposed tariff is not adequate to cover the differential between the foreign shipped product and the American.

On page 386 “Tariff information, 1921, hearings before the Committee on Ways and Means, House of Representatives, Schedule B, Earths, earthenware, glassware, January 11, 1921,” will appear copies of original affidavits to the Ways and Means Committee, which were furnished to show the average cost of unmanufactured pumice stone to the American producer delivered at the market. This cost is an average of \$39.945 per ton. Of this cost the freight and cartage item alone is \$22.20 per ton including 3 per cent war tax.

The only person appearing in opposition to an increase in tariff on pumice stone was Mr. Frank L. Goetz, representing James H. Rhodes & Co., who furnished the committee with figures covering the costs to American importers of foreign stone. (P. 44, hearings before the Committee on Ways and Means, Schedule B, Earths, earthenware, glassware, Jan. 11, 1921.)

These costs are as follows:

Ocean freight.....	\$7.10
Raw material.....	13.75
Duty.....	1.15
Total.....	21.10

The proposed duty in paragraph 206, of two-tenths of 1 cent a pound would increase the above figure for foreign stone landed on our seaboard, duty paid, to \$25.50 a ton, only \$3.50 more than the amount we pay the railroads for our transcontinental haul. From these figures it will be seen that if the proposed tariff is not increased the American producer can not possibly survive, and that unless he be given a tariff which, in normal times and under a normal rate of exchange, will allow him to meet European competition, he will be compelled to completely abandon the domestic market to foreign sources.

We presume that this is not the desire of the committee who undertook the revision of the tariff nor of the controlling political party who in their platform of 1920 stated: "But the Republican Party reaffirms its belief in the protective principle, and pledged itself to a revision of the tariff as soon as conditions shall make it necessary for the preservation of the home market for American labor, agriculture, and of industry." The fact that the proposed tariff is inadequate can be seen with great certainty by comparing the present schedule with schedule B, paragraph 89, of the act of 1909, which is as follows:

"Pumice stone, wholly or partially manufactured, three-eighths of 1 cent per pound; unmanufactured, valued at \$15 or less per ton, 30 per cent ad valorem, valued at more than \$15 per ton, one-fourth of 1 cent per pound, manufactures of pumice stone or of which pumice stone is the component material of chief value, 35 per cent ad valorem."

This schedule is considerably higher than the one now proposed, and yet in 1909 there was no American-produced pumice stone, nor was domestic pumice stone produced in commercial quantities until the demands of war, and the cessation of foreign imports as a result of the submarine campaign, made it necessary for the American consumer to look for a domestic supply.

In 1909 the general costs of mining operations in America were slightly over one-half of what they are to-day, and yet at that time, and with a tariff considerably higher than the one now proposed, the enormous natural deposits of American pumice stone remained undeveloped while the American market continued to be supplied by Italian stone produced by convict labor. With all solemnity we make this charge, that the interests who would welcome a minimum tariff on this commodity have been indirectly exploiting in our home markets the product of Italian convict labor to the detriment of American labor, and that if this exploitation is continued there will be in this branch of mining activity no "preservation of the home market for American labor * * * and industry." We therefore humbly petition your committee to make the following changes in paragraph 206, on page 37, of H. R. 7456:

Line 13, strike out the words after "ton," and before the figure "1," i. e., "two-tenths."

Line 14, strike out the words after "ton" and in front of figure "1," i. e., "three-tenths," and insert the words "one and one-tenth." Strike out the word "cent" after "1," and insert the plural, "cents."

Line 15, insert after the word "manufactured," the words "one and."

Line 18, after the word "for" insert the words "1 cent per pound and."

It is assumed that in considering the justice of the request made above, your committee will raise the following points:

(1) An increase in the tariff will probably increase the cost to the ultimate consumer, thus bringing about a further advance in the price of one of the staple commodities at a time when the efforts of the Nation are being directed to a reduction in prices, and to a general retrenchment.

Our answer to this is:

It has been shown in the testimony before the Ways and Means Committee that the American manufacturer, exclusive of his carrying and selling charges, produced the finished or marketable product at a cost of approximately $1\frac{1}{2}$ cents per pound. The selling price at the time these figures were compiled was from $3\frac{1}{2}$ to 5 cents per pound in wholesale quantities, and from 7 to 10 cents a pound in retail quantities. Recent market quotations taken from the Oil, Paint, and Drug Reporter are as follows:

Pumice stone: Original packages, 5 to 6 cents per pound; selected lump, in barrels, 7 to 10 cents per pound; powdered, pure, 5 to 8 cents per pound.

We submit this as evidence that the consumer enjoys no advantage from the comparatively cheap price of the imported stone, and that the increase in the tariff will mean simply a reduction in the importer's margin of profit which is over 200 per cent.

(2) An increased tariff will greatly curtail if not eliminate the importations of pumice stone, and this would mean a corresponding loss of revenue to the Government.

Answer: Government statistics show that a large amount of imported stone comes in under the heading of "Manufactured or partially manufactured." This grade of stone, together with certain other grades not found in America, will continue to be imported irrespective of any duty which might be placed, because the uses to which

pumice stone is put are of such a nature that the cost of this material is an infinitesimal part of the manufacturing processes. Two examples might be cited:

(a) Pumice stone is an abrasive used in rubbing metals, paints, etc. An automobile which sells for \$5,000 or \$6,000 receives about six or eight coats of paint and varnish. Before each coat the previous coat is "dressed" or "rubbed down" with powdered pumice stone, and the amount of stone used in such an operation is approximately 1 pound. It will be seen from this that a fluctuation of 1 cent or so a pound in the price of the stone will have absolutely no bearing on the ultimate product.

(b) A modern high-powered naval or coast-defense gun costing tens of thousands of dollars is built with the same accuracy and attention to detail as a chronometer. The "dressing" and "rubbing down" of these guns and of their projectiles is conducted with micrometer exactness, and yet the amount of pumice stone used in the operation is so small that even with an increased tariff and assuming that the ultimate consumer has to bear the entire burden of this increase, the cost of this gun would not be increased by over \$1.50 at the maximum.

From the fiscal year of 1914 to 1918, inclusive, the United States received \$17,975 duty from unmanufactured stone, but received during the same time \$79,000 duty on stone listed as "Manufactured or partially manufactured." This manufactured or partially manufactured stone totaled, as far as available governmental records show, 48,149,593 pounds, or an average of about 5,830,000 pounds in a year. A duty on this of 1 cent a pound would have given the Government an annual revenue over \$58,000 as against the \$15,000 annual revenue which they now receive.

Affidavits furnished to the Ways and Means Committee showed the average freight rate for the American transcontinental haul to be slightly over \$20 per ton. Since these affidavits were furnished these rates have been increased 20 per cent, so that the present rate is approximately \$25. From an annual shipment of 5,000 tons, therefore, the Government would derive through the 3 per cent war tax on bills of lading \$3,750, which is in excess of the amount they received on an average from the duty on imported unmanufactured stone during the fiscal years of 1914 to 1918, inclusive.

The question might be raised as to why "transcontinental" haul is cited as an example, as it would be expected that a considerable portion of American-produced stone would be distributed at intermediate points.

The answer is that American mines produce only crude or unmanufactured stone. This stone is worked up by mills which were originally situated on the Atlantic seaboard in the situation most accessible to the European product, and for this reason the great part of the American stone comes to these mills and after manufacture is then reexported to western points.

The student of political economy, as applied to international trade, is going to inquire into the effects of what an increased tariff would have upon our economic relations with Italy, from which country all of our importations of pumice stone are derived. The basis of this inquiry would be expected to cover (a) balance of trade, Italy's debt to United States, and (c) rate of exchange between Italy and the United States.

Balance of trade: During the five years preceding the late European war, 1909 to 1913, inclusive, the United States exports to Italy exceeded the imports by an average of \$13,095,400 yearly. Of this amount \$507,400 represents the average annual value of foreign exports from the United States to Italy, making the average annual excess of our domestic exports \$12,588,000.

During this same period Italy's average annual imports into the United States commodities which were duty free were \$17,659,382, while her average imports of dutiable goods were \$30,866,000. (Reference, Statistical Abstract of United States, 1918, p. 386.)

Now, if we take our average annual imports of pumice stone over the same period we find it amounts to only \$83,516, or less than two-tenths of 1 per cent of the total value of Italian imports.

The above figures are given covering the period between and including 1909 and 1913, because it is believed advisable to separate the European war period when normal conditions were very much unstabilized.

Between 1914 and 1918, inclusive, the United States exports to Italy exceeded her imports by an average of \$224,321,071 yearly. Of this amount \$14,510,916 represents the average annual value of foreign exports from the United States to Italy, making the net excess of our domestic exports \$222,369,612.

During this same period Italy's average annual imports into the United States commodities which were duty free were \$14,510,961, while the average annual imports of dutiable goods were \$34,529,594. This shows that in spite of the enormous demands made upon all her resources as a result of the war, Italy was able to increase her average annual imports of dutiable goods into the United States by over three and one-half million dollars. (Reference, Statistical Abstract, United States.)

The average annual imports of pumice into the United States over the same period \$100,160, or about two-tenths of 1 per cent of the total value of Italian imports.

While this fraction of a per cent is relatively so small as to be negligible, it is more probable that a duty of 1 cent per pound would not seriously curtail the imports of any but the cheaper grades of pumice as pointed out above. The trade recognizes numerous grades of this commodity, only two of which have been successfully produced here in America. Some of these grades were sold to American importers for as much as 9 cents per pound, and were retailed at prices up to 50 cents per pound, depending upon quantity and quality. The lack of production of these grades by domestic properties will cause the American consumer to continue to look abroad for his further supplies.

Italy's debt to United States: On page 636, table 369, Statistical Abstract, United States, 1918, Italy's debt to the United States is given as \$1,385,000,000. The interest on this, if we assume a rate of 4 per cent, amounts to \$55,400,000 annually. The declared value of all unmanufactured pumice imported into the United States during the last 10 years averages a little less than \$54,000 per year. Even if we were to assume that these imports were all profit to the producers, and that the entire amount was applied to above mentioned interest, it would take the entire receipts of this pumice stone commerce for a period of over 1,000 years to pay one year's interest on the Italian loan.

Rate of exchange between Italy and United States: Recently the Lackawanna National Bank quoted Italian lire at \$5.66 per 100, or \$0.0566 each. Assuming an average stable value of the lire of \$0.193, this means a drop in the purchasing power of 70.6735 per cent. If uncertain and uncalculable factors are disregarded, such as the present political situation, strikes, local boundary disputes, etc., all of which have a certain undeterminable influence, a calculation can be made as to what effect a curtailment of pumice shipments would have on the rate of exchange. This calculation is naturally based on the trade balance.

In the year ending June, 1918, we exported to Italy a total of \$477,898,744 worth of all kinds of merchandise, importing during the same period \$30,014,349 worth of merchandise both free and dutiable, leaving Italy with a trade balance of \$447,884,395. (Reference, Statistical Abstract of United States, 1918, p. 386.)

According to the figures of the customs house Italy shipped into America during the fiscal year of 1918, \$36,466 worth of unmanufactured stone. If this entire amount were deducted from her total exports to the United States, her trade balance would be \$447,847,929.

The problem is, therefore, if a trade balance of \$447,884,395 decreases the purchasing power of a lire in America by 70.6735 per cent, by what per cent will a trade balance of \$447,847,929 decrease it?

Carrying the calculation out to 4 decimal places, the answer is found to be 70.6793 per cent, or in other words the purchasing power of the lire would be decreased by a further fifty-eight ten thousandths of 1 per cent. Under the normal value of 19.3 per cent for the lire, this would be equivalent to about eleven one thousandths of a mill, an extremely infinitesimal fraction when compared with the ordinary fluctuations of exchange.

CHINA CLAY OR KAOLIN.

[Paragraph 207.]

STATEMENT OF JOHN RICHARDSON, REPRESENTING JOHN RICHARDSON CO. AND OTHERS.

Mr. RICHARDSON. My name is John Richardson, of Boston.

The CHAIRMAN. And what is your business?

Mr. RICHARDSON. Importer of china clay or kaolin, paragraph 207.

The CHAIRMAN. Will you submit your views to the committee, if you please?

Mr. RICHARDSON. I represent not only the John Richardson Co., but also the English China Clay Sales Corporation, Paper Makers' Chemical Co., John W. Higman Co., Hammill & Gillespie, Morey & Co., George Knowles & Son, A. Meincke, and L. A. Salomon & Bro., all importers of English china clay.

We recommend, sir, that the duty as stated in the Underwood tariff of \$1.25 per ton be not increased.

China clay or kaolin is a raw material which is produced in Cornwall, England, and also a material called by the same name, but different properties is produced in the United States—in Georgia, North Carolina, South Carolina, Virginia, Pennsylvania, and to less extent in other parts.

The total consumption in the United States amounts to between 350,000 and 450,000 tons per annum. Of this amount, roughly 60 per cent has in the past come from England, and the balance, 40 per cent, has been produced in the United States.

The CHAIRMAN. What is the monetary value of that aggregation?

Mr. RICHARDSON. Of the total?

The CHAIRMAN. Yes; roughly.

Mr. RICHARDSON. The value in money of the total consumption is roughly, amounts to somewhere about \$6,000,000 delivered. It is difficult, of course, to give any averages on a subject of this kind, owing to the conditions we are passing through now.

The CHAIRMAN. I only want to get a very rough idea of the magnitude of the industry.

Mr. RICHARDSON. At the hearing before this committee on Saturday, Mr. Edgar, the largest producer of domestic clay in this country, testified, and in response to a question as to his reasons for demanding an increase in the tariff of \$6 per ton, answered that those reasons were contained in his brief, and outside of that the main point he had in mind was the difference in freight rate between the rate paid by the domestic producers to a point of consumption in Maine, and he took as the place of the domestic producer the State of Georgia where some of his mines are located, which amounts to \$9.06 a ton, and he then compared that to a 10-shilling rate for ocean freight, which he stated was paid by the importer of the clay.

The statement that the rate of the ocean freight was 10 shillings was also contained in the brief of the domestic producers on page 51 in the hearings before the Ways and Means Committee. The rate has not been 10 shillings throughout this year; it has been 15 shillings. Presumably it is as low as this owing to present lack of ocean tonnage. Mr. Edgar's statement does not take into account, either, the fact that the importer of china clay has to pay the inland freight as well as the ocean freight when it comes to this country.

In order to develop this rate question and to try to arrive at some fair comparison for the purpose of coming to a decision as to what duty should be placed on this article, I have made some rough estimates of the quantities consumed at various points, and a fair average of rates for imported clay and domestic clay to those points.

The rates on the imported clay, of course, include both the ocean rate and the inland rate. The rate on the domestic clay I have given here is only a fair average, and it is taken from Georgia points, which are farther distant from points of consumption than some of the other points, where domestic clay is produced. We start in and find that Maine consumes about 50,000 tons a year.

Senator WALSH. In the paper mills, principally?

Mr. RICHARDSON. In the paper mills principally. I should have said in that connection that this clay is consumed largely by paper mills, particularly high-grade book paper mills. Probably 70 per cent of all the foreign and domestic clay consumed here goes to

paper production, and a large part of the balance is used for pottery, and a small amount is used as a filler in cotton cloth, linoleum, and other substances. But the paper and pottery makers are the main users.

The paper mills of Maine alone consume about 50,000 tons a year. The domestic rate from Georgia is roughly \$9—I believe \$9.06, to be exact—the import rate, including both ocean rates of 15 shillings, and I am not now including the rail rate on the other side, but including the ocean rate of 15 shillings, and the inland rate to the mill will mount roughly to \$5.50.

The Massachusetts paper mills consume roughly 50,000 tons a year. The rate from Georgia is about \$9, and the foreign rate, including the inland rate, about \$5.50.

The New York and New Jersey consumption is about 50,000 tons. The rate from Georgia is about \$8.65, and the foreign ocean rate and the inland rate is about \$8.

Senator DILLINGHAM. Is talc used in connection with this clay in paper making, or separately from it?

Mr. RICHARDSON. No, sir; it has been used to some extent, but does not work out for the purposes for which this material is used. It is practically a noncompetitive article as regards clay.

Senator DILLINGHAM. Is it used for a different purpose from the clay?

Mr. RICHARDSON. I am not a paper manufacturer, and I can not say, but I know we do not come in active competition with it.

Pennsylvania, Delaware, and Maryland consume about 50,000 tons. The rate from Georgia is about \$7 and \$8 for foreign.

Virginia and West Virginia consume about 35,000. The rate from Georgia is about \$7 and the foreign rate about \$8.

Michigan—out at Kalamazoo they have a very large paper center—50,000 tons. The rate from Georgia is \$7.55 and \$10 foreign.

Ohio consumes about 60,000, again a large point of consumption; the domestic rate is \$8 and the foreign rate \$10.

Wisconsin, which was not referred to at all in the brief of the American producers, uses practically entirely domestic clay, and the domestic rate is \$9 and the foreign rate \$12.

In conclusion, on the subject of these rates, I would say that at some points the domestic producer has the advantage on rates; at some points the importer has the advantage. But it is to be borne in mind that there is now a duty of \$1.25 on this article, and it is to be further borne in mind in this connection that in the brief of the domestic producers filed before the Ways and Means Committee, in their table of statistics, they state that to compete with foreign clays at Boston, Mass., would mean to the domestic producer a loss of \$1.22 a ton. (See brief, domestic producers, hearings before House Ways and Means Committee, Pt. I, p. 514.)

It just happened, aside from this tariff matter, that we have tried to sell Bird & Sons at Walpole, Mass., near Boston.

Senator WALSH. They are leading paper makers?

Mr. RICHARDSON. They are makers of low-grade roofing and other papers. Bird & Sons wrote us on January 20 of this year that they could not use the foreign clay when compared to the domestic clay, which is entirely satisfactory, and they could obtain it at less prices.

A copy of that letter appears in the Ways and Means Committee report at page 524.

Gentlemen, it seems to me that the domestic producer, in order to justify his request for an increase in this tariff, has got to show that protection is needed, and that, first, actual competition exists between his clay and the imported article; and, second, that he can not compete under present circumstances.

As to the existence of actual competition, Mr. Edgar in his testimony on Saturday admitted to your committee that the foreign coating clay used for coating papers could not be duplicated in the United States; that the manufacturers of high-grade coated paper, in order to compete with other markets, must have the English clay. That probably amounts to about one-fourth of the supply of English clay that is brought in each year. Probably one-half of the supply of English clay that is brought in each year consists of what is known as high-grade filler and high-grade potting clay. There is no clay in the United States that will compete with those clays.

The low-grade filling clay which is used for paper manufacturing and is imported from England, amounts to perhaps one-fourth of the total imports, and that low-grade filler is the only clay with which the American clay is in competition.

There are various grades of American clay, and only the best American paper clay competes with this low-grade English filler, which narrows the situation down so that the actual competition existing between American and English clays is in fact very small.

In regard to the ability of the American producer to compete, we have already shown that to certain points the American producer has the advantage on freight rates, while to certain other points the importer has the advantage.

And, gentlemen, I believe that it has been established in the last 10 years that a tariff on clay plays almost no part in the competition. It was halved in 1913—cut from \$2.50 to \$1.25. The American business, according to the testimony of Mr. Edgar, at page 501 in the Ways and Means Committee report, has steadily increased since that time; and, furthermore, their prices have practically doubled. They have had very prosperous times under the lowered duty.

I just want to read to you a little line from the Tariff Information Surveys, prepared for the House—and I would say in this connection that the American producer took his brief as regards general information practically verbatim from the Tariff Information Surveys. But he omitted the conclusions in the surveys, and I want to read one or two to you. At page 16 of Tariff Information Survey on paragraph 76, act of 1913 [reading]:

There is no substitute for English clay in the better classes of paper, and the fact that American paper manufacturers continue to pay duty for the English clay to a large extent confirms this statement.

The possible and probable injury to the market of domestic clay is limited to the use of English clays; in the main, to low-grade papers.

That is as I explained to you.

The lowest grade of English clay costs but little more than the best domestic clays, but the size of the total output, the values involved, and the amount of it in our paper clay pits are insignificant as compared with the importance of the finished paper industry of the United States.

And, again, under Tariff Considerations, page 17:

It would appear from the foregoing that the tariff plays little part in the competitive length of foreign kaolin in the United States market.

I believe that is absolutely true.

Mr. Edgar testified on Saturday morning that he was going to put down unless he got some relief. The domestic producers testified before the Ways and Means Committee that their business had fallen off 60 per cent this year. I have here the figures for the total exports from the United Kingdom for the first six months of 1920 and of 1921, according to the China Clay Review for July, 1921.

For 1920 the total exports for the first 6 months were 211,633 tons; in 1921, they were 87,096; that is the total not only for the United States but also for all foreign markets. Probably the United States brought in some 60 per cent of that, and it is clear from those figures that we have imported in the first 6 months of 1921 not over 40 per cent of what was imported in same period last year. It is my belief that our business has fallen off about 70 per cent, and the domestic producers say theirs has fallen off 60 per cent.

They say that the placing of this tariff on china clay is going to do them good, but the truth is that the paper makers are not doing any business. Their mills are down, and they have been down, and they are consuming very little china clay at present. We are all in the same box. A high tariff would not start them up.

At page 506 of the tariff hearings on Schedule B, paragraph 76, before the House Ways and Means Committee, Mr. Hayne, the president of the American China Clay or Kaolin Association, testified that under any circumstances in the world there would be 200,000 tons a year of English clay coming into this country. And he said if you put the duty at \$10 a ton, the clay would still come in.

Gentlemen, the average importations from 1910 to 1919 amounted to about 220,000 tons; and the biggest year known of, except 1920, of which we have not got the figures yet, was 268,000 or 270,000 tons, somewhere in there.

It would appear again from Mr. Hayne's statement that the two articles are noncompetitive, and that it is a matter of profit and not protection that concerns the domestic producer.

In regard to the size of the industries, Mr. Hayne testified before the House Ways and Means Committee, page 505, that there were from 7,000 to 10,000 men employed in the domestic clay industry; and, further, that the wages were from \$2.50 to \$10 per day. I have taken those figures at 200 working days, 10,000 men at \$2.50 per man, which would be a total yearly wage of \$5,000,000. According to the estimate of the Tariff Survey, page 17, the total value of the domestic output for the year 1919 was estimated at \$1,648,000, a record high value.

The total value of the domestic was \$1,648,000, and Mr. Hayne's testimony is that they paid not less than \$5,000,000 for labor.

I believe that there are not over 1,500 men employed in the whole domestic clay industry, and I have various figures from the Tariff Information Survey and the Geological Survey reports that indicate that.

Mr. Hayne further testified that the labor costs in England were at least 60 per cent under the domestic costs.

The Cornish Guardian and Clay Chronicle of December 31, 1920 states:

Clay workers demand increase over 1 shilling 6 pence per hour paid them.

A shilling and 6 pence, at the rate of exchange of \$3.70 or \$3.75 makes 27 cents an hour, or practically the same as the \$2.50 a day paid in America.

I want to point out that the Government is a large buyer of paper that contains imported clay, and it is going to contain imported clay under any circumstances because the paper manufacturers have testified they can not manufacture in competition with other countries without using the imported clay.

Senator McLEAN. What percentage of the cost of the paper that the Government uses, for instance, is represented by the clay?

Mr. RICHARDSON. I could not say, sir. I want also to refer to the brief and supplemental brief filed by John Richardson Co. with the House Ways and Means Committee, which are printed at pages 484 and 519 of the Tariff Information, 1921, Hearings before Committee on Ways and Means, Part I, and a brief and supplemental brief filed by the English China Clays Sales Corporation and Hammill & Gillespie and printed at pages 493 to 496.

Senator WALSH. Have you talked over this matter with the manufacturers of paper?

Mr. RICHARDSON. We have talked the matter over with the manufacturers of paper at great length.

Senator WALSH. What is their attitude?

Mr. RICHARDSON. They are opposed to any increase of the duty.

Senator WALSH. Are they represented here?

Mr. RICHARDSON. No, sir. We have represented them. We have been in very close touch with them, and we have always taken up the matter of clay duty ourselves in all the hearings. They testified however, before the War Industries Board in 1918, that they absolutely had to have the English clay in their business, and that they would have to have it whatever the price was, and, of course, with them it is a question of competition with Scandinavia, Germany and other countries.

BRIEF OF JOHN RICHARDSON CO., BOSTON, MASS.

We desire to supplement our statement made before your committee on August 2, 1921, in which we recommended that the duty on china clay or kaolin (H. R. 745 par. 207) be not increased over the rate of \$1.25 per ton carried in the Underwood bill, Schedule B, paragraph 76. We desire particularly to refer to the brief filed with your committee on August 20, 1921, by Mr. Edgar on behalf of the producers of domestic clay.

The brief of the American producers states that "the great quantities of foreign goods coming in now at prices 50 per cent below our cost is slowly but surely bringing on one of the most disastrous panics we have ever known."

If this statement refers to imported china clay it is erroneous. During the first six months of 1921 less than 40 per cent of the quantity of china clay or kaolin was imported into this country than was imported in the first six months of 1920 (see The China Clay Trade Review, published in London, July, 1921, p. 66); nor has any china clay been imported at prices 50 per cent below the cost of the American producers. Mr. Edgar testified that "our cost of production and labor varies all the way from \$7 to \$10 per ton." (Tariff Information, 1921, pt. 1, Schedule B, p. 503.) The lowest grade of English clay imported for paper and pottery has at no time during 1921 sold for less than \$9 per ton f. o. b. English port, to which must be added ocean freight, duty and inland freight from Atlantic seaport. Higher grades sell for about \$11 f. o. b. English port.

It is stated in the brief that "we can not pay a \$6.18 freight per ton to Maryland, \$9 freight per ton to New England, or an \$11 freight rate to Northern New York. While English clay comes to our ports for \$1.82 per long ton or \$1.62 per short ton, the freight is figured and our clay is sold."

English clay does not come to our ports for \$1.82 per long ton, but with the present rates of ocean freight and exchange at \$3.70, the ocean freight alone is \$2.77 per long ton, to which 3 shillings a ton, or about 55 cents for freight to English seaport, and inland freight in the United States, must be added. Here, as in other parts of the brief, the statement of the American producers naming certain points of consumption is misleading. Kindly refer in this connection to testimony of John Richardson before your committee.

It is stated in the brief that "we can not bleach our clays. We have to ship them with as little preparation as possible to meet foreign competition."

A large part of the American production (after mining with steam shovels) is washed and dried. The English residual clay is mined by a hydraulic process, then washed and dried. The quantity of imported English clay, if any, which receives any further bleaching treatment is so small as to be insignificant, probably less than 1 per cent. It is stated in the brief that "they have presented as evidence a few letters from the comparatively few mills that use only English clay or are prejudiced in favor of it, but they are very few when compared with the many mills using all domestic clay or mixture of both."

Letters have been presented from the Oxford Paper Co., S. D. Warren Co., West Virginia Pulp & Paper Co. (Tariff Information, pp. 522-524, inclusive), Crocker, Burbank & Co., Fitchburg Paper Co., Whittemore Manufacturing Co., and the Bryant Paper Co. (Tariff Information, pp. 494, 495), which include the largest book manufacturers in the United States, if not in the world, and together make up a most substantial part of our total output. Several of these mills use domestic paper clays to varying extents as filler in conjunction with the imported clay.

It is stated in the brief that "they are filling many mills in this country with clay to be paid for when used and with it a guaranty against advance or decline in price."

This statement can not be substantiated, although it is probably true with regard to a few small lots. Clay is a cheap, bulky article. Storage means loss. Importers are not bankers and do not sell their clay as indicated.

It is stated in the brief that "we have fought organized competition, you see here to-day, until we have almost—not quite—divided with them the clay tonnage of the country, where they once had all. The Ways and Means Committee spelled ruin for us when they allowed us only \$2.50 per ton duty with which to combat foreign clay at prewar prices with our costs in transportation alone advanced 58½ per cent."

At the hearings before the Ways and Means Committee on January 8 and 9, 1913, Tariff Schedules, Schedule B, p. 528, Mr. Peter W. Morgan, on behalf of the American Clay Producers' Association, requested that the duty of \$2.50 be not removed. He stated in his brief, which was subscribed to by the principal domestic manufacturers, that "if the duty of \$2.50 is removed and it should appear that our prices have to be reduced to meet the reduction in cost, we should inevitably have to go out of business, there being no such margin of profit as would permit us to operate."

The duty was reduced at that time to \$1.25 per ton. Despite this fact the American producer has, according to the statement before your committee, "almost—not quite—divided with them the clay tonnage," and his prices have practically doubled. Nor has the domestic producer called upon "to combat foreign clay at prewar prices with our costs in transportation alone advanced 58½ per cent." English clay to-day, despite the low exchange, costs f. o. b. English port about two and one-half times its prewar cost. The ocean freight is higher. The inland freight in the United States is also higher.

We submit that the domestic producer has entirely failed to show adequate reasons for further protection than the \$1.25 accorded by the Underwood bill. We recommend that the duty be not increased.

BRIEF OF THE ENGLISH CHINA CLAYS SALES CORPORATION AND HAMMILL & GILLESPIE, NEW YORK CITY.

The present duty on china clay or kaolin is \$1.25 per ton as per Underwood tariff, Schedule B, paragraph 76.

The duty proposed under H. R. 7456, paragraph 207, is \$2.50 per ton, or an advance of 100 per cent above the present tariff.

We respectfully request that the present duty of \$1.25 per ton be not advanced.

At the present rate of exchange and ocean freights the cheapest or common grade of English china clay that is imported for paper making can not be marketed at less

than \$12.50 to \$14 per ton ex ship Atlantic seaboard, and to this price must be added the inland railway freight to consumer's mill. This inland freight to points in certain freight traffic territory is as high and to some points even higher than on domestic clay shipped from southern mines to consuming mills. As soon as sterling exchange advances prices on English clay automatically advance, so that at normal exchange basis the prices would range from \$16.50 upward.

Domestic crude clay prior to the war sold at \$3.75 to \$4.25 f. o. b. mine and domestic washed clay at \$4.75 to \$5.50 per ton f. o. b. mine. The present prices on domestic clay range from \$6 to \$7.50 f. o. b. mine on crude clay and \$8 to \$10 for washed clay. These prices do not include domestic pulverized clays, which are quoted at \$12 to \$20 f. o. b. mine and have no competition, as there is no pulverized clay imported.

According to figures furnished by one of the domestic clay producers the present cost of production with present high labor and coal is \$4.50 to \$5 for crude clay and \$5 to \$6.50 for washed clay.

To produce a ton of English clay requires more than double the amount of labor and laborers than is required in the domestic mines and the cost per ton for labor in the English clay works is therefore correspondingly higher than the cost per ton in American mines.

At the present time the English ordinary day laborer in the clay industry is receiving 1s. 6d. per hour for a 7-hour day, that is, 63s. for a 42-hour week (about \$15.38 in American currency). Pieceworkers, such as loaders and dry men are paid on a different scale and their wages are much higher than those of the day laborers, ranging from £4 to £5 per week (\$19.50 to \$24.25 in American currency) according to the tonnage handled. Labor cost represents about 50 per cent of the total cost of production, but the coal bill is also a heavy one, as English clays are obliged to go through a drying process in kilns fed by coal fuel for which only the best Welsh coal is suitable. The cost of this coal is extremely high at the present time. Compared with 1914 the increase in wages alone has been 150 per cent and the increase in the cost of coal for the English producer has been even greater.

The United States Government is a large buyer of machine-finished book paper, supercalendered book paper and surface-coated papers. The paper manufacturers of these grades of paper are the largest consumers of English china clay and the proposed increase in the present duty of 100 per cent (from \$1.25 to \$2.50 per ton) will increase the cost of production of these grades of paper and work an unwarranted hardship on the paper manufacturer in view of the declining prices on the finished paper.

China clay is a raw material necessary for the manufacture of high-grade paper, and any duty imposed increases the price and cost of paper production—largely used by the Government and throughout the country for educational purposes.

Domestic clays can not replace English china clays in the production of high-grade paper, pottery, and chinaware.

Clay is admitted free of duty into Canada and gives the Canadian paper manufacturer an advantage over the American paper producer in the world's export trade.

We therefore ask the committee to give this matter their consideration and recommend that duty on china clay be not advanced.

We respectfully refer committee's attention to Tariff Information of 1921; Hearings before the House Committee on Ways and Means, Part I, page 493. original brief at page 496, supplementary brief, filed by us.

BRIEF OF PAPER MANUFACTURERS.

STATEMENT OF FACTS.

In 1908 and in 1913 the John Richardson Co. was represented at the hearings before the Ways and Means Committee and requested the removal of the duty on china clay or kaolin. In 1908 the petition was dismissed and the duty of \$2.50 per ton remained in force. By the tariff act of 1913, paragraph 76, the duty was reduced to \$1.25 per ton, at which amount it now stands.

This brief recommends that there be no increase of the duty on china clay or kaolin.

EXPLANATION OF TERMS.

The terms "china clay" and "kaolin" are synonymous. China clay, or kaolin, is a raw material chiefly used in the manufacture of paper and pottery. In this brief the term "china clay" will be used except with reference to North Carolina clay, which is customarily called "kaolin."

China clay is decomposed granite. It is found in large quantities in Cornwall, England. A material differing in important respects in quality, but called by the same name, is found in the United States, principally in Georgia, South Carolina, and Pennsylvania. In both countries the term "china clay," or "kaolin," is applied to materials of varying qualities and commercial values. About 90 per cent of all the clay imported into the United States is English china clay.

IN ITS NATURAL STATE.

China clay is either residual or sedimentary. *Residual clays.*—Beds of china clay occurring at or close to the place of original deposition are known as residual clays. These clays in their natural state are mixed with a large quantity of feldspar, mica, and sand. In the United States, so far as is known, there is practically no residual clay except North Carolina. All English clays are residual. *Sedimentary clays.*—In the erosion of the earth's surface, residual clay is washed down into lakes and seas. On its journey most of the feldspar, mica, and sand are stripped out and other impurities are added. It is deposited in the form of a sediment, and is known as sedimentary clay. Except for the North Carolina clay the china clay of the United States is largely sedimentary.

HOW MINED.

The methods used to mine the English residual clay differ fundamentally from the methods used in mining the sedimentary clay of the United States. *The English method.*—A stream of water under high pressure is directed from a hose against the side or slope of the bed, washing down clay, feldspar, mica, and sand. With each ton of clay that is washed down there are about 2 tons of sand and other materials. The heavier materials are settled out of the clay stream at the bottom of a pit, shoveled into cars and hauled to the waste pile. The clay stream is pumped to the surface and run at decreasing rates of speed through drags, thus dropping out the heavier impurities. The clay stream then runs to settling pits, most of the water is run off, and just enough left to convey the clay to the tanks from which it is trucked to the presses. After the drying process the clay is thrown into sheds ready for shipment. *The American method.*—The clay is dug out of the face of the bank with hand tools or steam shovel. In many instances after being assorted for color and dried in an open shed, the clay is ready for shipment. In other cases it is ground or pulverized and in some cases is washed with good results (South Carolina Geological Survey, Bulletin No. 1, Series A, 1904, p. 62). The American method of breaking clay out of a deposit by hand tools or steam shovel is as unsuited to the conditions confronting the English miner as is the English process of extracting clay by means of a clay stream to the American miner.

ANALYSES.

We here present a table of an average test of English clay and of a test of clay from two mines in South Carolina and one in North Carolina:

	Medium English China clay.	Paper clay, South Carolina. ¹	Paper clay, South Carolina. ¹	North Carolina kaolin. ²
Silica	45.62	45.02	44.23	45.70
Alumina	38.98	38.98	38.92	40.61
Iron oxide	.81	.77	2.31	1.39
Manganese	.69			.45
Magnesia	.10	.07	tr.	.09
Water				.35
Moisture or total water	12.30	13.58	12.90	8.98
Calcium	.50			2.82
Silicic oxide		.85	1.21	
Sulphur		.03	.12	
Soda		.26	.30	
Potash		.55	.26	
Total	100.00	100.11	100.25	100.39

² North Carolina Geological Survey.

AS TO TEST BY ANALYSIS.

"There are, however, many physical properties which the ultimate analysis does not explain, because they are dependent largely on the mineralogical composition (North Carolina Geological Survey, Bulletin No. 13, by Heinrich Ries, 1897, p. 30).

Two clays may show practically the same chemical analysis and one be enough whiter than the other to make it commercially valuable where the other could not find a market. The accompanying exhibits show clearly that there is a difference, for practical purposes, between English and American clay.

Exhibits A and B are samples of the deposits of English and American clay in a certain state.

Exhibit C shows 10 grains of ordinary English clay in a certain quantity of distilled water. Exhibit D shows 10 grains of high-grade domestic paper clay in the same condition. On shaking these bottles it is apparent that the English clay is held in suspension to a far greater degree than the domestic. This goes to show, first, that the English clay is finer in grain than the domestic; second, that it has less grit or impurities of silica.

Exhibits E and F, samples of English and domestic paper clay, respectively, further shows that the domestic clay is harder, shorter, leaner, more yellow in color. The sample of English clay is better color, and is termed by the miners fat, long or green (Rudolph Wagner, Ph.D., professor of chemical technology at the University of Wurzburg), and possesses a higher degree of plasticity than domestic. A clay of good color and high plasticity is desirable for paper making.

USES.

By far the largest use of china clay is for paper-making. Forty years ago paper was made chiefly from rags and old paper. The manufacturer did not need china clay to give his paper a finish. Ground wood and sulphite, owing to their lower cost, now replace rags in most paper. China clay is used to fill and finish paper made from wood. Without clay the surface is harsh and not readily printable. China clay is now an absolute necessity for much of the paper made.

In wall paper and low-grade book paper, china clay is used as a filler. In high-grade book and magazine paper china clay is used both as a filler and as a finisher or coater. The superior grades of English clay alone satisfy the manufacturer of high-grade coated papers. (See statement by paper manufacturers before War Industries Board, Mar. 27, 1918, Appendix A.)

The second largest use of china clay is for the manufacture of pottery. The pottery requires a clay that will burn white and will not crack or craze. English clays, owing to their uniformity and to their lack of tendency to crack or craze when burned, have been found to be more satisfactory for potting. Prof. Bleininger, United States Bureau of Standards, Pittsburgh office, has said: "The use of American clays in the production of white ware pottery is technically possible, but it is claimed by the potters that these clays can not be supplied in large enough quantity and of the required degree of uniformity to justify the shutting out entirely of the English clay. In our experience, irregularity in the quality of (American) clays has been met with frequently. The clay would differ quite decidedly in quality with different cargoes although supplied by one firm."

In both countries, as a general rule, clays in certain pits are more suitable for pottery than for paper and vice versa. The North Carolina clays, mentioned as being among the only known residual clays in the United States, are used almost exclusively for pottery.

Clay is also used (1) as a stiffener mixed with size for cloth and other textile fabrics; (2) for the manufacture of sulphate of alum; (3) in the manufacture of ultra marines; (4) as an absorbent and stiffener in the manufacture of linoleum. For all these purposes English clay is considered superior.

QUANTITIES.

The number of tons of English china clay imported into the United States and of domestic production of paper and pottery clays in each of the years 1909 to 1913 were as follows:

English imports of china clay and domestic production of paper and pottery clays.

Year. ¹	English imports.	Domestic production.		Year. ¹	English imports.	Domestic production.	
		Paper clay.	Potting clay.			Paper clay.	Potting clay.
		Short tons.	Short tons.			Short tons.	Short tons.
1915.....	193,492.98	81,586	31,227	1915.....	230,484.00	113,033	28,031
1916.....	231,234.45	85,949	34,221	1916.....	228,936.00	153,434	47,723
1917.....	228,598.42	99,265	27,400	1917.....	206,729.00	174,449	31,885
1918.....	237,365.78	119,857	25,852	1918.....	192,705.00	141,725	37,969
1919.....	263,838.14	126,377	28,834	1919.....	146,260.00	148,000	39,000
1920.....	241,935.99	116,328	34,191	1920 ²	300,000.00

English imports based on fiscal year. Domestic production based on calendar year.
Calendar year.
Estimated.

The decrease of importations for the years 1918 and 1919 was caused by shortage available ocean tonnage due to the allocation of tonnage for other purposes by the European Governments. In the year 1920 such allocation was discontinued, with the result that the importation of English clay for the calendar year exceeded 300,000 tons. We are unable to obtain figures as to the production of domestic clays for 1920.

RELATIVE COSTS.

In each country there is a wide divergence between the cost of individual clays. Not only is the cost of the domestic kaolin, or potting clay, different from the cost of domestic paper clay, but also there are differences based on quality between the clays and paper clays coming from different pits. So, too, the prices of English filler clay and coating clay vary widely, the coating clay in many cases bringing a price half as much again as that brought by the filler clay. However, certain average comparisons are possible. For the year 1918 the average cost at the mine of domestic paper clay was \$7.54 per ton, while for the same year the foreign imported value of English china clay f. o. b. English port was \$6.77. (U. S. Geol. Surv., Mineral Resources, 1919, Pt. 2.) To the cost of English clay at the English seaport must be added about 17s. for ocean freight and \$1.25 for duty, which makes the cost at Atlantic port \$15.13 per ton. Since the compilation of the foregoing figures by the Government, the price of English clay f. o. b. seaport in England in English money has materially increased. This increase has been accompanied by a decrease in the value of the pound sterling. At the end of 1920 with exchange at \$3.50 English coating clay at the American seaport cost about \$20 to \$21 and a low-grade English filler clay about \$15. The price of domestic paper clay rose between 1918 and the first half of 1920. Recent reductions in the price of this clay have brought the mine cost to between \$9 and \$10. As exchange approaches normal the cost of English clay will be increased. On a basis of \$4.86 to the pound sterling and present English prices, the cost of filler clay at Atlantic seaport would be about \$20, and of English coating clay at Atlantic seaport about \$27 to \$28 per ton.

COMPETITION.

American clays do not compete with the best English clays used for best book and coated paper. The statement of the large paper manufacturers made before the War Industries Board, March 27, 1918, a copy of which is set forth in Appendix A of this report, bears conclusive testimony to this fact. Manufacturers of high-grade pottery are practically unanimously of the opinion that English clay is essential for good results. They find that American kaolin with different qualities can be mixed with English potting clays to good advantage.

SIZE OF DOMESTIC CLAY, PAPER, AND POTTING INDUSTRIES.

Although we have found no recent figures for the number of men employed and the amount of investment in domestic paper clay and kaolin, it is certain that the industry is relatively small as compared to the paper and potting industries. We believe that considerably less than 1,000 men are employed in the domestic paper and potting clay industry. The paper industry, the chief user of china clay, is one of the largest industries of this country, both from the point of view of capital

invested and labor employed. Add to this the potting industry of the United States which is by no means inconsiderable in both respects, and the relative importance of the domestic clay industry is seen to be comparatively insignificant.

SUMMARY.

The duty on English china clay is now \$1.25 per ton. We urge strongly that the duty should not be increased.

English china clay is essentially a different material than the American product called by the same name. It is a residual clay. American clay is largely sedimentary. English clay is mined by water process. American clay is dug out of the pit. Although in analysis English and American clays do not differ widely, analyses do not show their relative values for commercial purposes. Their essential differences are brought out by the exhibits presented herewith.

In the main, uses of English and American clays differ widely. Owing to their different properties American clays can not be substituted for English without damage to the product, be it paper or pottery.

Despite the shortage of ocean tonnage during the war and the great resultant opportunity for increase of domestic production, manufacturers of both paper and pottery have continued throughout to demand English clay. The importation of over 300,000 tons in 1920 is ample evidence of this demand. English clay costs more, and yet must still be used by both paper makers and potters.

The clays, in fact, are largely non-competitive. An additional duty would be of small or doubtful value to the relatively small American clay industry. It would inevitably cause an enhancement of the price of the products of the great American paper and pottery industries, which we believe must continue to use English clay.

APPENDIX A.

We earnestly hope that after careful consideration of the reasons given below it will be found possible to allow shipments of English china clay to continue as heretofore.

(1) Domestic clays are not suitable as a complete substitute for English clay in book and printing papers. In the lower grades of book and printing paper a considerable percentage of American clay may be safely used. In the higher grades, however, the quality of the paper would be so seriously affected that the American clay can not safely be used, and absolutely can not be used in coated papers.

(2) We do not believe that the development of southern clays is sufficient to provide for the needs of this country, without regard to car shortage, embargoes or labor difficulties.

(3) The combined amount of domestic and foreign clays produced is required by the paper industry, without regard to other industries.

(4) For the last year or more the railroad situation has resulted in largely reduced shipments from the South, and during the last few months the situation has become much more critical.

(5) Under normal conditions, cars are a long time in transit to all points, and this is particularly true of New England.

(6) A very considerable percentage of English clay is used in the mills located close to the Atlantic seaboard.

(7) A large percentage of English clays have been brought into this country practically as ballast.

(8) We can see but one argument for stopping the importation of English china clay, namely, to conserve shipping. As an answer to this, we would say that since the European war, steamers have been furnished for such service under permits by the English shipping board.

(9) If English clay shipments are not permitted to be brought to the United States over an extended period, we predict a closing down during such period of the mills producing coated papers, as domestic clay positively can not be substituted to produce a satisfactory product, and the demands for such papers would cease. It should be borne in mind that coating machines can not be converted or utilized in any other form for the manufacture of paper, and that a large number of employees will be thrown out of work, resulting in hardship not only to them but to their employers.

(10) If the importation of English clay is stopped entirely, it will mean that the paper makers of America will have less than 40 per cent of the clay they now use, and as clay is used mainly for two purposes, first, to give the finish necessary for the requirements of the printer, and secondly, to decrease the cost of the product, this will

ult in a hardship particularly on the consumers of periodicals and other book papers, these classes of paper require the finish and softness which can be obtained only by the use of a considerable percentage of clay.

NOTE.—War Industry Board decided against proposed embargo.

STATEMENT OF MILTON A. EDGAR, REPRESENTING THE AMERICAN CLAY PRODUCERS' ASSOCIATION.

Senator SMOOT. Give your full name for the record.

Mr. EDGAR. Milton A. Edgar; residence, Metuchen, N. J. I represent as president the American Clay Producers' Association, with mines in New Jersey, Pennsylvania, North and South Carolina, Georgia, and Florida. I also represent as an individual, outside of my official capacity, Edgar Brothers' Co., of Metuchen, N. J., with mines in Georgia and New Jersey, of which I am president, and the Edgar Kaolin Co., of Edgar, Fla., and Metuchen, N. J.

Senator WATSON. In what are you interested?

Mr. EDGAR. I am interested in paragraph 207, clay and kaolin.

We have prepared a brief which is just what it states on its face—the brief of the American Clay Producers' Association, supplementing brief of the association filed with the Ways and Means Committee of the House and again presented for the consideration of the Senate Finance Committee, and to which reference is made in our brief.

I would say for the allied companies that I represent as an individual to-day that we have over a half million dollars invested in the business of mining and refining and preparing these clays suitable for the use of our manufacturers in this country. I would also state that I have been in this business for 50 years, and I think I know something of the wants of the consumers. During the war they were very wonderful fellows. They said they would do everything for us when the war was over because we treated them right while the war lasted. The facts are all set forth in this brief, and I will not take the time of the committee any further. If there are any questions that you desire to ask I will endeavor to answer them. I also have some marked copies of the report of the hearings of the Ways and Means Committee, with special references for the convenience of the committee——

Senator McLEAN. Do you want the rates changed somewhat?

Mr. EDGAR. We are asking for an increase in the rates. What we want and why we are asking for it is embodied in this brief, and I will not take up your time to explain it.

Senator SMOOT. Senator Watson, do you desire to ask some questions?

Senator WATSON. I do not know whether I do or not until I look this up. What is the present rate?

Mr. EDGAR. The present rate is \$1.25. The rate in the bill is \$2.50.

Senator WATSON. The rate provided in the Fordney bill is \$2.50?

Senator DILLINGHAM. Why do you want that increased?

Mr. EDGAR. Our brief will tell you all about it, gentlemen.

Senator DILLINGHAM. Can you not tell about it, briefly?

Mr. EDGAR. In our presentation to the House committee we asked for a \$6 tariff rate from the points of production to the points of consumption. East of Pittsburgh and Buffalo the rates run \$9 a ton; in some cases a little more and in some a little less. The English freight rate to-day is \$2 a ton. It is about 10 shillings, or \$2.50, a

ton. It is almost a ballast rate. The contention is made by the importers that our clay is not adapted for high-grade book-paper purposes. Our reputation rests on Webster's definition of the word "fact"—a thing done. We did it for years. Some of the highest-grade book-paper makers of the country tell me personally that they get a better result than they do from the English clay. We admit in our brief that for coating purposes paper makers prefer the English clay, and we have no objection to that. We also show in our brief the rate of increase both to the potters and to the paper manufacturers in their finished product through the duty.

I would state that our Florida clays are exclusively used for pottery purposes, and I would refer you to any potter in this country as to the character of the Edgar clays. There is not a man in the country that does not know us.

Senator SIMMONS. What are the chief factors which enter into your request, the difference in water rates and in rail rates? Your competitor brings in his product by water?

Mr. EDGAR. Our competitor brings his product in by water. We are confronted by a condition and not a theory. The fact is we have three large plants in Georgia equipped to run 24 hours a day. We are running to-day two plants at 10 hours a day, three days in the week; and unless we get some chance of redress in the near future I will go down there on the 1st of October and be compelled to shut up every plant we have.

Senator SIMMONS. That is not the phase of this matter that I am speaking of.

Mr. EDGAR. That is a phase of the result, and that ought to interest American Senators.

Senator SIMMONS. I am simply asking you a question for information.

Mr. EDGAR. I see.

Senator SIMMONS. I understood you to say a little while ago that you want this high rate of protection because of the great difference in the freight rates by rail in this country and by water from Great Britain.

Mr. EDGAR. It is largely that; but all the reasons in detail, Senator—

Senator SIMMONS. I am only going to ask you questions about the freight-rate business.

Mr. EDGAR. I am glad to answer any questions that I can answer.

Senator SIMMONS. I recognize that you stated that that was not the only element that entered into it, but that was one of the important elements—the difference in the freight rates?

Mr. EDGAR. That is one of the large items. Of course, we emphasized that because it was a large item.

Senator SIMMONS. What I wish to ask you is this: You are asking this committee to make a rate in a permanent tariff?

Mr. EDGAR. Yes.

Senator SIMMONS. We hope very much that we may in the future have very much lower rates in this country than we have now. We all feel that the freight rates are exorbitantly high. On the other hand, right now it is recognized that the water rates, the ocean rates are very low, abnormally low.

Mr. EDGAR. Not any lower than they were prior to the war.

Senator SIMMONS. They are considered very low for this day.

Mr. EDGAR. Yes.

Senator SIMMONS. We have not got back yet to the prewar level prices.

Mr. EDGAR. Either in labor or product.

Senator SIMMONS. But it seems very low for these times. It is hoped, especially by those who are interested in the American merchant marine——

Mr. EDGAR. You mean the Shipping Board?

Senator SIMMONS. Yes. It is hoped that the ocean rate will go up and that the rail rates will come down. If we fix a rate of duty here based upon these freight differentials and embody it in a permanent tariff, and these differentials are changed in the course of a short time, that rate would probably be an unfair rate, would it not?

Mr. EDGAR. I would reply to the Senator that during the last 30 years I have never seen the time when British goods were not landed in Boston as ballast. I used to be in the fire-brick and architectural terra-cotta manufacturing business. They would land fire brick in Boston without any freight except the absolute cost of putting it in and taking it out. That has always been the case. There are so many more goods going from this country over there, as a rule, than there are coming from there here that they are always glad to get, at least so far as my experience goes—and I have been at it for 50 years—to get anything they can as return freight. They will take that at any price for the sake of dumping it on our markets.

Senator SIMMONS. Do you mean to tell the committee now that this product is brought in from England as ballast to-day?

Mr. EDGAR. We call it that.

Senator SIMMONS. It does not interest us so much to know what has been done in the far distant past as what is being done now.

Mr. EDGAR. I will leave it to the gentlemen of the committee to draw their own inferences as to whether 10 shillings a ton is a cheap rate. At one time in my life I had the good fortune to be collector of customs, and I had considerable experience. I happened to be one of the employees that our late President, Grover Cleveland, removed because of offensive partisanship. But that did not hinder me from watching the particular features that apply to those things. The fact that the freight rate now from our mines to points of consumption is around \$9 and that the English freight rate is 10 shillings seems to me to be——

Senator SIMMONS. What was your freight rate before the war?

Mr. EDGAR. I have no data before me, but you can get that. I think you will have lots of figures as to that.

Senator SIMMONS. I think the committee would like very much to have it. As one member of the committee I would like to know what your freight rate was before the war. If we are going to fix this duty upon the basis of protecting you against the difference in the freight rates on your product and those of your competitor I would like to know what the freight rate was in normal times in this country.

Mr. EDGAR. You will find in the importers' statement in the reports of the House hearings that it was stated that English clay sold for \$15 and ours sold for \$9 or \$10. They neglected to state that our \$9 or \$10 rate was the rate f. o. b. and theirs was the rate delivered at the port of entry. While their statement was correct, it was misleading.

Senator SMOOT. Is that all?

Mr. EDGAR. That is all, sir.

Senator SIMMONS. Will you furnish the committee with the domestic freight rate prior to the war?

Mr. EDGAR. I will endeavor to do so, sir.

Senator SIMMONS. Your books ought to show it.

Mr. EDGAR. If it is possible to obtain it, I will be glad to give the committee that information. I would state for the information of the committee that with reference to that particular class of goods that I am especially interested in a protective tariff on, namely, clay for paper purposes, I was not engaged in producing that particular grade of clay until 1909. Consequently, I only had a few years' experience in that line of business prior to the war. I have been engaged in pottery clays for 35 or 40 years. However, I will say to the Senator that I will go to some people that I think are able to furnish me with that information, and I will be very glad to write to the committee and send any information that I can obtain.

Senator SIMMONS. Thank you, sir.

BRIEF OF MILTON A. EDGAR, REPRESENTING THE AMERICAN CLAY PRODUCERS ASSOCIATION.

To give a brief idea of the situation affecting the American china clay or kaolin miner, we wish to point out that about 250,000 tons of 2,000 pounds of domestic clay is consumed annually in normal times, against 300,000 tons of English clay. Of the 250,000 tons of domestic clay consumed, about 180,000 tons are produced in the South, the remaining 50,000 tons in Pennsylvania. The chief clay-producing States in the South are North and South Carolina, Georgia, and Florida.

The market for this china clay or kaolin lies almost entirely in the North and West. The paper mills take about two-thirds of it. The remainder goes to potteries and small users, such as paint, etc.

The problem confronting the American clay producer, therefore, is transportation, the long intervening distance between the mines and the consumer, particularly the chief customer, the paper mills, who locate themselves as near as possible to the spruce forests of the far North.

WHY DOMESTIC CLAY MINERS MUST BE PROTECTED.

Since 1914 the railroad rates on domestic clay have increased 25 per cent while the railroads were under Government supervision and 33½ per cent more since August 1920. Our cost of production, such as coal, labor, etc., has increased accordingly.

The total freight increase has been 58½ per cent. Some of our best former customers would have to pay a freight in excess of \$9 a ton to-day. Needless to say, they are not doing it. Why? Because the ocean freight on English clay, always a half-price rate, is now lower than it was in 1912. It is now 10 shillings per long ton of 2,000 pounds, which, at the rate of exchange August 18, 1921, amounts to \$1.82 per long ton. In 1912 the ocean rate from England on clay was 8 to 9 shillings (\$2 to \$2.25) per long ton. To-day it is \$1.82 per long ton.

The English mining costs have probably advanced in a similar ratio to our own, though they always have been lower.

But with this tremendous advance in domestic freight rates on clay and the fact that the freight rates below prewar basis, the American clay miner is facing utter and absolute ruin. Sixty per cent of the domestic clay business normally lies in the North Atlantic States, not far from the coast. We can not pay a \$6.18 freight per ton to Maryland, a \$9 freight-ton to New England, or an \$11 freight rate to northern New York, while English clay comes to our ports for \$1.82 per long ton, or \$1.62 a short ton, the freight is figured and our clay sold.

On top of all this, our English friends sell America \$1 worth of clay for 75 cents. You might call it 25 per cent off for cash. Their exchange is 25 per cent lower than normal. (On August 18, 1921, it was \$3.64½). Their clay is all sold f. o. b. England.

Gentlemen, in petitioning the House of Representatives for a \$6 tariff, an advance of \$4.75 over the present tariff, we asked only for an even break on transportation and did not take into consideration the 25 per cent difference in exchange, but as

on account of our 58½ per cent advance in freight rates. Since then ocean freight on English clay has declined 50 per cent, so our case is worse than it was last April by far.

We are told our freight will be reduced, but it is ridiculous to expect it to go back to prewar basis when the railroads are broke and their employees have had numerous raises in wages, and wages can be reduced but little and allow the man to live.

An average per ton reduction of \$1 to \$1.50 on clay freight is more than we can expect, but we will accept the promise in good faith and ask you for a tariff of \$5 per ton if possible; \$4.50 is the least we could get along on, even if transportation is reduced. We would take this tariff with the firm belief that our Congress will shortly pass some legislation to equalize the rate of exchange between our country and foreign nations. The great quantities of foreign goods coming in now at prices 10 per cent below our cost is slowly but surely bringing on one of the most disastrous crises we have ever known. We have an economic situation never before known in the history of the world.

CONCLUSION.

We have stated the situation exactly as it exists. The English representatives will tell you the paper mills and potteries have to have English clay. It is true we do not produce a coating clay for surfacing paper equal to the English. We can not afford to bleach our clays. We have to ship them with as little preparation as possible to meet foreign competition in price and as filler clays for paper they do meet competition. Almost as much American clay is in use in the potteries as English. Our 250,000 tons production of china clay speaks for itself.

They will also tell you we are limiting our fight to the section east of Pittsburgh and Buffalo. We are, but in so doing we are fighting for 60 per cent of our normal business which has been taken from us. We can compete in the Middle West; yes, 513 paper mills out of a total of 818 in the United States lie in the North Atlantic States, including the largest users of clay. Many paper mills, of course, use little or no clay, but the proportion is very nearly correct in the totals just mentioned.

They have presented as evidence a few letters from the comparatively few mills that use only English clay or are prejudiced in favor of it. But they are very few, when compared with the many mills using all domestic clay or a mixture of both.

We respectfully submit, the paper mills and potteries are asking for protection for themselves, but a few of them would rather see 60 per cent of our clay companies ruined than have to pay a little more for their clay. (Sixty per cent of our normal business is gone even if times were normal. We are not considering the present depression, but a permanent tariff bill.)

Please refer to pages 514 to 518 of the Hearings on General Tariff Revision before the Ways and Means Committee, Part I, Schedule B. It gives a full statement of conditions in April. This supplement tells you how much worse conditions are now than then. But chiefly let us point out that the tariff of \$4.50 or \$5 asked for will mean added cost to the potter of less than 1 per cent. In paper the added cost will be measured in hundred thousandths of a cent a pound. (See p. 516, par. 8 of schedule mentioned above.)

If you allow us to be driven out of business (one of our best mines failed a short time ago; others are near it), don't you suppose the English, freed of competition, could raise prices? Their past performances would certainly indicate it.

We might even mention that they are filling many mills in this country with clay, to be paid for when used, and with it a guarantee against advance or decline in price. Gentlemen, we have fought the organized competition you see here to-day until we are almost, not quite, divided with them the clay tonnage of this country, where they once had it all. The Ways and Means Committee spelled ruin for us when they lowered us only \$2.50 per ton duty with which to combat foreign clay at prewar prices, with our costs in transportation alone advanced 58½ per cent.

Our future rests in your hands. We have asked as little as possible, too little for me, perhaps. But every American clay producer stands ready to swear that the statements of fact are true to the best of his knowledge and belief.

FLUORSPAR.

[Paragraph 207.]

STATEMENT OF A. A. NORTEN, HOPKINSVILLE, KY., REPRESENTING THE FLUORSPAR PRODUCERS OF KENTUCKY AND ILLINOIS.

Senator SMOOT. Will you kindly state for the record your name and address and whom you represent?

Mr. NORTHEN. A. A. Northen, Hopkinsville, Ky. I represent the producers of fluorspar in Kentucky and Illinois.

Senator SMOOT. Proceed, then.

Mr. NORTHEN. Fluorspar is a mineral used largely as a flux in the manufacture of open-hearth steel.

Senator SMOOT. Have you a brief?

Mr. NORTHEN. We have a brief, which we will file with the secretary, but there are just a few points with reference to the general situation that I desire to bring to the attention of the committee.

Senator SMOOT. What are you asking for, Mr. Northen?

Mr. NORTHEN. We are asking for a tariff of \$10 per ton.

Senator SMOOT. Under the Underwood bill it was \$1.50 and under the Payne-Aldrich bill it was \$3, and now you want \$10?

Mr. NORTHEN. Yes.

Senator WATSON. You are interested in fluorspar alone?

Mr. NORTHEN. Yes, sir. In order to understand the conditions that surround our industry, it is necessary to go into the conditions for several years prior to the war.

Senator WALSH. Do you know how much of the product that is consumed is produced in America?

Mr. NORTHEN. The consumption of fluorspar has been greatly increased in the last few years, especially since the war began.

Senator WALSH. How much is consumed in America?

Senator SMOOT. America is the largest producer of fluorspar in the world.

Mr. NORTHEN. Yes, sir; it is.

Senator WALSH. Can you give us the figures to save time, Senator Smoot?

Senator SMOOT. If he has them, he can state them.

Mr. NORTHEN. The domestic production in 1914 was 95,000 tons. It was greatly increased during the war. In 1918 it was 263,000 tons.

Senator WALSH. What was the consumption in 1914?

Mr. NORTHEN. That simply shows the sales of domestic spar in 1914.

Senator WALSH. How much was imported?

Senator SMOOT. Ten thousand two hundred and six tons were imported in 1914. Do you know how much was exported, Mr. Northen?

Mr. NORTHEN. Just a very small amount; in fact, a very inconsiderable amount.

Senator WATSON. The imports in 1910 were 42,000 short tons. In 1914 10,000 and in 1918 12,000.

Mr. NORTHEN. You can understand that shipping conditions at the general war situation would cut down the imports during the years in which the war was in progress.

Senator SIMMONS. What were the imports last year?

Mr. NORTHEN. Last year the imports were approximately 24,000 tons.

Senator SIMMONS. What was the production last year?

Mr. NORTHEN. I have not the production figures for 1920.

Senator WALSH. That is almost a basic necessity; to know from these witnesses the production and consumption.

Senator SIMMONS. What is the nearest year to 1920 for which you have the figures?

Mr. NORTHEN. We have the figures for 1919. In 1919 it was 18,290 tons.

Senator McLEAN. Have you stated that correctly?

Mr. NORTHEN. That is the way I have it here for the production of 1919. Of course, there is no way of determining the exact production of domestic spar, but there are no considerable stocks carried at the mines, and the figures here given represent actual shipments.

Senator WATSON. The 1917 production, according to the Tariff Commission, was 218,000 tons. That is the latest information.

Senator SMOOT. And we imported 12,000 tons.

Senator SIMMONS. What were the imports for 1918?

Mr. NORTHEN. In 1918 the imports were 12,572 tons. Fluorspar is an absolutely essential element in the manufacture of open-hearth steel, and during the war, on account of the fact that open-hearth steel was in greater demand and was, in fact, specified almost altogether on Government contracts, the great majority of the furnaces were converted, as I understand it, from the Bessemer type to the open-hearth type. That is one of the reasons for the great increase in the consumption of fluorspar.

Originally in the Kentucky field the deposits were surface deposits requiring no mining machinery and no refining machinery; and it was a very cheap process; in fact, it was only a matter of getting out this material from the pockets on the surface and running it through the ordinary log washer.

Senator WATSON. Where does the imported product come from, and why do you have to have such a great increase to protect it?

Mr. NORTHEN. It comes largely from the lead dumps in England; and the process is simply that of picking it from those dumps. There is no mining cost; there is no water hazard; there is no mining machinery to take care of; and there is no development work to be done.

Senator WATSON. Is fluorspar found independently of lead?

Mr. NORTHEN. It is to some extent, but usually it is found in connection with lead; that is to say, in some of our deposits we have a preponderance of lead, while in others there is only a small percentage of lead.

Senator WATSON. Where is it found mostly in the United States?

Mr. NORTHEN. The largest fields are the Illinois and Kentucky fields. They represent, approximately, 80 per cent of the domestic production. In those fields, as I stated previously, in years past it was not a mining proposition; it was simply a matter of getting this material out of the surface pockets and running it through the ordinary log washer. That was the only preparation needed.

During the war these deposits were depleted because of the fact that the Government recognized a serious situation with reference to fluorspar, and at the instance of the Government the producers in those fields undertook to increase to the limit the production of fluorspar. The result is now that these surface deposits are exhausted. It is a deep mining proposition, involving extensive work in the way of development, sinking shafts and driving levels; and the treacherous nature of the fluorspar deposits makes it expensive from the standpoint of production.

Senator SIMMONS. What is the extent of our deposits in this country? How long will they last if you produce to the full limit of our consumptive capacity?

Mr. NORTHEN. So far as the deposit of fluorspar—that is, developed from a mining standpoint, blocked out, you might say—is concerned there is no considerable tonnage in the United States, and the fact that this material occurs in lenticular form as a deposit makes it very difficult to block out. You will understand that these pockets are in this shape [indicating], and the fluorspar occurs in faulted veins where the displacement is sometimes 1,200 feet.

Senator SIMMONS. But you said you found it in two States and only two States?

Mr. NORTHEN. No, sir; I said that the majority of the production came from Kentucky and Illinois. It is found in other States.

Senator SIMMONS. Then you spoke of one mine that was exhausted during the war. I wondered whether we had an unlimited supply of this material here in this country such as would supply the domestic demand in the future.

Mr. NORTHEN. That can only be determined, Senator, by an elaborate process of development work.

Senator SIMMONS. I thought we had a bureau that was making estimates on such things.

Mr. NORTHEN. I was about to explain just a minute ago that you can not determine as to a fluorspar deposit by the ordinary method of churn or diamond drilling. You have to go at it with the idea of doing your development work in order to determine what available tonnage you have. For instance, since you have these deposits in lenticular form you will find them pinching out either perpendicularly or horizontally. You may sink your shaft and in driving in the fault you may drive into a considerable pocket of fluorspar; but driving along in that fault possibly it will pinch out and then you may drive for any distance, the entire length of the drift representing dead work. We have driven levels as much as 200 feet in length without a pound of production.

Senator SIMMONS. Well, you have answered my question as definitely as you can.

Senator WALSH. What does it sell for per ton?

Mr. NORTHEN. The price during the war was from \$25 to \$45 per ton.

Senator WALSH. What does it sell for now?

Mr. NORTHEN. The price is \$20 per ton on the domestic production now.

Senator WALSH. You want a tax of \$10 on that?

Mr. NORTHEN. And the price on the imported material is, approximately, \$10 a ton.

Senator WATSON. Is there any substitute for it in the manufacture of open-hearth steel?

Mr. NORTHEN. There is no known substitute for it in the manufacture of open-hearth steel.

Senator SIMMONS. What was the price before the war?

Mr. NORTHEN. The price before the war was from \$6 to \$7 a ton.

Senator SIMMONS. And it is \$20 a ton now?

Mr. NORTHEN. Yes, sir. It has been as high as \$45 per ton.

Senator WATSON. You say it is the only substance that can be used for the particular purpose for which it is used?

Mr. NORTHEN. In the manufacture of open-hearth steel there is no known substitute.

Senator WATSON. Does the consumption of it increase or remain out steady?

Mr. NORTHEN. Of course that would depend upon the volume of the steel business, but that would be affected by the fact that the great majority of the furnaces have been converted from the Bessemer type to the open-hearth type. The tendency in the last few years has been toward greatly increased consumption.

I wish to file with this brief that I present a copy of a letter addressed to the chairman of this committee by Mr. Benedict Crowell, president of the Rosiclare Lead & Fluorspar Mines, of Rosiclare, Ill. I understand that my time is up. If there are any questions I will be glad to answer them.

The CHAIRMAN. We will give very careful consideration to your statement.

DEF OF A. A. NORTHEN, HOPKINSVILLE, KY., REPRESENTING THE FLUORSPAR PRODUCERS OF KENTUCKY AND ILLINOIS.

Fluorspar is a fluxing material used in the manufacture of open-hearth steel. It is an absolutely essential element, nothing having been found that will take its place. As a result of its use the metal is made to flow more freely, throwing off the impurities of the iron and reducing the silica and sulphur content.

The use of fluorspar has been greatly increased as the result of the conversion of a great majority of Bessemer-type furnaces to the open-hearth type. The open-hearth type prior to the war represented about 35 per cent of the total furnace capacity, while since the war the open-hearth type furnaces represent over 80 per cent of the total furnace capacity.

As a result of the use of fluorspar greater furnace capacity is secured, a cheaper metal charge is made possible, and a superior quality of steel is obtained.

Fluorspar is also used as a flux in iron blast furnaces, iron foundries, and gold, silver, copper, and lead smelters; in the manufacture of glass, of enameled and sanitary ware, and of hydrofluoric acid; in the electrolytic refining of antimony and lead; in the production of aluminum; as a bond for constituents of emery wheels; for carbon electrodes; in the extraction of potash from feldspar; and in the recovery of potash in the manufacture of Portland cement.

Fluorspar deposits are of an uncertain nature, being what is known as lenticular in form; thus making it impossible to determine by the ordinary methods, such as core and diamond drilling, just what is the extent of any particular deposit. It is only by an elaborate and costly system of shaft sinking and level driving that a definite estimate of the magnitude of a deposit may be determined. In contrast with coal, with its relatively horizontal veins; or limestone, with its massive strata, with their consequent cheap mining, fluorspar is generally found in perpendicular faulted fissures. The varying width of the veins and the continuing increase in depth of workings rapidly increase the cost. The deposit may change in a short distance from a width of 25 feet to a complete pinch, and pinches may continue for hundreds of feet, requiring much expensive dead work.

During the early development of the fluorspar mining industry a great majority of operations were surface operations, the fluorspar being removed from lenses or pockets outcropping on the surface, and the only process of refinement was that of running the crude ore through a log washer. At one time in the Kentucky field there were many of these surface deposits which could be mined at a very low cost.

In the spring of 1917 the mining of fluorspar was greatly stimulated by prices of from \$5 to \$45 per ton., f. o. b. shipping point. The net result of this period of activity has been the elimination by exhaustion of all shallow deposits of fluorspar, the depletion of the developed portions of the dependable mines, and the demonstration of the fact that future production in Kentucky will depend upon extensive exploration and development and mining at greater depths, which necessitate higher class labor and great expenditures for power plants, concentrating mills, and deep-mining equipment. The uses of fluorspar are such that any import duty that may be placed upon it will have no adverse effect upon any of the industries using this product. For example, only 5 to 10 pounds of fluorspar are used to a ton of finished steel.

If the present tariff is not increased sufficiently to make it possible for the present fluorspar producers of this country to continue their operations, the supply will necessarily come from abroad, and when the domestic producers in the United States are

shut down the foreign exporters will get a higher price from the steel and other manufacturers than is now being charged them for the domestic product.

A sufficient tariff at this time means the continuation of this industry; a tariff which does not protect means utter demoralization.

We feel confident that the steel industry and other users of this country are interested in securing a definite supply of this essential material. These industries are justified as well as the fluorspar industry.

The national security requires an adequate domestic supply of fluorspar. The lessons learned during the recent war will not be quickly forgotten. The United States will never again be satisfied to rely upon any foreign country for a supply of an essential raw material. After this country entered the late war early in 1917 a survey was made to determine the extent to which the United States must rely on foreign sources for war essentials, and attention was quickly directed to fluorspar. The matter was taken up by the War Department and the Bureau of Mines, and strong pressure was brought upon the domestic producers to increase production in an effort to meet the country's needs. By placing in operation practically every known deposit in the United States the producers during 1917 and 1918 were just able to meet the demands of the steel companies. This was done in many cases at the expense of other production. Fluorspar was finally included in the so-called administration minerals bills passed by Congress October 5, 1918, the title to which provided as follows:

"To provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of those ores, metals and minerals which have formerly been largely imported or of which there is or may be an inadequate supply."

That the committee may have before them some comparative figures of the cost of production, we herewith submit the following:

The cost of production, at the mines, in Kentucky and Illinois during the year 1921 was \$20.25 per ton of 2,000 pounds.

The selling price at the mines in Canada, not the cost, 35 miles beyond the boundary of the United States, as furnished by the United States Government reports for the period January-June, inclusive, 1921, was \$9.80 per long ton, or \$8.75 per short ton.

In England the cost of production at the mines during the same period averaged approximately \$2.80 per ton, United States currency.

There can be no dispute that the amount of tariff allowed by the Ways and Means Committee of the House of Representatives, namely, \$5 per ton for the first year and \$4 thereafter, will in no sense afford such protection as will enable this industry to continue in successful operation.

At the time the original petition was filed with the Ways and Means Committee the House imported fluorspar was being delivered in New York, duty paid, at approximately \$16 per ton, and at that time it seemed that a duty of \$5 per ton would have afforded reasonable protection.

The radical decline in the price on the imported material as shown in the figures given here is ample warrant for the filing of this petition for an increased tariff which will sufficiently protect the industry and enable it to go forward and produce.

This tariff should not be less than the difference between the cost of production of fluorspar at the mines in this country and the cost of the spar landed from foreign countries without duty paid, which cost, as evidenced by the data secured from the United States Government records, is approximately \$10.50 per ton during the first six months of 1921.

The cost of this foreign spar, \$10.50, includes cost of production, transportation, and profit to the foreign producer, as compared with the average cost of \$20.25 in this country, without profit to the producer.

Based on the data which we have set forth, it is perfectly obvious that the possible tariff that will be adequate to protect this industry is \$10 per ton of 2,000 pounds.

To summarize:

1. Fluorspar is absolutely essential in the manufacture of open-hearth steel. There is no known substitute. It is also used in the manufacture of hydrofluoric acid and in the manufacture of certain kinds of glass.

2. The average amount of fluorspar consumed in the steel industry is less than 10 pounds per ton of finished steel.

3. The national security requires adequate domestic fluorspar production. This was demonstrated during the recent war, when the possibility of a domestic shortage created considerable concern. Such a shortage would have decidedly crippled the war efficiency of this country. Fluorspar was finally included under the "administration minerals bill," which was passed "to provide for national security and defense by encouraging the production of minerals which had formerly been largely imported or of which there is or may be an inadequate supply."

4. On account of the demands made upon existing mines during the war, production in the United States has now become a costly deep-mining, hazardous industry, the present average cost of production, not including any profit, being \$20.25 per ton of 2,000 pounds.

5. The greatest known supply of cheap fluorspar is in England, where most of it is not mined, but is hand-picked "at a low cost from tailings of lead mines and from a gob in abandoned mines, and is shipped to this country as "ballast at a very low freight rate." The producing cost of fluorspar in England is approximately \$2.80 per ton, and with existing ocean freight rates it is now offered in large quantities at Atlantic ports at a price of approximately \$10.50 per short ton after payment of the present duty of \$1.50 per ton.

6. This condition justifies a tariff of \$10 per ton of 2,000 pounds as a minimum. Unless this protection is afforded, the fluorspar industry as such will cease to exist in the United States, nearly all operations will be abandoned, and there will be no possible opportunity for exploration for or discovery of new deposits. In that event the great steel mills of the United States will be forced to depend for their supply of an essential material upon a foreign source, uncertain as to extent and subject to complete interruption in case the channels of commerce should be again disturbed.

LETTER OF BENEDICT CROWELL, PRESIDENT OF THE ROSICLARE LEAD & FLUORSPAR MINES.

ROSICLARE, ILL., June 30, 1921.

HON. BOIES PENROSE,

Chairman Finance Committee of the Senate.

MY DEAR SENATOR: This company has for many years been the largest producer of fluorspar in the United States.

When in January, 1921, the producers of fluorspar presented a memorial to the Ways and Means Committee of the House of Representatives asking for a tariff of \$5 to \$6.50 per net ton of 2,000 pounds on fluorspar, all of the important mines in the United States were in operation. To-day all mines are closed down.

The price of gravel fluorspar in the United States to-day is about \$20 per net ton from the mines. The cost of fluorspar for the year 1920, based on sworn figures of the 17 largest producers of Kentucky and Illinois, was as follows:

Total tons produced.....	141,393
Total cost.....	\$2,864,442.88
Average cost per ton.....	\$20.25

Our principal foreign competition comes from England. The writer has just returned from England after having made a careful examination of the fluorspar industry in that country. The average cost of putting gravel fluorspar on the cars at the mines (in England) is now about \$2.80 per ton United States currency, as compared with our cost of \$20.25 per ton. English fluorspar is now being delivered in our eastern seaports, duty paid, at a cost of about \$12 per ton.

It is therefore perfectly apparent that the mines in America will stay closed down unless this differential is corrected by a duty. In my opinion, the duty necessary to accomplish this is approximately the difference between these two figures.

In addition to the above, I would invite your attention to the fact that English fluorspar mines are located less than 100 miles from ocean transportation, while American mines have a long and expensive rail haul. Furthermore, English producers have the advantage of shipping their fluorspar as ballast, taking the lowest possible ocean freight rate.

The two elements to be taken into consideration are the lower cost of production of the English fluorspar and the lower cost of transportation, which, added, make a differential to-day against the American fluorspar of between \$8 and \$9 per net ton. There is no truth in the rumor that the English sources of supply are approaching exhaustion.

I, therefore, representing the principal fluorspar producers of the United States, appeal to your committee for relief from this disastrous situation.

Very truly, yours,

BENEDICT CROWELL, *President.*

MICA.

[Paragraph 208.]

STATEMENT OF CHARLES P. STORRS, REPRESENTING THE STORRS MICA CO., OWEGO, N. Y.

The CHAIRMAN. Where do you reside, Mr. Storrs?

Mr. STORRS. Owego, N. Y. I represent the Storrs Mica Co., manufacturers of mica chimneys and importers of mica.

The CHAIRMAN. Are you in that business?

Mr. STORRS. Yes, sir. I am vice president of the company.

The CHAIRMAN. What is it that you want with reference to the bill?

Mr. STORRS. I want to harmonize the different views, as far as possible, to avoid wasting the time of the committee.

Senator WATSON. What paragraph of the bill?

Mr. STORRS. Paragraph 208. We endeavored to get together on the suggestion of the chairman, and have one representative speaker for the whole industry, but we were unable to agree on rates that were satisfactory to all of us.

Senator WATSON. If you gentlemen can not agree, in the business how do you expect us to agree?

Mr. STORRS. Well, sir, we desire to submit it to you and let you decide what is best for us. We will tell you the facts.

Aside from my own firm, I represent a group of manufacturers who use mica as a raw material and who are opposed to any increase in the duty on their raw material. I have a memorandum here which I would—

Senator SIMMONS. Where is your factory?

Mr. STORRS. Owego, N. Y.

There is one bit of harmony that developed in our endeavor to get together on this matter. All of the interests are agreed that there should be, in all fairness, a wider difference between the rate on the raw material and the manufactured product. That, I think, will be carried out by a paragraph something like this:

Suggested draft of paragraph 208:

208. Mica, unmanufactured, 17 per centum ad valorem; mica splittings, 19 per centum ad valorem; mica, cut or punched, mica plates, built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 34 per centum ad valorem; ground mica, 20 per centum ad valorem.

As to the following clauses: "Mica, unmanufactured, 17 per centum ad valorem; mica splittings, 19 per centum ad valorem." I would say that as I understand the American valuation, a 17 per centum ad valorem on the American valuation would be a little higher than the present 25 per centum ad valorem on the foreign value, and that the 19 per centum on the splittings, on the American valuation, would be a trifle higher than the present 30 per centum, so that the revenue would be a little bit higher, but practically the same.

The next clause would be with reference to the manufactured material—

Mica, cut or punched, mica plates, built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 34 per centum ad valorem.

That would furnish a differential between raw material and the manufactured product.

Senator SMOOT. Under the Payne-Aldrich bill you had 10 cents a pound and 20 per cent ad valorem.

Mr. STORRS. Yes, sir. The manufacturers feel that that would not be sufficient. Most of them are asking for higher than 34 per cent.

Senator SMOOT. You want 34 per cent, you say?

Mr. STORRS. That is my suggestion; yes, sir.

Senator SIMMONS. On the manufactured?

Mr. STORRS. Yes, sir. On the ground mica—no one seems to be very much interested in that—for the sake of simplicity I would suggest leaving off the specific duty and leaving the 20 per cent ad valorem.

Senator SIMMONS. The first is mica, unmanufactured, or rough trimmed only. You suggest striking out 4 cents a pound and 17 per cent ad valorem, and inserting what?

Mr. STORRS. Seventeen per cent ad valorem.

Senator SIMMONS. Striking out the 4 cents a pound?

Mr. STORRS. That is my suggestion; yes, sir.

Senator SMOOT. I thought that was on ground mica.

Mr. STORRS. No, sir; on all three clauses. But the particular point that I wish to make is——

Senator SIMMONS. That is your raw material?

Mr. STORRS. Yes, sir; and the splittings constitute the raw material of the board manufacturers, such as the Mica Insulator Co. It is used very largely in the electrical industry. The splittings are not usable in any way until they are manufactured. They bear at present a rate of 30 per cent on the foreign valuation, and I figure that the 19 per cent would be a little bit higher than that.

Senator SIMMONS. My dear sir, let us take the thing as it runs. The next is mica, cut or trimmed, mica splittings, mica plates, and built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 10 cents per pound.

You want the 10 cents stricken out?

Mr. STORRS. I ask for that; yes, sir.

Senator SIMMONS. For the 17 per cent you want what?

Mr. STORRS. Thirty-four per cent.

Senator SIMMONS. Ground mica, 4 cents per pound and 20 per cent ad valorem. What do you want for that?

Mr. STORRS. I suggest that the specific be stricken out. The 20 per cent is sufficient to cover that.

The CHAIRMAN. Why do you object to these specific duties?

Mr. STORRS. Because they constitute on the raw material an increase over the present duty, which I do not think is fair to the industry. I feel that the 17 per cent ad valorem corresponding to the present rate is a pretty high duty on raw material. A great deal of it has to be imported.

Senator WALSH. How much of it?

Mr. STORRS. Sixty per cent of the consumption.

Senator WALSH. Where is mica mined?

Mr. STORRS. Largely in North Carolina and in New Hampshire, in this country. It is imported largely from British India, Brazil, and the Argentine. The imported mica is required by many manufac-

turers who find it impossible to use the domestic material. We have to import it, and we do not like to have an unnecessary duty added to the imported mica which only gives an increase to the cost of the product and does not, I think, benefit the American producers. I think they are amply protected by this rate suggested.

Senator SIMMONS. I want to ask you why you think you should be entitled to double duty on your manufactured product over that on your raw material.

Mr. STORRS. I simply hit upon that as a compromise. It is very much lower than most of the manufacturers are asking for. They are asking for 60 per cent.

Senator SIMMONS. Of what?

Mr. STORRS. Sixty per cent ad valorem on the manufactured mica.

Senator SIMMONS. They want a differential between the raw material and the manufactured?

Mr. STORRS. Some of them will ask you for 30 per cent on the raw material and 60 per cent on the manufactured article.

Senator SMOOT. Just double the amount?

Mr. STORRS. Yes, sir.

Senator SIMMONS. It is your idea that the duty on the manufactured article ought to be double the duty on the raw material?

Mr. STORRS. It would seem so, yes, sir; to give ample protection.

Senator SIMMONS. I just wanted to get your views.

BRIEF OF CHARLES P. STORRS, REPRESENTING STORRS MICA CO., OWEGO, N. Y.

We respectfully submit for the consideration of the Finance Committee, the following paragraph in place of paragraph 208 of the House bill, as providing fairer and more satisfactory classification and rates of duty applying to mica:

"Par. 208. Mica, unmanufactured, 17 per centum ad valorem; mica splittings, 17 per centum ad valorem; mica, cut or punched, mica plates, built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 20 per centum ad valorem; ground mica, 20 per centum ad valorem."

The above proposed paragraph subdivides mica into four groups, as follows: (A) Unmanufactured mica; (B) Mica splittings; (C) Manufactures of mica, including mica cut to size or punched to a particular form or pattern; (D) Ground mica. These four groups cover the material in all the forms in which it might be imported and will be taken up in order.

(A) UNMANUFACTURED MICA.

This covers knife or shear trimmed mica in irregular form, not capable of use without being subjected to manufacturing process, such as cutting, punching, turning, or otherwise working into usable form. The proposed 17 per cent ad valorem on this class, applied under the American valuation provisions as outlined by the committee at this time, is approximately the equivalent of the present (Underwood tariff) rate of 25 per cent ad valorem on foreign valuation, which applies to mica valued above 15 cents per pound. The quantity of mica valued not above 15 cents per pound imported during the last few years is negligible and the revenue derived therefrom very small. (See U. S. Tariff Commission Survey of Mica, page 20.) The bulk of the unmanufactured mica imported consists of that valued above 15 cents per pound. In 1920 this item was 1,134,021 pounds, valued at \$1,091,709 (averaging \$0.963 per pound), and producing a revenue amounting to \$272,927. (See U. S. Tariff Commission Survey of Mica, page 21.)

Thus, the following table, based on mica of a foreign valuation equal to \$1 per pound, will fairly show the result of our proposed rate of 17 per cent, as compared with the present (Underwood) rate. In determining the American valuation upon unmanufactured mica, the "domestic selling price" method will not apply, as the

stic mica is not freely offered for sale in "knife-trimmed" form as is the imported, it is passed direct from miner to manufacturer in "thumb-trimmed" form, that is, h rough and cracked edges, and therefore not directly comparable in value to responding sizes of imported material. Owing to the great variety of grades differ- only slightly in quality and varying irregularly in price in a widely scattered rket, the second or "import value" method of valuation will be difficult to apply. s therefore likely that as regards unmanufactured mica the "export value" method l be used. It is the last-mentioned method that we follow in making this estimate.

Comparison of our proposed rate (17 per cent) with present rate.

	Underwood tariff, 25 per cent.	First entry under pro- posed 17 per cent on American valuation.	Subsequent entries under pro- posed 17 per cent on American valuation.
sign market value (invoice price), per pound.....	\$1.00	\$1.00	\$1.00
pping and entry charges, 7 per cent.....	.07	.07	.07
ty ad valorem.....	.25	1.2603	1.2623
Total cost landed.....	1.32	1.3303	1.3323
pense and profits 16 per cent.....	.2112	.2128	.2131
American selling price.....	1.5312	1.5431	1.545

17 per cent on previous American selling price, \$1.5312.
17 per cent on previous American selling price, \$1.5431.

The above table shows that our proposed rate would provide a duty only slightly excess of the rate now in effect. The following comparison shows the effect under American valuation of the rate posed for unmanufactured mica by witnesses appearing on behalf of the producers domestic mica, who ask a rate of 30 per cent ad valorem, which appears to us to be reasonable and a totally unwarranted increase if applied to a raw material which mestic miners are quite unable to provide in sufficient quantities of the particular aracteristics and qualities for which the imported material is considered desirable.

	Under- wood tariff, 25 per cent.	First en- try under rate pro- posed for miners, 30 per cent on American valuation.	Subse- quent en- tries under miners' proposed rate, 30 per cent on American valuation.
sign market value (invoice price) per pound.....	\$1.00	\$1.00	\$1.00
pping and entry charges, 7 per cent.....	.07	.07	.07
ty ad valorem.....	.25	1.4594	1.5322
Total cost landed.....	1.32	1.5294	1.6022
penses and profits 16 per cent.....	.2112	.2447	.2564
American selling price.....	1.5312	1.7741	1.8586

30 per cent on previous American selling price, \$1.5312.
30 per cent on previous American selling price, \$1.7741.

Under the producers' proposed rate the duty on unmanufactured mica is more n doubled; in fact the increase they ask in ad valorem rate alone amounts to 113 cent of the present rate. We urgently oppose any increase over the rate proposed by us, 17 per cent ad lorem, as any higher rate would only increase the cost of this raw material to manu- turers who require the imported material and also to the consumers of their products. rported mica is superior for many purposes to the domestic product, and is pre- red by many manufacturers. In fact for certain uses the imported mica is indis-

pensable. This point is set forth in detail in our brief submitted to the Ways and Means Committee (Hearings, Part I, pp. 547 and 548) and corroborated by letters from various manufacturers submitted with such brief (Hearings, Part I, pp. 551-553).

This view is further indorsed by the testimony of Mr. Brereton and Mr. Dorian of the Columbia Graphophone Co., before the Finance Committee on August 22.

The fact that the production of domestic mica takes care of only 40 per cent of the domestic consumption and has averaged about that figure for a number of years is shown on page 17 of the Tariff Information Survey on Mica. We quote from page 2 of this survey: " * * * as the domestic production during the war years 1914-1918, with added inducement, made little increase, it is evident that the domestic product is quite unlikely to supply the home market."

Our request that no higher rate than 17 per cent ad valorem be imposed on manufactured mica is indorsed by 11 other manufacturers, as appears by letter of July 23, 1921, signed by them and submitted to the committee with the written testimony on August 19, 1921.

(B) MICA SPLITTINGS.

This form of mica, which is the raw material used by manufacturers of mica houses or plate, is of great importance to the electrical industry and is produced only in small quantities in this country. As it bears at present a 30 per cent ad valorem rate (on foreign valuation), we suggest that the equivalent rate (19 per cent ad valorem on American valuation) be imposed in the new act. The bulk of the revenue from mica is derived from these two classes, unmanufactured mica and mica splittings.

(C) MANUFACTURES OF MICA.

In spite of the wide divergence of views in the mica industry as to a suitable rate for the raw material, all are agreed that there should be a greater differential between the raw and manufactured products. We believe that to encourage the manufacture of all kinds of mica products within this country an ad valorem rate of 34 per cent would be effective, although other manufacturers are asking for much higher rates on the manufactured material.

(D) GROUND MICA.

We believe that 20 per cent ad valorem on this product would be sufficient to adequately protect this branch of the industry.

LETTER OF PROTEST.

JULY 23, 1921.

FINANCE COMMITTEE,

United States Senate, Washington, D. C.

SIRS: We strongly protest against a rate of duty on unmanufactured mica higher than 17 per cent ad valorem (on American valuation). This rate affords ample protection to the miner of domestic mica. Imported mica has the qualities necessary for certain manufactured articles of great importance. A high rate of duty on mica as a raw material is an unnecessary and unreasonable burden upon many manufacturers who must use it and upon the consumers of their products.

Storrs Mica Co., manufacturers of mica chimneys, Owego, N. Y.; L. F. Benton Co., manufacturers of spark plugs, Vergennes, Vt.; Dubilier Condenser Co. (Inc.), manufacturers of radio condensers, New York City; Elsemann Magneto Corporation, manufacturers of magnetos and ignition apparatus, Brooklyn, N. Y.; New York Mica & Manufacturing Co., manufacturers of spark plugs, Auburn, N. Y.; Pelouze Manufacturing Co., manufacturers of electric devices, Chicago, Ill.; Thresher Manufacturing Co. (Inc.), manufacturers of mica insulation, Brooklyn, N. Y.; Robert K. Preston Mica Co., manufacturers of stove and electric mica, Chicago, Ill.; The Torrington Co. Standard Plant, manufacturers of spark plugs, Torrington, Conn.; American Electric Heater Co., manufacturers electric heating devices, Detroit, Mich.; Lindstrom Smith Co., manufacturers of electric appliances, Chicago, Ill.; American Bosch Magneto Corporation, manufacturers of magnetos and battery ignition, Springfield, Mass.

STATEMENT OF LOUIS McCARTHY, VICE PRESIDENT AND TREASURER OF THE MACALLEN CO., BOSTON, MASS.

Senator SMOOT. What is your occupation?

Mr. McCARTHY. Vice president and treasurer of the Macallen Co.

Senator SMOOT. What do they make?

Mr. McCARTHY. Mica insulation.

Senator SMOOT. What is your view of this question?

Mr. McCARTHY. I represent 15 manufacturers and miners and dealers. The miners consist of the northern group, in New Hampshire. We had a meeting together and we all found that paragraph 108, on mica, in the House bill, was unsatisfactory to all branches of the industry.

Senator WALSH. What are those branches?

Mr. McCARTHY. Miners, manufacturers, and dealers.

Senator WALSH. What is the difference between the manufacturers and dealers?

Mr. McCARTHY. A dealer in mica is a man who does nothing but buy mica and sell it.

Senator WALSH. Does he import it?

Mr. McCARTHY. He may not be an importer. He may be a dealer buying locally.

Senator WALSH. A jobber?

Mr. McCARTHY. Yes, sir.

Senator WALSH. A jobber in the manufactured article?

Mr. McCARTHY. Yes, sir.

Senator WALSH. All three classes are dissatisfied with this provision?

Mr. McCARTHY. All three are dissatisfied with it as drawn up.

Senator SIMMONS. Why are the dealers dissatisfied? Upon what ground are they dissatisfied?

Mr. McCARTHY. Because they do not think it gives them the proper protection. They do not like a specific duty.

Senator SIMMONS. They do not have anything to do with the specific duty. They do have to do with the total rate of duty, whatever it may be, specific or ad valorem. Why should the dealer object? Is he objecting upon the ground that these high duties make mica so high that he can not readily dispose of it in this market?

Mr. McCARTHY. The main objection which the dealers whom I represent have to the House bill is that there is 4 cents per pound of specific duty on mica. If they pay 10 cents a pound for the mica they are paying 40 per cent of its value on 4 cents a pound; but if they pay \$5 a pound for the mica they are only paying 4 cents duty, practically nothing—

Senator SIMMONS. You are talking about the dealer in raw materials, and I am talking about the dealer in the finished product.

Mr. McCARTHY. No, sir; the manufacturer has no protection whatever in this bill, absolutely none. I myself am a manufacturer.

Senator WALSH. You have no protection because there is no differential between the duty on the raw material and on the manufactured article.

Mr. McCARTHY. We have none.

Senator SMOOT. There is 6 cents a pound difference.

Senator WARSON. You mean in the present law?

Senator SMOOT. I mean in the House bill.

Senator SIMMONS. Four cents per pound on the raw material and 10 cents per pound on the finished product?

Mr. McCARTHY. The ad valorem duty is the same.

Senator SIMMONS. That is more than twice.

Senator WATSON (reading from bill). "Ground mica, 4 cents per pound and 20 per centum ad valorem."

Senator WALSH. Explain that to the committee, Mr. McCarthy.

Mr. McCARTHY. Mica splittings constitute at least 80 per cent of all manufactures made from mica, and are subject to a duty of 10 cents per pound, both raw and manufactured, and 17 per centum ad valorem. Mica splittings are in the same clause with manufactured mica.

Senator WALSH. The splittings are what are used in manufacturing?

Mr. McCARTHY. Yes, sir.

Senator WATSON. Are mica splittings a raw material or a manufactured product?

Mr. McCARTHY. A raw material, it has been decided by the customs court.

Senator SIMMONS. Explain to the committee the difference between unmanufactured or rough trimmed mica and mica splittings. I do not understand the difference. You say they are both raw materials.

Mr. McCARTHY. I will have to, if you will allow me, make a little explanation.

Mica has somewhere up to a million laminations to the inch. Some professor said that if anybody did not believe that, he could count them. The fact is that nobody has ever split a splitting of mica but what there would be a thousand laminations left. You might split it up to one-eighth or one-sixteenth of an inch in thickness and no splitting is over one-thousandth part of an inch thick.

Senator SIMMONS. Is your splitting done by machinery?

Mr. McCARTHY. It is done in India by the natives, by hand, just with an ordinary knife.

Senator SIMMONS. I am talking about in this country; I am not talking about India now.

Mr. McCARTHY. It is not produced here. It is simply a physical impossibility, owing to the difference in the rate of wages; and we have no help here who would ever split it right. If you bought American splittings, instead of being 1 mill in thickness it would be almost anything.

Senator SIMMONS. Then you do not buy from the American producers any splittings of mica?

Mr. McCARTHY. No, sir; not to amount to anything; and if the mica produced in the United States were turned into splittings it would not supply 30 per cent of the demand for splittings. There is an enormous amount of splittings consumed in the United States.

Senator SIMMONS. After you buy your rough mica from the American producers, you have to split it?

Mr. McCARTHY. Not for splitting work. We buy our splittings already split. For other purposes we might get an order called for mica one sixty-fourth of an inch thick or half an inch thick and we might have to split it down as it comes.

Senator SIMMONS. If you buy mica from an American producer and the American producers do not split it, then you have to split it for the particular uses which you make of it?

Mr. McCARTHY. No, sir; we can not use it at all, in the built-up mica. It is used for washers.

Senator SIMMONS. You do use American mica, do you not?

Mr. McCARTHY. Yes, sir; but not in splittings.

Senator WATSON. What is American mica used for?

Mr. McCARTHY. It is made into washers and other things.

Senator WATSON. Is there any difference in the American mica and the foreign mica as to the uses to which it can be put?

Mr. McCARTHY. Yes, sir; there is a distinction. There are certain grades of electrical work for which nothing but Canadian mica will answer. They have got to use it. Then, there is other electrical work for which they consider India mica better; and there is some work for which the American mica is suitable.

Senator SMOOT. Do you agree with the former witness, that a 2 per cent ad valorem difference between the "unmanufactured, or rough trimmed only," and the "mica, cut or trimmed, mica splittings, mica plates, and built-up mica" would equalize the items?

Mr. McCARTHY. I do not catch your meaning, Senator.

Senator SMOOT. Have you the bill there?

Mr. McCARTHY. Yes, sir.

Senator SMOOT. Mr. Storrs testified that he wanted to strike out 4 cents per pound and leave 17 per cent on the "unmanufactured, or rough-trimmed only."

Mr. McCARTHY. I can answer that by simply saying that I have been in the mica business for 35 years. I was originally a very large miner. I dealt in it, but I reformed and went into the manufacturing end of it and dropped the other end. I know every end of the mica business, and I can speak unprejudiced, because I am only in the branch of it. I have nothing to do with the raw mica. Every classification that was ever made on mica is simply for mystification. Mica is one item that should have a flat ad valorem duty, and the appraisers at the customhouse should say what it is worth.

Senator SMOOT. What about my question? Do you agree with Mr. Storrs that the 4 cents per pound specific should be stricken out and the 17 per centum ad valorem should remain on mica "unmanufactured, or rough trimmed only"?

Mr. McCARTHY. That is immaterial whether you put it at 17 or 30.

Senator SMOOT. Then do you know whether the miner of mica is satisfied with that proposition?

Mr. McCARTHY. I know they are not. We have had conferences with the miners for the last two days.

Senator SMOOT. What do you want with reference to it?

Mr. McCARTHY. It is stated in my brief, as follows:

Mica valued at not above 15 cents per pound, 6 cents per pound; valued above 15 cents per pound, 30 per cent ad valorem; mica splittings 30 per cent ad valorem; mica plates and built-up mica and all manufactures of mica, or of which mica is the component material of chief value, 60 per cent ad valorem; rough mica, 25 per cent ad valorem.

That is what these 15 men have agreed upon before having any consultation with the miners.

Senator WATSON. What do the miners want?

Mr. McCARTHY. The miners practically agree with us in everything with the exception that they think they ought to have a higher protection on small mica, which they will present in their brief.

Senator WALSH. Under paragraph 208, manufactures of mica, or of which mica is the component material of chief value, bear a duty of 10 cents per pound and 17 per centum ad valorem. Eighty per cent of "all manufactures of mica" are composed largely of mica splittings, are they not?

Mr. McCARTHY. Yes, sir.

Senator WALSH. Mica splittings have a rate imposed of 10 cents per pound and 17 per cent ad valorem. Therefore, you say there is no differential in favor of the manufactured articles over the raw material?

Senator SMOOT. Splittings and built-up mica.

Senator WALSH. That is his raw material.

You say that if there is to be a tariff imposed upon the raw material, you want it to protect you upon the difference in the cost of labor?

Mr. McCARTHY. Yes, sir.

Senator WALSH. What he wants is on splittings, or built-up mica. He is not complaining of "rough-trimmed only."

Mr. McCARTHY. No, sir. The miners are going to appear here.

The CHAIRMAN. How many mica miners are there in the country?

Mr. McCARTHY. There are somewhere in the neighborhood of a hundred signatures to their brief.

The CHAIRMAN. How many mica miners are there?

Mr. McCARTHY. I have not the exact figures. There are probably several thousand engaged in the industry.

Senator SMOOT. In mining and manufacturing?

Mr. McCARTHY. The manufacturers are much larger in number. There are more men engaged in manufacturing.

Senator WALSH. How many manufacturers are on your brief?

Mr. McCARTHY. It is very hard to define what a manufacturer is. I have a half million dollars or more tied up in my manufacturing. Another man might have a punch press and put himself down as a manufacturer.

Senator WALSH. How many join with you in this request?

Mr. McCARTHY. They represent about 85 or 90 per cent of all the mica manufacturers in this country.

Senator WALSH. What is the number on the brief?

Mr. McCARTHY. Fifteen.

Senator SIMMONS. I understood Mr. Storrs to ask for 34 per cent ad valorem on manufactured mica. You want 60 per cent?

Mr. McCARTHY. Sixty per cent is what I thought we could just as well have, owing to the fact of our competition and that Germany is regaining her world markets again.

Senator SIMMONS. Has Germany the world's market in mica?

Mr. McCARTHY. She came very near having it here; and if it had not been for the war we would have had no protection under the Underwood bill. Germany was coming in here and underselling right and left, but the war came on and cut that off.

Senator SIMMONS. Was your only competition in mica before the war with Germany?

Mr. McCARTHY. Oh, yes; we had tremendous competition.

Senator SIMMONS. Did it all come from Germany is the question.

Mr. McCARTHY. No; the Japanese and the Indians. They had no way into it to some extent before the war, but owing to the lack of shipping they could not get the goods over here. Consequently during the war period and up to now they have been sending circulars to everybody in the trade offering stuff away below our price.

Senator SIMMONS. How much mica was imported into this country before the war?

Mr. McCARTHY. They imported perhaps 30 per cent of what was produced in the country.

Senator WATSON. What is meant by built-up mica? Is that all forms of manufactured mica?

Mr. McCARTHY. What is meant by built-up mica is simply this: The films come one-thousandth part of an inch thick. They are put down on a screen and built up to any thickness. They are then put under powerful hydraulic pressure and formed into a plate and those are then cut up into segments and folded into rings or other forms in which it is desired. But natural mica, as it comes from the mine, will not stand pressure. If you press a natural piece as it comes from the mine it will break all to pieces. In this form [indicating] it will stand any pressure you want to put upon it.

Senator WATSON. I understand that you manufacturers are not particular about the amount of the tariff that is put on the raw material if you get a sufficiently high differential.

Mr. McCARTHY. That is it; if we get double the duty on manufactured articles that we get on the raw material.

There is one more remark that I would like to make before leaving. Under our suggestion the Government will get from 30 to 50 per cent more revenue and everybody will be satisfied about it without materially increasing the cost to the consumer.

Senator SMOOT. Your proposition is that on "mica, unmanufactured, or rough trimmed only," you want 6 cents a pound. On mica splittings and built-up mica, 30 per cent ad valorem, and on manufactured mica you want 60 per cent ad valorem?

Mr. McCARTHY. Yes, sir. That is stated in our brief. That was stated before having any consultation with the miners. The miners will present their brief, and I do not hesitate to say that we want the miners to get proper protection.

Senator WALSH. Why do you say that it will not increase the price to the consumer?

Mr. McCARTHY. Because at the present time it is 25 per cent on splittings, and this is only going to be 5 cents more.

Senator WALSH. How much is your duty on the manufactured product to-day?

Mr. McCARTHY. Twenty-five per cent.

Senator WALSH. The same?

Mr. McCARTHY. Yes, sir.

Senator WALSH. There is no differential?

Mr. McCARTHY. No, sir; no differential, and there will be only 5 cents a pound increase.

Senator REED. I understand that there is a duty on the raw material and that you anticipate that would be increased. Therefore you want an increase on the manufactured product. Why do you need the increased duty on the manufactured product?

Mr. McCARTHY. Because we have none for our protection. We have the same duty to-day on manufactured goods and on raw material. We have no protection.

Senator REED. You think you ought to have twice the duty on the manufactured product?

Mr. McCARTHY. Yes, sir.

Senator REED. You have been running along and getting along all right under the present law?

Mr. McCARTHY. Only because the war made conditions such that the foreign competition could not get here. If it had not been for that we would have been out of business.

Senator REED. How were you before the war?

Mr. McCARTHY. I do not know what percentage, but the Germans were coming in here very heavily.

Senator REED. How did you get along before the war?

Mr. McCARTHY. The Underwood tariff did not go into effect until just shortly before the war. Before that I was not in the business in the manufacturing end.

Senator REED. I will not wait to go into that particular question but I want to get at this: This bill proposes a tariff upon the raw material, and you want a duty upon the manufactured product much greater than that on the raw material to make up for that difference. Do you think you have to pay more for your raw material if there is a tariff put upon it?

Mr. McCARTHY. We are paying 25 per cent duty now on the raw material.

Senator REED. But if the tariff on your raw material is increased do you think you will have to pay more for your raw material?

Mr. McCARTHY. Only the difference in what the tariff would be on the raw material.

Senator REED. Do you think the additional tariff on the raw material will increase the price of the raw material that much?

Mr. McCARTHY. It can not help it.

Senator REED. Then, you agree to the proposition that the tariff does increase the price of an article?

Mr. McCARTHY. Well, of course; naturally it does.

Senator REED. Certainly.

Mr. McCARTHY. But we must have revenue.

Senator REED. I am not discussing that. I am just discussing the question that the tariff adds to the price of an article.

Mr. McCARTHY. Yes, sir.

Senator REED. And the consumer has to pay it?

Mr. McCARTHY. Yes, sir.

Senator REED. That is all.

Senator WATSON. The tariff is added to the price of the article until that article is produced in such quantities in this country that the home competition cuts the price down. Is not that true?

Mr. McCARTHY. Certainly.

Senator WATSON. And if you had enough production of raw mica the United States to supply the entire home demand, then the tariff would not make any difference in the cost of the raw material?

Mr. McCARTHY. We are up against a proposition where even the miners will tell you, if you ask them when they come here, that producing films in this country is a physical impossibility. It is out of the question. We have got to get our film from abroad. We base our cost of material naturally on what the films cost us delivered in the factory—duty, cartage, and everything else.

Senator REED. You can not follow that reasoning up to the point Senator Watson suggests, and voluntarily cut the price of this particular article, because you can not get it.

Mr. McCARTHY. I did not catch your question, Senator.

Senator REED. I will not press it.

BRIEF OF THE MANUFACTURERS, MINERS, AND DEALERS IN MICA.

The subscribers to this brief are manufacturers, miners, or dealers in mica. The provision in H. R. 7456 covering our products is found in Schedule 2, paragraph 208, reading:

"PAR. 208. Mica, unmanufactured or rough trimmed only, 4 cents per pound and 17 per cent ad valorem; mica cut or trimmed, mica splittings, mica plates, and built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 10 cents per pound and 17 per cent ad valorem; ground mica, 4 cents per pound and 20 per cent ad valorem."

This provides, among other things, that the duty upon "mica splittings, mica plates, and built-up mica, and all manufactures of mica or of which mica is the component material of chief value," shall be 10 cents per pound and 17 per cent ad valorem. Mica splittings are the raw material from which mica plates and built-up mica are manufactured. The duty as fixed by paragraph 208 does not differentiate between raw material and the products manufactured from such raw material. It does not give protection to the domestic manufacturers, and without such protection it will be difficult or impossible for the industry to survive.

An equal duty upon raw material and upon the manufactured products violates the spirit of the entire tariff. Paragraph 1457 of the bill assesses upon raw and unmanufactured articles not specially provided for a duty of 10 per cent ad valorem, and upon all articles manufactured, in whole or in part, not specially provided for, a duty of 20 per cent ad valorem. The propriety and necessity for a differential in duty upon raw materials and upon manufactured articles made therefrom is clearly recognized therein.

Pig iron, scrap iron, and scrap steel, under paragraph 301, are dutiable at \$5 per ton, whereas manufactures composed wholly or in chief value of iron and steel (par. 393) are dutiable at 35 per cent ad valorem.

In the tariff acts prior to 1913 mica splittings were dutiable as unmanufactured mica, thereby giving the domestic manufacturers a lower duty upon their raw material than was assessed upon their manufactured products. Under the tariff bill of 1913 mica splittings were made dutiable at the same rate as manufactures of mica, but the conditions which have existed during the intervening years have been so abnormal that there was no competition of foreign manufacturers of mica plate or of built-up mica. Under peace conditions the domestic manufacturers of mica plate and of built-up mica can not meet foreign competition unless the principle of differentiating between the raw materials and the manufactured product be observed in paragraph 208.

Believing that the best interest of the Government, from the viewpoint of revenue and simplification of schedule and of the miners, manufacturers, and dealers in mica, can be preserved by a change not only in the rates but in the wording of the paragraph, we petition the Finance Committee to change the present paragraph to read as follows:

"Mica valued at not above 15 cents per pound, 6 cents per pound; valued above 15 cents per pound, 30 per cent ad valorem; mica splittings, 30 per cent ad valorem; mica plates and built-up mica and all manufactures of mica, or of

which mica is the component material of chief value, 60 per cent ad valorem ground mica, 25 per cent ad valorem."

The paragraph as suggested by your petitioners will give more revenue to the Government, more protection to the American manufacturer and miner, than the present paragraph 208 in H. R. 7456.

STATEMENT OF C. W. JEFFERSON, MANAGER OF THE MICA INSULATOR CO., NEW YORK, N. Y.

Senator WALSH. Are you in the same business as the last witness?

Mr. JEFFERSON. Yes, sir.

Senator SMOOT. Have you a brief?

Mr. JEFFERSON. I have some notes here that I would like to read from in regard to mica splittings.

Senator SMOOT. Just mica splittings?

Mr. JEFFERSON. Mica splittings only.

Senator SMOOT. What do you want on them?

Mr. JEFFERSON. We have agreed to ask for a duty of 30 per cent. That is, of course, based on foreign valuation. Nineteen per cent would be a little more than that on American valuation, so far as we can make it.

Senator WALSH. Proceed with your statement.

Mr. JEFFERSON. This brief may be considered supplementary to the one submitted by Mr. Louis McCarthy for the manufacturers, miners, and dealers in mica, one of whom is my company, the Mica Insulator Co.

I might say that the people who signed this brief represent 95 per cent of the manufactures of mica in this country.

I trust that you will allow that I am entitled to say a word about mica splittings, because I have to bear the responsibility of their use back to 1892.

Senator SIMMONS. Do you want the same duty upon manufactured mica that the last witness asked; that is to say, 60 per cent?

Mr. JEFFERSON. Yes, sir.

Senator SIMMONS. In other words, you put 30 per cent on mica splittings, which is a very small part of the mica that is used, for the purpose of getting 60 per cent on all manufactured mica?

Mr. JEFFERSON. The mica splittings is a very large proportion of the mica used.

Senator SIMMONS. It is not all of it, by any means?

Mr. JEFFERSON. It is not quite all.

Senator SIMMONS. You want to double it. Because of the 30 per cent upon that one article, mica splittings, you want to double the duty on all mica.

Mr. JEFFERSON. All manufactures of mica. But that, even, does not give us complete protection against the existing cheap labor which is current over in Europe and also in India at the present time. In India there is a firm which has resources of \$500,000,000 and which

as gone into the manufacture of this mica board. I heard the other day, on very good authority, that this concern was willing to put in their losses for years to get established around the world, so that they could get control of the manufacture of this mica board made from splittings.

We make splittings from these sheets, split mostly from the smaller sizes of sheet mica. These splittings or films are used in the manufacture of what is called mica board. We call it "Micanite," a trade name. Others call it by other trade names, the name indicating by whom the mica board was made. This mica board, with the aid of heat, can be pressed or molded into innumerable shapes and articles demanded by electrical engineering.

Senator SIMMONS. Let me ask you a question. The last witness said that we do not produce mica splittings in this country?

Mr. JEFFERSON. No; we do not.

Senator SIMMONS. If we do not produce mica splittings in this country, why do you want 30 per cent on mica? What is there to protect? That is the key to your whole proposition, to get 30 per cent on mica splittings. You say that there are none produced in this country. Why do you want to put that 30 per cent on?

Mr. JEFFERSON. I will come to that in my paper here very shortly. We do not want it.

Senator SIMMONS. You are asking for it.

Mr. JEFFERSON. That is a concession to the mica miners in this country; that is all.

Senator SIMMONS. You said there were no mica splittings produced in this country.

Mr. JEFFERSON. There are not.

Senator SIMMONS. Then the miners in this country are not likely to ask for it if there is none of it produced in this country.

Mr. JEFFERSON. You can use that as a club to get what you want, and we may have to compromise on 30 per cent.

Senator REED. I do not understand your remark about using it as a club. Who is being clubbed?

Mr. JEFFERSON. All these matters in regard to the tariff are given and take.

Senator REED. Mostly take, I think. I have never seen anybody giving anything.

Mr. JEFFERSON. When we consented to that 30 per cent we were giving—

Senator REED. You gave it to whom?

Mr. JEFFERSON. We gave it for the benefit of the mica miners.

Senator REED. Did you have a consultation?

Mr. JEFFERSON. Yes, sir; we had a consultation with them.

Senator REED. And agreed on how much they were going to get?

Mr. JEFFERSON. We did not end with any agreement. We broke and went on our own hook.

Senator REED. Who represented the mica miners?

Mr. JEFFERSON. Mr. Burleson represented some of the big miners down in North Carolina; Mr. Brown and many others that I do not have in mind.

Senator REED. When you say you had a consultation, you mean that the manufacturers had a conference with these miners and you

tried to come to an agreement as to how much each of you would demand, and you did not quite agree. Nevertheless, when you make this request you are trying to make it so that it will suit both parties.

Mr. JEFFERSON. That is the idea.

Senator REED. You made it high enough so both would be satisfied.

Mr. JEFFERSON. So both would be more or less satisfied, and keep quiet.

Senator REED. That is a good way to compromise.

Senator WATSON. You tried to agree on a tariff on the raw material and a differential on the finished product. You could not agree, so you determined to come in and ask for what you wanted!

Mr. JEFFERSON. Yes, sir.

Senator REED. To ask for what both wanted. Get it right.

Senator WATSON. This gentleman does not pretend to represent the miners.

The CHAIRMAN. The probabilities are that this committee will not agree.

Senator REED. Yes; I think so.

Mr. JEFFERSON. The small sheet mica from which films are split was, before the advent of mica board, thrown away by the miners of mica as waste onto the dumps of refuse about the mines. The consumption of this mica grew rapidly, and the miners soon discovered that their refuse dumps were valuable assets. The use of mica board revived the business of mica mining over the entire world. For a year or so the breaking up or splitting of this small sheet mica was done in this country. The cost of doing so, however, proved to be a heavy drag upon the growth of the industry. It was an operation so tedious and yet requiring such close application to do it well that it was difficult to obtain the necessary number of workers. So steps were taken with the miners of India to split up the mica before sending it over to us, their cheaper and more patient labor being more adaptable than any labor to be found for the work on this side.

Senator LA FOLLETTE. Just what do you mean when you say the steps were taken with the miners of India?

Mr. JEFFERSON. Steps were taken by the Mica Insulator Co. with the mica miners of India, with whom they were in contact, to try to get them to split the mica for us. We sent a representative of our company over there to get that work done.

Senator REED. You wanted that done by the cheapest labor you could get?

Mr. JEFFERSON. Naturally; because we could not get it done here. It would be an absolute physical impossibility to get the quantity of splittings that we needed split in this country. We do split a little bit here. I can show you some pay-roll sheets of our splitting factories up in Canada, where the price is six times as great—that is, the labor price—as the Hindu labor price, and the girls make only \$2.50 and \$3 a week.

Senator WALSH. In Canada?

Mr. JEFFERSON. Yes, sir; the little French Canadian girls. I am ashamed to think that we have on our pay rolls a lot of employees who are earning such a small amount. We can only get mica split in towns where there are no other industries and no other work.

Senator REED. If you did not have this cheap labor in India and they charged in India the same prices that they do in this country, the price would go up to everybody and then you could raise the wages here?

Mr. JEFFERSON. The wages here would have to go up. Splitting mica is done by cheap work, and it would have to be raised fully a dollar a pound. We could not get splitters even at a dollar a pound.

Senator REED. But you could get them at some price.

Mr. JEFFERSON. We can not get the skilled labor here like those patient Hindus.

Senator REED. The point I want to get at is this: There is very cheap and very patient labor in India. There is dearer labor in Canada which could learn to do the work. That is true, is it not?

Mr. JEFFERSON. Yes; but they can not do the work like the Hindus—nothing like them.

Senator REED. They never could learn it as well?

Mr. JEFFERSON. They never could.

Senator REED. So you have got a class of labor in India that is superior to any class you can get in the United States for this work?

Mr. JEFFERSON. For this work.

Senator REED. That labor is not only superior, but it is very cheap and very patient?

Mr. JEFFERSON. Yes, sir.

Senator REED. So you have to employ American labor—and I am embracing Canada in the term "American." You went over to India to arrange to get this very cheap labor. Instead of paying your home labor more wages and letting the public pay the cost of promoting American labor, you went over and arranged for the very cheap labor of India, and you say it is one-fifth of the price of the poorly paid labor in Canada. Is that the situation?

Mr. JEFFERSON. Yes, sir.

Senator REED. You propose still to have this splitting done in India, do you not?

Mr. JEFFERSON. Yes, sir.

Senator REED. You do not believe, then, in the principle of a tariff that represents the difference between the foreign labor and American labor?

Mr. JEFFERSON. I do as a whole; yes.

Senator REED. But not in your case?

Mr. JEFFERSON. Not in regard to splittings, because splittings are not a product of this country and never will be.

Senator REED. What are splittings?

Mr. JEFFERSON. I will show you what splittings are——

Senator REED. Let us start with the raw material that you mine and get out of the earth.

Mr. JEFFERSON. It is all raw material. It can be considered raw material.

Here [exhibiting] is mica as it comes from the mines. It is unequal in thickness. The splitters then take hold of that mica and split it into films.

Senator REED. This raw material that you display here, and which is one-sixteenth of an inch thick, or perhaps one-twentieth of an inch thick——

Mr. JEFFERSON. Yes, sir.

Senator REED. Can be split into many other thin sheets?

Mr. JEFFERSON. Yes, sir.

Senator REED. And when you speak of splitters you mean some body who takes this and divides it into sheets?

Mr. JEFFERSON. Into films.

Senator REED. Makes it into very thin sheets?

Mr. JEFFERSON. Yes, sir.

Senator REED. Then you call those sheets films. I understand the process, but I wanted to get it in the record. I had another matter in mind.

This mica comes out of the ground originally in the same shape in America as it comes out of the ground in India?

Mr. JEFFERSON. Yes, sir.

Senator REED. But when you come to the labor of dividing these very thin sheets or splittings that is done by individuals, is it?

Mr. JEFFERSON. Yes, sir.

Senator REED. And the laborer in India works for about one-fifth of what you pay in Canada?

Mr. JEFFERSON. Yes, sir.

Senator REED. And instead of employing American labor you went over to develop the splitting industry in India?

Mr. JEFFERSON. Yes, sir.

Senator REED. You did that because that labor was so very cheap and very patient?

Mr. JEFFERSON. Yes, sir; and very skillful.

Senator REED. Of course you would not claim that these people over in India are any more skillful, naturally, than your Canadian and French girls?

Mr. JEFFERSON. They are very much more skillful in that particular kind of work.

Senator REED. Then you do not think there ever can be any competition, any real labor competition, between labor in this country and in Canada, of course, on this particular work?

Mr. JEFFERSON. No, sir; no competition at all.

The CHAIRMAN. This witness has exhausted his fifteen minutes.

Senator REED. That is my fault, Mr. Chairman. I want to know about this business. I want to conform to any rule that the committee has.

The CHAIRMAN. There is no rule on the Senator.

Senator REED. I will be as brief as I can.

You want protection against the pauper labor of the world on everything you produce?

Mr. JEFFERSON. You can not call it pauper labor.

Senator REED. It is the cheap labor of the world?

Mr. JEFFERSON. Yes, sir.

Senator REED. You want to go and hire cheap labor whenever it will benefit you?

Mr. JEFFERSON. By using that cheap labor we can give far more and greater employment to the women and girls who are in the

manufacture of this material in this form presented to the American manufacturer. [Indicating.]

Senator REED. On this general principle that by using the cheap labor of other countries we can increase the efficiency of our own plants?

Mr. JEFFERSON. We can.

Senator REED. Then you are a free trader.

Senator WATSON. No; not at all. He wants free trade in raw materials, but not finished products.

Mr. JEFFERSON. That is it.

The quality of splittings we now obtain from India——

Senator SIMMONS. When you go over there and use this cheap labor in India in preparing your raw material which you call splittings, what is the effect upon the kind of raw mica that is produced in this country?

Mr. JEFFERSON. No effect at all.

Senator SIMMONS. Why no effect? Does it not come into competition with it in any way?

Mr. JEFFERSON. No; it does not.

Senator SIMMONS. Now, we have it. It does not come in competition with mica in this country in any way?

Mr. JEFFERSON. No, sir.

Senator SIMMONS. Then the splittings that you bring here are not in competition with anything produced in America?

Mr. JEFFERSON. No, sir.

Senator SIMMONS. Directly or indirectly?

Mr. JEFFERSON. Directly or indirectly.

Senator SIMMONS. And you are proposing to this committee to put a 30 per cent duty on it?

Mr. JEFFERSON. I have not said anything about percentages in my paper. I am not bearing upon that point at all.

Senator WATSON. Who converts the raw material in this country into splittings? You mine mica in this country?

Mr. JEFFERSON. Yes; but it is not converted into splittings at all here.

Senator WATSON. Is it sent over to India and converted into splittings and then shipped back?

Mr. JEFFERSON. Sometimes, but not very much, because the mica obtained in this country does not contain the special peculiarities necessary for making a good quality of this mica board.

Senator McLEAN. Why does not some Yankee invent a splitting machine?

Mr. JEFFERSON. Our company has spent as much as \$10,000 per year in trying to develop splitting machines. We have tried all manner of means. We have a splitting machine that will split mica and split it well, but the cost is prohibitive in comparison with the splitting done in India. There are splitting machines that produce more, but when they produce more the quality is such that we cannot use it.

Senator LA FOLLETTE. The mica in this country could be split here if we had the Hindu labor to do it, could it not?

Mr. JEFFERSON. It could be split here, but the quality of the mica obtained from the mines here is not suitable for our purpose.

Senator SIMMONS. Will you let me ask you what duty you propose on unmanufactured and rough mica, such as is produced in this country?

Mr. JEFFERSON. That is out of my province, sir. I have tried to confine myself entirely to splittings.

Senator SIMMONS. But what I am interested in is whether you are not putting this splittings duty on purposely to get 60 per cent on the finished product of all the mica you produce, whether from the splittings of India or from the mica produced in this country. If you will tell me what duty you propose on the unmanufactured and rough mica, I will then be able to determine in my mind whether you are putting this 30 per cent on for the purpose of prizing up the duty on your finished product.

Senator SMOOT. You agreed on a certain rate?

Mr. JEFFERSON. Yes, sir.

Senator SMOOT. And that rate was 6 cents for mica valued at not above 15 cents a pound; 30 per cent ad valorem; mica splittings. 30 per cent ad valorem; mica plates and built-up mica and all manufactures of mica, 60 per cent ad valorem.

Senator SIMMONS. You want 6 cents a pound?

Mr. JEFFERSON. Six cents specific.

Senator SIMMONS. Equivalent to 40 per cent?

Mr. JEFFERSON. On mica valued at not above 15 cents a pound.

Senator SIMMONS. You are advocating 6 cents a pound on rough mica?

Senator SMOOT. Trimmed.

Senator SIMMONS. I am not talking about trimmed at all.

Mr. JEFFERSON. It is all trimmed.

Senator SIMMONS. Unmanufactured and rough-trimmed mica yes. You are advocating 6 cents a pound on that?

Mr. JEFFERSON. I am not advocating any specific duty, because it is very inequitable.

Senator SIMMONS. What ad valorem duty do you advocate on :

Mr. JEFFERSON. Thirty per cent.

Senator SIMMONS. On the untrimmed?

Mr. JEFFERSON. Yes, sir.

Senator SMOOT. Mica valued above 15 cents a pound.

Senator SIMMONS. That was the other witness.

Senator SMOOT. That is the agreed rate.

Mr. JEFFERSON. The quality of splittings we now obtain from India could not be produced here at any figure, so skillful have the Hindoo workers become—

Senator WATSON. Can you not file your brief?

Mr. JEFFERSON. I have another page, and then you will have the whole story.

This fact has been acknowledged by the mica miners of this country. At a combined meeting of miners and manufacturers a couple of days ago, which I attended, it was so stated. Their remarks at the meeting can be summed up in the statement that they were not interested in mica splittings.

Why, therefore, a heavy duty?

The characteristics of mica vary greatly. Generally speaking, it can not be said that one kind of mica is better than another. It can

is said, however, that one kind of mica is better than another for a particular application. The kind of mica best suited, say, for photograph disks would be classed as a poor mica for making mica board.

Mica board to be of universal use for electrical purposes must be made of mica splittings from mica of low resiliency and extreme softness. It so happens that the mica we obtain from India combines these two features to a greater extent than any mica mined in this country. If mica splittings for making mica board are not in competition with domestic miners—and I maintain they are not—what use can a tariff be except to produce revenue for the Government? The lower the price of mica board, the less use of substitutes could be made. Most of these substitutes are in some form or other of wood pulp. The amount of wood pulp entering into electrical insulations is enormous.

Then, again, if the cost of mica splittings be lowered so that their use could be extended the result would be an improvement in the quality of all kinds of American electrical machinery.

As a general thing insulation mica stands on a pedestal high up above any other, and it is through the rending of sheet mica into films—the films being the foundation of the business—that enables mica to be used economically in the electrical industry. It is our raw material in the same sense as cotton after it is ginned is the raw material in the cotton industry.

Senator REED. What is the total production of mica in the United States, in dollars?

Mr. JEFFERSON. I could not tell you that right off hand.

Senator REED. Let me see if I can find it.

Senator WATSON. It amounted, in 1917, to 1,276,533 pounds of sheet, valued at \$753,874, and 3,429 short tons of scrap, valued at \$52,908. This came from eight States—70 per cent from North Carolina and 23 per cent from New Hampshire.

Senator REED. What is the total consumption of mica in this country?

Mr. JEFFERSON. I can not tell you off hand, Senator.

Senator REED. Senator Watson, can you tell me that?

Senator WATSON. The domestic consumption averaged 72 per cent of all mica. India, the United States, and Canada supply about 98 per cent of the total estimated production of sheet mica. Domestic production in 1906 to 1910 averaged 57 per cent of the total mica and 24 per cent of the sheet mica of the world; 1911 to 1915, 63 per cent of all mica and 19 per cent of the sheet mica. Domestic consumption averaged 72 per cent of all mica for both periods, most of the ground mica used being domestic. The ratio of domestic production to consumption of sheet mica averaged about 44 per cent for both periods.

Senator REED. Then there is about 50 per cent of this mica imported?

Mr. JEFFERSON. Yes, sir.

Senator REED. And the total in this country is how much, Senator Watson?

Senator WATSON. Consumption, you mean?

Senator REED. No; the total produced in this country. I want to get at how much it amounts to.

Senator WATSON. The production for 1917 amounted to 1,276,533 pounds, worth \$753,874.

Senator REED. It would seem, then, that the total consumption under \$2,000,000. I wanted to get that as a basis for a question. About 50 per cent of the raw mica comes into this country from abroad?

Mr. JEFFERSON. In the form of splittings.

Senator REED. What is the name of your business concern?

Mr. JEFFERSON. The Mica Insulator Co.

Senator REED. Where is that located?

Mr. JEFFERSON. The office is in New York and the factory is Schenectady.

Senator REED. Have you any factories in Canada?

Mr. JEFFERSON. We have a factory in Canada for splitting the Canadian mica which we have to use for certain purposes.

Senator REED. How large a concern is this?

Mr. JEFFERSON. When we are busy we employ between four and five hundred hands, skilled workers and mechanics.

Senator REED. How many men are employed in the mica industry in the United States, all told?

Mr. JEFFERSON. I should say, all told, between three and four thousand.

Senator REED. That includes the mica manufacturers who work up into boards and manufacture it?

Mr. JEFFERSON. Yes; who make the finished article for the electrical manufacturers.

Senator REED. Of course, when it is made up, it is of much greater value than \$2,000,000?

Mr. JEFFERSON. Oh, yes.

Senator WATSON. Does 4,000 include all the miners?

Mr. JEFFERSON. Oh, no; it is very hard to say how many mines there are, because mining is done in many cases by farmers who in spare moments dig out a little mica on the side.

Senator REED. Could you approximate the number of people who are engaged in digging the mica?

Mr. JEFFERSON. I could not.

Senator REED. Well, 4,000 or 5,000 is the total. Now, what is the total value of the mica when it is manufactured by these 4,000 people ready for consumption?

Mr. JEFFERSON. The value of the finished article?

Senator REED. Yes.

Mr. JEFFERSON. Probably about \$4,000,000.

Senator REED. What are the wages that you pay these 4,000 people?

Mr. JEFFERSON. The wages, of course, have been on the increase and the girls average about \$20 a week, and the men average \$30, \$35 or \$40 a week.

Senator REED. I was trying to get at the aggregate amount of wages. What proportion is the wages to the total finished product in value?

Mr. JEFFERSON. I should say about one-half.

Senator REED. Do you have any competition from abroad except this Indian competition?

Mr. JEFFERSON. We have competition from the factories in England, and we have competition from the factories in Germany and

from the factories in Switzerland and the factories in Holland, and it is a struggle to hold up our end, and we can only do it by developing improved methods which obliterate a certain amount of our expensive labor.

Senator REED. That is a proper economic proposition.

Mr. JEFFERSON. Yes.

Senator REED. And you were competing before the war. How many years had you been competing?

Mr. JEFFERSON. The competition was just rising to a very serious condition just before the war.

Senator REED. How many years had you been running without any protection on the raw material?

Mr. JEFFERSON. The raw material has been protected here, and that fact has increased our cost and limited our output.

Senator REED. But if you had had the free raw material you could have competed, could you not, in your finished product?

Mr. JEFFERSON. We could have competed better; we would have built up a larger business and been able to manufacture cheaper, and we would have been able to increase our export trade very considerably.

Senator REED. How much capital has your concern?

Mr. JEFFERSON. We started with a small amount of capital, but it has gradually grown.

Senator REED. What is your capital to-day?

Mr. JEFFERSON. The capital to-day of our company is \$125,000.

Senator REED. What were your dividends last year, and your profits?

Mr. JEFFERSON. I can not tell you those figures exactly; I do not know. We have an investment of, say, about \$600,000.

Senator REED. I thought you said \$125,000?

Mr. JEFFERSON. That is the capitalization.

Senator REED. That is the capital stock?

Mr. JEFFERSON. Yes; we have been growing since 1892, and we have gradually grown. The profits we have had we have put into the factory and our machinery, and we have always been hard up for money.

Senator REED. You have been paying dividends all the time?

Mr. JEFFERSON. We paid 12 per cent for several years.

Senator REED. You started with how much capital?

Mr. JEFFERSON. \$125,000.

Senator REED. You have paid 12 per cent on it ever since?

Mr. JEFFERSON. For several years; yes.

Senator REED. You have increased your assets to \$600,000?

Mr. JEFFERSON. Yes.

Senator REED. And you have got a surplus set aside?

Mr. JEFFERSON. No; we have not; that has gone into the increase of manufacturing facilities.

Senator SIMMONS. I understood you to say a little while ago that the competition in manufactured mica from abroad was growing very rapidly just before the war. I find here in the official record that for 1910 of cutter-trimmed mica plates, of built-up mica, and all manufactures, whole or increased value, of mica for that year 168,000 worth; for the year 1911, \$250,000 worth; for the year 1912,

\$101,000 worth; for 1913, 107,000 worth; for 1914, \$22,000 worth. That was a right sharp competition being built up.

Mr. JEFFERSON. Well, we had to meet the various quotations and that sort of thing that were presented by the importers from abroad and quotations that they turned in were exceedingly lower than ours and our sales agents had to get around the country with our customers and convince them that even at the lower price of the imported micaite or board our material was cheaper than the foreign on account of the quality of the goods.

Senator SIMMONS. Have you been able to manage to keep it out?

Mr. JEFFERSON. We managed to a certain extent to keep it out, but the time has come when the foreign manufacturer has equal skill to ourselves in making all of this material.

STATEMENT OF JAMES L. FRAZEE, NEW YORK, N. Y.

Senator SMOOT. Your name is not on the list, but I understand you wish to testify on mica because you are compelled to leave?

Mr. FRAZEE. Yes, sir. It seemed necessary to take up a little of your time on this question, because Mr. McCarthy—

Senator SMOOT. Have you testified before?

Mr. FRAZEE. No, sir. Mr. McCarthy, who presented the brief of the manufacturers—I am one of the signers of that brief—had statement—

Senator WATSON. Are you a manufacturer?

Mr. FRAZEE. Yes, sir; and a miner.

Senator SIMMONS. Where is your plant?

Mr. FRAZEE. I have a plant in New York. I have a little mica house in New Hampshire and one in North Carolina. I am interested as a miner as well as a manufacturer.

The question was asked here yesterday how it happened that we were all so unanimous in asking for 30 per cent ad valorem, and Mr. McCarthy was going to explain that unanimity. There never has been any unanimity among the mica producers and manufacturers before. They have never been able to agree; but when the House passed the bill that is now before you it left the manufacturers and the miners so totally out of any opportunity for protection whatever that they thought they had to agree if they expected to get anything.

The mica industry in this country is only beginning. Although it is an old industry, fifty or sixty years old, it is only beginning to be important.

As the electrical industry grows the mica industry, or the production of mica in this country, will continue to grow if the miners can produce his goods. For that reason the miners and the manufacturers had a number of conferences in which they discussed the differences of opinion between them and what it was necessary to have in order to foster the mining industry and prevent the disaster that we could all of us see would come upon the miners with the tariff as it was proposed. It was for that reason that they got together.

The miners have prepared a brief, and it is signed by 125 active producing miners.

Senator SMOOT. Let me ask you this: Do you agree to 6 cents per pound and 30 per cent and 60 per cent, according to whether it is rough trimmed, built-up, and manufactured?

Mr. FRAZEE. No. That brief, as Mr. McCarthy explained, was prepared before consultation with the miners. In the brief which the miners will file you will find this language, which was prepared by Mr. McCarthy himself, or with his approval, and it is because of this paragraph in the brief that I am before you now, because Mr. McCarthy could not present it:

We have met in consultation all the principal manufacturers of mica in the United States prior to the preparation of this brief and have submitted to them the following paragraph:

We are assured by representatives of all the interests concerned that they urge the adoption of a paragraph similar in general principle except for duties on cheaper grades of mica.

The miners contend at that point that they should have 10 cents per pound on mica valued at up to 30 cents, and in addition to that 30 per cent ad valorem duty.

Senator SMOOT. Thirty cents and 30 per cent?

Mr. FRAZEE. Yes, sir. The necessity for that would be very apparent if you had time to go into the conditions of the industry and the peculiar nature of the mica that is produced in this country, the difficulty of preparation, and the necessity of preparing those cheaper grades of mica so as to put them into the market in the right shape.

Just on that point, here is a sample of North Carolina mica which I trimmed myself last night [producing sample]. There is No. 5, India trimmed [exhibiting sample].

Senator WATSON. Mined in North Carolina?

Mr. FRAZEE. Mined in North Carolina. That is No. 5 India trimmed, slightly spotted. It is worth about 60 cents a pound, or maybe less, in that shape.

Senator SIMMONS. You say it is worth about 60 cents a pound?

Mr. FRAZEE. Something like that; maybe a little less; maybe 50 cents.

Here is a small 4 that is soft and perfectly adapted to splittings, about which we had so much discussion yesterday.

Here is a stained 4 which is soft and perfectly adaptable for insulation and heating.

Here is a clear slightly stained No. 3. This is worth probably \$1 or \$1.25 to \$2.50.

Here is a 4 clear, which is worth \$2.50.

Here is a 3 clear and slightly stained, worth—I am giving the prices of the imported material—\$3.25.

Here is a piece of absolutely clear Government standard No. 2 which is worth \$7.

Here is a piece of No. 1 partly stained which is worth about \$5.

All of those came out of the same piece of mica, the same identical sheet.

When you consider the difficulties with which the miners have to contend in the preparation of that mica you can see why it is that the miners in this country have always had to sell their mica in a rough-sheeted thumb-trimmed shape and sell a sheet of mica that contained all those different grades at one fixed price.

Senator WATSON. The difference in price depends on the stage of the manufacture, does it not?

Mr. FRAZEE. Yes, sir; but with protection on the smaller grades of mica the miner will then be able to prepare his mica in this way and the smaller grades which have heretofore not been worth anything like what the India corresponding grades are, can be put on the market by the American miner and the American miner can supply all we need.

Senator WATSON. The raw material is just as good here as it is anywhere else, is it?

Mr. FRAZEE. Yes, sir. There is not a finer piece of mica produced in the world than that piece right here [indicating]. That is a clear No. 2, fit for making phonograph diaphragms.

There is where the miners are making a contention, and I agree with them. I am a phonograph-diaphragm manufacturer. They contend that they should have a special duty on imported phonograph diaphragms, because phonograph diaphragms are made from a special grade of mica which they produce, but they can not cut that out and sell it and get what it is worth. They have to sell it as a lump.

Senator WALSH. What is that piece you have in your hand?

Mr. FRAZEE. That is a piece I got those other pieces out of, and there is every grade of mica [exhibiting].

Senator WALSH. Gotten out of one piece?

Mr. FRAZEE. Yes, sir.

Senator SIMMONS. Why do they have to sell it in a lump?

Mr. FRAZEE. That is the way the manufacturers and the buyers in North Carolina and New Hampshire have been buying it.

Senator SMOOT. Is it because you do not split it? The miner does not split it?

Mr. FRAZEE. The miner does split it, in a way, and he trims it in a way, just thumb-trimmed. It is for the protection of those smaller sizes, then, instead of having the small sizes go in and only sell his mica on the value of the best as well as the poorest that is in it, all in one piece, and lump it that way, and he will then be able to prepare his mica just as the Indian prepares it, and just as the South American prepares it, and put it on our market——

Senator WATSON. The miner himself does not prepare it up to this stage [indicating]?

Mr. FRAZEE. He never has, except in rare instances.

Senator WATSON. Most of that was done by a process of manufacturing?

Mr. FRAZEE. No, sir; that is done——

Senator WATSON. That is done by the miners?

Mr. FRAZEE. Yes, sir.

Senator WATSON. Splitting?

Mr. FRAZEE. He simply splits it out, sheets it. Here [indicating] is the way it comes from the mine. It has been rough-trimmed. That is just a trimming process.

Senator WALSH. Is that the trimming process which some one described as being done properly only by the Hindus?

Mr. FRAZEE. No, sir; he was speaking of the manufacture of splittings.

Senator WALSH. That comes from this raw mica, does it not?

Mr. FRAZEE. Yes, sir; but that good clear piece——

Senator WATSON. What does the manufacturer do to it if the miner does all that?

Mr. FRAZEE. That is just ready to begin work on.

Senator WATSON. That is to say, the manufacturer does not further split it at all in what you call mica splittings? I thought you said the miner himself reduced it to that stage.

Mr. FRAZEE. The miner himself should reduce it to this stage.

Senator WATSON. He should, but does he do it?

Mr. FRAZEE. In rare instances he has done so; but with the protection which gives him a good price for his small material he will do it in this country; and if he does not, the mica buyers in his section will do it for him, because they can handle it at a profit.

Senator WALSH. It can be done here as well as it has been done in India if you have protection?

Mr. FRAZEE. Yes, sir.

You asked what the preparation was or what further preparation there was that made this worth \$7 a pound. We make diaphragms out of it. We have to split it within a fraction of a thousandth of an inch in thickness. Then it has to be drilled and turned and made to proper size and shape for phonograph diaphragms.

Take mica in this shape [indicating]. That is split into films that vary from two to three thousandths of an inch. These go into making up condensers. Instead of being worth \$2.50 a pound, when we have finished with this and stamped out my condenser films from it I have only got about one pound for two, but I have produced an article out of a \$2.50 mica that I sell for \$9.50. There is where the manufacturing comes in.

STATEMENT OF W. VANCE BROWN, ASHEVILLE, N. C., REPRESENTING AMERICAN MINERS OF MICA.

The CHAIRMAN. Where do you reside, Mr. Brown?

Mr. BROWN. Asheville, N. C. I am in the same group with Mr. Burleson, who has asked me to speak.

The CHAIRMAN. What is your occupation?

Mr. BROWN. I am a manufacturer of raw mica. I am the senior partner in the Asheville Mica Co.

Senator SMOOT. Do you speak for the entire group, Mr. Brown?

Mr. BROWN. No. I want to introduce a brief that we have prepared, that is all. I have the brief, but it has not yet been printed. I want to have it come in sequence, that is all.

Senator DILLINGHAM. To what paragraph does it relate?

Senator McLEAN. It relates to paragraph 208.

Mr. BROWN. The Asheville Mica Co. are buyers of raw mica product of these mines, both domestic and foreign. This we cut, trim, or stamp to various shapes required by the users thereof.

We have had 30 years' experience. The miners are practically all financially small and are scattered through several States, without any kind of an organization. A large group are in western North Carolina, west of the Blue Ridge, and north and south of Asheville. A majority of that section has been voting for protection for 50 years. They themselves have received but little, if any. We claim that their case should be given attention now, and our plea in this brief is for

them more particularly. We can take care of ourselves in any event we think; that is, the Asheville Mica Co., because we are simply buyers of the raw product.

The CHAIRMAN. What did you mean by the expression "voting for protection?"

Mr. BROWN. I meant that group in the section 200 miles long and 40 miles wide are nearly all Republican voters. But I want to make this further explanation: Since coming here to present this brief acting on the suggestion of your chairman to get together, there have been conferences with others who have appeared before you with respect to their particular view as to what should be done about the tariff on mica, and to our brief we have attached a paper giving the result of such conferences. From this addition you will see that our original request for protection to the miner has been materially reduced. This is not because we believe now that we were wrong but because the miners feared the apparent opposition left no probability of their wishes being granted in full. We trust that in any case such information as these briefs contain may be of assistance to you in deciding what we appreciate is a tangled riddle anyway.

Senator SMOOT. You agree with the others that you want 6 cents per pound on rough trimmed mica and 30 per cent ad valorem on the built and splittings, and 60 per cent ad valorem on manufactured.

Mr. BROWN. You are asking me a question?

Senator SMOOT. You spoke of an agreement, and the committee was informed that the agreement reached contained those figures.

Mr. BROWN. No, sir; not 6 cents. I have a copy of the agreement here.

Senator SMOOT. Then, the agreement has been changed.

Mr. BROWN. Unmanufactured or rough trimmed only, valued at not above 30 cents per pound, 10 cents per pound and 30 per cent ad valorem; valued above 30 cents per pound, 30 per cent ad valorem—

Senator SMOOT. The miners presented that.

Mr. BROWN. I believe not, sir. That is what was handed to me as the agreement that they had made.

Senator SMOOT. All right.

BRIEF OF W. VANCE BROWN, REPRESENTING THE AMERICAN MINERS OF MICA.

Mica is a material that when in sheet form is principally used as an insulating material in the manufacture of various forms of electrical apparatus. It is also used as a window in stoves. A small percentage is used in various other manufacturing. In nearly all cases the mica used is but an extremely small fraction of the value of the apparatus manufactured.

Approximately 65 per cent of the world's production of mica is produced in India with the cheapest labor in the world. The United States produces a little more than one-half of the remainder.

From 50 per cent to 75 per cent of the production of a mica mine is scrap or refuse only fit for grinding purposes. When it is ground, it is used principally in the manufacture of wall paper, roofing, rubber tires, and for molding purposes.

The same varieties and qualities of mica come from India, South America, and the United States. Users are sometimes prejudiced in favor of one production or another but they are all very similar. The United States production averages more of the low qualities than of the finer. This is because the fine qualities are usually in hard rock or at deeper levels requiring large capital and more extensive mining.

There has never been a protective tariff on mica. The Dingley bill of 1897 was the first time carried a tariff on mica; it was not considered a protective tariff, but only something to encourage the industry. Even this small encouragement was reduced by the Payne-Aldrich bill, and again slightly reduced by the Underwood-Simmons bill; now, again, under the proposed Fordney bill, the industry's plea results in a further contraction of the slight protection it had.

is may be wise and proper from the point of view of the manufacturers of electrical apparatus in the North and of the large importers of mica in the eastern cities. If protection by tariff is to be given, the producers of mica are much better ended to it because of the competition of India cheap labor than are some other industries, and, moreover, mica is an essential article in the time of war. In 1917 the United States Government had to ask the Government of Great Britain to let them have mica in order to turn out the electrical apparatus needed for war purposes, and by obtaining this supply could its requirements be satisfied, for there was no other way then to develop the undoubted but undeveloped supply of this country.

The Fordney bill overlooks the request of the manufacturers of phonograph diaphragms for a special clause, and also of the domestic producers for a special clause for crude, raw, or refuse mica. The latter is now being imported under the "sundry" clause in the existing tariff bill, "Raw or unmanufactured, 10 per cent ad valorem." Under the proposed Fordney bill it would come in free of duty under section 1614. This paragraph would permit us to import crude, refuse, or run-of-mine mica, the value of which might run into several hundred dollars a ton, free of duty. The output of domestic mines is sold in an almost crude state, hence this paragraph puts mica on the free list, unless rough trimmed or cut. Since the time of the Dingley bill the domestic production has increased materially, but at the same time importations have also increased, and of the total consumption of mica in the United States up to and including 1918 the imported has been furnished approximately 65 per cent and the domestic production 35 per cent of the total. In 1919 it was 75 per cent and 25 per cent respectively. The figures for domestic production for 1920 are not yet available, but the importations more than doubled in value over the preceding year. Therefore, there is every reason to believe that the percentage of foreign mica consumed in the United States was greater in 1920 than in 1919.

We are not producers but are buyers of the raw mica from the miners. Three-fourths of our purchases are of the domestic product and one-fourth of the imported. We have realized from long experience that conditions do not warrant us or anyone in employing any large amount of capital nor to extensively mine mica. Time and again it has been tried out and money lost, and while there are several hundred mines in the United States (in Western and Southern States and also New England), the winning ones are only those of richer veins and they are run in a crude, small way by miners who have other resources, particularly farming.

We appeared before the Ways and Means Committee and asked for a tariff on mica that would be a protective but not a prohibitive tariff. On behalf of the mica producers of the United States we request that you ignore all the past tariffs and bring out a schedule that will really be a protective tariff on mica, and thus develop an essential, although at present small, industry.

For this purpose we would suggest the following:

Mica—Unmanufactured or rough trimmed only and mica splittings, 25 cents per pound and 50 per cent ad valorem. Cut, stamped, or trimmed, built-up mica, and manufactures of mica or of which mica is the component material of chief value, 10 cents per pound and 50 per cent ad valorem. Phonograph diaphragms, 10 cents per pound and 50 per cent ad valorem. Crude, raw, scrap, or refuse, 1 cent per pound and 50 per cent ad valorem. Ground, flakes, or dust, 2 cents per pound and 50 per cent ad valorem.

We append for your information table showing the percentage of domestic production used in the United States and a letter concerning wages in India.

(Indorsed by 194 producers of mica.)

THE AMERICAN MINING CONGRESS,
Washington, D. C., August 20, 1921.

THE ASHEVILLE MICA CO. AND ASSOCIATES,
Biltmore, N. C.

GENTLEMEN: Following a three-year investigation of the domestic mica industry and studies of this industry in the deposits of the various States of North Carolina, Georgia, New Mexico, and South Dakota, and the manufacturing enterprises dependent on this material for their products, as chief of the division of mineral tariff of the above organization, I feel that I can entirely indorse the schedule on mica now being submitted to the Finance Committee of the United States Senate by you, as being justified protection to a worthy industry, on a basis of scientifically classified schedules.

Very truly, yours,

HERBERT WILSON SMITH,
Chief, Division of Mineral Tariffs.

SOUTHERN TARIFF ASSOCIATION,
Washington, D. C., August 20, 1921

SENATE FINANCE COMMITTEE.

GENTLEMEN: We indorse the attached brief of the mica miners and manufacturers.
Yours, truly,

J. A. ARNOLD

Percentage of domestic production of the total consumption of the United States.

[From Department of Commerce and Geological Survey reports.]

Year.	United States production.	Foreign importation.	Total consumption.	Percentage furnished by United States.
				<i>Per cent.</i>
1909.....	\$280,529	\$618,813	\$899,342	31
1910.....	337,097	725,823	1,062,920	31
1911.....	355,804	505,552	861,356	41
1912.....	331,896	755,584	1,087,480	30
1913.....	436,060	947,783	1,383,843	31
1914.....	329,956	629,484	959,440	34
1915.....	428,769	692,269	1,121,038	38
1916.....	594,391	1,071,356	1,665,747	35
1917.....	806,782	1,430,048	2,236,830	36
1918.....	764,940	1,541,129	2,306,069	33

1920.....	(¹)	3,474,000	(¹)

¹ Not known.

AMERICAN CONSULAR SERVICE,
Calcutta, India, March 8, 1921.

The ASHEVILLE MICA Co., Biltmore, N. C.

SIRS: In response to your letter of January 4, I have to inform you that one mica mining firm in India stated that their labor "receives a maximum of 8 annas (16 cents per day)"; a second firm gives the following particulars concerning wages paid to them:

Mining—Each laborer, per day:	<i>Cents</i>
Carpenters and fitters.....	18-1
Men coolies.....	12-1
Women coolies.....	7-1
Boy coolies.....	3-1
Preparation—Each laborer, per day:	
Cutters.....	7-1
Splitters.....	4-1
Sorters.....	9-1

In addition to this Indian staff, we also employ Anglo-Indians as assistants at the mines themselves on salaries ranging from 60 rupees (\$19.20) to 200 rupees (\$64) per month, according to capacity.

Very respectfully, yours,

ALEXANDER W. WEDDELL,
American Consul General

We have inserted the equivalents in American money at normal exchange. Presumably lower exchange would show the American money figures yet lower.

ASHEVILLE MICA Co

WASHINGTON, D. C., August 19, 1921

The FINANCE COMMITTEE,
United States Senate, Washington, D. C.

Since the preparation of the foregoing brief, by your suggestion we, representing the miners of mica, have met in consultation with those who have appeared before you in the interest of mica, none of whom are miners, but are manufacturers of built up plate, phonograph diaphragms, mica chimneys, cut, stamped, or punched mica shapes from foreign mica chiefly, or are importers and dealers in foreign mica, and as a result have reached a compromise of our several views, all, with the exception of a few importing concerns, agreeing to support and approve of the following paragraph and to request that you put same into effect without change:

'Mica.—Unmanufactured or rough trimmed only, valued at not above 30 cents per pound, 10 cents per pound and 30 per cent ad valorem; valued above 30 cents per pound, 30 per cent ad valorem; cut, stamped, and punched mica, 20 cents per pound and 60 per cent ad valorem; mica splittings, 30 per cent ad valorem; built-up mica and all manufactures of mica, or of which mica is the component material of chief value, 60 per cent ad valorem; mica diaphragms, 10 cents each and 60 per cent ad valorem; crude, raw scrap, or refuse fit only for grinding, 2 cents per pound; ground, ke, or dust mica, 4 cents per pound.'

The miners of mica have thus reduced their request for protection to the minimum it will save their present position from further decline, though without hope of improvement, and also there will be no increased burden to the electrical manufacturer through increased tariff on pure mica that they are more particularly interested in.

Yours, respectfully,

J. E. BURLESON, *Spruce Pine, N. C.*
 TAR HEEL MICA Co., *Plumtree, N. C.*
 D. T. VANCE.
 ASHEVILLE MICA Co., *Asheville, N. C.*
 B. C. GRINDSTAFF.

STATEMENT OF J. E. BURLESON, SPRUCE PINE, N. C.

The CHAIRMAN. Mr. Burleson, where do you reside?

Mr. BURLESON. Spruce Pine, N. C.

The CHAIRMAN. What is your occupation?

Mr. BURLESON. The mining of mica.

The CHAIRMAN. Proceed.

Mr. BURLESON. That has been my occupation for the last 45 years, not so much so as it was after the war started. We never had protection sufficient to equip the mines with machinery until the war started. I went to accumulating mines and machinery to operate them with, and the Government called on us all down in that section to aid them in getting mica for the airplanes and other uses. I took up different properties and started buying machinery and equipping the mines. I put in machinery worth around \$75,000, which is standing idle to-day and rusting on account of the foreign importations coming in cheaper than we can produce mica for.

I went in Georgia and struck a new field there that had never been operated. There are several counties there that are very rich in mica that are undeveloped. I opened up about six mines down here. This sample that I have here is some of the product from the State of Georgia that is about equal to the North Carolina and other American mica.

We are handicapped in this particular. When the Fordney bill passed I shut down all my mines. I was operating four mines. We need sufficient protection.

Senator WATSON. How much will protect you, Mr. Burleson?

Mr. BURLESON. What we are asking for will not protect us, but it will probably put us on our feet so we can operate.

Senator WATSON. What are you asking for?

Mr. BURLESON. What we are going to file in our brief.

Senator WATSON. Can you not tell us what it is.

Mr. BURLESON. No; I can not. We are going to state it in our brief. It is the same as Mr. Brown has just stated to you.

Senator McCUMBER. Ten cents per pound and 30 per cent ad valorem?

Mr. BURLESON. Yes; 10 cents per pound specific on all unmanufactured or rough-trimmed mica and 30 per cent ad valorem.

Senator WATSON. Why did you shut down your mines?

Mr. BURLESON. Because I saw that the price was so low that we could not afford to pay the labor prices we were paying and continue to operate.

Senator WALSH. You kept the mines going until the bill was passed.

Mr. BURLESON. Yes.

Senator WALSH. And you could afford to lose all that time?

Mr. BURLESON. I thought the bill would be better.

Senator WALSH. So you have been running your plant at a loss for several months past, and as soon as the Fordney bill passed you shut down?

Mr. BURLESON. I shut down the mines. I have not sold a pound of mica since last December. If I could sell it at anything like what I sold it for before I would do so. I have \$100,000 worth of mica on hand.

Senator McCUMBER. What do you pay your labor?

Mr. BURLESON. About \$3 a day for common labor.

Senator DILLINGHAM. What did you pay before the war?

Mr. BURLESON. Before the war we paid around \$1.50.

Senator McCUMBER. Do you use colored labor mostly?

Mr. BURLESON. No, sir; mostly white labor, except in Georgia where we use some colored labor. We have very few colored laborers in our section; they are principally white. I was working from 300 to 400 hands up until about the 10th of December, and I then began to cut down. I saw the thing was going to the bad.

Senator WALSH. Did you cut down because of the fact that you could not get a sufficient price for your material, or did you do so because there was a reduction in the demand for the mica?

Mr. BURLESON. It was because we could not get the price for the material.

Senator WALSH. And you could have sold all the mica that you wanted to, but at a loss?

Mr. BURLESON. I can not say that we could. But we could have sold the mica, I suppose, by putting it down low enough, although we could not afford to do it and run.

Senator WALSH. There has been no shortage in the demand, then, as I understand?

Mr. BURLESON. Well, there is a shortage in the demand, but there has been an awful lot of stuff coming in from abroad.

Senator WATSON. Have you people figured out the cost of production in the competing countries and know that it will take this tariff to protect you?

Mr. BURLESON. We have. That will not protect us, but it will allow us to go along. We have never been properly protected on this industry.

Senator SIMMONS. Mr. Burleson, it appears here from the official record of imports for the calendar year 1920, that is last year, that the total importations of mica, manufactured and unmanufactured, was less than a million dollars in value.

Mr. BURLESON. I am not keeping posted on that. I am in the mining line.

Senator SIMMONS. There does not seem to be so very much unmanufactured mica. There was only about \$294,000 worth unmanufactured mica. Of course, the committee understands some-

the general facts of the situation, but, as a matter of fact, is not our trouble in carrying on this business at this time due to the fact that you have lost your customers because the war was your great customer, and in order to supply the demands of the war you had enormously increased your output and when the war closed you were left with a big stock on hand that you could not sell because the war demand had ceased?

Mr. BURLESON. No, sir; I have not any of the stock. I sold all the stock on the 10th of December that I had on hand, and the stock that I have got was accumulated since the 10th of last December.

Senator SIMMONS. Can you furnish the committee with any information as to the annual production of mica in this country?

Mr. BURLESON. The annual production can be made, if we have the proper protection, anything, mostly, that we want.

Senator SIMMONS. What was the annual production before the war?

Mr. BURLESON. I can not give you that information without referring to the different reports on the production. I have not got that in mind.

Senator SIMMONS. From these figures it looks as if before the war, and even in 1920, the American producer of mica had absolutely the whole American market, with the exception of a million dollars' worth.

Mr. BURLESON. We have been up against more or less foreign competition all the time. We were not producing as much mica as we could produce, but when the war came we had to go to work and clean out these old mines and equip them with machinery. The way it stands now it means a loss of my machinery that is standing at the mines rusting, and also an investment of around \$300,000 in the mining properties.

Senator SIMMONS. But the question before this committee is whether this million dollars' worth of mica of all kinds that came into this country in 1920 is the cause of your trouble.

Mr. BURLESON. Certainly it is the cause of our trouble.

Senator SIMMONS. You think \$1,000,000 worth of mica imported into this country is the cause of your trouble?

Mr. BURLESON. It just takes that much more of the market of this stuff.

Senator SIMMONS. And taking that much away from you, do you think it has reduced the price to this extent and made it unprofitable?

Mr. BURLESON. Certainly.

Senator SIMMONS. That would depend upon how much you are making in this country, as to whether the importation of a million dollars' worth would affect the price in this country at all.

Senator McCUMBER. All of the mica consumed can not be worth very many million dollars.

Senator SIMMONS. That is what I am trying to find out.

Senator SMOOT. I have it here. These are the facts. The record shows that the amount that was produced in America so rapidly increased, during the year 1917, that the price fell during the war.

Mr. BURLESON. No.

Senator SMOOT. You may say no, but this is what the record shows.

Mr. BURLESON. I know I did not get any less for mine.

Senator SMOOT. In 1917 the quantity was 1,276,533 pounds. The value was \$753,874. In 1918 that increased to 1,644,200 pounds, and the value decreased to \$731,810. Even with the great increase of production the price of it is lower.

Senator SIMMONS. Senator Smoot, I want to understand what you are reading there.

Senator SMOOT. I am speaking now of the mica sheets and scrap. Then I will tell you what was imported.

Senator SIMMONS. The figures I was giving just now were the total importations.

Senator SMOOT. In 1919 there were produced in America 1,545,700 pounds, and the price fell to \$483,567. In other words, you produced more mica in the United States than there was a call for, and the price went down during the war.

Mr. BURLESON. Prices at which I was selling did not go down.

Senator SMOOT. I am speaking now of the whole production of the United States.

Mr. BURLESON. I have never seen anything of that.

Senator McLEAN. According to those figures, the importations equaled the entire production in this country.

Senator SMOOT. The importations for June of 1921 were 21,303 pounds; value, \$24,770.

Senator DILLINGHAM. What was it in the other years?

Mr. BURLESON. Mica during the war did not go up in proportion to what other materials did that were used in the war.

Senator SMOOT. In 1920 there were 1,409,803 pounds imported, with a valuation of \$1,244,701.

Senator McCUMBER. So you will see that the imports are practically as much as the home production in value.

Senator SIMMONS. I am very much surprised to hear that the home production is no greater than it is. Does that include all——

Senator SMOOT. That includes the sheets and scrap.

Senator SIMMONS. The imports include all kinds of mica. The importations of unmanufactured mica for that year amounted to over \$294,000.

Senator SMOOT. The prices that I quoted were for only the unmanufactured mica.

Senator SIMMONS. That was only \$294,000?

Mr. BURLESON. Will you just permit me to say a word further? In working these mines, when we get down to a certain depth, we strike water. Then we have got to buy costly machinery, and we can make the output to any amount we want if we have the proper protection. We can supply the whole that the country wants.

Senator SMOOT. The record also shows that before the war America produced 63 per cent of all the mica produced in the world, and we consumed 70 per cent of all the mica consumed in the world.

Mr. BURLESON. During the war you will remember that this country was short of mica and had to call on the English Government to help them out.

Senator McLEAN. What is your price now compared to the price before the war?

Mr. BURLESON. I can not answer that question. I thank you gentlemen.

STATEMENT OF B. C. GRINDSTAFF, ASHEVILLE, N. C.

Mr. GRINDSTAFF. Mr. Chairman, I represent the miners, and I want to make a little clearer—

Senator WALSH. We had here the other day, Mr. Chairman, some manufacturers of mica, and they agreed upon one man to represent them. We had some dealers and they agreed upon one man to present them, and we have already had three or four miners, and there is another. Is there any limit to the presentation of these cases?

Senator SIMMONS. I want to say, with reference to these two gentlemen who have just been examined, that they have taken very little time.

The CHAIRMAN. One-third of the morning is over now on repetition.

Mr. GRINDSTAFF. I do not want but a minute, Mr. Chairman. I just want to make it a little clearer with reference to our agreement.

The CHAIRMAN. You want to do what?

Mr. GRINDSTAFF. I want to make this compromise a little clearer to the committee. We met, the miners and manufacturers, in a conference, and I do not think the committee understands the agreement we arrived at.

The CHAIRMAN. When did you meet?

Mr. GRINDSTAFF. We met the first of the week.

Senator SMOOT. We were told the other day by several people that these were the agreed rates:

Mica valued at not above 15 cents per pound, 6 cents per pound; valued above 15 cents per pound, 30 per cent ad valorem; mica splittings, 30 per cent ad valorem; mica plates, and built-up mica and all manufactures of mica, or of which mica is the component material of chief value, 60 per cent ad valorem; ground mica 25 per cent ad valorem.

Senator McCUMBER. Now, do you change that?

Mr. GRINDSTAFF. That is what I want to make clear to you.

Senator WATSON. Is that right or wrong?

Mr. GRINDSTAFF. It is wrong. If you will let me explain it you will see it. Manufacturers had their brief already printed and we did not have ours printed. They could not change theirs, and we agreed to put our briefs in as they were. Ours were very much higher. We agreed to lower our request to 10 cents specific on mica up to 30 cents per pound and take off from what we were asking on splittings, which are partly manufactured, and put that on an ad valorem duty and no specific, and we would turn both briefs in and make this statement to the committee. That 6 cents per pound that Mr. Smoot speaks of was not agreed on and ours was not agreed on, but we agreed only that we would not make a fight between the manufacturers and the miners.

Senator SIMMONS. Let me make a suggestion to you. Can you take the schedule there and write in the duties that you miners want? Can you make the corrections there that you say you want?

Senator McLEAN. I suggest that these interests have an opportunity to file a corrected brief.

Mr. GRINDSTAFF. We have it, and it will be filed, and you can then see it all clearly.

Senator SIMMONS. Your brief states what you want?

Mr. GRINDSTAFF. We have a supplemental brief stating the condition of this compromise.

The CHAIRMAN. The committee is in a hopeless condition of confusion on the subject, and if you can file anything to clarify it, it would be well to do so.

Mr. GRINDSTAFF. The only contention was that they wanted a lower duty on splittings, and we were with them as far as the manufactured stuff is concerned. The miner has to stand for the protection on the manufacture, and we gave way on the raw material because we are small producers of the splittings that they wanted but of the other mica we produce about one-third of the consumption.

Senator WATSON. Mr. Grindstaff, does your brief state what you want?

Mr. GRINDSTAFF. Yes, sir; our brief states what we ask for, and then there is a supplemental brief which states——

Senator WATSON. What you are willing to take?

Mr. GRINDSTAFF. It states our compromise.

Senator WATSON. Why do you not file the brief and state what you want.

Mr. GRINDSTAFF. Well, it will be filed.

Senator WATSON. All right, then.

Mr. GRINDSTAFF. I wanted to explain this compromise, this agreement, so you could all understand it.

Senator SIMMONS. Why do you not sit down and write that exactly as you want it, and then we will know what you want?

Mr. GRINDSTAFF. The manufacturers have their schedule in there and then you will find a supplemental brief with it.

STATEMENT OF JAMES I. BRERETON, REPRESENTING THE COLUMBIA GRAPHOPHONE CO.

Senator SMOOT. Mr. Brereton, you appear in regard to mica diaphragms?

Mr. BRERETON. Yes.

Senator SMOOT. I think Mr. Johns spoke for you this morning.

Mr. BRERETON. No, sir; no one has spoken for us. We are consumers. You have heard from the miners and manufacturers, but you have not heard from the consumers.

I represent the Columbia Graphophone Manufacturing Co. We use diaphragms in the making of our instruments. With every instrument there is one reproducer, and in the reproducer there is one diaphragm. We desire to have the present tariff unchanged.

Senator SMOOT. Do you mean the present tariff or the House provision in the bill under consideration?

Mr. BRERETON. No, sir; I mean the present tariff.

I have been the purchasing agent of this company between eight and nine years, and previous to that, for about 14 years, I was the superintendent of the factory, so that I have come in rather close contact with the diaphragm question.

We believe, for three reasons, that this should remain unchanged. First, we and other manufacturers must use diaphragms made from imported mica. Regardless of what the tariff may be, we are obliged to use almost entirely imported mica because the domestic mica is not suitable for this purpose.

On Saturday Mr. Frazee exhibited some nice samples of domestic mica. It was not brought out, however, what proportion that mica, which we will assume was suitable for diaphragms, bore to the consumption of the domestic mica; in other words, the domestic manufacturers or miners might supply as much as 10 per cent of the total requirement. I doubt if they could supply that, but not more than that. The remaining 90 per cent must, perforce, be imported mica.

I purchased over 1,000,000 diaphragms in 1920, and not one of these diaphragms, as far as I am aware, was made from domestic mica, and not one cost less than 35 cents.

Secondly, we believe that the domestic manufacturers are amply protected under the present tariff, because in the brief filed before the Ways and Means Committee some of the domestic mica diaphragm manufacturers stated that it cost them to make our size, which is $2\frac{5}{8}$, 20 cents. You will find that at page 551, Part I, Schedule B. That flat statement is made. The best quotation that I have been able to get in the last two years from foreign manufacturers has been 27.8 cents laid down in New York. That order was placed in March, 1920—an order for 25,000 as a trial order from a foreign manufacturer. I canceled that order in December of that year, about nine months afterwards, because the manufacturer had, up to that time, delivered not one, and from the correspondence I judged he never would be able to deliver.

I think it was on March 25 that I had a letter relative to this matter, and in this connection please bear in mind the figure that I have given you of 27.8 as the lowest price I have had quoted from foreign manufacturers in two years.

Senator DILLINGHAM. For what unit?

Mr. BRERETON. On our size— $2\frac{5}{8}$ in diameter.

Senator DILLINGHAM. I understand.

Mr. BRERETON. Per piece—each.

I would like to read this letter. It is from the Phonograph Appliance Co., New York City, under date of March 21, 1921. It reads:

GENTLEMEN: On March 16, following up your request of January 29 for quotations in mica diaphragms, we wrote you quoting a price of 27 cents.

Since then we have closed the deal which at that time we expected to close, and we will have facilities for making up these goods for you at this exceptionally low price or some time to come.

Please let us know when our representative may call on you with samples, and greatly oblige.

Yours, very truly,

PHONOGRAPH APPLIANCE CO.,
By J. L. FRAZEE.

That means, in a nutshell, that my best price of 27.8 cents was more than met in this quotation of 27 cents. Therefore, we consider that the domestic manufacturers must, under the present tariff, be protected or they could not cut under the quotations I have been getting. They have, I believe, requested 60 per cent ad valorem and 10 cents specific duty per diaphragm. On their stated cost of 20 cents, this would mean 22 cents additional, or a protection of 110 per cent. That is not protection; it is an embargo.

Lastly, we believe that under these conditions the Government could not obtain any additional revenue, as there would be no diaphragms imported, and this is where we are especially interested.

We, as the consumers, however, would have to pay an additional cost as, without question in my mind, the domestic manufacturer would add this duty to the present cost, although, as shown, they are in a position now to compete favorably with foreign manufacturers. The position, therefore, would be simply that of taking from the consumer and handing it to the manufacturer, with no benefit at all to the Government in the way of additional revenue.

I shall be very glad to answer any questions that may be put to me.

Senator DILLINGHAM. What is the difference between domestic mica and the imported mica? Why is the latter better for diaphragms?

Mr. BRERETON. It is characteristic of the domestic mica which is what we call wavy, due, I think, as geologists have explained, to pressure ridges. The mica, of course, is found embedded in rock and as that rock cools it contracts unevenly. The consequence is, looking along the surface of the mica, it is wavy, and these waves make it impossible to use it in diaphragms. There are other characteristics, such as bubbles, etc., which are more or less common to both the domestic and the foreign mica. But that is the great trouble. Where you can get domestic mica without these ridges, such as Mr. Frazee showed—I did not examine the samples, but I assume that to be the case—it is just as suitable for diaphragms as the foreign mica. But there is but a very small percentage that can be used.

I would like to call your attention to a statement made on page 551, part 1, Schedule B. This is an extract from a letter submitted with Mr. Storrs's brief, I think, and is from the Phonograph Apparatus Co. Mr. J. L. Frazee is, I think, its general manager. I am going to read this in confirmation of my statement that the domestic mica is not, broadly speaking, suitable for the manufacture of diaphragms.

We know it to be a fact that the largest buyer of domestic mica in the United States is located near the center of domestic production, has now in his warehouses enormous quantities of mica, imported from India and other foreign countries, which would indicate that the entire production in the greatest producing area in the United States is not sufficient to support even one large manufacturer. The same thing is true of the large manufacturers in other mining sections. * * *

To increase the cost of imported raw mica for their use would undoubtedly force them to manufacture a large part of their mica products abroad, and would throw out of employment more men and women in this country than the entire population of the United States dependent upon mica mining.

At the bottom of that page this occurs:

With a protective tariff in force for many years and with buyers constantly coming and going to these neighborhoods, with the unlimited demand, and with the highest prices paid anywhere in the world, the American mica-mining industry has achieved little, if any, improvement.

In the brief of the diaphragm mica manufacturers, on page 556 of this same volume, this occurs:

Domestic mines produce a very small quantity of diaphragm mica, entirely inadequate to the needs of the home industry, which relies mainly upon imported mica—chiefly India mica—for that material.

There are other statements made in Mr. Storrs's brief that corroborate our claim, which is parallel with theirs that the industry can not depend upon the domestic mica and, therefore, must import mica regardless of the tariff placed on it. The result, as we look at it, will be an increase in the cost of diaphragms to us. At the same time

ep in mind, please, that the lowest figure that I have obtained in 6 years is 0.8 of a cent, as laid down in New York, higher than the one given by the manufacturers as they offered it to me in ordinary trade correspondence.

Senator McLEAN. How much does one of these diaphragms weigh?

Mr. BRERETON. Each one weighs a very small fraction of an ounce, about twice as much as two sheets of this paper cut $2\frac{5}{8}$ of an inch. The diaphragms are from $8\frac{1}{2}$ to $10\frac{1}{2}$ thousandths of an inch thick. This paper is about $4\frac{1}{2}$.

Senator McLEAN. That is all I care to ask.

STATEMENT OF MARION DORIAN, REPRESENTING THE COLUMBIA GRAPHOPHONE MANUFACTURING CO., BRIDGEPORT, CONN.

Mr. DORIAN. Mr. Chairman and gentlemen of the committee, I so represent the Columbia Graphophone Co. and am a consumer. I have provided myself with several of these diaphragms, thinking perhaps that the committee might like to see them. These diaphragms I purchased locally from a dealer. They are not our usual diaphragms, but approximately what we use.

Each machine has what we call a reproducer. This diaphragm is mounted in the reproducer, and to it is attached the sounding horn, and the sound waves passing through the sounding horn impinge on this diaphragm.

As Mr. Brereton, our purchasing agent, has informed you, he bought 1,000,000 of these articles during the year 1920, and every one was purchased from an American manufacturer of mica diaphragms. He also told you that we must use imported mica, for the reason that domestic mica is unsuitable for this purpose.

Among other witnesses who appeared before the Ways and Means Committee of the House was Mr. Storrs, of the Storrs Mica Co., Oswego, N. Y. In his testimony Mr. Storrs brought out the fact that the domestic mica is unsuitable for diaphragm purposes and for other purposes for which mica is used by American manufacturers, because of its inferior quality.

I might say at this point—I am not sure but that it has already been said—that in addition to being a manufacturer he is an importer of mica.

In answer to a question asked by a member of the Ways and Means Committee he said that no matter what duty is put upon imported mica, they would be forced to bring it in. The question was repeated somewhat in this form—I am quoting from memory: "No matter how high the duty may be, you would still have to bring it in?" The answer was, "Yes; although it might be put so high that it would drive other industries to search for a substitute, and the Government gets a good revenue from this relatively small industry."

At those same hearings there was filed a brief by the mica phonograph-diaphragm manufacturers, one of whom was the Phonograph Appliance Co., that has been referred to by Mr. Brereton as giving a quotation of 27 cents. In that brief, which you will find on page 556, Part I, of the Ways and Means report of the hearings, these phonograph-diaphragm manufacturers make the statement that the mica mines produce from 2 to 10 per cent of the quality of mica

used in the manufacture of these little articles and other articles of which Mr. Storrs is a manufacturer; and, as Mr. Brereton read to you, they state that the domestic mica is entirely unsuitable for this purpose, and that we must resort to imported mica.

There are several different kinds of mica. India mica is considered the best. Argentine and Brazilian micas are approximately as good as the India mica, but we can not use the domestic mica except in an emergency and as a matter of necessity for making these diaphragms. That is conceded by all these gentlemen.

This brief of the Phonograph Appliance Co.—and these other manufacturers joined in that brief—was signed by Mr. Frazee, who presented to this committee on Saturday last some specimens of mica which he said was domestic, but he did not say to this committee—and I do not think he could have said to this committee—that this could be produced in this country in sufficient quantities to meet the demand of this and other manufacturers.

Further, Mr. Storrs, in his testimony before the Ways and Means Committee, referred to a report of the Geological Survey, in which they said that the development of the American mines had been very insignificant, notwithstanding the stimulus of war conditions and the great demand for mica from domestic mines.

Mr. Herbert W. Smith, of the American Mining Congress, with offices in the Munsey Building, corroborated that statement, but he said that perhaps that was due to the fact that the American mines had not taken as much care in selecting, grading, and trimming the material. I speak of that because I want to be absolutely fair.

It is a fact that we can not get, and we have never been able to get, domestic mica in sufficient quantities to meet our demands, even if the supply were equal to the demands which we have to meet in the making of diaphragms. We can not get, and have not been able to get, domestic mica that is free from the defects which are fatal to its use in the diaphragm. That being the case, it comes down to this, that if you increase the duty on the manufactured diaphragm you are going to place a very heavy burden on the shoulders of the users of these diaphragms.

Mr. Brereton has told you that out of the 1,000,000 that he bought in 1920 not one cost less than 35 cents. Think of it. Thirty-five cents for that little fragment of mica. Of course, there is some labor involved in the preparation of it, but the labor is simple. They take this mica and split it to the desired thickness. You can do that with a penknife or a paper cutter. When they have gotten the desired thickness, they stack the pieces up in a pile, one on top of the other with paper between them. They put them in a lathe and turn them down to the desired diameter. While they are still in the lathe they are trimmed down and finished up. They are taken out of the lathe, packed in lots of 100, with pieces of paper in between them, and then they are ready for shipment. There have been statements to the effect that the labor involved is highly skilled labor and very expensive. I submit, gentlemen, that any schoolboy of average intelligence could learn that process in a week or a month at the outside, so that there is not any question of skilled labor involved in the making of these diaphragms.

We could make them ourselves if we had an outlet for the waste material. That is the real element of cost in the manufacture. In the diaphragm, however, there is very little waste, because they can take it out of a sheet and use what is left over for the smaller diaphragms which are more in use than the larger ones.

Each of these gentlemen comes before you and tells you that he does not want an increase on the raw material. He thinks that the importation of the raw material is sufficiently protected so far as they are concerned, because the imported material sells at a great deal higher price than the domestic; and there is no competition between the domestically mined mica and the foreign mica as to the raw article. On the manufactured products, however, they want an excessive duty. I do not know just what they have asked in their brief, because it occurred here this morning that one gentleman who was testifying said that they had filed a brief and that they wanted to file another brief to explain that first brief; and we have also heard that there is an understanding or an agreement between the miners and the manufacturers whereby they get together and have this matter passed upon.

Senator SMOOT. I think that I would not take the time to go into that. We will decide that in the committee.

Mr. DORIAN. But I want to make this point, that the consumer is not invited into these conferences, so that the consumer is between the upper and the nether millstones. What will happen will be this: the committee, in its wisdom, should put on such a tariff as they propose, it would certainly put an absolute stop to importations. The addition of a flat or specific rate of 10 cents seems to me to be an absurdity.

Senator McLEAN. It is 10 cents a pound, is it not?

Mr. DORIAN. No, sir; it is 10 cents for each one of these articles.

Senator McLEAN. They want 10 cents specific duty?

Mr. DORIAN. Ten cents specific duty. Ten cents on each of these articles. Then they have a 60 per cent ad valorem rate. It does seem to me that it is out of all bounds of reason. Only one thing could result, and that would be that the Government would get no revenue whatever. They would add not only 10 cents to each of these articles but they would also add 60 per cent, and we, as consumers, would pay the additional cost. We would be helpless, because no foreign manufacturers could supply us with these articles against such a handicap as that. I do not care to take more time of the committee. I would like to have the privilege of filing a brief which I will prepare in a day or two.

Senator SMOOT. You may have that privilege.

STATEMENT OF MARION DORIAN, REPRESENTING THE COLUMBIA GRAPHOPHONE MANUFACTURING CO., BRIDGEPORT, CONN.

The Columbia Graphophone Manufacturing Co., of Bridgeport, Conn., respectfully urges consideration of the following facts:

It is a very large consumer of manufactured mica in the form of phonograph diaphragms, made of imported mica. During the year 1920 it purchased over 1,000,000 these diaphragms and all of them from American manufacturers.

The Columbia Graphophone Manufacturing Co. does not import mica or manufacture mica products. It is purely and simply a consumer of mica diaphragms manufactured by others. These diaphragms are an essential part of the reproducer or horn and box on every talking machine.

PHONOGRAPH DIAPHRAGMS ARE MADE EXCLUSIVELY OF IMPORTED MICA AND THE SUPPLY IS LIMITED.

On page 544 of part 1 of the printed hearings before the Ways and Means Committee in January, 1921, will be found the following statement by Mr. Charles P. Storrs, president of the Storrs Mica Co., of Owego, N. Y., importers and manufacturers of mica:

"For certain purposes the India mica is absolutely required, and mica from Brazil which is very similar to the India mica."

On page 545 of the same report of Mr. Storrs's statement occurs the following:

"Mr. GARNER. If I understand you, the difference in the quality of mica makes it absolutely necessary to continue its importation?"

"Mr. STORRS. Yes, sir; undoubtedly."

"Mr. GARNER. It makes no difference what the rate of duty might be, they would continue to bring it in on account of the superior quality that you speak of which the domestic mica does not meet?"

"Mr. STORRS. I think the rate of duty could be raised so high it would turn the industry to some other substitute after a certain point. The revenue derived from the importation of mica is rather large now for a small industry."

Mr. Storrs in addition to making an oral statement filed a brief with the committee. This brief is printed on page 546 of the printed record of the hearing.

On page 547 he gives certain reasons for opposing an increase in the duty, as follows:

"a. The domestic product can not meet all the requirements of American manufacturers."

"b. The imported mica is better suited for many purposes than the domestic product."

"c. The production of domestic mica does not need any further protection than that afforded by the present rate of duty on the raw material."

"d. Prices at which imported mica is sold in the United States are considerably higher than prices prevailing for domestic mica."

In his brief Mr. Storrs elaborates on these points, making clear his belief that domestic mica is unsuitable for many uses for which the imported mica must continue to be used regardless of the duty; that domestic mining of mica has not been and will not be stimulated by a higher duty; and that the domestic article is not in competition with the imported because of price differences.

In support of his views Mr. Storrs filed with the Committee on Ways and Means a number of letters and telegrams from American manufacturers and attention is called to these and particularly to the telegram from Phonograph Appliances Co., appearing on page 551 of the hearings as follows:

"We strongly oppose the increased duty on unmanufactured mica. Foreign manufacturers have far too much advantage now. Letter follows."

The Phonograph Appliance Co. is a manufacturer of mica phonograph diaphragms. Its general manager is Mr. J. L. Frazee who appeared as witness before the Finance Committee on August 20, 1921, to support an increase in duty on unmanufactured as well as manufactured mica.

This same Phonograph Appliance Co., joined in a brief filed with the Ways and Means Committee by the Mica Phonograph Diaphragm Manufacturers which appears on page 556 of report of the hearings. The Phonograph Appliance Co. nature to that brief is signed by J. L. Frazee, general manager.

We quote from that brief as follows:

"3. Diaphragms are made of the best mica obtainable. Diaphragm mica is scarce, mines yielding only from 2 per cent to 10 per cent of mica suitable for diaphragm work out of their total sheet mica output."

"4. Domestic mines produce a very small quantity of diaphragm mica entirely inadequate to the needs of the home industry, which relies mainly upon imported mica for that material."

"11 (p. 557, hearings). The undersigned * * * are strongly opposed to an increase of duty on imported unmanufactured mica because the existing 25 per cent tariff has worked out satisfactorily and has given reasonable protection to domestic products as it is conclusively shown that India mica has sold uniformly at lower prices than domestic mica."

At the date of submission of the above brief the diaphragm manufacturers were anxious to obtain their supplies of the imported raw material at the lowest possible price and "strongly opposed" any increase in the existing (1913) tariff, while urging the most drastic increase in the manufactured products.

This was their attitude before the Ways and Means Committee. When they appeared before the Finance Committee, having failed in their object before the Ways and

eans Committee, they change their plea and urge an increase on both manufactured and unmanufactured imported mica.

To explain this, Mr. J. L. Frazee stated to the Finance Committee that he had recently acquired an interest in some domestic mines and was now both domestic miner and domestic manufacturer.

Granting that Mr. Frazee is now a domestic miner that does not of itself alone explain why, if his brief above quoted is to be given credence, a duty which was "working satisfactorily" in January is obnoxious and inadequate in August of the same year. Nor does it explain why the other diaphragm manufacturers who joined that brief should also change their views inasmuch as they have not apparently become domestic miners also.

A more logical reason is given in the testimony of Mr. Jefferson, who appeared before the Finance Committee on August 19, 1921, and stated that the miners and manufacturers had sat in conference together and had agreed on the recommendations to be offered this committee.

In other words, after mutual pledges, they got together, leaving the consumer to fight for himself.

DOMESTIC MICA UNSUITED FOR MANY IMPORTANT MANUFACTURED ARTICLES.

It is clearly shown by the evidence adduced before the Ways and Means Committee and the witnesses quoted that domestic mica is inferior in quality to the imported and unsuited for use in the manufacture of many articles of great utility, including diaphragms.

The United States Geological Survey in a report referred to by Mr. Storrs, on page 4 of the hearings before the Ways and Means Committee, shows that the production of domestic mica is about one-third of the total consumption in this country, thereby demonstrating that even if suitable it is inadequate in quantity.

Mr. Herbert W. Smith, of the American Mining Congress, whose statement appears on page 554 of the House hearings, admits the inferiority as to quality and inadequacy in quantity of the domestic mica.

All of the witnesses concede that the price of the domestic is much lower than the imported, so that no price competition can exist.

It is obvious, therefore, that if the domestic product could be utilized it would be preferred because of its cheaper price and more accessible location.

It follows, therefore, that no matter what duty is imposed the imported article must be brought in and in the same proportions as heretofore.

HIGHER DUTY WILL NOT AID DOMESTIC MINES TO PRODUCE A PRODUCT THAT IS NON-EXISTENT IN ADEQUATE QUANTITY.

The Geological Survey, Mr. Storrs, Mr. Smith, and the diaphragm manufacturers when before the House committee all concede that the production of domestic mica is not stimulated by tariff rates or the tremendous demand incident to war conditions.

It is true that Mr. J. L. Frazee, of the Phonograph Appliance Co., and one other witness, Mr. Burleson, before the Finance Committee exhibited specimens of domestic mica which they alleged was suitable for diaphragm and other manufactured articles heretofore made from imported mica, but neither of them said, nor is it believed, they could have demonstrated that mica of that quality could be produced domestically in anything like adequate quantity.

Everybody knows that it is a simple and easy thing to exhibit specimens. It is quite another matter to show output.

NO MANUFACTURING PROBLEMS INVOLVED IN MAKING DIAPHRAGMS.

In the manufacture of a mica diaphragm several simple steps or operations are necessary. The work is not complex or difficult, and no greater skill or expertness is required than can be taught an employee of average intelligence in a week or two. No mechanical training or apprenticeship is necessary. The different steps or operations are approximately as follows:

1. The raw material is split to the thickness desired.
 2. Punched or cut into circles or cut into squares.
 3. Arranged in stacks about 3 inches long, with paper between each layer of mica.
 4. Stacks placed in a lathe and turned to the approximate diameter required.
 5. The edges finished or smoothed while still in the lathe.
 6. Wrapped in packages of 100 each for shipment.
- It will be evident that this calls for no high standard of skill and that moderate-priced labor can be used. A schoolboy could do it.

It should be understood that the sheet, piece or fragment of mica from which a diaphragm is to be obtained must be larger than the given diameter of the finished articles, so as to permit of the necessary shaping, trimming, and finishing.

The labor involved is exactly the same in a small or large diaphragm and consequently the labor cost is the same.

DOMESTIC DIAPHRAGM MANUFACTURERS AMPLY PROTECTED UNDER PRESENT TARIFF

Mr. James I. Brereton, of Bridgeport, Conn., purchasing agent of your petitioner appeared before your committee on August 22, 1921, and testified that during the previous year (1920) he purchased, exclusively from domestic manufacturers, over 1,000,000 diaphragms, and that none of them cost less than 35 cents apiece. Most of them cost more because in 1920 the consumer paid all that the traffic would bear.

Mr. Brereton stated to your committee that the best quotation he had been able to secure from a foreign manufacturer in the last two years was 27.8 cents each. That a sample order for 25,000 placed in March, 1920, had to be canceled in December, 1920, because the foreign manufacturer could not perform his contract. During that same interval we were paying domestic manufacturers 35 cents or more for the same article.

In March, 1921, the Phonograph Appliance Co. over the signature of Mr. J. I. Frazee quoted a price of 27 cents each for diaphragms of the best imported Indian mica and stated they could continue that price for a good while to come. So that in March of the present year they were able to underbid the foreign manufacturer notwithstanding the duty and the presumably higher labor cost.

The letter containing this quotation, Mr. Brereton read and filed with your committee.

THE RATES REQUESTED BY THE COMBINE OF DOMESTIC MINERS AND MANUFACTURERS PROHIBITIVE AND UNNECESSARY.

A specific tax of 10 cents (not 10 per cent) on each diaphragm, plus an ad valorem of 60 per cent is urged by these interests on imported mica diaphragms.

No reasonable person can doubt that such rates, if imposed, would immediately and permanently shut off all importation. It would constitute an effective embargo.

The moment such rates became effective, however, the price of American mica diaphragms to American consumers would rise proportionately and the American consumer would be held fast in the grip of a legalized monopoly, unable to obtain supplies from any other source.

THE GOVERNMENT WOULD BE A LARGE LOSER.

If such rates or any increase in existing rates be imposed no benefit would accrue to the Government, because importations would be curtailed if not actually prohibited.

Furthermore the revenue now derived under existing law, and which witnesses say is considerable, would be cut off.

For these reasons it is earnestly and respectfully urged that no increase over existing rates is necessary or wise on manufactured or unmanufactured mica imports.

TALC.

[Paragraph 209.]

STATEMENT OF W. C. BOSWELL, BALTIMORE, MD., REPRESENTING THE TALC AND SOAPSTONE PRODUCERS' ASSOCIATION OF AMERICA.

The CHAIRMAN. Mr. Boswell, will you state to the committee where you reside?

Mr. BOSWELL. My name is W. C. Boswell. I reside at 2222 Mount Holly Street, Baltimore, Md.

The CHAIRMAN. What is your business.

Mr. BOSWELL. Talc mining.

The CHAIRMAN. Where do you mine?

Mr. BOSWELL. In Maryland. I represent the Talc and Soapstone Producers' Association of America.

The CHAIRMAN. You are in the mining business yourself.

Mr. BOSWELL. Yes, sir; have been for 15 years.

The CHAIRMAN. What do you suggest in connection with this bill.

Mr. BOSWELL. A different rate on the crude material.

The CHAIRMAN. A higher rate?

Mr. BOSWELL. A higher rate, yes, sir, to balance the rate that we have.

The CHAIRMAN. Did you hear Mr. Edgar testify the other day?

Mr. BOSWELL. No, sir.

Senator WATSON. You do not know whether you agree with him or not?

Mr. BOSWELL. No, sir.

The CHAIRMAN. Will you proceed briefly to state your position?

Mr. BOSWELL. I represent the massive miners more than the pulverized, because I have been out of the pulverized end of it for 10 or 12 years owing to the low price. Under the 1909 tariff we had protection of 1 cent per pound on the cut and powdered material. Since 1913 we have had 15 per cent ad valorem, which amounted to practically nothing. But in those years we went out of business. We closed up our plants. We could not compete with the imported material. But during the war the supply being cut off our mines opened up again.

Senator McCUMBER. Mines of what?

Mr. BOSWELL. Of talc. We opened up and began producing and we supplied the abnormal demand all through the war.

The CHAIRMAN. What is your product chiefly used for.

Mr. BOSWELL. For insulation of electrical appliances, gas burners and gas tips. This material represents about 75 per cent in labor to get it out. We have to be careful in blasting. We cut it up with cross-cut saws from large boulders to blanks of less than a quarter of an inch square. To get this material out of our mines costs about 20 a ton for the crude material in the ground. To work it up into tubes anywhere from 50 to 75 pounds it costs us \$40 per ton, and into these small blanks here [indicating] it costs us \$100 a ton. That is counting our waste and our labor on it. We can not compete with the importer under the present rate, because he keeps his price just a little lower than the American producer can meet.

We would ask that the same classification that you have in the bill now be retained—1 cent a pound for the cut and sawed material; three-quarters of a cent per pound for the pulverized; and one-half a cent a pound for the crude material.

Senator McCUMBER. What is the foreign source of supply?

Mr. BOSWELL. From China, India, Japan, Italy, Germany, and Africa.

Senator WATSON. What is the difference between talc and soapstone?

Mr. BOSWELL. Just the difference in names.

Senator WATSON. They are the same thing?

Mr. BOSWELL. Practically the same thing; yes, sir. The classification calls for talc, steatite or soapstone, and French chalk. Those are the different trade names and they even bring it in as lava.

Senator WATSON. You produce more than all the other countries of the world together, do you not?

Mr. BOSWELL. Yes, sir; and we do not need even a single pound of imported, because our material is equal to any of the imported material.

Senator McCUMBER. Just for my information: Is the talcum powder made out of this same material?

Mr. BOSWELL. Not out of this material; that is made out of the pure white material.

Senator McCUMBER. Is it made out of the same substance?

Mr. BOSWELL. It is made out of talc. This must be talc; it must be free of grit, cleavage, capable of withstanding heat to 2,200°, or even higher and retain its shape. This piece [exhibiting sample to the committee] has standard threads.

Senator McCUMBER. None of the talcum powders are made from this material, you mean?

Mr. BOSWELL. No, sir.

The CHAIRMAN. Is there enough of this material made in this country to supply the demand?

Mr. BOSWELL. Our mines in Maryland can more than supply the whole demand of the United States. We only consume 1,500 tons of this material a year.

Senator WATSON. Is that the total consumption of this high-grade material—massive talc?

Mr. BOSWELL. Yes, sir; 1,500 tons.

Senator WATSON. The Tariff Commission reports in 1915 that the total production of talc and soapstone in the United States was 186,000 short tons and in 1917, 218,000 short tons.

Mr. BOSWELL. That includes pulverized in all forms; not this massive talc.

The CHAIRMAN. The figures show that the United States produces more of this material than all the rest of the world put together.

Mr. BOSWELL. Yes, sir. We have 33 producing mines. That material is sold to-day in the pulverized state as low as \$5.50 a ton, and they are trying to get the imported material from Canada.

We have reports of this high-grade material coming from China from our Bureau of Mines last year, not only giving the location but saying where they could get it and secure it for \$9 in sacks and \$7.25 in bulk, free at the port. We can not compete with that material in the high-grade material, which costs us \$20 a ton to get it out.

Senator WATSON. What does it cost them to deliver it?

Mr. BOSWELL. They sell it at \$7.25 delivered at the port. We can not tell what it costs.

Senator WATSON. The imports for the calendar year 1920 were 43,477,000 tons.

Mr. BOSWELL. On the massive talc there is no way whatever to separate the massive from the ground, because the straight 15 per cent ad valorem includes the ground and the cut.

You asked me about the crude material. Here is the report sent out by our Bureau of Mines, which has been very extensively reported on all foreign talc, in April, 1920—I will not read the description of it, more than this—all this is from China:

The grade of talc is reported as being excellent, the massive talc ranging in color from light cream to flesh pink or to light green in the poorer grades. Specimens on file at the Department of Geology, National Museum, Washington, D. C., were examined by the author. The specimens examined were of exceptionally pure, fine

ined, cream-colored, massive talc, translucent, especially on thin edges. The finely powdered material was a brilliant clear white, superior in color even to the best talcs with an excellent slip and no grit.

It is reported that the talc can be delivered at the ports of Newchwang or Dairen at about \$9 per ton in sacks or \$7.25 in bulk.

Senator WATSON. That applies to the port in China?

Mr. BOSWELL. Yes, sir.

Senator WATSON. It is not the port in the United States?

Mr. BOSWELL. It comes over here as ballast.

Senator WATSON. Where is the United States market for it—in the East or West?

Mr. BOSWELL. It is all in the East—it comes to New York.

Senator WATSON. It comes to San Francisco and then across the country?

Mr. BOSWELL. No; it comes to New York from China.

Senator WATSON. All the way as ballast?

Mr. BOSWELL. All the way as ballast.

The CHAIRMAN. Is that all, Mr. Boswell?

Mr. BOSWELL. All we ask on this talc is that the same classification be retained and, if possible give us three-fourths of a cent a pound on the refined ground and one-half cent a pound on the crude. Only the highest grade of crude is imported into this country.

I would like to file a short brief.

The CHAIRMAN. Without objection, it will be printed in the record.

BRIEF OF W. C. BOSWELL, REPRESENTING THE TALC AND SOAPSTONE PRODUCERS' ASSOCIATION OF AMERICA.

This brief is filed on behalf of the Talc and Soapstone Producers' Association of America, representing 33 producing mines, with over \$8,000,000 in property and machinery—California, 8; Vermont, 6; North Carolina, 8; New York, 3; Georgia, 4; Maryland, 3; Pennsylvania, 1; New Jersey, 1.

Talc is truly an American mineral, and one of the most important. We have mined it for more than 30 years. It is used by manufacturers of paper, leather, cloth, paint, earthenware, rope, rubber, plaster, gas burners, bushings, electric insulators, and many other items.

The most valuable is the massive talc that is so uniformly fine-grained, compact, and soft, free of cleavage. Must be free of grit and low in iron.

The valuable properties of finished massive talc are the great hardness and tenacity, resistance to heat, acids, and alkalis, high in compressive strength, high dielectric strength. There is no other known mineral that can be manufactured into articles in the raw state and hardened in a furnace and retain its perfect shape. Massive talc is indispensable for the manufacture of gas tips, gas burners, bushings for gasoline engines, electrical insulation, and hundreds of other like articles.

Massive talc is mined in large blocks or boulders, then cut into smaller sized blocks by man power, using cross-cut saws. These blocks are then taken to rip or cut-off machines and cut into cubes or blanks, as many of the articles manufactured are of special design and the blanks are cut according to specifications. The sizes range from one-fourth by one-fourth by one-half to 3 and 4 inches square, and larger.

These blanks are placed one at a time in small high-speed lathes, when the articles are turned, drilled, slotted, and threaded as the case may be. The talc article in the raw state is placed in small ovens or kilns heated by gas or electricity, where they are subjected to a temperature of about 2,000° F. from 24 to 48 hours, when the articles become harder than glass.

There is practically no expansion or contraction, standard threads cut in the original blanks are still standard after the baking.

Massive talc is mined in Maryland, Virginia, North Carolina, Georgia, Vermont, and California. For the past eight years a number of the mines have been forced to close down, owing to the imported material from France, India, Italy, China, Japan, and Germany, massive talc coming from these countries as crude talc, free from duty, cut into cubes, blanks, and strips, and a large per cent partly manufactured, only one or two operations needed to complete the article after it is received by the manufacturer, 15 per cent ad valorem.

When it is in the large blocks or bowlders, it is brought in as ballast without freight charges. To produce this material in this country it costs the mine owner \$20 per ton to get the raw material out of the mine (1914 wage scale); to cut into cubes \$40 per ton to cut into small blanks like samples referred to, \$100 per ton.

The importers are offering the large blocks or bowlders at \$7 per ton at the shipping ports of China, India, and Japan. The cut blanks and cubes are quoted at \$27 per ton at foreign ports.

The American mines supplied the abnormal demand during the war and the material has met every requirement. In normal times there is not over 1,500 tons of massive talc consumed in America. Competition between the producers for this business is always keen. This keeps the price at rock bottom as far as the American market is concerned.

The tariff of 1909 enabled the American miner to keep in operation. After 1914, with only 15 per cent ad valorem duty, we could not meet the importers' price. The World War cut off the imports; the American mines again opened up and supplied the demand.

Massive talc is imported under different names—talc steatite, soapstone, French chalk, and lava rock.

Tariff bill H. R. 7456 carries the following classifications and duties:

"PAR. 209. Talc, steatite, or soapstone, and French chalk, crude and unground, one-fourth of 1 cent per pound; ground, washed, powdered, or pulverized, except toilet preparations, one-half of 1 cent per pound; cut or sawed, or in blanks, crayons, cubes, disks, or other forms, 1 cent per pound; manufactures (except toilet preparations), of which talc, steatite, or soapstone, or French chalk is the component material of chief value, wholly or partly finished, and not specially provided for, if undecorated, 25 per cent ad valorem; if decorated, 30 per cent ad valorem."

The rates in tariff bill H. R. 7456 are just one-half what we think the talc importer should have in order to operate against the imported material.

The 1909 rate was 1 cent per pound on cut, sawed, powdered, or pulverized talc.

Conditions have changed since the 1909 tariff. The American producer pays higher wages, carries insurance on his labor and competes with the foreign producer for labor. Only high-grade talc is imported in any form. We believe the duty on crude talc should not be less than one-half of 1 cent per pound. This would equalize the rates of duty and better protect the American producer.

The mines producing massive talc have made no sales for six months. The importers have controlled the market with prices the American producer can not meet. Our talc mines are closed down and thousands of dollars of equipment stand idle.

With a protective rate these plants will be able to meet the price of the imported material and give work to many idle men.

We respectfully ask that the classifications and rates of duty now in tariff bill H. R. 7456 be not reduced and the American valuation be used on all imports.

STATEMENT OF R. N. LOCKWOOD, BROOKLYN, N. Y., REPRESENTING THE TALCUM PUFF CO.

The CHAIRMAN. Where do you reside?

Mr. LOCKWOOD. In Brooklyn.

The CHAIRMAN. You desire to talk upon the same thing as Mr. Boswell?

Mr. LOCKWOOD. Mine is an entirely different point of view from Mr. Boswell's.

The CHAIRMAN. Do you both want the same thing?

Mr. LOCKWOOD. No, sir; I am a manufacturer of toilet preparations; we use powdered talc in the process.

The CHAIRMAN. You do not want any duty?

Mr. LOCKWOOD. I am perfectly willing to stand 15 per cent ad valorem as in the past, but I would like to make a few remarks before the committee, if I may.

The CHAIRMAN. Go ahead, Mr. Lockwood.

Mr. LOCKWOOD. We manufacture toilet preparations, 90 per cent of which are made of talcum powders and marketed through the drug stores, principally.

Senator WATSON. What are talcum powders made of?

Mr. LOCKWOOD. Talcum powder is principally talcum and per-me.

Senator WATSON. Talcum powder is made from something. Is it made from talc?

Mr. LOCKWOOD. For baby powders boric acid is added, in order to make it a soothing powder. Some other powders are made with agnesia in order to make it fluff up, make it light.

The CHAIRMAN. Boric acid constitutes one element in the manufacture?

Mr. LOCKWOOD. Yes, sir; it is a nonirritating substance, and we use only the better grades of powdered talc in the manufacture of talcum powders. To-day the price of talcum powder such as we use is approximately \$20 a ton at the mine, and with a half-cent a pound retail, as proposed in the present bill under consideration, it means virtually 50 per cent ad valorem.

Senator McLEAN. What does it retail for a pound?

Mr. LOCKWOOD. We do not sell it that way.

The CHAIRMAN. It retails through the drug store, so we know what the consumer pays.

Senator WATSON. I understood the last witness to say that talcum powder was not made from this talc at all. Is that so?

Mr. LOCKWOOD. Not from his particular grade of talc.

Senator WATSON. Are there numerous grades of talc?

Mr. LOCKWOOD. Yes, sir; there are.

Senator WATSON. Is this fine French grade that comes in the kind of tin on which talcum powder is made?

Mr. LOCKWOOD. Some of it is made from that.

Senator DILLINGHAM. This is all made from the white?

Mr. LOCKWOOD. That is the principal feature; it must be white. It must have that degree of slip which is not common to all talc. Some talcs are dry and mealy, and it must be as free from lime as it is possible to get it; otherwise it does not perfume properly.

Senator WATSON. Where do you get this talc?

Mr. LOCKWOOD. The majority of it comes from Canada to-day. There is very little foreign Italian talc used at present for toilet preparations, which is the best talc obtainable.

Senator McCUMBER. Do we in the United States have any talc that you can make talcum powder from?

Mr. LOCKWOOD. Yes; but it is not available.

Senator McCUMBER. Talcum powder is all made from talc that is imported?

Mr. LOCKWOOD. No, sir; it is not all made out of it. There is one deposit in North Carolina that produces a very good grade of talc suitable for our purposes, but the production, through, I think, faults in management, is not steady, although I have within the last month had a car from there.

Senator McCUMBER. Could there not be made a differential between the kind that is used for toilet purposes and talcum powders, and the kind that is used for other purposes, as indicated by the preceding witness?

Mr. LOCKWOOD. It occurred to me—I heard the gentleman's remark—that that was something that was very necessary, because his

raw shapes are principally made up for use in commercial purposes. I assume, for gas tips and things of that character, that are treated afterwards.

The normal price of talcum powder such as we use is \$20 at the mine. I can buy it from Canada or North Carolina at that price—and the 15 per cent ad valorem duty to-day it would appear is sufficient to protect the American industry. I am not asking for a reduction on that, but we do feel, even if it is necessary to put on a special duty, that one not greater than 15 per cent should be a proper duty.

Senator DILLINGHAM. Whereabouts in Canada is it produced?

Mr. LOCKWOOD. It is produced at Madoc, Canada, about midway between Toronto and Montreal; and I assume that their production costs are relatively the same as they are in North Carolina. I know not the details of that. Of course, being a manufacturer of toilet preparations I am not altogether familiar with the mining problem.

The CHAIRMAN. Have you anything further?

Mr. LOCKWOOD. Simply we would submit that the duty of 50 per cent, what is equivalent to 50 per cent, is far in excess of what should be for protection. We consume normally 3 or 4 tons a day and the addition of that duty means \$7 a ton additional on an item that to-day costs \$20 or \$23 with the present duty.

Senator DILLINGHAM. There is a good deal of white talc produced in northern New England?

Mr. LOCKWOOD. That is not suitable for the use in toilet preparations, as it is not as white as it should be.

Senator DILLINGHAM. It is perfectly white.

Mr. LOCKWOOD. It is white, but not possessing the degree of whiteness that it should have to produce a grade of talcum preparation, which is very essential. There are various grades, and there is a tremendous amount produced in this country, but it is not all white; in fact very little of it is of suitable whiteness, and I only know of one deposit in North Carolina which is suitable. We would use that if it were not for the difficulties they have in production, which does not give us a sure supply.

The CHAIRMAN. Its most important use is medicinal?

Mr. LOCKWOOD. Yes, sir; it is used extensively in hospitals.

BRIEF OF R. N. LOCKWOOD, BROOKLYN, N. Y., REPRESENTING THE TALCUM PUFF CO.

Supplementing my statements before the committee on Schedule 2, paragraph 209, talc, I would respectfully submit the following:

We market toilet talcum powder under the brand "Air Float," which is distributed principally through the 10-cent stores throughout the country, and the retail price through that selling practice for 17 years is necessarily fixed.

There are three prime factors necessary in talcum powder for toilet, hospital, baby-powder uses, viz: Color—it must be pure white; freedom from lime content—a negligible percentage; and that quality known as "slip," which gives freedom to the mechanical motions of the body and proves a comfort to babies and bedridden persons.

The cost of powdered talc plays a material part in the cost of our production. With the retail price fixed at 10 cents, and going to the masses, as it does, we could not and do not use an inferior quality.

We are one of the largest users of talcum powder in the United States for toilet preparation purposes, consuming normally 3 to 4 tons per day, with an annual output of approximately 9,000,000 packages, at an average profit over a period of years but one-fourth of 1 cent per package.

We know of but one deposit—that in North Carolina—that produces powdered talcum such as we would use, and from this source we purchase when it can be

cured, but the production is spasmodic and the supply not assured, and it is obvious that we must maintain proper business relations with a source of supply that is ready and assured. This we find at Madoc, Ontario, Canada.

As stated in my testimony before the committee, the average cost for powdered talcum fit for our uses is \$20 per ton at the mine, whether it be North Carolina or Canada, and we respectfully submit that the present duty of 15 per cent ad valorem affords ample protection to the American producer, as the cost of production at both points is relatively the same.

Recently there has been a drive on the part of one or two California producers to force their product into the eastern market, and we submit that protection sufficient to permit producers on the Pacific coast to compete in New York, where within a radius of 100 miles we believe that at least 75 per cent of talcum toilet preparations are produced, is unfair to the manufacturers of toilet preparations, and we submit that a duty of one-half of 1 cent per pound is excessive and will only tend to an increase in price on the part of the American producer.

We have marketed "Air Float" talcum powders for 17 years and have never used talc produced in New York State or Vermont, as we believe neither of these sources produce talc fit for our purposes, and no manufacturing process that we know of can make them so. It is our opinion that testimony before the committee will show that talcum powder produced in New York and Vermont is used principally in the manufacture of paper, paint, and rubber, where the degree of purity necessary for toilet preparations is not essential, and we are informed that such talc sells as low as \$7 per ton, as against \$20 per ton for a grade suitable for our preparations.

Powdered talc to us is a crude material as it must be perfumed and prepared for toilet use, and we would call the committee's attention to the fact that the proposed duty of one-half of 1 cent per pound is much in excess of the basket clause of 20 per cent on unenumerated manufactured articles.

We would respectfully request that the committee consider the advisability of a different classification for ground, washed, powdered, or pulverized talc for toilet preparation purposes, at a duty not materially different from the 15 per cent ad valorem now charged, for talcum toilet preparations have surely become a necessity.

STATEMENT OF MICHAEL DOYLE, PRESIDENT INTERNATIONAL PULP CO., GOUVERNEUR, N. Y.

Mr. DOYLE. I live in Rochester, N. Y.

The CHAIRMAN. What is your occupation?

Mr. DOYLE. I am president of the International Pulp Co. We are very largely engaged in the mining and milling of American talc. Our mills are located in northern New York, near Gouverneur, not far from the St. Lawrence River. We have been pioneers in the industry. Personally, I have been connected with the business since 1885 as a manufacturer and miner, and, now, for the past 20 years, as president of this company.

I wish to say to you that this business had its inception in the United States of America. It started in a small way in 1876 to 1877, and we have developed it. The product was first put upon the market at prices ranging from \$40 to \$60 a ton; and in 1920, on account of the differentiation in the various grades, the price had fallen as low as \$8 a ton for some grades, though some of the grades selling as high as \$20 to \$25 a ton.

We make the pure white talc, and I may say to you that from a knowledge of the business through all of these years, a knowledge that embraces every part of this country in which talc is found, that we have here in this country sufficient deposits of talc to satisfy every demand which exists now or which in my opinion can exist in this country in the future.

We have very great deposits in New England, and in almost all of the States; and I might say that New England has come to the front until it is one of the first producing sections of this country.

The CHAIRMAN. It seems to be a question of grade and character of product rather than the amount produced.

Mr. DOYLE. The quality is improving every year. We are producing in California to-day a quality that is equal to the best that comes from France, Italy, or Spain. The production in California has increased fourfold in the past eight years, and it is growing.

We have also in the South very large deposits of talc and soapstone, and I might say, for the benefit of the Senator who inquired for the difference between talc and soapstone, that the difference is this. Talc in its ordinary state contains more or less impure matter, quite a percentage of silica, and soapstone is almost entirely pure talc. It is soapy, slippery, and saponaceous, and that is the difference between the two.

We are producing in this country to-day and have the facilities to produce all that is wanted in America.

I should say to you that it is not ordinary quarrying. We have to go under the ground for this material. We have mines now which we are working at a depth of 700 to 900 feet.

The CHAIRMAN. Where are those mines located?

Mr. DOYLE. They are located in St. Lawrence County, New York State. Incidentally I will say to you that we are the largest producers of white talc in America. I feel that we are the largest producers in the world, in fact.

The CHAIRMAN. How many men do you employ?

Mr. DOYLE. We employ about 300 men. It is necessary to have cheap power in order to reduce this refractory material. We have in use on the Oswegatchie River about 15,000 hydraulic horsepower developed, of which 10,000 horsepower is used for the grinding of this material and 5,000 for electrical development, the electricity being distributed to the surrounding territory.

Senator McCUMBER. For what purpose is the talc that you produce used?

Mr. DOYLE. The principal purpose is in the manufacture of paper. It is used as a filler for book papers and newspapers, in which it gives a little better finish, and we are improving by new machines and methods the quality every year. So that I anticipate that within a comparatively few years our material will take the place of a very large amount of the foreign China clay that comes into this country now at the rate of 200,000 tons a year.

Senator McCUMBER. If it is just as good as the French product for talcum powder that is used in the United States, why is it not used exclusively for that?

Mr. DOYLE. The trouble of it is that many of our people, unfortunately, have an idea that when anything comes from a long distance, especially from abroad, and if it has been coming in here for a number of years, it is very much better than the home product.

Senator McCUMBER. But the witness who preceded you stated that there was some produced in the United States that could be used for the talcum-powder purposes and that was obtained from North Carolina. That would indicate that he was not so prejudiced against its being obtained in the United States, but he evidently does not agree with you that the New York product is proper for that purpose.

Mr. DOYLE. We are selling to manufacturers, to the people who use the goods for that purpose.

California is doing more to-day than any other State in the production of high quality talc. I might say to you that North Carolina produces the smallest quantity for that purpose of any State. We are making a quality and improving our quality so that in a comparatively short period—a few years—we will be able to make a quality equal to the best produced in any part of the world. We are doing it to-day to the extent of 40 or 50 or 60 per cent of the consumption equal to the best foreign material.

With our facilities here in America, with these big deposits that only require development, what we need is the protection that should come to the American manufacturer. What I mean by "protection" is this, which will give you an idea: We are paying at our mills at the present time to the ordinary mill worker \$4 a day, and we are paying our miners \$5 a day.

Senator DILLINGHAM. What did you pay previous to the war?

Mr. DOYLE. Before the war we paid \$2 or \$2.50 a day for the people in the mills, and about \$3 to \$3.50 in the mines.

Senator WALSH. Has there been any reduction in wages?

Mr. DOYLE. There has only been one reduction, Senator, and that has been a reduction of 10 per cent, and that was from the extremely high peak of 1920. We were obliged to make that reduction because we were losing the business, and it was going to others.

Senator WALSH. All of our textile mills in New England have made a reduction of 32 per cent?

Mr. DOYLE. We have only reduced our wages 10 per cent, and our main purpose has been to get an organization together and hold on until we could get better business and better times.

We have the support and protection; and one word upon this question of protection: There is the very much lower labor costs abroad; and then, again, another thing, I made a special effort to have this article put upon a specific basis because in the past the abuses were so grave that they were almost scandalous at the low valuations at which these goods came into this country. I cited official reports at the hearing before the Ways and Means Committee showing that some of this material came in as low as \$4.37 a ton, goods that were sold in our markets at \$30 and \$40; and I therefore advocated strongly an American valuation based for the assessment of our duties.

With that condition we are in a position to supply the demands of this country, and what we would ask is this: Your consideration that that rate be increased. We ask that it be increased to one-half cent per pound on the crude, and that the rate on the powder be increased to 1 cent a pound.

It will make no difference whatever to the consumer, and just to illustrate, I bought a package of well-known talcum powder, and I weighed it on my scales, and it weighed 4 ounces. I paid 25 cents for that 4 ounces. Four ounces would mean \$1 per pound, and for every 2,000 pounds of that material consumed it would mean \$2,000. You can imagine how infinitesimal the rate would be upon that amount so far as the ordinary consumer is concerned.

This is a big industry. In 1920 the total production in America was about 220,000 tons. The importations for that year very

largely were from Canada and amounted to 24,000 tons, largely from that country.

As to lower costs and lower freight rates, as an example of the bad conditions of freights, we have to pay to go abroad 50 cents a hundred pounds on our material, if we ship any; on the other hand, they can come into our market as low as 12 cents a hundred pounds.

We are shipping from northern New York our material to the seaboard—New York, Philadelphia, and Boston—at a rate of 50 cents a hundred pounds, and they are bringing the same goods from abroad at one-third of that rate. I hope they will be able to make a change before long, and I trust that railroad operations will be such and that conditions will change so that we can get somewhat lower rates, but to-day that is the situation; and that should be borne in mind.

I will be glad to answer any questions within my power that the committee may wish to put to me on this matter, because I want to give you the fullest possible information.

The CHAIRMAN. The committee has heard a number of witnesses—Mr. Doyle, on this question of talc, and I think with the help of the Treasury experts and our own figures we can work it out. We are very much obliged to you for your information.

Mr. DOYLE. I will leave a memorandum covering my views, which will be a little more in extenso and will give full details about it.

The CHAIRMAN. All right, sir.

BRIEF OF MICHAEL DOYLE, GOUVERNEUR, N. Y., REPRESENTING THE TALC AND SOAPSTONE INDUSTRY.

The present rates of duties on importations of talc and soapstone into the United States are shown in the dutiable list, Schedule A, paragraph 69, and in the free list, paragraph 621, of the tariff act of October 3, 1913, as follows:

Dutiable list (par. 69): Talcum, ground talc, or steatite, cut, powdered, washed, or pulverized; unit, pound; duty, 15 per cent ad valorem.

Free list (par. 621): Talcum, steatite, and French chalk, crude and unground; unit, pound; duty free.

The changes desired and recommended for the favorable consideration and adoption of the committee are given in H. R. 9063, introduced by Hon. Joseph W. Ford on September 5, 1919, and are:

Talc, steatite, and soapstone, and French chalk, crude and unground, one-half cent per pound.

Talc, steatite, soapstone, and French chalk, ground, washed, powdered, or pulverized, 1 cent per pound.

Talc, steatite, soapstone, and French chalk, cut or sawed, or in the form of blades, crayons, or cubes, 2 cents per pound.

Manufactures of talc, talcum, steatite, soapstone, and French chalk, wholly or partly manufactured, if not decorated, 50 per centum ad valorem. If decorated, 100 per centum ad valorem.

REASONS FOR THE CHANGES RECOMMENDED

(a) To increase the revenue to the United States on the importations from foreign countries of talc and soapstone.

(b) To increase and develop the manufacture of talc and soapstone in the United States and to protect the industry against unfair competition from foreign producers and manufacturers, whether caused by cheap labor conditions, lower or subsidizing transportation charges, or otherwise.

(c) To enable domestic producers to successfully and profitably compete with the imported goods manufactured by foreign producers with cheap labor.

(d) To induce new capital to invest in the industry in the United States, as well as a larger development and production lower prices may be expected.

(e) To obtain greater protection against imports from Canada, France, Italy, Austria, and other countries.

IMPORTANCE OF INDUSTRY IN THE UNITED STATES.

This is essentially an American industry, having its origin and greatest development in this country. It required years of laborious and expensive work by the American producers to bring the industry to its present position. The foreign manufacturer waited until its success was assured, and then without risk entered our markets, favored by low labor costs and low tariff duties, all at the expense of the American manufacturer, both in profit and output.

Talc and soapstone are cheap, economic minerals, closely alike in quality and use, in which there are very large deposits in the United States.

Talc is a magnesium silicate, containing 63 per cent of silica, 32 per cent of magnesia, and 5 per cent water. Soapstone is a massive rock, so rich in talc as to have a soapy feel.

Talc is remarkable for its softness, difficult fusibility, insolubility in ordinary acids, and low electric conductivity. These properties make it one of the most stable, unchangeable, and most useful of minerals. It is largely used as a filler in the manufacture of paper, also in the manufacture of paints and rubber, new uses being found for it each year.

Soapstone has almost all of the same qualities of talc. It is more generally used for the manufacture of electric switchboards, laundry tubs, tanks, sinks, and fume hoods. The uses of these minerals show a constant annual increase in the United States.

The United States produce about 60 per cent of the entire supply of the world. The principal deposits are in the States of New York, Vermont, Virginia, North Carolina, California, and Georgia.

Large deposits of these minerals exist in France, Italy, Austria, Canada, China, and Japan, the United States being the principal market for such.

DEVELOPMENT OF INDUSTRY.

These minerals were first mined and manufactured on a practical scale about 40 years ago in northern New York. Since then the business has spread to other States and localities in which the deposits were found and where favorable manufacturing conditions existed, especially cheap and abundant water power for the crushing and grinding of these minerals.

From 1880 to 1912, inclusive, the production in the United States aggregated 2,402,132 tons, valued at \$26,667,658.

From 1913 to 1919, both inclusive, the production in the United States was 1,301,316 tons, valued at \$13,100,057.

For the year 1920 the production is estimated at 213,000 tons, valued at \$2,360,000, an average value of \$11.08 per ton.

For the entire period from 1880 to 1920, both inclusive, the total production was 3,916,448 tons, valued at \$42,127,715, an average of \$10.75 per ton.

The largest production of talc prior to 1920 was in 1917, with a tonnage for the year of 198,613 tons, valued at \$1,889,672.

The production in 1918 was 191,477 tons, valued at \$2,089,960. Prices ranged in 1920 from about \$8 per ton to \$20 per ton, according to quality.

There are at present 30 producers and manufacturers of talc and soapstone in the United States employing about 2,500 persons. The total number employed in the industries using talc and soapstone is in excess of 250,000. There is opportunity for a large and profitable expansion of the industry in this country, provided protected from adverse and injurious competition from abroad. There is an increasing demand for talc in the paper, paint, and rubber, roofing, textile, linoleum, and other industries. There is invested now in the industry over \$8,000,000, all of which is American.

During the war imports were cut off and the domestic sources developed, and qualities were made in this country equal to the finest made abroad. The States producing the largest quantities at the present time are Vermont, New York, and California in the order named.

We are able to produce now from new deposits in the eastern States and also in California, qualities equal to the best made abroad, entirely satisfactory for all the requirements of the trade in the United States.

UNFAIR COMPETITION FROM ABROAD.

The schedule of wages paid by the foreign producer is much lower than is paid by the manufacturers in the United States. The wages paid to miners average \$5 a day and to mill employees \$4 for eight hours work.

The wages paid in Europe range from \$1.80 to \$3 a day. In Japan, similar mill work is done at a cost of 33½ cents a day for men, and 16½ cents a day for women in 11 hours work.

Fully 65 to 70 per cent of the total cost of all talc and soapstone produced in the United States is for labor, which at the present time is principally American.

The talc and soapstone industry of the United States suffers from the unloading or dumping in our markets of surplus stocks which the foreign manufacturer is unable to sell in his own market.

Low ocean ballast rates permit of shipments to the United States which are a menace and injury to the profits and business of the American manufacturer.

An example will be of interest: The present rate from New York to London and Liverpool, England, on talc and soapstone is \$1 per 100 pounds; the present rate from London and Liverpool to New York on talc and clay, crude and ground, used in the manufacture of paper and other purposes, is 15 shillings per ton of 2,240 pounds equal at \$3.50 per pound sterling to, \$0.12 per 100 pounds, a difference of \$0.88 per 100 pounds.

This shows clearly the advantage of the foreign manufacturer in ocean freight rates permitting entrance into our markets of foreign goods much cheaper than we can ship ours abroad to the same countries and by the same routes.

Ad valorem basis for tariff is unfair and unjust to the American Government and to the American producer.

SPECIFIC BASIS PREFERABLE.

The talc and soapstone industry of the United States suffers from unfair and imprudent ad valorem valuations made abroad upon goods intended for exportation to the United States.

There have been many flagrant examples of such in recent years on shipments arriving from France and Canada and other countries.

For example, French talc worth in the American markets \$20 to \$40 per ton was declared to be of the following values abroad: 1912, 3,941 tons, \$5.14 per ton; 1913, 3,570 tons, \$5.82 per ton; 1917, 2,452 tons, \$4.37 per ton.

The duty levied on these imports was 15 per cent, or 65½ cents per ton, on the lowest and 87 cents per ton on the highest.

Levied on the value of same in America \$20 to \$40 per ton, which are the true market and competitive values against the American manufacturer; the duty at the same rate of 15 per cent would amount to \$3 per ton for the lowest and \$6 per ton for the highest valuation, against the amounts actually paid of 65½ cents and 87 cents, respectively, which increase would inure to the advantage of the Government and the greater protection of the American manufacturer.

The declared values of goods of foreign production at some obscure or isolated place abroad, in which there is no local demand or use, which are intended for entry into the United States on the basis of these low declared values, result not only in a heavy loss to the Government but also a heavy loss to the American producer, both in profit and protection.

We submit that the duty should be levied on these goods on their value at the point of entry of the United States or the principal consuming and competing markets in our country, instead of at some isolated or little known locality abroad.

We are of the opinion that the maximum revenue will be secured by the Government and the maximum protection by the American producer whenever it is possible to levy duties upon specific basis. In this way there will be neither chicanery nor camouflage in juggling values. We recommend strongly specific basis.

IMPORTS AND FOREIGN COMPETITION.

The great danger at the present time is that the foreign deposits in Europe, North Africa, and China and Japan will be actively developed by cheap labor, and with low ocean freight rates they will become a still greater menace to the American manufacturer, reducing his output as well as his profits.

The American market is the largest in the world for talc and soapstone, and all foreign manufacturers seek it by every means within their power. It is not only the largest but the richest, and they seek there business and profits which they are unable to obtain in their own countries.

The imports of talc in 1919 were 14,602 tons, valued at \$259,004. In 1920 estimated about 24,000 tons, valued at \$475,000. The increase is 40 per cent over 1919 and 10 per cent over the previous record.

Foreign manufacturers at the present time are making strenuous efforts to increase their business in the United States.

Of the imports during 1920 more than 70 per cent was from Canada, about 20 per cent from Italy, and the balance from France and other European and Asiatic countries. The bulk of the shipments from abroad at present is cut, ground, or prepared, and is of a relatively high grade. There is no quality imported so fine that it can not be duplicated from the deposits in the United States and by the American manufacturer. The average declared value of the imported talc in 1920 was about \$20 per ton. In years previous to the war the declared value of talc shipped from France to this country have been very much lower. In 1912, 3,941 tons at \$5.14 per ton; 1916, 570 tons at \$5.87 per ton; 1917, 2,452 tons at \$4.37 per ton.

There is danger that these low values will be repeated at no distant date as soon as the foreign producing countries recover from the present abnormal war conditions.

The great changes which have taken place in the affairs of the world since 1913 make a revision and reclassification necessary of the duties on talc and soapstone, so as to meet the present producing and competitive conditions in foreign countries, the supreme desire of the foreign manufacturers being to secure an entrance into the American market, not only on account of the higher values prevailing here, but the very high value of the American dollar, as compared with their own currencies.

The Canadian producer who sells in the American markets to-day \$10,000 worth of talc receives a premium of 12 to 15 per cent thereon, so that this transaction of \$10,000 is worth to him \$1,200 to \$1,500 additional in Canadian money, a very handsome profit from the privilege of selling in the American market, in which he has not a dollar invested and bears no part of the heavy taxes for the requirements of the Government which the American producers are obliged to pay.

There can be no good reason why the foreign producer, who sells his goods in this country should not pay for that privilege at least in the same degree as the American producer.

We should not deliberately aid and encourage any foreign nation by tariff rates or otherwise to compete adversely with the products of American industry, whereby our labor is restricted and lowered in value or the commerce of the Nation made less profitable to our people.

Our wealth and progress are based upon our industries, commerce and work. We have no other sources by which we can expand the prosperity and greatness of our Nation. How important it is that we should foster, protect, and develop them to their fullest extent.

We have an Army and Navy to protect our rights and liberties, and our political possessions, for the safety and welfare of our people. It is desirable that we extend the same measure of protection to our industries and commerce and our producing capacity, for the benefit and happiness of our people.

CONCLUSION.

The changes in the present tariff rates on talc and soapstone as shown by H. R. 9063, introduced by Hon. Joseph W. Fordney, September 15, 1919, will develop the industry in the United States, furnish larger and more remunerative employment to our people, utilize deposits of minerals now neglected in many parts of our country, especially in the South, to the advantage of the owners and eventually by improved machinery and a larger output, furnish these goods to the manufacturers and consumers at materially lower prices than prevail at the present time.

We strongly recommend these changes, for the benefit of the Government and the American producer.

GRAPHITE (PLUMBAGO).

[Paragraph 211.]

STATEMENT OF L. S. BROWN, REPRESENTING THE SPRINGFIELD FACING CO., SPRINGFIELD, MASS.

Senator McCUMBER. Mr. Brown, please give your name and residence and business.

Mr. BROWN. L. S. Brown, of the Springfield Facing Co., Springfield, Mass.

Senator WATSON. What subject are you interested in?

Mr. BROWN. Graphites.

Senator WATSON. What paragraph is that?

Mr. BROWN. I am sure I can not tell you. I am sent here hastily and am somewhat ignorant on that phase of it.

Senator SMOOT. It is paragraph 211.

Mr. BROWN. I might say that this is a subject that I am not thoroughly posted upon. I simply appear because of numerous customers of ours who felt that perhaps nobody would appear here to represent New England in the case. So, yesterday noon I tried to prepare enough to come here and just state the conditions existing in New England at least.

I have been for 40 years in the foundry facing business. It gives me a large acquaintance among the foundry men of New England and I might say that during all those 40 years I have been chasing up new discoveries of graphite, hoping that I could get something that would compete and give me something in advance of Ceylon and in all those 40 years I have never seen a single deposit that was workable at a profit. Furthermore, I feel that the desires and the representations of those who are petitioning for the high tariff—I understand they are petitioning for 6 cents per pound, although I may be mistaken about that—

Senator DILLINGHAM. The bill provides 10 per cent ad valorem.

Mr. BROWN. I knew that the House committee recommended that but it was represented—perhaps this is hearsay—that certain people were still going to ask for 6 cents per pound.

I might say I believe those people are entirely deceived in regard to their own material. There is no question in the world but what laboratory tests do prove wonderful results. Those laboratory tests in practice can not be carried out. It was the action, no doubt, of these believers in their mines, the American mines, that made them feel that while we are in such an emergency and that the United States resources should be brought to bear in saving the country and producing goods that we were importing, that has had an influence in having the war officials ask for 20 per cent American graphite to be used in crucibles. There are very few people in the country who appreciate what a great injury that 20 per cent has done. Many little brass foundries have really been put in a place where they can not recover because they were forced to use a crucible with American graphite in it that instead of giving 30 or 40 heats would only give from 1 to 6 heats. Little foundries could not stand that, but I understand it was a ruling of the Government that they must use 20 per cent so as to use the American goods.

Now, those crucibles in practice do not run over 1 to 6 heats. A large concern in Waterbury, Conn., that was employing 18,000 or 20,000 hands, mostly all on war work, was so handicapped by the amount that they could produce in their melting shop that they were obliged to go out and buy Ceylon plumbago and make their own crucibles and with the American products mixed with Ceylon they were getting only from 1 to 6 heats to a pot. As soon as they made their own with pure Ceylon lead they ran from 30 to 50 heats.

Senator WATSON. The Tariff Commission reports that producers assert that both Montana and Alabama graphite has been accepted as equal to the Ceylon material.

Mr. BROWN. That is absolutely a mistake. All the brass foundries of the country will tell you that that is a mistake. I under-

and that they claim that advanced scientists have produced crucibles at some of their laboratories that were better than Ceylon. I have yet to find anybody that can post me in regard to that. If there is anybody here that can do so I would be very glad to hear from them, but I understand there has never been any of them put in practice. However, we do know that the Government to favor the Alabama interests, did ask for 20 per cent to be used in their crucibles, and that has cost the people of this country millions of dollars. It has almost wrecked many of them.

Speaking of the crucibles to use the Alabama graphite, or American graphite we may say, they have to use much more clay to make the mass form into the crucible. Clay does not conduct the heat to the metal, so that ordinary foundry men who know nothing about scientific ideas can only go by common sense, by their actual experience, and they tell me that it takes from two to four times as long to heat up, to melt the metal in that pot, where there is so much clay used, as it does where the regular old-fashioned Ceylon crucible is used.

Senator McLEAN. What did you say the Government regulation was in regard to it?

Mr. BROWN. Twenty per cent.

Senator McLEAN. That regulation provided that 20 per cent of the American product must be used?

Mr. BROWN. Yes; that was a war measure, and undoubtedly it was to favor these very people who are asking for a big tariff on graphite to-day.

Senator SMOOT. There was another reason beside that. I do not think that was the real reason.

Mr. BROWN. Well, I beg your pardon.

Senator SMOOT. I will agree with you, though, that the crucibles are not nearly as good.

Senator McCUMBER. Was the other reason the matter of shipping?

Senator SMOOT. No; the other reason was a matter of war.

Senator McCUMBER. Well, the Government needed the ships.

Senator SMOOT. That and also the requirements of the Government that they wanted to divide it, and they could not get sufficient quantity anywhere else. They could not get the imports, and in order to make the number required not only by the trade, but by the Government also, they required 20 per cent of the American graphite to be used, so that the product would go around.

Mr. BROWN. I am not a crucible man, but I do say this, those who have given the matter careful study and who were obliged to make crucibles themselves tell me that if the crucible concerns could have kept on making the same crucibles that they were making without adulteration, they would have had more than enough to go round, because they had to use so much of it and make it bad.

Senator SMOOT. Are you interested in the articles that make graphite?

Mr. BROWN. No; I am not interested in graphite, only in a very small way. I do not use a hundred tons of graphite a year.

Senator WATSON. What do you make?

Mr. BROWN. I make foundry facings. Foundry facing is a flour made from graphite. The very best facing is made from the very best Ceylon graphite. It is ground into a fine flour, which is spread

or shaken over the molds or painted on with a brush or rubbed on with the hand. There are all grades.

Senator WATSON. When this facing is sprinkled on, what part does it play?

Mr. BROWN. When the hot iron comes into the mold this makes a parting between the sand and the mold, so that the casting comes out cleaner and nicer and with a better finish.

Senator McLEAN. What does it cost now to import graphite?

Mr. BROWN. I suppose it costs from a cent and a half to 6 cents per pound.

Senator McLEAN. \$120 per ton?

Mr. BROWN. Yes, sir.

Senator SMOOT. That would be the best grade?

Mr. BROWN. That is the high grade, understand, the finer grade.

Senator SMOOT. It was \$81 per ton in 1915; \$74 a ton in 1914. Then it went to \$226 per ton in 1918.

Mr. BROWN. You understand there are many grades of graphite. But at all events it has been a serious thing to the foundry man to have to stand the 20 per cent.

Senator McLEAN. What does the domestic article cost?

Mr. BROWN. I do not know what the Alabama article does cost, but there are domestic graphites that in the crude state can be bought for \$9 or \$10 a ton, from that up, the better grades up to \$15.

Senator SMOOT. What percentage of graphite is there in the Alabama ore?

Mr. BROWN. In their ore that they mine—I am posted only as I have read upon the subject—there is only from 2 to 3 per cent graphite; whereas you understand the Ceylon product contains a much larger percentage. The Ceylon product is mined much as you would mine coal, in great big veins or pockets, as I understand it. The greater loss that has come to the small foundry men has been due to the fact that it takes so much more fuel to melt their metal in a cheap crucible.

Then, again, a crucible made from Ceylon lead can be used a great many times, as I stated, from 30 to 50. Now, that uses down very thin. It wears out slowly, so much so that at times when the melter comes to take his pot out with tongs from the fire it actually squeezes out of shape, and after metal is poured and crucible is refilled and goes back into the furnace and melts, the weight of the metal restores it to its proper form.

Senator SMOOT. What you want is graphite and plumbago on the free list the same as it has been in the past?

Mr. BROWN. Yes, sir; that is what we would like. I do not know that there is anything more that I desire to say.

BRIEF OF L. S. BROWN, REPRESENTING THE SPRINGFIELD FACING CO., SPRINGFIELD, MASS.

Forty years' experience among the foundries in New England warrants me in saying emphatically that the manufacturers of this country need protection much more than the graphite miners. Very frequently we have graphite deposits in different sections of the United States drawn to our attention. Whenever they are within reasonable distance, we investigate, hoping each time that it is something that will prove interesting, and while in several cases we have made investments to prove possibilities, we have never been able to find anything that could be worked at a profit, and feel confident there never was a graphite mine in the United States that proved a money maker. It seems easier for promoters to secure investors in graphi-

ines than it would be in real gold mines. Wonderful literature, showing analyses by different chemists, and sometimes samples of real Ceylon graphite, said to come from the mines they are promoting, make it easy for sharp promoters to get good money at never returns a penny.

In our own State of Massachusetts there are graphite mines, so called, that have been periodically opened by new capital, and worked until capital was gone, for more than a century, and while the claim has always been that it was equal to Ceylon graphite the actual using of it proved that it would never do the work of Ceylon, even though the carbon contents show it to be a wonderful deposit.

The claim made that Alabama crystalline makes a first-class crucible (the claim apparently being backed up by the statements of advanced scientists) was so impressed upon the Government officials at a time when the great cry was "Develop our natural resources," and also the arguments in favor of true patriotism, that it was no wonder the war ruling that all crucibles should be made using 20 per cent of American flake graphite was passed.

The claim that using 20 per cent Alabama or Texas would conserve the Ceylon was absolutely wrong, as it was soon demonstrated in every brass mill or foundry that the crucibles would not stand up, and they were obliged to use from five to eight times as many, so the use of Ceylon was much greater than it would have been had the ruling not been made, and production that the Government needed was held back.

The July, 1919, number of the American Ceramic Society Journal contains an article, by permission of the Director of the United States Bureau of Mines, with the following quotation: "When the American graphite crucible manufacturers were confronted with the necessity of using American graphite altogether or in part as a substitute for Ceylon graphite, on which they had previously depended almost entirely, it was soon discovered that crucibles containing American graphites were very unsatisfactory as compared with those made of Ceylon graphite."

A great many large brass manufacturers at once installed electric furnaces, which require no crucibles, and several of the very largest either bought a crucible manufacturing plant or else installed a crucible department, going into the market and buying Ceylon graphite, and with the crucibles they made could get from 30 to 50 heats, where with those they had to buy they could only get 3 to 7, the average being less than 5 heats. The cost of the extra crucibles many foundries were forced to pay was only a small part of the loss, as many of the crucibles would break while melting, allowing metal to run into the fire, where much of it was lost.

It also took much longer time to melt the metal, consuming several times as much fuel, and loss of much time of workmen.

The manager of one of the large brass mills in the Naugatuck Valley, Conn., stated to me that they could not have furnished the Government contract had they not made their own crucibles. During the war they employed 18,000 to 26,000 hands. His one plant, by no means the largest, alone employs over ten times the number of hands claimed to be employed by American graphite producers.

Possibly the southern interests were not thinking of themselves and really believed they were patriotic, but now when they must know the great injury the ruling did to the country I believe it is most unjust to now ask for protection.

This discovery of American graphite is no new thing. Companies have been made, mines opened and closed, and entire capital lost for over 50 years.

Fifteen years ago I invested in a wonderful electric separator, because it was going to do such wonderful work on graphite, believing that if it did work we could use it on all the great deposits that we knew of, but we never received anything from it, except the expense of annual meeting. Even if it should do all they expected, it can not make a usable or foundry facing stock, as nature has squeezed the graphite in the southern mines so very thin that it can not do the work required, as it does not have the body. While the chemical analysis may be the same, the physical condition is entirely different. If I understand correctly, graphite can be compared to gold mining. Hydraulic mining, producing nuggets and all grades down to dust, compares with the Ceylon graphite, which is taken from large deposits, coming out in large pieces down to dust, and there are museums which have exhibition pieces weighing 100 pounds or more, while some of the quartz-mined gold is invisible to the naked eye, it being so very fine and light. This latter compares with the southern graphite, which comes in rock in which there being only a very small per cent of graphite in the rock. The same electric separator they use for both gold and graphite, or at least that was the inventor's intention when it was first invented. While the coarse and fine gold melts into one mass, melting the American flake, which is so very thin, with the Ceylon greatly injures the Ceylon.

For many graphite deposits that have been found were nearly all found and promoted before war times, and glowing, promoting promises of successful operations were

made. It worked all right as far as getting capital was concerned, and now they demand a tariff to get their money back, but even the high tariff they ask will not allow them to make money, when it is a positive fact that the material produced will not do the required work, as it would simply force electrical installation at all brass foundries, providing conditions are as my 40 years' experience among foundries lead me to believe.

For foundry facings we could not possibly produce a high-grade facing our customers demand, as the southern is so light and fluffy it will not stick to the mold. In fact, very small per cent we have found by practical experience destroys the Ceylon which it is mixed, and we would not buy southern stock at any price.

I have no interest in any crucible concern, and admit we are one of the smallest grinders, putting our whole attention to producing the highest grade foundry facing. Our interest in this proposed tariff is not entirely personal; but knowing what many of our customers have suffered, and will suffer, even with low tariff on graphite, I find it my duty to protest against any duty, even for revenue, as the protection given to southern interests by the war rulings has been such an injury to manufacturers and users of crucibles and foundry facings that I must, in behalf of my customers, pray for free graphite, same as our industry has been built up on, and almost shattered during the period when most people are supposed to have made money.

**STATEMENT OF HERBERT B. JOHNSON, GENERAL MANAGER
SOUTHWESTERN GRAPHITE CO.**

Senator WATSON. You are to speak on what?

Mr. JOHNSON. On graphite.

Senator WATSON. What paragraph is that?

Mr. JOHNSON. Paragraph 211.

Senator McCUMBER. Are you an importer or manufacturer?

Mr. JOHNSON. An American producer.

Senator McCUMBER. A producer?

Mr. JOHNSON. Yes, sir.

Senator McCUMBER. You are not an importer?

Mr. JOHNSON. No, sir.

Senator SMOOT. What do you want?

Mr. JOHNSON. The tariff on American graphite has been reduced from 3 cents a pound to 10 per cent ad valorem.

Senator REED. You want the rate increased?

Mr. JOHNSON. We want it increased the same as the manufacturer does. We want equal protection with our neighbor, the manufacturer. We want 35 per cent.

Senator REED. Do you mean crude or refined?

Mr. JOHNSON. Refined.

Senator SMOOT. What about crude?

Mr. JOHNSON. Crude graphite comes in competition with by-products produced by the American producer—the lower grade products. The idea is to equalize the cost of producing the American product so as not to charge all our cost against No. 1 flake, which is used in the manufacture of crucibles.

Senator SMOOT. The House provides 10 per cent on the crude and refined.

Mr. JOHNSON. Yes; that is true.

Senator SMOOT. Well, I want to get at what you want.

Mr. JOHNSON. We want 35 per cent.

Senator SMOOT. On crude and refined?

Mr. JOHNSON. On graphite—crude and refined graphite.

Senator WATSON. Can this graphite be used for all purposes for which Ceylon graphite can be used?

Mr. JOHNSON. Yes.

Senator WATSON. Is it equal in quality to it?

Mr. JOHNSON. There is some difference due to the fact that the Ceylon graphite has been on the market for 35 years.

Senator WATSON. I am talking about the quality now.

Mr. JOHNSON. The tests that have been made show that the American graphite can be used where the Ceylon graphite can be used with equally good results.

Senator WATSON. Is it equal in quality for foundry facings and so on?

Mr. JOHNSON. Yes; it is equal in quality.

What the American producer is objecting to is not the importation of Ceylon graphite. We are not asking for a prohibitive tariff on foreign graphite. In European countries—Great Britain and France especially—they are importing a great deal of graphite from Madagascar and Ceylon. This graphite from Madagascar is equal in every way to the Ceylon graphite. There is some difference between the Ceylon graphite and the American graphite, but there is little or no difference between the Madagascar graphite and the American graphite. Both are flake graphite.

Senator REED. Where is this graphite produced in this country?

Mr. JOHNSON. Graphite is produced in Texas, in Alabama, Pennsylvania, New York, North Carolina, California, Colorado, Alaska, and Montana.

Senator REED. Do you get what you use from Texas?

Mr. JOHNSON. Yes.

Senator REED. It is in the form of rock in the earth, is it not?

Mr. JOHNSON. Yes.

Senator REED. Are there large deposits there?

Mr. JOHNSON. Yes, from 1,000,000 to 1,800,000 tons.

Senator REED. How much did you say?

Mr. JOHNSON. From 1,000,000 to 1,800,000 tons.

Senator REED. That is in the ground?

Mr. JOHNSON. Yes, that is in the ground.

Senator REED. How do you mine or quarry it?

Mr. JOHNSON. It is open cut quarry work. The process is similar to that used in producing copper. It has to be crushed, concentrated and refined.

Senator REED. You quarry it largely by machinery?

Mr. JOHNSON. Yes, by steam shovel.

Senator REED. Can you pick it right up?

Mr. JOHNSON. No. You have to drill and blast about 600 to 1,000 tons at a time.

Senator REED. You grind it by machinery?

Mr. JOHNSON. It is ground by machinery, concentrated and refined into the finished product ready for the manufacturer's use.

Senator REED. What is graphite used for generally?

Mr. JOHNSON. Graphite is used for the manufacture of crucibles, foundry facings, lubricants, stove polish, and pencils. We are producers of domestic flake graphite, which is used by others in the manufacture of the above articles.

I have a chart here and brief, which I have prepared, showing out what we are up against, what we are asking for, and what graphite is used for; in other words, about 45 per cent of graphite is

used for crucibles, 25 per cent for foundry facings, 15 per cent for lubricants, 10 per cent for stove polish, and 5 per cent for pencils.

Here is what we are up against. Here [indicating on chart] is the foreign and domestic deposits of Ceylon, controlled largely by the English, and Madagascar, controlled by the French. They have rich deposits, simple methods of mining, low freights, and cheap labor. Against that, the American producers have low-grade deposits. They have to mine their ore, mill it, and concentrate it, and then refine it. In other words, the American graphite is the finished product of the American producer. It takes just as much machinery, just as large an investment, and sometimes larger, as that required by the manufacturers who use this product in the manufacture of graphite crucibles, foundry facings, etc.

Senator REED. Let me understand that; it is too technical for me. You get all your ore out by this high-class machinery?

Mr. JOHNSON. Yes, sir.

Senator REED. And grind it by machinery?

Mr. JOHNSON. Yes, sir.

Senator REED. What is the advantage that the Madagascar manufacturer has over you?

Mr. JOHNSON. The manufacturer there just simply mines the graphite out and hand sorts it with coolie labor at a price of 60 or 70 cents a week.

Senator REED. Yes; but he does it by hand.

Mr. JOHNSON. He does it by hand.

Senator REED. When it is out, is it any different from yours?

Mr. JOHNSON. It competes with our finished product, but it is a little lower in grade.

Senator REED. Do they not have to grind theirs?

Mr. JOHNSON. No; they do not have to grind their ore, but ship it in lump form such as this [exhibiting lump of graphite to the committee].

Senator REED. Some grind it, do they not?

Mr. JOHNSON. The American crucible and foundry facing manufacturer grinds it himself and prepares it according to his own formulas.

Senator REED. All of this graphite, wherever it is obtained, has to be ground in a mill of some kind. Is theirs any simpler or easier to grind than yours?

Mr. JOHNSON. No.

Senator REED. Then each of them have to have a method that costs the same. Over there in those other countries they mine by hand with the old, simple method, with very cheap labor. You mine over here with a steam shovel, and your steam shovel can not compete with their cheap labor?

Mr. JOHNSON. No, sir; not on labor. Our great cost in the production of graphite is the concentrating and milling which we have to do.

Senator REED. Do they not have to concentrate and mill?

Mr. JOHNSON. No, sir.

Senator REED. They have a superior quality?

Mr. JOHNSON. They have a superior quality only in the sense of a much richer deposit; in other words, we get 70 to 80 pounds per ton

ore as it is in the ground; that is, our crude ore contains 70 or 80 pounds per ton of recoverable graphite, while in Ceylon and Madagascar their crude ore contains 600 to 700 pounds of graphite per ton, and that simple hand-sorting in Ceylon and Madagascar brings their graphite into the same state as our graphite after mining, milling, and refining, requiring plants costing from \$150,000 to \$600,000, and the employment of both skilled and common labor.

Senator REED. If that superior quality of graphite is put in the ground over there, do you think that we ought to deny the people of the United States the use of it in order that you may produce that inferior quality here; that is, the quality that requires so much more labor?

Mr. JOHNSON. The quality of our finished graphite is not inferior. The proposition we are up against is that the deposits which we have are lower grade, and in order to get a product equal to this product imported into the country we have to use this high-class machinery, skilled labor, etc.

Senator REED. But do you think that Congress ought to pass a law now that will make up for the difference between the low-grade ore in this country and the high-grade ore deposits of those other countries?

Mr. JOHNSON. Yes, sir. We believe we are justified in asking for consideration inasmuch as this industry was developed during the last five years in war times when we had to have graphite and also because we are now able to produce superior quality of graphite which is suitable for all uses.

Senator REED. Let us see. What is your company?

Mr. JOHNSON. The Southwestern Graphite Co.

Senator REED. What is its capital stock?

Mr. JOHNSON. About \$200,000, and \$600,000 invested in the property.

Senator REED. Was that all paid in?

Mr. JOHNSON. Yes, sir.

Senator REED. What are its assets to-day?

Mr. JOHNSON. Our assets to-day are worth about \$523,000.

Senator REED. What dividends does your company pay?

Mr. JOHNSON. It has not paid a dividend, and I can give affidavits that no officer of the company has received one cent in dividends, salary, bonus, or commissions.

Senator REED. It never has paid?

Mr. JOHNSON. No; it never has paid a dividend.

Senator REED. So, running along, you have not been making any money during the war?

Mr. JOHNSON. We have not been making any money, but always sitting in money.

Senator REED. At present high prices, do you think we ought to support an institution of that kind which could not even live during the war and support it continuously and for all time?

Mr. JOHNSON. It could not pay during the war, for the reason that the plant and process was not completed to a point where we could compete and make a profit.

Senator REED. Is it ever going to be completed so that it can compete?

Mr. JOHNSON. It is completed now so that with protection for some time it will be able to compete with the foreign importations.

Senator REED. Is it ever going to be able to walk alone?

Mr. JOHNSON. That is a question.

Senator REED. It is a question, is it not?

Mr. JOHNSON. About the same as anything else.

Senator WATSON. But until it can walk alone it will be employing American workingmen paid American wages?

Mr. JOHNSON. Absolutely.

Senator REED. How many men do you employ?

Mr. JOHNSON. In our particular plant we employ approximately 100 men. There are approximately 2,800 to 3,200 men employed in the industry.

Senator REED. In the whole United States?

Mr. JOHNSON. That is, including the producers, not including the manufacturers.

Senator REED. How many tons of this stuff have you in the United States?

Mr. JOHNSON. How many are handled?

Senator REED. Yes.

Mr. JOHNSON. About 9,000 tons of the domestic finished product against 21,000 tons imported.

Senator WATSON. If you have ample protection according to your theory could you supply the home demand?

Mr. JOHNSON. Yes, sir.

Senator WATSON. With the American product?

Mr. JOHNSON. With the American product.

Senator REED. And you will employ American labor?

Mr. JOHNSON. Yes, sir.

Senator REED. And you will tax all of the American people?

Senator McLEAN. That depends on what the price of this stuff is going to be in years to come.

Senator REED. Yes.

Senator McLEAN. It is very expensive, apparently, the importations costing \$250 a ton. If you should be compelled to go out of business, would the foreign producers have a monopoly of the market so that they could exact as high prices as the trade would bear?

Mr. JOHNSON. Absolutely; they have done it.

Senator McLEAN. Is it your idea that if you could be encouraged so that you could compete on some sort of a fair basis that you could in a few years lower the cost to the American consumer?

Mr. JOHNSON. Yes, sir. The price of Ceylon graphite increased 300 per cent during the war, and our consumers paid the price. We can produce a superior article, supply the demand, and lower the cost to the consumer after we are established.

Senator REED. Yes, and so did everything else increase in price. Let us see, how many sources of supply did you say there are—Ceylon and Madagascar?

Mr. JOHNSON. Ceylon and Madagascar principally.

Senator REED. What was the price of graphite before the war?

Mr. JOHNSON. The average price of graphite before the war was approximately 3 or 3½ cents per pound for all grades. During the war foreign graphite sold as high as 30 cents per pound.

Senator REED. What is it to-day?

Mr. JOHNSON. The average price of foreign graphite to-day, since thousands of tons have been dumped on the market, is 2 cents a pound.

Senator REED. What are you selling at?

Mr. JOHNSON. We are selling our graphite at an average price of less than 4 cents a pound.

Senator REED. But you are selling it for more than they sold it before the war?

Mr. JOHNSON. We are not selling it; that is the trouble. We have a million and a quarter pounds in our warehouses; we can not meet the competition.

Senator REED. Let us stick to the point. The statement you made at a moment ago was that before the war they sold their graphite for 3½ cents a pound, that is, the foreign graphite, and you are not able to make it now for less than 4 cents per pound.

Mr. JOHNSON. No, sir; we could not sell it at less than 4 cents a pound.

Senator REED. So that before you ever came into existence this foreign monopoly could have controlled our market, according to the statement that we had a minute ago. Nevertheless, with full ability to control our market, they were selling for a half cent a pound less than you are able to make it now?

Mr. JOHNSON. But during the war that graphite sold at a greatly increased price.

Senator REED. So during the war did wages go up about three times, so did wheat go up, cotton went up about four times, and everything else went up.

Mr. JOHNSON. On the other hand, the manufacturers of graphite products have been protected with a 20 per cent tariff.

The artificial graphite industry of Niagara Falls was developed and has prospered under tariff protection. At first, when this graphite was put on the market, it was considered a joke by importers and manufacturers. Look at the industry to-day. Look at the rapid development of the artificial graphite industry under a protective tariff.

Senator REED. I thought perhaps you represented Niagara Falls. They make a great deal of graphite at Niagara Falls, do they not?

Mr. JOHNSON. That is artificial graphite; it is used in storage batteries, electrodes, anodes, etc., and does not compete in any way with either the imported graphite or the domestic graphite. I do not represent the artificial graphite manufacturer.

Senator REED. What do they sell that for?

Mr. JOHNSON. I have not any figures on the price; they are not published.

Senator REED. Does it compete with yours?

Mr. JOHNSON. No; it does not compete with us, because it is used for an entirely different purpose. It is a very fine powder produced by electricity in electrical furnaces, which we can not duplicate, and no one else can from the natural graphite. But the manufacturer has developed this business under a protective tariff.

Senator REED. Let us see, what business did they have before the war—was there a graphite industry in this country then?

Mr. JOHNSON. There was no graphite-producing industry to speak of. There were two or three little plants which fooled around trying to get out high-grade graphite, but could never do it.

Senator REED. They had a protective tariff, then?

Mr. JOHNSON. The American producers have had no protective tariff.

Senator REED. When did they get the protective tariff under which you say it developed?

Mr. JOHNSON. The manufacturers?

Senator REED. Yes.

Mr. JOHNSON. I believe it was under the Underwood bill.

Senator REED. How much was it?

Mr. JOHNSON. Twenty per cent ad valorem.

Senator REED. Did they begin to prosper under that?

Mr. JOHNSON. Yes, sir; and they are now asking for 15 per cent additional.

Senator REED. And they prospered under 20 per cent tariff that was based upon the foreign valuation, and they now ask for 35 per cent tariff based upon the American valuation, which would be about twice or three times the foreign valuation. So you want to have your tariff multiplied by about 5 or 6, although you prospered under the 20 per cent tariff?

Mr. JOHNSON. We did not. I am speaking for the American producer.

Senator REED. I am speaking for the American producer; I am not speaking of you individually, of course.

Mr. JOHNSON. The manufacturers have prospered, but the producers have not.

Senator REED. You just represent the miners of this material?

Mr. JOHNSON. I represent the producers of American graphite mining, milling, and refining.

Senator REED. When the manufacturers prospered did the millers prosper?

Mr. JOHNSON. They are not in the manufacturing class.

Senator REED. And who is it that is not included in the manufacturing class?

Mr. JOHNSON. The producers of American graphite, the men who mine it from the ground, mill it, and refine it, and put it in the form of finished products and sell to these manufacturers of crucibles, etc.

Senator WATSON. The manufacturers to whom the graphite that you produce is sold?

Mr. JOHNSON. Yes; there are two distinct classes, American producers and manufacturers.

Senator REED. Was there any such business as yours—that is, the producers—before the war?

Mr. JOHNSON. No; with a few exceptions of little experimental plants. To-day there are 53 well-designed plants built all over the country; before the war there were three.

Senator REED. And you built them up during the war on war prices?

Mr. JOHNSON. Yes, sir; but with high-priced machinery, labor, and freight to do it with.

Senator REED. And you did that without any tariff?

Mr. JOHNSON. We did that without any tariff as a patriotic duty to furnish graphite, which could not be brought in, owing to embargoes and because of the appeal of Government representatives; also by inducements offered by the manufacturers.

Senator REED. Apparently as a patriotic duty. You did not think there was any money in it?

Mr. JOHNSON. When we started we did; yes. We expected protection the same as the manufacturers of our product are getting to-day. We were promised protection by the Government representatives.

Senator REED. Who promised you that?

Mr. JOHNSON. We were promised that by the men from the Department of the Interior, who came down to the mines and urged us to build large plants and increase production.

Senator REED. I want to know who they were who promised that by Congress?

Mr. JOHNSON. Of course, they did not make that promise directly from Congress, but we were encouraged by the offer of protection we would get if we invested our money in the industry and built the plants. Graphite was included in the war minerals bill and was rated as a key industry.

Senator REED. You spoke about how the foreigner raised his price during the war. What did you sell for during the war?

Mr. JOHNSON. No. 1 flake graphite last year sold for an average of 10 cents a pound.

Senator REED. Well, but during the war?

Mr. JOHNSON. During the war it sold for 14 to 15 cents a pound. Foreign Ceylon graphite sold for 15 to 30 cents per pound.

Senator REED. And you went up just like the others?

Mr. JOHNSON. We went up because the graphite was scarce, and they were offering yearly contracts at a premium.

Senator REED. Certainly; and you took it as a patriotic duty?

Mr. JOHNSON. Certainly, just the same as all the rest of them took it.

Senator REED. I do not blame you for that.

Senator DILLINGHAM. Mr. Johnson, in starting out you stated you had a statement to make to the committee. You have not been permitted to give it. Have those questions brought out everything you wanted to say?

Mr. JOHNSON. They have not.

Senator DILLINGHAM. If not, I would like to hear you make your statement.

Mr. JOHNSON. In view of the fact I assumed I would be allowed 15 minutes to make my statement here, I prepared a brief on the graphite subject, including my own brief abstracts from the report of the Tariff Commission and the hearings before the Ways and Means Committee in 1919.

I have prepared a chart similar to this, showing the general status of the domestic and the foreign graphite industry and the manufactured products. I have also shown the average cost of production of American flake delivered to the market.

I have shown a picture of the average typical American graphite plant. Ten per cent tariff will wipe out these 53 plants and put

them out of business; 35 per cent tariff means that they will have a chance to survive and operate.

Senator SMOOT. Was this put into the record in the House?

Mr. JOHNSON. No; this was not; this is a brief I have just made to put into the record here.

Senator DILLINGHAM. Have you copies for members of our committee? If you have it, I would like to have it put into the hearings, if possible.

Senator McLEAN. The witnesses preceding you said that electric graphite could not be used for the purpose of lining furnaces.

Mr. JOHNSON. For crucibles? We naturally get considerable opposition. The chief opposition we have to contend with is the crucible industry, and some men making foundry facings and similar things tell us that it can not be used for crucibles. I would like to read a letter I have from a company who has been using only American graphite for making crucibles [reading]:

PHILADELPHIA, PA., August 18, 1921.

DEAR MR. JOHNSON: In reply to your letter of recent date, regarding the success we are having with your Texas graphite, we are very glad to advise you that same is working out very good. We found that we can use this graphite very successfully, using 100 per cent American flake graphite in our mixture and are selling our product to the biggest user in this country, who report to us that they are averaging about 55 heats, in carload lots.

For your information, we have secured as high as 148 heats from crucibles made from your product. Would also state that as far as we have gone, American flake is very satisfactory to us and we shall continue to use same indefinitely.

Please quote me your best price on carload similar to the car last shipped.

Yours, truly,

THE ELECTRIC REFRACTORIES CORPORATION,
L. M. WILWARD, Secretary-Treasurer.

In the investigations made by Dr. Stull it was shown that crucibles can be made satisfactorily of American graphite.

Senator SMOOT. Do you mean to say there has been no complaint on the part of the miners against crucibles made during the war from American graphite?

Mr. JOHNSON. On the part of miners?

Senator SMOOT. Yes.

Mr. JOHNSON. There has been no such complaints.

Senator SMOOT. Of course, I know there has been. I know that because my mining company has called my attention to it many times. I am only telling you that I know there has been that complaint.

Mr. JOHNSON. There have been several complaints by the users of crucibles.

Senator REED. Well, the miners are the users of crucibles?

Mr. JOHNSON. But not the miners of graphite?

Senator REED. I did not say the miners of graphite; I said the miners of metals in the West, where we use these crucibles for assaying the ore taken out of the mines, who use crucibles extensively.

Mr. JOHNSON. Are those crucibles made of graphite the same as the crucibles used in the steel and brass industries?

Senator SMOOT. Our crucibles are made from graphite, and they have to be very good, of course. I am surprised to hear you have not had any complaint.

Senator REED. The witness misunderstood you, and I for a moment did also. The witness thought you were speaking of miners of graphite, and you spoke of the complaint of miners of other materials who had to use the graphite in crucibles.

Mr. JOHNSON. I misunderstood the Senator's use of the term "miners." There was one reason we had considerable complaint about the use of crucibles. Shortly after the war broke out the English cut off the importation of Ceylon plumbago. France placed an embargo on Madagascar graphite. The Klingenberg clay imported from Bavaria and used in the manufacture of crucibles was cut off by the blockade. No experimental work or any other work in a practical way had been made with mixing American clays. Therefore we were up against not only the use of American graphites, but were up against the use of American clays. We were completely cut off from the use of imported clays as well as imported graphite. That is what stimulated the American graphite industry and also the American clay industry. So that the quality of crucibles made during that period can not wholly be laid to the American graphite. We have made great improvements during the last two years in mining, milling, and refining processes, so that now we are making a much higher grade product and a more uniform and standard product.

Senator SMOOT. I have not heard any complaints from the mines of late, but I do know that for a while they had awful trouble. They would start an assay and they never knew whether they would get it out or not.

Mr. JOHNSON. I think if you will investigate you will find that that was due as much to the clay as to the graphite.

Senator SMOOT. That may be so.

Mr. JOHNSON. We had trouble due to the impurities, such as iron, in the clay as well as the graphite, which made weak points in the crucibles. So that the experience of the crucible manufacturers during that period can not wholly be laid to the American graphite.

Furthermore, the production of Madagascar graphite has increased from 16,000,000 pounds in 1914 to 70,000,000 pounds in 1919, of which 20,000,000 pounds were imported into this country. This shows that flake graphite is being used to a very large extent and is substituted for Ceylon graphite.

Senator McLEAN. I suppose graphite is rather a small item in the total cost of the steel product, is it not?

Mr. JOHNSON. Very small. We are not objecting to a tariff for the manufacturer. We have registered no complaint about that. But we simply can not exist as producers with the 10 per cent tariff, and with a 35 per cent tariff we can exist. That is a great deal less than asked for in the hearings before the Ways and Means Committee, which was equal to 85 per cent. I was not personally in favor of such a high tariff, but we are entitled to 35 per cent; that is, we will have to have at least that much in order to be able to exist and compete on equal terms with the foreign product.

We furnished graphite during the war, and if the industry does not get protection so that it can exist, and we can not operate our plants again, what are you going to do if we have another war?

Senator REED. We are going to completely disarm in about 90 days.

Mr. JOHNSON. Oh, yes; that sounds good. In my brief which I submit I show a form of Canadian plumbago guaranteed; in other words, we had not only to guarantee what we were doing with the raw material but what we were doing in the finished products manufactured of graphite.

BRIEF OF HERBERT B. JOHNSON, GENERAL MANAGER SOUTHWESTERN GRAPHITE CO.

Graphite is a mineral of vital importance in the manufacture of munitions in war time.

Graphite is essential in the production of steel, brass, bronze, alloys, and other metals manufactured in crucibles. Also used in many other industries.

This domestic key industry, built up in five years under pressure of war-time conditions, now needs favorable protective tariff to survive and compete with foreign producers who are favored with rich deposits, cheap labor, and low freight rates.

Producing of graphite is one of the key industries.

Ten per cent tariff will not reopen the 52 graphite mills in the United States. It will wipe them out.

Thirty-five per cent tariff will put American producers on fair competitive basis with foreign producers and save this important industry.

ESTIMATED AVERAGE COST OF AMERICAN GRAPHITE DELIVERED TO CONSUMER.

Average cost of plant with production of 3,000,000 to 4,000,000 pounds per year, including property, construction, machinery, equipment, experimental and research work, \$175,000 to \$250,000.

Average grade of American deposits, 4 per cent graphitic carbon, or 80 pounds per ton of crude ore.

Average recovery of finished products, 50 per cent, averaging 74 per cent graphitic carbon content, or 54 pounds per ton of crude ore, including crucible flake and dust products.

	Per ton
Mining cost.....	\$1.20
Milling cost.....	1.10
Refining cost.....	.90
Total.....	3.20

	Cents per pound
Production cost of graphite products.....	5.9
Hauling, handling, and freight to market.....	1.5
Taxes, insurance, interest, amortization, and depreciation on investment....	1.3
Total cost per pound of graphite.....	8.7

Ten per cent tariff is equal to approximately difference in freight rates of American and foreign graphite to market, approximately 33 per cent of cost of hauling, handling and freight to market, approximately 30 per cent of cost of taxes, insurance, interest amortization, and depreciation charges.

Ten per cent tariff is inadequate and means the wiping out of the 53 plants.

GRAPHITE TARIFF.

Graphite has been on the free list since 1872.

For many years large deposits of graphite have been known to exist in the United States, but these were not considered marketable or of any commercial value on account of the low carbon content of the ore.

No satisfactory, practical, or economical method of concentration for purifying the low grade ore had been developed; there was no comparison or competition with the rich foreign deposits; therefore, no necessity of tariff protection or revenue possible from this source.

Prior to 1914 American graphite was not considered satisfactory for the manufacture of crucibles, electrodes, carbon brushes, foundry facings, and many other products.

side of graphite, due to the low grade of the American deposits and the objectionable purities contained therein.

Before 1914 practically all the graphite and clay used in the manufacture of crucibles was imported from Ceylon and Klingenburg, Bavaria, respectively.

All formulas and specifications used by the American manufacturers and users of graphite specified Ceylon graphite because it was the only source of supply known to be of commercial value. Ceylon graphite had been used for many years, and had been generally accepted as the standard. Experiments in the manufacture of graphite products had all been made with Ceylon graphite, which was used in all compounds, mixtures, and formulas. Consequently, the American graphite industry prior to 1914 was built up and established wholly on a basis of using foreign products as raw materials, such as Ceylon and Mexican graphite, and clays used for binder imported from Klingenburg, Bavaria.

The war greatly upset and changed these conditions, and the American manufacturers found that the embargoes, blockades, and submarine menaces not only cut off this source of supply, in some cases completely, but the increased freight rates and insurance and brokerage charges tripled the cost of their raw materials.

Until the United States entered the war, in 1917, the use of Ceylon and Madagascar graphites by American manufacturers was unrestricted as long as guaranties could be furnished to the British and French Governments that the products into which these graphites entered would not fall into the hands of the enemy.

FORM OF WAR-TIME CANADIAN PLUMBAGO GUARANTY.

The MINISTER OF CUSTOMS, *Ottawa, Canada.*

In consideration of your consenting to the delivery to us of the plumbago which we have purchased or shall hereafter purchase from ———, we hereby give you the following undertaking, which shall remain in force so long as Great Britain is at war with any European power:

- (1) We will use the said plumbago solely for our own manufacturing purposes.
- (2) All orders received by us for plumbago crucibles or plumbago in a form suitable (whether after refining or otherwise) for the manufacture of, or for use as, crucibles, foundry facings, or lubricants to be sent to countries other than the United Kingdom, France, or British possessions shall be executed from stocks maintained by us in the United Kingdom or France or be executed by shipments to the United Kingdom or France and reshipment from there, under license to be obtained for export therefrom.
- (3) We will not execute any orders for plumbago crucibles or plumbago in a form suitable (whether after refining or otherwise) for the manufacture of, or for use as, crucibles, foundry facings, or lubricants to be sent, either directly or indirectly, to any country or State at war with Great Britain.
- (4) We will not sell to any person in the United States any plumbago crucibles or plumbago in a form suitable (whether after refining or otherwise) for the manufacture of, or for use as, crucibles, foundry facings, or lubricants without satisfying ourselves that there is no intention on his part to export, or resell the same for exportation, otherwise than by shipping to the United Kingdom or France and reshipping from there, under license to be obtained for export therefrom.
- (5) We will present to you on demand the original contracts or other documents evidencing the sale by us of any plumbago crucibles or plumbago in a form suitable (whether after refining or otherwise) for the manufacture of, or for use as, crucibles, foundry facings, or lubricants.

Dated at ———, ———, 191—.

MADAGASCAR GRAPHITE FOR THE UNITED STATES.

For some time prior to the beginning of the war the graphite situation of Madagascar for various reasons had become somewhat demoralized. It was therefore desired by the colonial government that an attempt be made to interest American importers in Madagascar graphite as a probable means of relief. A beginning was made and several direct shipments went forward prior to the war and a few shipments after the war. In October, 1914, however, a decree was issued by the Madagascar authorities prohibiting the exportation of graphite from the colony except for France, England, Russia, and Belgium. This decree was issued notwithstanding the fact that there did not appear at that time to be any serious demand from Europe for the large stock of from 8,000 to 10,000 tons of graphite estimated to be on hand in the island. This remained the situation until February, 1916, when the French ministry of colonies decreed that all graphite shipped from Madagascar should be billed to Marseille and

that only after the needs of France had been supplied would authorization be given for shipment of this mineral from Marseille to any foreign country.

Exportation to the United States.—In October of the same year there was published in the official journal of Madagascar a notice stating that according to new instructions from the ministry of colonies, issued in agreement with the chief staff of munitions the regulations governing the exportation of graphite from the colony were changed so as to permit the surplus of the local production to be exported to the United States via Marseille. At the same time it was stated that graphite for England might be shipped direct under certain conditions. In view of the present tonnage situation the State Department was requested to endeavor to obtain the consent of the French authorities to the direct exportation of graphite from Madagascar to the United States and has now been advised that the French ministry of armaments is disposed to grant a favorable hearing to applications for such shipments.

Our imports in long tons of unmanufactured plumbago or graphite from France and Madagascar during the fiscal years (ending June 30) 1913-1917 were as follows:

[Long tons.]

	1913	1914	1915	1916	1917
France.....	16	38	451	2,232	2,232
Madagascar.....	18	152
Total.....	16	56	603	2,232	2,232

The above report is based largely on reports submitted to the Bureau of Foreign and Domestic Commerce by American Consul James G. Carter at Tananarive, Madagascar, who was largely instrumental in starting the direct exportation of Madagascar graphite to the United States.

On declaration of war in April, 1917, these guaranties became unnecessary, as they were superseded by broader American defense measures.

Under the President's proclamation of August 27, 1917, and supplementary list published by the War Trade Board, graphite crucibles, graphite electrodes, graphite flake graphite, and plumbago were placed on the list of commodities whose conservation was necessary on account of the limited supply and needs of the United States in its successful prosecution of the war. Consequently, these articles were not exported, except by special license of the War Trade Board.

Toward the end of June, 1918, in view of the necessity for conserving shipping for the direct military program and after stocks of overseas graphite in the hands of crucible makers, refiners, and dealers were found sufficient to last about six months, it was decided, after July 2, 1918, to restrict completely the importation of overseas graphite for the rest of 1918. This order was followed on August 10, 1918, by a request from the War Industries Board that all crucible makers use 20 per cent domestic flake graphite in their crucible graphite mixtures for the rest of 1918 with an increase of 25 per cent for 1919. This request carried with it the statement that applications for import licenses of manufacturers not complying with the provisions of the requirement would not be approved by the War Industries Board.

The Government realized fully the possibility of being completely cut off from the supply of raw materials of vital importance as war minerals, thus directly and seriously affecting the manufacture of munitions and ordnance, and not only took steps to conserve the stock of supplies on hand, but urged strongly the rapid development of the domestic deposits with the promise of Government help in every way possible.

This emergency not only worked severe hardships on the American producers who were constructing large milling plants in isolated sections of the country, confronted with scarcity of labor, high wages, high cost of machinery and equipment, also freight embargoes and delays, but necessitated the changing of formulas and mixtures which the manufacturers had been using for 30 years, and this experimental work seriously affected the life of crucibles, not only on account of using American graphite, but the necessity of using American clays. Very little research work had been done on either product and very little was known about the qualities or actions of these products in actual practice. It was therefore fitting and advisable that the Bureau of Mines should thoroughly investigate not only the use of domestic flake graphite in crucible manufacture, but also the preparation of the graphite and the clays, as well as the proper mixture to increase the life of the crucibles important and vital in the production of munitions and ordnance.

The investigations were very helpful both to the American producer and manufacturer, and were conducted in three phases, as follows:

1. An examination of the deposits in Alabama and other States and a survey of the methods of mining and preparations used. In this connection methods of sampling and analyses were noted and experiments made to determine a standard method of sampling and a rapid but accurate method of analysis.
2. Experimental work on concentration and refining of domestic crucible graphite to improve the quality of the product and lessen the waste.
3. Experimental work in crucible manufacture to determine the properties of domestic flake and the maximum proportions that might be used without impairing the quality of the crucible. This work was accompanied by photomicrographic study of crucible structure.

These investigations were made at Pittsburgh station of the Bureau of Mines, Salt Lake City, Utah, station, and Columbus, Ohio, station, respectively, and are covered in Bulletin No. 112, "Mining and Preparing Domestic Graphite for Crucible Use," Department of the Interior, Bureau of Mines; also Bulletin No. 3, Vol. II, published by the American Ceramic Society. The crucibles were made at the plant of the Levisius Crucible Co., of Swissvale, Pa., and were made in standard machines, on conditions as equal to practical commercial work as possible. These tests demonstrated the fact that satisfactory crucibles could be made of American graphite and clays.

CRUCIBLES MADE WITH DOMESTIC GRAPHITE VERSUS CRUCIBLES MADE WITH FOREIGN GRAPHITE.

Dr. Stull, of Columbus, Ohio, conducted a series of tests for our Government where the graphite contents were varied from 100 per cent Ceylon to 100 per cent Alabama graphite. These results are reported on page 224, March, 1919, Journal of the American Ceramic Society, and are as follows:

	Heats.
100 per cent Ceylon.....	7.75
7.27 per cent Ceylon and 22.73 per cent Alabama.....	9.75
4.55 per cent Ceylon and 45.45 per cent Alabama.....	17.75
1.82 per cent Ceylon and 58.18 per cent Alabama.....	14.25
100 per cent Alabama.....	21.00

In 1915 the demand for graphite crucibles increased greatly, because of the placing of large foreign contracts for munitions and ordnance with American plants and because of the inferiority of crucibles made of clays other than the Klingenburg clay, the manufacturer fearing a shortage of foreign graphite offered high prices and very favorable contracts for the supply of American graphite.

This stimulated the development of the American deposits. Thousands of people were urged and encouraged to invest money in the development of the domestic industry by Government reports and representatives, also by attractive prices and urgent appeals of the manufacturers who sent representatives to encourage the producers and offered very attractive contracts.

This activity attracted conservative business men and the best engineering ability, and in spite of many handicaps and hardships rapid progress was made, not only in increasing the production, but in developing methods and combinations of processes which produced graphite in commercial quantities superior in quality to the foreign graphite. The Crucible Steel Co. and the Bridgeport Crucible Co. paid premiums for high-grade graphite and made contracts for supplies a year in advance and their records will show that very satisfactory crucibles were made of American graphite. Statements to this effect were made by their representatives, which were great encouragement to the American producer, who felt that he was doing his part in winning the war.

The Joseph Dixon Crucible Co. responded quickly in the emergency. They had been operating their plant in New York State using old traditional and antiquated methods of concentration for many years. These methods of operation, while satisfactory and profitable in the production of graphite used for lubricating purposes selling at 40 cents per pound, could not possibly be made use of on a competitive basis with the foreign prices for crucible flake graphite which had increased 300 per cent.

They sent to Alabama their most experienced experts; also employed expert engineers to study new methods used, and after most careful study junked their plant in New York State and constructed a new modern plant, using a method proved successful in Alabama milling practice, and during this period invested \$200,000 in the Quenelda Graphite Co., then the largest operating company in Alabama, on condition

that the output should be sold exclusively to the Dixon Crucible Co. The Quenelta Graphite Co. was later consolidated with several other companies known as the Quenelta Graphite Corporation, and an effort made through the Chelsea Finance & Securities Corporation of New York to list the stock of the company on the New York curb. This effort, however, was not successful, and the slide rule profits and dividends shown in the prospectus were never realized. It is reported that this plant is now shut down and in process of receivership.

The report of the Tariff Commission and the exhaustive hearings before the Ways and Means Committee show very strongly that graphite is a mineral of vital necessity and importance during war, and that the domestic industry, which is in its infancy, not only needs tariff protection, but absolutely must have it to survive and meet foreign competition.

[Extracts from report of United States Tariff Commission, September, 1919.]

"The prices of imported graphite doubled in the early years of the war. The price of domestic flake increased correspondingly. At the war level (10 to 15 cents per pound) domestic mines were able to operate at a small profit, but the average cost of the best flake is close to 10 cents, as compared with about 4 to 8 cents per pound for the Madagascar product at New York." (Shelley, J. W., Graphite in Madagascar, Mining Magazine, vol. 14, p. 327, 1916. P. 8.)

"Some difficulty was experienced after the outbreak of the war in finding a domestic clay to take the place of the Bavarian clay formerly used, but domestic clays have been found and satisfactory crucibles have been made from domestic clay and 100 per cent domestic graphite."

"Recently Madagascar graphite has been replacing Ceylon material in the European markets, and American crucible makers have had considerable success, both in mixing up to 40 per cent of the domestic flake with Ceylon material and in utilizing 100 per cent Alabama flake." (P. 1.)

"There is, however, one deposit in Montana which has lately been producing graphite that is being accepted by crucible makers as equal to the Ceylon material. The quantity ultimately available has not been proved, but is believed by the operators (letters in auxiliary files, United States Tariff Commission) to be sufficient to supply domestic demands for many years to come. Alabama flake is also accepted by certain companies as satisfactory crucible material, and has shown even superior results in crucible tests reported by Dr. Stull in the Journal of the American Ceramic Society, March, 1919." (P. 16.)

"Ceylon.—The Ceylon deposits are believed, however, to be approaching exhaustion.

"Madagascar.—This African island probably has the world's best future supplies of flake graphite. The deposits are large, conveniently situated, remarkably rich—containing 50 per cent or more of graphite—and are capable of greatly increased production. From 1914 to 1917 the output trebled. Anticipating the decline in production from Ceylon, British crucible makers as well as the French now obtain their graphite supplies from Madagascar. Madagascar plumbago is of increasing importance in the United States, but the Madagascar flake is more like the domestic flake than is the Ceylon lump." (Mineral Resources, 1913, Vol. II, p. 18.)

"In normal times the domestic graphite-mining industry is not in a position to compete successfully with unrestricted imports from Madagascar and Ceylon. The domestic product costs more and must be sold at a lower price. In both Ceylon and Madagascar the deposits are of large extent and so free from impurities that comparatively little treatment or refining is necessary. Most of the domestic flake as found disseminated in low-grade deposits requires comparatively complicated machinery and processes to prepare it for market. It has the further disadvantage of being thinner. The Ceylon flake especially has had some technical and much popular reputation as being more desirable for making crucibles. At present Alabama flake producers claim, and are seeking to establish, that war experiments have shown that such a reputation and its resulting differential in prices are unwarranted, so far as their product is concerned.

"Labor in the Far East is much cheaper than in the United States and, partly by virtue of the natural advantages of the deposits, has no difficulty in producing in quantity.

"In spite of the great distance from the American market, graphite from these islands used to be sold continually in the United States at prices that allowed a profit to domestic producers. Before the war the highest grade of Ceylon graphite was sold in New York at less than 10 cents a pound, as against a maximum of about 8½ cents for domestic flake. The gradual exhaustion of the deposits and increasing

est of production in Ceylon are more than offset by the rapid development of Madagascar deposits. Canada is the only other country from which flake graphite is imported, but the amount is too small to exert any marked influence on the domestic markets, and its quality is similar to that of the American product.

"Many of the Alabama plants are situated 6 to 9 miles from railroads and in a region where wagon roads (clay) are difficult to maintain. For certain companies, therefore, the transportation problem is serious. But the gravest handicap is the universally low grade of the deposits. Even if the price of 10 cents per pound can be obtained for No. 1 flake—nearly 50 per cent higher than before the war—only the most efficient plants will be able to survive. Improvements in treatment of ore and refining of the product are strengthening the position of the producers, and the possible establishment of plants for the manufacture of graphite finished products close to the mines and the consequent ready sale of by-products (No. 2 flake and dust) would be even more assistance; but it is an open question whether the industry, which has lately been established, can maintain itself against the competition of foreign producers having better natural resources." (Pp. 24 and 25.)

"The Texas industry is favored by nature to an even greater degree. Its main handicap is the lack of outlet for by-product grades of flake." (P. 25.)

"For domestic flake graphite the supply exists and can be obtained.

"Until business in the United States has resumed its normal peace-time trend, some method of control or regulation will be necessary to prevent the collapse of certain industries, which the lessons of the present war have taught should not be permitted to die." (P. 25.)

The necessity and importance of graphite is just as vital in the manufacture of steel, brass, and other alloys used in the manufacture of munitions as manganese ores and concentrates, molybdenum ore and concentrates, tungsten ore and concentrates, ferromanganese, titanium, nickel, cobalt, vanadium, quicksilver, and others.

The world's supply of high-grade graphite is controlled largely by England, which controls Canadian, Australian, and Ceylon producers, and holds large concessions in Madagascar. Canada and Australia are protected by reasonable tariff; Ceylon and Madagascar need no protection, because there are no manufacturing industries of importance to protect.

The graphite producers of Canada are encouraged and protected with a tariff of 24 per cent on crude graphite and 32½ per cent, including war tax, on manufactured ground graphite imported into Canada.

The graphite producers of Australia are protected with a tariff of 25 per cent on graphite imported into Australia.

At the present time there are 52 out of 53 graphite plants shut down completely; only one mine and mill in operation in the United States to-day. We are absolutely dependent upon England and France for the supply of high-grade graphite which comes from Ceylon and Madagascar.

The House increased the duty on quicksilver from 7 to 35 cents per pound by request of the War Department, which said it was necessary to encourage American quicksilver mines, which had decreased from 51 to 14 from 1917 to 1920. "Government protection to the industry is essential," said Secretary Weeks.

The Ceylon and Madagascar producers have advantages over the domestic industry at the present time which only favorable tariff protection at this time can equalize; that is, cheap labor, low freight rates, and rich deposits.

Comparison of wages per week.

	United States.	England.	Japan.	Germany.	Ceylon.	Madagascar.
Process men.....	\$31.03	\$18.17	\$4.90	\$6.34	\$1.98	\$3.96
Common labor.....	18.15	13.32	4.50	5.52	.60-.70	1.40

Against this the domestic producers have had to contend with high freight rates, high scale of wages, and high cost of equipment installed in their plants. They have taken their losses the same as manufacturers in other industries and are now only asking for sufficient protection to enable them to sell their goods and keep their extensive plants in operation. Graphite is the finished product of the domestic producer and requires just as expensive machinery, equipment, and skill to extract from the ore as the manufacturer of graphite products requires to manufacture crucibles, electrodes, foundry facings, brushes, and many other products made of graphite.

During the war we were dependent upon foreign graphite and we paid the price. Ceylon graphite increased in price over 250 per cent from 1914 to 1917, as shown by statistics published by the Geological Survey. (Graphite in 1919.)

Average prices of Ceylon graphite c. i. f. New York, 1914-1919.

[Cents per pound.]

Year.	Lump.		Chlp.		Dust.		Remarks.
	First grade.	Second grade.	First grade.	Second grade.	First grade.	Second grade.	
1914.....	6½-9½	7½-8½	7½-7½	6½-7	4½-5½	3½-4	Low, first half; high, second half.
1915.....	9½-20	8-14	7-14	6½-12	7½-9½	6½-9½	Do.
1916.....	20-28	14-21	13½-20	11½-17	9½-12	9½-10	Do.
1917.....	28-32	21-23	20-23	17-19	11-13	10-12	High level maintained throughout year.
1918.....	28½-15½	22-14	21½-12½	18½-11	12-10½	10-9	High, first half; low, second half.
1919.....	14-15½	12-13	10-11	8-9	6½-7½	5-6	Low throughout year.

The wages and cost of living in Ceylon did not increase over 250 per cent, although the Ceylon producers and importers must have noticed some effects on their prices. Who paid the price? The United States Government, largely, in the additional cost of munitions which could only be furnished through the melting of steel, brass, and other alloys in crucibles made of graphite.

The freight and insurance rates on Ceylon and Madagascar graphite increased over 200 per cent during the war, and the supply was very uncertain, due to submarine danger at all times. Ceylon and Madagascar are located at great distance from our market and in case of war we can easily be completely cut off from this supply. What if the American industry is wiped out, where is our graphite coming from? How shall we manufacture alloys which are vital in the manufacture of munitions?

Now is the time to protect American graphite as well as tungsten, molybdenum, manganese, and other important domestic minerals. We have made a start, but 10 per cent is not enough to interest any capital in the industry or reopen the 52 mines and mills that are idle and not producing. We are not asking for a prohibitive tariff. Give us the same protection that the manufacturers have; that is, 35 per cent ad valorem, and we can and will operate our plants. We are making an earnest plea for a fair opportunity to compete with the foreign producers and we can do this by producing a higher grade product with our modern machinery which will meet all demands of the trade. This is not theory, but has been demonstrated in practice.

At the hearings before the Ways and Means Committee the graphite producers pleaded for a tariff equal to approximately 3.1 cents per pound in order to survive against cheap foreign labor and low freight rates. These hearings were held for the discussion of bill introduced by Mr. Heflin, and after full consideration of the facts regarding the status of the industry presented by the producers representing New York, Montana, Pennsylvania, Alabama, Texas, Colorado, and Massachusetts and the report of the Tariff Commission, a new bill (H. R. 11815) was introduced by Mr. Fordney recommending the following schedule:

"First. Crude crystalline graphite ores, 1 cent per pound of ore for ores containing 50 per cent or under of graphitic carbon; 2 cents per pound of ore for ores containing over 50 per cent of graphitic carbon, the term crude graphite ores being defined for the purposes of this act as ore which has not been subjected to any process of refining or concentration which changes the graphitic content of the ore as mined.

"Second. Lump and chip crystalline graphite (plumbago, silver lead), 3 cents per pound of graphite, the term lump and chip being defined for the purposes of this act as larger crystals of graphite, more or less broken up in mining and treatment, of a size which will not pass through a screen with openings one-quarter of an inch square.

"Third. Flake crystalline graphite (plumbago, silver lead), crude concentrates and refined flake, 6 cents per pound of graphite, the term flake being defined for the purposes of this act as smaller crystals of graphite, more or less broken up in mining and treatment, of a size which will pass through a screen with openings one-quarter of an inch square.

"Fourth. All other products, manufactured materials, and compounds containing graphite, crystalline, or amorphous, advanced by manufacturing beyond the state of crude ore, not specifically provided for in this act, in addition to any duties assessed and collected under existing law, 5 cents per pound for the graphite contained therein.

This schedule not only specifies rates which would amply protect the domestic producers, but also includes additional protection for the manufacturers of graphite products who have had a tariff protection of 20 per cent ad valorem for some time, and the tariff proposed in the new bill increases this to 35 per cent ad valorem. The House committee, however, reduced the proposed tariff on graphite to approximately five-tenths of 1 cent per pound, or 10 per cent, which just about equals the difference in freight rates, and is most inadequate.

Freight rates.

Madagascar to New York (long ton) (40 shillings).....	\$7. 14
Madagascar to New York (long ton) (120 shillings).....	21. 42
Madagascar to New York.....	12. 00
Alabama to New York.....	15. 00
New York to Chicago.....	12. 60
New York to St. Louis.....	14. 70
New York to Cincinnati.....	11. 00

In view of these exhaustive hearings and favorable reports, and considering the reasonable protection given to steel products, alloys, articles manufactured of graphite and other minerals which are directly associated with graphite in the manufacture of crucibles and considered of vital importance, it is very difficult to determine what the committee had for consideration which would recommend this great reduction of tariff protection. This reduction means the absolute wiping out of this American industry which required five years to build up during war times at the urgent request of Government representatives.

It is reported that the graphite deposits in Ceylon are being rapidly exhausted. Germany and Japan have been using flake graphite exclusively in their crucible mixtures for years. English crucible manufacturers have secured important concessions in the Madagascar graphite mines, and England and France have manufactured crucibles from Madagascar flake which meet every test, and are allowing part of Ceylon graphite to be sent to the United States.

That flake graphite is entirely suitable for crucible mixtures is proved conclusively by the astounding growth of the Madagascar flake graphite industry, which increased in production from 16,000,000 pounds in 1914 to 70,000,000 pounds in 1918, and over 20,000,000 pounds having been imported into the United States in 1919 and sold to the manufacturers of graphite products at an average of \$0.059 per pound.

CEYLON GRAPHITE—THE TRADE WITH AMERICA.

[From Ceylon Observer, weekly edition, Apr. 13, 1921.]

The following extract from the Board of Trade Journal was cabled to the secretariat day:

In the case of graphite, the crucible makers of the United States have hitherto relied upon Ceylon as their main source of supply, importing some 15,000 tons annually from that island. Imports during the war were largely increased, but shortage of tonnage prevented the transportation of an adequate supply from overseas and domestic mining was stimulated. Domestic output reached its maximum in 1918, when 6,431 tons of flake graphite were produced from American deposits. Latterly, according to the report 'Montana has been producing graphite that is being accepted by crucible manufacturers as equal to the Ceylon material.' Moreover, it seems that the tests recently made by the American Ceramic Society have shown that 'as good graphite can be obtained from the domestic as from the Ceylon material.' If these statements be well founded, the domestic deposits might be expected to compete favorably with the Ceylon product in future, provided the costs were equalized either by more efficient methods in the American mining regions or by an import duty on Madagascar, which is now on the free lists; but operating costs in all the American mining districts are high because of the heavier cost of labor and relatively high percentage of impurities present in the domestic flake. In the Alabama field transportation difficulties present an important obstacle to development. The report includes that, under normal conditions, 'the domestic graphite mining industry is in a position to compete successfully with unrestricted imports from Madagascar and Ceylon.' Though the deposits in Ceylon are becoming gradually exhausted and the costs of production in that island increasing these factors are more than offset, for as the American domestic producers are concerned, by the rapid development of the deposits in Madagascar. The commercial production of graphite in the last-

mentioned country, which began in 1909, had reached 70,000,000 pounds in 1919. In that year the producers' union of Madagascar are stated to have offered to supply the United States annually with 15,000 to 20,000 tons of flake graphite at 5 cents per pound f. o. b. Tamative (for graphite containing 85 per cent carbon). Freight, brokerage, and other overhead charges would have brought the price to the American consumer up to 6.7 cents per pound. Efforts to find a market in the United States for Madagascar plumbago appear to have continued since the war, and it is reported that large tonnages were offered in April, 1919, at 7 cents per pound delivered New York."

What the American producer vigorously objects to is this substitution of Madagascar flake graphite for the Ceylon product by manufacturers in the United States where we have 52 plants completely shut down, each one of which can produce a flake graphite product superior in every way to the Madagascar graphite.

During the past year over 10,000,000 pounds of Madagascar flake graphite has been dumped on the American market at an average price of 2 cents per pound which is less than half the production cost in Madagascar. What was the object? To wipe out the American producers before they get organized or established. This is competition that American producers can not possibly meet, any more than the American dye and other industries could compete with the German methods before the war.

The domestic graphite producers can not compete in price with these foreign producers and importers unless they are given adequate tariff protection.

Tariff bill H. R. 11815 provides a differential rate. Section 2 applies to Ceylon lump. Three cents per pound is approximately 35 per cent of its value. Section 3 applies to Madagascar and other flake graphites. Six cents per pound is approximately 100 per cent of production cost of Madagascar.

The crucible manufacturers came before the committee and objected to a tariff on foreign graphite, emphasizing in particular the Ceylon product, but saying nothing about the Madagascar flake, which they have used since 1914, in increasing amounts over 50,000,000 pounds having been imported since that date.

No tariff protection and these methods of deluging the American market with foreign flake at prices below cost wipes out the American producer, thereby leaving the American market thereafter monopolized and controlled by foreigners. It is most unjust to allow the American producers to be thus completely wiped out in return for the large investments, strenuous efforts, and splendid services they rendered to the Government when our country needed American graphite.

The artificial graphite manufacturers have developed a wonderful business under tariff protection. This is shown by the production record of the Acheson Graphite Co. of Niagara Falls, N. Y.:

	Pounds.		Pounds.
1915.....	5,084,000	1918.....	9,144,000
1916.....	8,397,281	1919.....	8,164,000
1917.....	10,474,649	1920.....	7,397,000

This record shows that when artificial graphite was needed during the emergency of war it was immediately forthcoming.

At first artificial graphite was regarded as more or less of a joke by the importers and some manufacturers. They thought it could never replace or compete with Ceylon or Mexican graphite. But for five or six years, because of its purity, it has been and is now considered as the very best product obtainable for the manufacture of brushes, electrodes, anodes, and storage batteries.

Tariff protection is responsible for the tremendous growth of the artificial graphite industry. Tariff protection is responsible for the successful and profitable growth of the crucible industry and that of other manufactured graphite products.

Remove this tariff protection and, as Mr. McNaughton, of the Joseph Dixon Crucible Co., stated before the Committee on Ways and Means, "the industry would die. That is, foreign manufacturers of crucibles and other graphite products would swamp the American market with their goods manufactured with low-cost child labor at prices impossible for the American manufacturer to meet.

A 10 per cent tariff on graphite will not reopen any one of the 52 graphite manufacturers in the United States which are shut down. The industry will be wiped out.

Why should we allow the foreigner to ruin an essential key industry and prevent doing it? Why should the American producers be denied the safety and adequate protection that is given to the American manufacturers of graphite products?

Give the same protection to the American producers that the manufacturers of other industries have and watch the development of this important key industry. Give the graphite industry a chance to creep, walk, and grow strong and self-supporting and American.

ill, prowess, and ability will soon give a favorable account of themselves and be ready to serve our country whenever called upon.

At the conclusion of two days' hearings, September, 1919, before the Ways and Means committee, and after listening to the earnest plea, presentation of facts and testimony of the American producers, also the objections of the crucible manufacturers and importers of graphite, the chairman of the committee made the following statement during testimony of Mr. Bailey, representing the American Mining Congress:

"I want to say to you that it has always been my opinion that any man who asked for protection on his product and free trade on his neighbor's product was inconsistent and should receive but little consideration at the hands of Congress, and I believe I am right in that opinion.

"Some men are very selfish and because they must buy a certain material as a part of their raw material, which is their neighbor's finished product, ask to have them kept on a free list that he might, in his position, buy a little cheaper but still ask for protection on his own product. I do not care very much for a man of that kind."

Mr. Bailey: "I agree with you."

This opinion is whole-heartedly indorsed, not only by American producers, but by every American. The very foundation of our Government is based upon equality for all.

No representatives of crucible foundries, no consumers of graphite products such as foundry facings, carbon brushes, storage batteries, paints, pencils, lubricants, or other manufactured products appeared in opposition to the tariff asked for by the American producers to save the industry.

No jobbers, dealers, or consumers of crucible products, such as steel, brass, alloys and precious metals appeared against the bill, with the exception of the Crucible Steel Co., which manufactures its own crucibles.

The only opposition encountered was from a few selfish crucible manufacturers, importers and jobbers of graphite used in the manufacture of graphite products.

They would condemn the American producer of graphite as being unfit to exist and object to any tariff protection for the American graphite producers, but at the same time the manufacturer of graphite products pleads and receives an increase of 15 per cent ad valorem from 20 to 35 per cent (par. 216, H. R. 7456) additional protection to their business, and the foreigner exports the raw material at prices lower than we can produce.

The American producers and the consumers of the manufactured products have not registered any complaint or objection to this 15 per cent increase in tariff protection, but the American producers do object strenuously to the selfish attitude taken by this small minority among the thousands of producers and consumers composing the American graphite industry, who would enrich themselves, enrich the foreign producers and willfully destroy the 53 plants capable of producing American graphite which is equal to any foreign graphite.

Experience during the recent war proved conclusively that America can not possibly afford to be wholly dependent upon any foreign supply of any key war mineral.

The action of the English, French, and Canadian Governments, also the proclamation of the President August 27, 1917, show the absolute necessity and importance of controlling not only the distribution of graphite, but the products manufactured of graphite, especially during war times.

We are not asking for a prohibitive tariff. We do not want to exclude the foreign product any more than the manufacturer does by asking for an increase of 15 per cent in his tariff protection, but we do petition earnestly for at least equal protection with our neighbor, the manufacturer.

Give the American producers at least 35 per cent ad valorem tariff protection, but for the love of our country, and standards of fairness and justice, don't let the selfish few and the foreigner kill this important American key industry by the imposition of only 10 per cent tariff.

EXTRACT TESTIMONY AT HEARINGS OF PRODUCERS AND MANUFACTURERS BEFORE
WAYS AND MEANS COMMITTEE ON BILL H. R. 5941, INTRODUCED BY MR. HEFLIN.

[Mr. McNaughton, Dixon Crucible Co.]

Mr. MOORE. Mr. Conklin stated he was able to sell, although he did not indicate it was at a great profit, at 9 cents per pound. To obtain that from foreign countries you would have to pay 6 cents per pound duty. I want to know whether that duty is so high as to prevent importation of that particular kind of graphite. Do you know whether it is a prohibitive tariff?

Mr. McNAUGHTON. I can not answer the question without certain amplification with regard to the crucible business itself.

Mr. MOORE. Are you familiar enough with it to make a comment upon those questions I put to Mr. Conklin about the 9-cent American graphite, when you are paying 14 cents for foreign graphite of apparently the same grade?

Mr. McNAUGHTON. I would answer that question in this way: That during the war time we have paid fully 30 cents per pound for certain grades of graphite, and we could buy the domestic graphite for 15.

Mr. MOORE. May I ask you why you did that?

Mr. McNAUGHTON. There was not enough produced in this country to begin to meet our requirements.

Mr. OLDFIELD. You do not think the graphite industry in Alabama ought to be protected?

Mr. McNAUGHTON. I do not.

Mr. OLDFIELD. Do you think your industry ought to be protected?

Mr. McNAUGHTON. The crucible industry?

Mr. OLDFIELD. Yes, sir.

Mr. McNAUGHTON. It will die if it is not.

[Mr. J. W. Todd, Crucible Steel Co.]

The CHAIRMAN. We had a hearing on this bill, and somebody came here and opposed a duty on magnesite, but it finally developed that those gentlemen that opposed it owned a mine in Austria. They brought in some steel man here to say that the magnesite brick was not as valuable when made from American magnesite as it was made from foreign magnesite. When we pinned the gentleman down to the fact made in that statement, he did not know that the bricks that he used were made out of foreign or domestic magnesite. He was told that it was domestic. Since that time he has sent word to me that he wanted to retract that statement, he did not know what he was talking about. He said the bricks he was using were as good as he ever saw. He didn't know whether it was the fault of the man making the brick or the magnesite out of which it was made, or whether it was made out of foreign or domestic, but he came here to ask this committee not to make protection for domestic magnesite necessary to be produced in this country. Isn't it true that graphite is a key to American industry during war, and we need domestic magnesite (graphite) and, if so, Congress ought to protect that industry against foreign industry for our own protection?

Mr. TODD. I don't know whether the American graphite should be protected or not. I don't know its cost, but I do know it shouldn't be protected unless that protection carries with it a protection on the finished product in which it may be used.

[Mr. E. C. Hargrave, engineer, Byers, Pa.]

Mr. HARGRAVE. What about the graphite business? A few years ago, before the war, there was lots of graphite in this country, but not a great deal being produced. And what did they do? They went back and found some rich beds of graphite, and they took it out and practically panned it, to make a little graphite. And they found they had the graphite in the country, and money was induced to go into that business, millions of dollars. And then they commenced to use the low-grade product. They used the best devices of flotation, air separators, electric separators, in order to work that product, and to-day the question is solved in this country. And I come to you to-day, gentlemen, with a product that can be made in quantities, provided we are protected.

Mr. MOORE. Where is yours mined?

Mr. HARGRAVE. Chester County, Pa.

Mr. MOORE. In what part of Chester County?

Mr. HARGRAVE. At Byers, in the Pickering Valley.

Mr. MOORE. Byers?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. How much of a plant have you there?

Mr. HARGRAVE. We have spent \$60,000.

Mr. MOORE. In mining operations?

Mr. HARGRAVE. In mining operations.

Mr. MOORE. In reducing processes?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. Have you a complete plant there?

Mr. HARGRAVE. We have what we call one unit, and the reason I am here is that this summer I have interested large capital to come in with a view of building 10 units, new plant that will cost \$500,000.

Mr. MOORE. Are you sufficiently equipped to mine, reduce, and sell to the man who makes the crucibles?

Mr. HARGRAVE. Yes, sir; we sell to them.

Mr. MOORE. You are prepared to do the whole thing from mining on?

Mr. HARGRAVE. Yes, sir. There are gentlemen here that buy our graphite, that have bought large quantities of it.

Mr. MOORE. How long have you been in business there?

Mr. HARGRAVE. In 1917 an engineer came to me and asked me if I would be interested in going into this graphite business, and made me certain figures. Later I, with a gentleman from New York, furnished him the money to equip this plant, and he put a plant which ran nine months. The plant had a capacity of about 1 ton per day. After nine months running it was not very successful, not as successful as we thought ought to be, and this gentleman who was associated with me asked if I would not become responsible for its operation. I then went in the Pickering Valley and examined the plants running there, and adopted largely our processes from one of the large plants, and put in this one unit that I speak of, with some little variations. It has been, I was going to say, an almost perfect success. I think the gentlemen here to-day from the graphite district will say they never have seen such an exhibition of graphite as the product of this plant.

When the armistice came we were just figuring to go on and double the plant. We had all the arrangements made. When the armistice came, and since then in last February, we shut it down. Then we commenced to figure that we had to do the same with low-grade copper; that we had to figure on the steam shovel; that we had to make ten times the amount; that instead of having 30 or 40 tons a day we must handle 600 or 700 tons a day.

One of the principal ones was the Crystal Co. I am going to say, furthermore, that when we found we needed \$500,000 more in that mill, we started in and spent six or eight thousand dollars to prove what we could do. The engineers from several big crucible companies made inquiries as to what we could do with our product. They said the war forced them to use 20 per cent American graphite, but they whispered in our ear, every one of them, that they were using about twice as much. What I mean is that a larger percentage of American graphite was being used than they were compelled to use by the War Trade Board.

Mr. MOORE. While the war was going on your business was profitable?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. With fair prospects?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. Now you are closed down?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. Doing no business?

Mr. HARGRAVE. We are doing nothing. This investigation has been going on with a view of building this large plant, and on September 11 I got a letter from the man in charge saying that because of the large quantities of Madagascar graphite that could be put on this market at practically 5 cents a pound, they refused to furnish the money, and said the industry would have to be abandoned.

Mr. MOORE. You have \$60,000 invested in this enterprise at present?

Mr. HARGRAVE. Yes, sir.

Mr. MOORE. And you say you were negotiating for a larger investment?

Mr. HARGRAVE. Yes, sir; \$500,000.

Mr. MOORE. How far had you proceeded toward obtaining additional capital?

Mr. HARGRAVE. I thought I had it, and I will make it plain to you gentlemen. The gentleman interested was Mr. W. H. Smith, of Philadelphia, the big copper man; the Hayden Co., of New York; the Dorr Co., of New York; and the Door Co. engineer who made the examination, and they reported that every estimate that had been given them had been fully carried out in the investigation, but that the market for graphite was so uncertain under the conditions in regard to Madagascar graphite that they decided they could not go on with the enterprise.

Mr. MOORE. Then you stopped with your \$60,000?

Mr. HARGRAVE. Yes, sir; and we lose it.

Mr. MOORE. What have you to say with regard to the quality of your output and the Madagascar graphite. Which is superior?

Mr. HARGRAVE. Ours is superior to the Madagascar.

[Mr. H. B. Johnson, general manager Southwestern Graphite Co.]

Mr. JOHNSON. What we are anxious to do is to create a market for our product and to be able to sell it on an equal basis with Madagascar.

Mr. MOORE. Does the fact that large stocks were on hand, both foreign and domestic, according to this bulletin, influence you in supporting this bill?

Mr. JOHNSON. No, sir.

Mr. MOORE. Then you are arguing for the right to do business in time of peace as well as in time of war?

Mr. JOHNSON. Absolutely, for the reason that this investment was gone into as a business proposition and not as a war baby.

Mr. OLDFIELD. It is not your intention to stop foreign imports? You want to be placed on a competitive basis with your foreign competitors?

Mr. JOHNSON. That is all we are asking.

Mr. OLDFIELD. You do not want to stop foreign imports? That is not what you are after?

Mr. JOHNSON. No, sir. We are after a chance to show what we can do to operate a plant and make a reasonable profit.

Mr. OLDFIELD. And compete with your foreign competitors?

Mr. JOHNSON. Yes, sir.

Mr. BACHARACH. Do you contend your graphite made in this country compares favorably with the Madagascar?

Mr. JOHNSON. Absolutely.

[Mr. T. A. Just, president T. A. Just Co., Chester Springs, Pa.]

Mr. MOORE. So it is well known that there are generous deposits of graphite in the valley?

Mr. JUST. Yes, sir. The question I see in this whole thing, if you will pardon me, is rather more of human interest than technical interest, when you come down to the element of whether you people are going to permit our labor in our district to compete with the labor being used in India and Madagascar. With the permission of the Chair, I would like you to look at this picture. There is an article also written by one of our big crucible men in a magazine he was editing at the time. You will see there children 6 and 8 and 10 years old making graphite in Ceylon. I am paying common laborers \$4.50 a day, and giving them a house to live in and a garden. The highest paid labor in Madagascar receives 1½ francs a day. In India it is less than half that, 10 or 12 cents. The gentleman, upon whose office wall the duplicate of this picture is hanging, says that he is against this bill, and he is a producer of American graphite. But on the picture is his name as being the owner and producer of the graphite with those children in Ceylon, and he is the biggest importer of Ceylon graphite that comes into this country. So again I say that this resolves itself into a human interest.

I designed the machine that separates that in some 12 years of labor. I have spent in the business \$225,000, over \$125,000 of my own money. So that I am not either a speculator or a promoter in that sense.

I am not willfully opposing my friends the crucible people, because they are admirable people, and I have got to keep on good terms with them because they are buying my product; but I have to oppose them here to-day, because you either give us a tariff or we die, after 12 years' labor and a quarter of a million dollars expenditure. And, gentlemen, it would be the cruelest thing in the world to compel this industry to die after we are able to produce an article second to none of the quality of that in the world.

The CHAIRMAN. Do you approve of the rates set forth in this bill?

Mr. JUST. Most emphatically I do. It puts us on a par with the 10-cent-a-day laborer, with our system of handling it, with our mechanical skill and intelligence and our American education, to produce a quality of goods far in excess of the average flake, provided we get this needed protection. Now, gentlemen, I am not going to waste any more of your time, excepting in conclusion to say that the War Board brought me before it, with Mr. McDowell, the chemical engineer in charge of that division, and several other of these gentlemen, and I asked the specific question, "If I put in fifty or sixty thousand dollars more in this business, when you are in dire need of the graphite, which you say you are, what position is this Government going to take to protect me in this additional investment?" And Mr. McDowell said in reply, "I am questionably, I can not obligate my country. That is a function of Congress. But you gentlemen must know that this country will stand by those who stood by her in the hour of need."

And, gentlemen, I put seventy-five thousand cold dollars more in my plant, because I felt that that industry had proved itself, that we were going away ahead, and I say to my friend Mr. Hargrave that if you do not give us this duty it will crush these people out of business; it will not make this electric-furnace business put them out of commission, because our graphite will not militate for or against that. If the general progression of business makes that electric furnace cheaper than the other, it will be the electric furnace, irrespective of this duty and not because of it. That is a ridiculous statement to make.

And I want to say to you gentlemen, if our country needed us once, by heavens, it will need us again.

I am asking for the protection in this bill so that I can keep my men on a parity with those children, when my men are working for three or four dollars a day. That is the answer to that.

[Statement of Mr. Floyd Weed.]

Mr. WEED. Graphite is produced in Alabama from ores that yield an average of 30 pounds of finished product per ton of crude ore treated. The cost of production per pound is from 6 to 8 cents. This means that the total cost of mining, milling, refining, marketing, depletion, and depreciation approximates \$2 per ton of crude ore, a cost that compares favorably with mining and milling operations anywhere.

The CHAIRMAN. Have you all your overhead expenses here?

Mr. WEED. Everything in that.

The CHAIRMAN. Taxes and insurance and everything?

Mr. WEED. Taxes and insurance. So we are not asking for this tariff measure to support inefficient operations.

Of the 30 pounds of graphite recovered, 20 pounds is No. 1 crucible flake and 10 pounds is No. 2 flake and dust products.

No. 1 crucible flake, mixed with Ceylon graphite, is used by all but two or three American crucible manufacturers.

It is used to a limited extent in lubricants.

The other products can be used for nearly every purpose to which graphite is put, with the exception of lead pencils.

In competition with No. 1 flake are Ceylon lump and chip and Madagascar flake. As Ceylon lump and chip are accepted or demanded as the base for all crucible mixtures, speaking only of domestic practices, they are competitive only so far as their prices affect the domestic price, and the tariff on these products is asked for only to offset the differential against the domestic product imposed by the crucible men, or if our product was placed on a parity with the average price of Ceylon lump and chip of relative grades we would not at this time need this duty, so section 2 is proposed to offset this trade discrimination.

With Madagascar flake, which with other flake products is covered by section 3, the situation is different, for there is an actual difference in cost of production of not less than 3 cents per pound between that and the domestic, and with Madagascar now selling at 8 cents and Ceylon at 14 cents, of the proposed tariff of 6 cents, 3 cents is to offset the difference in cost of production, and 3 cents to place it on a parity with the present price of Ceylon. The effect of this will be to discourage the substitution of foreign flake for domestic, and this would be accomplished without increasing the prices of the domestic flake to crucible manufacturers through the operation of this section, as the prices will be fixed through the operation of section 2.

In competition with the other graphite products are Ceylon dust, Madagascar flake, and amorphous products, and these are used as direct and complete substitutes. They are sold at such low prices, and so many manufacturers are directly interested in their exportation, that domestic products from independent mines to find any market at all have to be sold at ruinously low figures, and the cost of production and profit borne almost entirely by No. 1 flake.

Computing the cost of No. 1 flake in this way, it costs the American producers 10 cents per pound to place it on the market without profit, and if the domestic industry is to survive the problem is to get a price higher than this for No. 1 flake, sufficient to assure a reasonable profit, or to make a market of the other products that will in effect carry part of the cost of production, and distribute the charges among all the manufacturers, rather than on the crucible manufacturers alone.

The proposed tariff will do this, without imposing an unreasonable charge on any one class of manufacturers, and will keep alive a most vital industry, without abnormal stimulation.

Unless this is done, the industry will be confined entirely to a few manufacturers who make their profits entirely from the manufacturing end.

To analyze briefly the opposition that has developed to this bill: The American capital invested in amorphous mines is that of American manufacturers of graphite products. The profit is made on the manufacturing end. The price of the crude ore is so low that there is no chance of American mines operating.

During the summer we were given a quotation on Mexican amorphous of \$70 per ton, or 3½ cents per pound. At the same time we bought in the open market a 1-pound can of the same material for 40 cents, and the jobber said it cost him 26 cents. The difference of 22½ cents per pound represents a margin of safety they have in the combined mining and manufacturing enterprise, which the miner who is not a manufacturer has not.

Mr. WEED. This bill will not affect the manufacturers of graphite products using imported material in their competition in foreign markets, for they get a 99 per cent drawback on duties under our present tariff law.

[Mr. Edson] S. Bastin, geologist, United States Geological Survey.]

Mr. CHAIRMAN. Director Smith has already testified and presented some data on behalf of the Geological Survey, but a number of points have come up in the course of the discussion that I have made a few notes upon, and I may make some comments to aid in clearing up certain points.

With reference to graphite being a key industry and with reference to the war regulation of graphite imports, attention has already been called to the fact that imports of graphite were restricted in order to save shipping.

As a general rule all restrictions upon the imports of mineral commodities during the war were based upon the fundamental idea of saving ships, and the recommendations for such restrictions were made by the mineral section of the Shipping Board. The War Trade Board actually imposed the restrictions, but acted upon the recommendation of the mineral advisers of the Shipping Board. But another principle was really involved in the recommendation that 20 per cent of domestic graphite should be used in the manufacture of crucibles.

I happened to have called together the group of men who first discussed this proposal. They included representatives of the Shipping Board, the War Trade Board, the War Industries Board, the Geological Survey, and the Bureau of Mines. The informal meeting was called early in 1918. At that time it was apparent that the domestic graphite industry was in a critical situation and that some measures were necessary in order to keep that industry alive. At that time we did not know how the war was going to turn. The submarine menace was still uppermost in our minds. We did not know when the possibility of imports from Ceylon and Madagascar might be interfered with.

I think I know the spirit of the conference when we first discussed this matter, and it was this: That aside from and in addition to the necessity of saving shipping it was the part of national wisdom to keep the domestic flake graphite industry alive as a war precaution, at least. We concluded that the fairest way to do this to all concerned was to specify that a certain minimum proportion of domestic graphite, 20 per cent, should be used in the manufacture of crucibles and that crucible makers should not be permitted to obtain imported graphite unless they showed evidence that they were using this 20 per cent.

Mr. MOORE. Was that to stimulate the industry in the United States or was it a precautionary measure only?

I do not know that I can say—it was both, in a way, Mr. Moore. It was a precaution, because we believed in the necessity of keeping that industry alive as long as we were uncertain as to the duration and outcome of the war. We did not feel that the country was in a safe position without the domestic graphite industry.

I cite this history to illustrate the fact that graphite was regarded during the war as distinctly a war mineral, a key commodity.

Mr. BASTIN. There is only one other point, Mr. Chairman, I wanted to mention. The question has been raised as to the relative merits of the Ceylon graphite as compared with the Madagascar flake and the domestic flake. It is very difficult for an impartial observer to evaluate this matter at the present time because it is difficult for him to separate the effects of technical differences or differences in the service given by the two graphites when embodied in crucibles. From the effects of prejudice in favor of a material which has been used during a long term of years and also the results the uncertainty of the American supply in past years, for it must be confessed that prior to the war crucible makers were not able to rely with any large degree of certainty upon the domestic supplies. But there is this much light thrown upon the relative merits of the Ceylon graphite versus the flake graphite; for we knew

at during the war Great Britain and France depended almost exclusively on the Madagascar flake graphite for the manufacture of crucibles, and we have no information that the crucibles made by that graphite were not of a satisfactory grade. Furthermore, it would be very difficult for most laymen to tell the difference between the Madagascar graphite and certain grades of American flake graphite such, for example, these from Pennsylvania which have been placed upon the table.

[Mr. George H. Bailey, American Mining Congress.]

Mr. BAILEY. George H. Bailey, of the American Mining Congress. I only have three or four remarks to make in regard to crucibles for making steel. There was no testimony given you this morning in regard to the possibility of that business being changed and being endangered from the electric furnaces. I can tell you that is not quite fair testimony and that at the present time there is nothing considered long that line interfering with the present crucible methods. That comes from a discussion had within the last three weeks with one of the most prominent manufacturers in the country. The possibility of using electric furnaces may go to other metals, but it will not reach steel for a long time, and until the electricity is very greatly cheapened.

There was some more testimony that I can not help but think was quite unfair here. It is a fact that the foreign makers of crucibles, according to the testimony given you here, all use the flake graphite; England, Germany, I understand, and France; and we understand Japan uses the Korean flake graphite in making crucibles which are sold here in this country even after paying the present duty of 20 per cent ad valorem. That shows the bringing in of flake graphite established in the crucible business. It is possible that these gentlemen who are using the old formulas in creating their crucibles out of Ceylon graphite to a standard that they have established in the past, who hesitate to change, will be compelled by the force of foreign competition to go to using the cheaper graphite produced here in this country. You must remember again that it is entirely possible for the reason that the process by which this flake graphite is being produced now is new; and has been perfected within the past two or three years.

Now that brings up this point, that they will find a formula by which they can use the flake graphite in making just as good or a better crucible than they have been making, and then they will need this product.

Now, where does that leave the situation? You have here 53 plants. These gentlemen own them. And remember, these plants are all new, and if these gentlemen are not given some protection at this time they must lose them. Now, who would be the natural recipients for the donations that may be made of these great properties? We can safely assume it will be the people who have now found that they can use them in their manufacturing business. It is not a comfortable thing to look at, but will naturally follow. The people who know what can be done under present manufacturing process can use their plants if they should be taken away from these men by lack of a market, and with the assistance of the bankruptcy courts. So it would be only necessary, without the assistance of a tariff, to allow these going business enterprises, the owners lose their properties in the next two or three years, and the manufacturers take up such of them as would be most valuable and use these same properties to the same extent.

We have enough graphite in the United States and Alaska to run the world for a great many years. We have unusable quantities, you might say. And, as Mr. Just told you before lunch, in Alaska they find the same type of graphite as in Ceylon. So, you see, the whole market can be supplied from our country.

There is such a thing as wanting to encourage and make prosperous the communities in the different sections of the country, and it is for that we are here, and are glad to submit this matter on the testimony that you have received. We will give any further information you may ask at any time, and we ask you at all times to call up the American Mining Congress and we will submit any additional information you may require for your consideration.

The CHAIRMAN. I want to say to you that it has always been my opinion that any man who asked for protection on his product and free trade on his neighbors' product was inconsistent and should receive but little consideration at the hands of Congress, and I believe I am right in that opinion. Some men are very selfish, and because they must buy a certain material as a part of their raw material which is their neighbors' finished product, ask to have them kept on a free list that he might, in his opinion, buy it a little cheaper, but still ask for protection on his own product. I do not care very much for a man of that kind.

Mr. BAILEY. I agree with you.

[Analysis of opposition to H. R. 5941, submitted by Mr. A. B. Conklin.]

No representative of crucible foundries appeared against the bill, aside from the Crucible Steel Co. of America, who manufacture only their own crucible.

No jobbers, dealers, or consumers of crucible products of either steel, brass, alloys or precious metals appeared against the bill.

The only opposition was from crucible manufacturers and importers or jobbers of graphite crucible products. The crucible makers were represented by Mr. McNaughton, of the Joseph Dixon Crucible Co., and Mr. Todd, of the Crucible Steel Co. of America.

Mr. McNaughton maintained that the Alabama development was unwarranted and ill advised, consisting of impractical experiments, the cost of which should not now be placed as a burden against the crucible industry.

After operating their mines at Ticonderoga, N. Y., for about 50 years with traditional methods, the Joseph Dixon Crucible Co., in 1918, completed the installation of a modern graphite milling plant at Ticonderoga. The process they adopted was selected from our Alabama development, after their engineers carefully investigated the various methods used in our district through the courtesy of our operators who afforded them every facility to reach a conclusion.

There is recorded in the records of Clay County, at Ashland, Ala., an instrument or mortgage dated some time in 1917, given by the Quenelda Graphite Co. to the Joseph Dixon Crucible Co. for a \$200,000 loan. Part of the consideration of this instrument was that all the crucible grade of graphite produced by the Quenelda and the Alabama Graphite Co. should be sold to the Dixon Co. It is commonly understood in Alabama that the sole motive of the Dixon Co. in furnishing this money was their desire to control the output of these two Alabama companies, who were then being operated by the same interests. Those were times when the crucible makers were zealously seeking the Alabama graphite.

[From the United States Geological Survey, Department of the Interior.]

GRAPHITE INDUSTRY IN 1920.

The quantity of domestic flake and amorphous graphite sold by producers in the United States in 1920 amounted to 9,510 short tons, an increase of 28 per cent over the quantity sold in 1919.

The value of the graphite sold in 1920 was about \$626,201, as compared with \$778,800 in 1919. These figures are based on reports made by producers to the U. S. Geological Survey, Department of the Interior.

Operators in Colorado, Nevada, and Rhode Island reported sales of 4,694 short tons of amorphous graphite in 1920 at an average price of \$10.60 a ton. This was \$3.52 a ton less than the average price in 1919.

The sales of crystalline graphite in 1920 amounted to 9,632,360 pounds, valued at \$586,443, as compared with 8,086,191 pounds, valued at \$731,141 in 1919. The average price per pound in 1920 was 5.9 cents; in 1919 it was 9 cents. Alabama led in the production of crystalline graphite, the sales in 1920 amounting to 4,894,648 pounds or 51 per cent of the total quantity sold in the United States.

The sales reported from New York and Pennsylvania amounted to 3,552,687 pounds or 37 per cent of the total in the United States, and the remaining 13 per cent was reported from California, Montana, and Texas.

The Acheson Graphite Co. reported the sale of 7,399,749 pounds of artificial graphite which is manufactured at its plant at Niagara Falls, N. Y.

Domestic graphite sold in 1915-1920, in short tons.

STATEMENT OF GEORGE F. PETTINOS, GRAPHITE PRODUCER AND IMPORTER, PHILADELPHIA, PA.

The CHAIRMAN. Will you kindly state your name and residence?

Mr. PETTINOS. My name is George F. Pettinos; Philadelphia, Pa.

The CHAIRMAN. What is your occupation?

Mr. PETTINOS. Graphite production and graphite importations, and the manufacture of the crude graphite into the various things for which it is used.

The CHAIRMAN. You use the home article and the imported article, both?

Mr. PETTINOS. Yes, sir; I also have a mine of my own, which I would like to talk about.

I will state my views in the matter of this duty. I want graphite on the free list.

I own one of the oldest and best deposits of graphite in the United States, at Byers, Chester County, Pa.

I have imported graphite for years. I have manufactured and sold crucibles in Philadelphia. I have a factory at Spring City, in which I take all kinds of crude graphite and put it into shapes that can be used for the various purposes; and therefore I know something about the subject.

The CHAIRMAN. Is this a large mine of graphite in Chester County?

Mr. PETTINOS. I would say it is the largest mine in Chester County.

The CHAIRMAN. That may not mean very much.

Mr. PETTINOS. The property consists of 95 acres. The graphite is distributed over probably half of that, so far as borings will show.

The crucible industry, as we all know, consumes the major portion of graphite used in this country. There is no question about that, and probably when it comes down to the crystalline graphite, which is really the only quality which can be used for the manufacture of crucibles, it probably runs up near, we will say, 75 and perhaps 90 per cent in value of all the crystalline graphite that is used in this country. Therefore, the production of crystalline graphite in this country and the importations stand or fall with the crucible industry. The crucible industry requires Ceylon graphite, and there is no graphite in this country—my own mine included—that will produce

a material that can be substituted for the Ceylon quality, except in small quantities up to, say, 10 per cent.

This is the testimony of every crucible maker in the land, without exception.

Senator WATSON. Have they tried the Alabama or Montana varieties to ascertain whether they measure up to the Ceylon for quality?

Mr. PETTINOS. Yes, sir; I have tried it myself, as a crucible manufacturer. During the war I tried a mixture of 35 per cent of flake graphite with Ceylon graphite. I made 8,000 crucibles. I was forced to use as much of the flake graphite as I could on account of the shipping conditions affecting importations from the Island of Ceylon. The average of those 8,000 crucibles was five heats when they should have been 26.

Afterwards, I took clay of the same identical quality, and I used all Ceylon graphite. The average of these crucibles was 26 heats. And I will say that in the navy yard at Portsmouth, N. H., 20 of these crucibles showed an average of 30 heats. Every one of the manufacturers of crucibles will tell you they had the same experience in trying to use American flake.

It is true that the Bureau of Standards has looked into this question and has made laboratory experiments of great interest, so far as scientific results are concerned. But if I was a committee I think I would take the testimony of the men who are in the business on a large scale, who have to satisfy their customers, and their bread and butter depends upon as to whether their product is suitable or not.

I am coming now to the point——

Senator WATSON (interposing). Are you gentlemen in anywise interested in the graphite deposits in Ceylon or Madagascar?

Mr. PETTINOS. Not myself; only so far as an importer.

Senator WATSON. You say you have no financial interest in those deposits?

Mr. PETTINOS. No; I buy their product, just as you would or anybody else, or any of the others who might open and own a mine.

I am coming to the point: The great competitor of the crucible is the electric furnace. The electric furnace to-day is on a par with the crucible as far as its costs and quality of production is concerned. If you handicap the crucible, the electric furnace will wipe the crucible industry out of existence. The Bethlehem Steel Co. some months ago used 10,000 crucibles a month; to-day they have cut every one of them out, just simply discarding their crucible furnaces, and they have equipped themselves with the electrical furnaces. I think that is enough to point to the direction in which this great crucible industry of a hundred years standing is going.

Senator WATSON. They did not do that on account of lack of graphite?

Mr. PETTINOS. No, sir; they did it because in their experience they found it a little bit cheaper to make their steel by the electric furnace than to use the crucible. Therefore, I say the electrical furnace is the great competitor of the crucible, and it is going to eventually eliminate crucibles entirely if the cost of graphite is increased by a duty.

You do not want to destroy an old-established industry. Give it its chance and let the survival of the fittest take place. In other words, if the electric furnace has the advantage of any handicap over the crucible, it will gain the preference and the crucible business will disappear.

Senator McLEAN. Was this change from graphite to electric furnace due to the tariff on the imported article?

Mr. PETTINOS. Oh, no; there has not been any tariff so far, you know.

Senator McLEAN. Are you talking about paragraph 211 and about the 10 per cent duty?

Mr. PETTINOS. Graphite has been on the free list for 50 years.

Senator McLEAN. Would it in the future in any way retard the increase in the use of the electric furnace—

Mr. PETTINOS (interposing). I did not quite catch that question.

Senator McLEAN. Would this 10 per cent ad valorem duty on our material retard the use of the electric furnace?

Mr. PETTINOS. No; it would increase the use of the electric furnace; it would handicap the crucible 10 per cent in favor of the electric furnace.

Senator McLEAN. Put it any way you desire. Is that addition of 10 per cent sufficient to protect your interests against the competition of the electric furnace?

Mr. PETTINOS. I do not want the protection. I am on the other side. I do not want to see this duty hamper the great industry that consumes the largest amount of graphite.

Senator McLEAN. I understand your position perfectly. But will the imposition of the tariff affect one way or the other the use of the electric furnace?

Mr. PETTINOS. It will if a tariff is put on graphite. The use of the electric furnace will increase, because the tariff will handicap the crucible just that much.

Senator SMOOT. You stated that the crucible would cost 10 per cent more. Of course, you did not mean that?

Mr. PETTINOS. I think it will cost more than 10 per cent more, if there is a 10 per cent duty put on, because graphite is the base of the manufacture of the crucible. It is the material that costs the most.

Senator SMOOT. It could not be 10 per cent on labor, nor could it be 10 per cent on the other products in the crucible. So it could not add 10 per cent on the crucible.

Mr. PETTINOS. It would probably add 10 per cent.

Senator SMOOT. No; it could not. You are receiving to-day 20 per cent protection on the manufactured article under the Underwood bill?

Mr. PETTINOS. I believe so.

Senator SMOOT. And this bill provides you what—35 per cent?

Mr. PETTINOS. I do not know.

Senator SMOOT. I mean on the manufactured article—the crucibles themselves.

Mr. PETTINOS, I do not know.

Senator SMOOT. I will say it does provide 35 per cent. Have you had very much competition from the importers of crucibles from foreign countries?

Mr. PETTINOS. No, sir; only a little bit from Japan during the war.

Senator SMOOT. What is the market value and selling price of products to-day?

Mr. PETTINOS. Which product do you mean?

Senator SMOOT. The product made from graphite or in which graphite is a component part.

Mr. PETTINOS. The price of the crucible averages about 10 cents a number. The number really is the size of the crucible.

Senator SMOOT. Yes.

Mr. PETTINOS. The market has dropped out of imported Ceylon plumbago to-day; it is down to 6½ cents. Amorphous graphite, the crude, is worth, laid down at my mill, about 3½ cents a pound.

Senator SMOOT. What is your capital stock?

Mr. PETTINOS. I am an individual.

Senator SMOOT. You are running as a partnership with how much money?

Mr. PETTINOS. I operate as an individual; I have \$1,000,000 personally; I operate as an individual; I am in no partnership.

Senator SMOOT. Just as an individual?

Mr. PETTINOS. As an individual.

Senator SMOOT. And out of that \$1,000,000 capital, what did you make last year?

Mr. PETTINOS. Last year I made \$59,000.

Senator SMOOT. Net?

Mr. PETTINOS. Net; and I paid my income tax on that.

It might be well to just state in passing how many of these crucible makers there are—the number is just 13. There are 7 in Pennsylvania, 3 in New Jersey, 1 in Illinois, 1 in Massachusetts, and 1 in Connecticut.

The points I wish to impress are that the electric furnace is the great competitor of the crucible to-day and that the major portion of graphite in this country is absorbed by the crucible manufacturers and the production and importation of graphite stand or fall with that industry.

Senator SMOOT. In a 70-pound crucible how much graphite do you have?

Mr. PETTINOS. Only No. 60 is used in the steel melting, so there would be the brass. The weight of a 70 crucible—I can not remember the exact figures.

Senator SMOOT. It is about 17 pounds.

Mr. PETTINOS. The weight would be about, I would say, 38 pounds, or perhaps 38 pounds total; and anywhere between 43 per cent and 50 per cent of that is graphite.

Senator SMOOT. That is what I say, about 17 pounds; that is what I asked.

Mr. PETTINOS. Yes, sir; that is right.

Senator SMOOT. You say on that 17 pounds in a 70-pound crucible it could not possibly be 10 per cent?

Mr. PETTINOS. You are quite right, Senator.

Senator SMOOT. So that it would be about one-seventh of 10 per cent, which is 1⅓, which it would add to each pound of graphite in this crucible.

Mr. PETTINOS. I would like to go back to the electric furnace. In 1908 there was no production of steel ingots by the electric furnace. In 1917 there were 304,543 tons against the production of 126.7 tons through the crucible. That tells the tale.

Senator SMOOT. But would not free graphite or no duty upon graphite or graphite importations manufactured with graphite stop that?

Mr. PETTINOS. Oh, no, sir; this is a physical condition.

Senator WATSON. That is what I am trying to find out, what that has to do with graphite. If this electrical furnace is coming anyhow and the electrical furnaces are driving out the crucible, graphite has nothing to do with it.

Mr. PETTINOS. The more you add to the cost of the crucible the quicker the industry will be driven out; is not that so?

Senator McLEAN. Have you any figures showing the cost of reducing ore to metal by the electrical process and by the graphite crucible?

Mr. PETTINOS. The cost of both are practically on a par. I have no details, but I will say this: The automobile is probably driving out the horse, but I think it would be bad to start to kill all the horses.

Senator McLEAN. At the same time you could not give them eternal life by putting a tariff on them.

Mr. PETTINOS. But let them give us their usefulness as long as they can, and then when their usefulness ceases we will all ride in automobiles.

The lead-pencil manufacturers use amorphous graphite, and they do not use any amorphous graphite that is produced in this country. The great percentage of amorphous graphite used by the lead-pencil manufacturers comes from Mexico, and of course any tariff on that will hit the lead-pencil makers.

I would just like to say that in 1919——

Senator SIMMONS (interposing). Do I understand you as opposing tariff on the raw material?

Mr. PETTINOS. I am against it, because I say it will destroy the very means or agents that consume the greater portion of it.

Senator SIMMONS. Are you advocating a tariff upon the finished product?

Mr. PETTINOS. No, sir; I have not asked for it.

Senator SIMMONS. You do not want a tariff on this?

Mr. PETTINOS. It does not interest me in either case, but I do not want to see the graphite industry handicapped with a tariff.

Senator SIMMONS. You are not asking any tariff for the manufacturer?

Mr. PETTINOS. No, sir. The exports for 1919 by the lead-pencil manufacturers amounted to \$3,565,347. At this particular time I think this country does not want to curtail export trade if possible. That is all I have to say.

Senator SIMMONS. I think I understand you, but I am not sure. I understood you as making this point, that the danger to your industry does not come from cheap imports?

Mr. PETTINOS. Why, no.

Senator SIMMONS. But the danger to your industry, you think, is from the competition in reference to making steel in electrical furnaces and not with graphite crucibles?

Mr. PETTINOS. The danger is adding to the cost of production of the industry—the crucibles. If you put a duty on that material that crucibles are made out of, then that great competitor, the electrical furnace, will wipe the industry off the face of the earth.

Senator SIMMONS. In other words, you are afraid if you put a duty thereon it will increase the cost of producing the product, and less your ability to compete with the electrical furnace.

Mr. PETTINOS. Absolutely.

Senator SIMMONS. But would you rather let your mine close down than your manufacturing establishment?

Mr. PETTINOS. That is it exactly. If I could sell all the product of my mine to the crucible maker I would have a fortune.

BRIEF OF GEORGE F. PETTINOS, GRAPHITE PRODUCER AND IMPORTER, PHILADELPHIA, PA.

I am well fitted to give your committee information of value as to the effect the duty on graphite would have on our industries because—

(1) I own and have worked one of the best and oldest graphite deposits in the United States at Byres, Chester County, Pa.

(2) I have imported graphite for years.

(3) I have manufactured and sold crucibles at Lehigh Avenue, Philadelphia Pa.

(4) I have a factory at Spring City, Pa., where I take the crude graphite and refine it for all purposes. I have been in the graphite business since 1892, practically 20 years.

The crucible manufacturers consume about 80 per cent of all the crystalline graphite used in this country; hence the graphite production of this country, and the graphite importation, stand or fall with the crucible industry.

Ceylon graphite is the base of the manufacture of the crucible, and there is no graphite produced in this country that can be substituted for it that will make a satisfactory crucible, and this is the testimony of every crucible maker in the country.

The electric furnace is the great competitor of the crucible, and to-day stands on a par with the crucible in cost and quality of production. Any addition to the cost of the crucible in the shape of a duty on the raw material that must be imported will sooner or later wipe out the crucible industry of 100 years standing and the electric furnace takes its place. This will take away any possibility of the thousands of smaller foundries, who can not afford to install the electric furnace, of competing with the large works who can.

The Bethlehem Steel Co. some months ago used 10,000 No. 60 crucibles a month and now they do not use one, because they have discarded all their crucible furnaces and have installed electric furnaces.

(1) In 1908 the production of steel ingots by the electric furnace was nothing; in 1917 the production by the electric furnace was 304,543 gross tons, and the production by the crucible was 126,716 gross tons.

The above illustrations are enough to show what will happen to the crucible industry that consumes 80 per cent of the graphite if further costs are added in the shape of a duty. It is true that the crucible makers have found that 10 per cent domestic graphite can be mixed with the Ceylon graphite, but if more than that is used the results are disastrous in proportion to the additional amount added. If the crucible makers could use the domestic product which costs one-half the price of the Ceylon product they would be a set of fools not to do so. A duty on graphite will penalize the crucible makers and give the electric furnace the advantage, and sooner or later the 80 per cent consumption of crystalline graphite is wiped out without giving revenue or protection.

The lead-pencil manufacturers can not use any of the amorphous graphite produced in this country, and they are hard hit by duty. Mexican amorphous graphite is used entirely for making lead pencils with the exception of a comparatively small amount of Ceylon graphite used in making one class of pencils.

(2) The lead-pencil manufacturers of the United States exported \$3,565,347 of pencils and pencil leads in 1917. This is not the time to increase their costs by a duty on their raw materials just when foreign trade is so necessary.

(3) The fact of producers of graphite in this country asking for protection on a material that sells for twice the price as theirs is something new in tariff protection.

Graphite has been on the free list for 50 years, and former legislators have realized that this condition has made the great crucible and lead-pencil factories what they are to-day.

I am not in favor of putting a duty on an important raw material that can be produced in this country. A duty on graphite will automatically wipe out the production of graphite and give no revenue to the Government nor any protection to graphite production in this country.

STATEMENT OF CHARLES E. KERN, REPRESENTING DEALERS IN GRAPHITE AND GRAPHITE PRODUCTS.

The CHAIRMAN. Mr. Kern, you are here again on graphite?

Mr. KERN. Senator, I am going to be very brief. I just want to speak about this crucible and electrical furnace business.

The CHAIRMAN. You are in the crucible business?

Mr. KERN. No; I am connected with the graphite interests. I am their counsel. The point is that the electrical furnace is something that can be used only by the large manufacturers.

The CHAIRMAN. We know all that.

Mr. KERN. There are probably 5,000 foundries that use crucibles today. Most of them could not put in the electrical furnace because the electrical furnace can not be provided at less than \$25,000, and they are the ones who would be discriminated against if we increase the price of the crucible by a tariff on graphite; that is the point I wish to make. We wish to have graphite kept on the free list.

There is only one other thing I desire to say: For eight months I have made it my business to inquire to find a crucible made of domestic graphite. I have not been able to discover a crucible that was ever made anywhere in this country made of domestic graphite; and I have made every effort to find it.

The CHAIRMAN. That has already been stated to the committee.

Mr. KERN. May I say another thing? The statement was made yesterday that crucibles could be made of domestic graphite. As a matter of fact I have tried to find a single instance in which a crucible has been made with more than 10 per cent of domestic graphite that would give a normal number of heats, and I have been unable to discover such a crucible. I have worked very diligently for that purpose. I have written letters to many people and have inquired broadcast, and I think I would have learned of it if such had been the case. I know that the Government officials at the navy yard during the war put in their specifications a requirement that the crucibles delivered to them should be made 100 per cent Ceylon graphite.

I will submit a brief and also a brief by Mr. Jonathan Bartley, formerly superintendent of the Joseph Dixon Crucible Co., showing the result of his seven years' experiments in a fruitless attempt to make crucibles from domestic graphite.

(The brief of Mr. Bartley will be found on p. 3966, Pt. V, of tariff hearings before the House Committee on Ways and Means.)

Senator SIMMONS. You think that the crucible plays no part in this question because it is not made out of the domestic graphite?

Mr. KERN. I fear I have made myself entirely misunderstood; I did not mean anything like that.

Senator SIMMONS. I understood you to say that you could not make these crucibles of domestic graphite. That is what you said. Now, I do not see why, if that is so, the crucibles bear any relation to the controversy that we have before us.

Mr. KERN. Oh, yes; the point is this: Representative Heflin, now Senator Heflin, introduced a bill in the House providing that a protective tariff be placed upon graphite up to 6 cents a pound.

Senator SIMMONS. That is the question that is before us.

Mr. KERN. The point is, that it is impossible to protect the domestic graphite by any kind of a tariff, because no matter how high the tariff may be it can not force the use of this domestic graphite in crucible making. We must have the Ceylon graphite. About 85 per cent of the imported crystalline graphite goes into crucibles. Of all the graphite used in the United States about 45 per cent goes into crucibles.

Senator JONES. Then your point is that a tariff on graphite would be detrimental to the industry rather than a protection?

Mr. KERN. Absolutely; it would simply hamper the crucible industry without protecting anything, because there is nothing in this country that can be used to make crucibles of.

Senator SIMMONS. I thought when you first started out that you said that domestic graphite was not used in the manufacture of crucibles at all, and now you modify it by saying that probably 10 per cent is used.

Mr. KERN. I meant that no crucible was made of anything like 100 per cent domestic graphite. The largest amount of domestic graphite that can be used is 10 per cent mixed with the clay.

BRIEF OF CHARLES E. KERN, REPRESENTING DEALERS IN GRAPHITE AND GRAPHITE PRODUCTS.

I represent graphite dealers and manufacturers who are endeavoring to bring about a revival of business in the crucible industry. While they are trying to keep prices down they are now threatened with a tariff on graphite which will increase the costs, although for more than 50 years graphite has been on the free list.

The crucible makers do not ask for any tariff protection. They see their greatest advantage in a quick revival of business and they believe this can be accomplished best by keeping down manufacturing costs. They believe this is the worst time to take graphite off the free list because it will add to their costs.

In the face of this effort they find that the Alabama graphite interests, which is practically another name for the Quenalda Graphite Co., are here trying to obtain duty on graphite. This Quenalda Graphite Co. claims to own 60 per cent of all the graphite deposits in the United States, which makes it one of our greatest monopolies of a natural product. Ninety per cent of all graphite deposits of the United States will be found in Alabama.

This graphite monopoly of Alabama bases its claim for a tariff on the alleged competition of cheap oriental labor, but labor is not a factor in this case because the Ceylon graphite has always sold for from 50 to 100 per cent more than the Alabama product. This is because the Alabama product can not be used to make crucibles beyond a small mixture that is used along with the binding clay. No crucible made of domestic graphite and fit for use has ever been put on the market, although the cheapness of Alabama graphite would make it enormously profitable. For several years there have been mysterious rumors that there would be such crucibles but the trade has never known of them.

Domestic graphite deposits have been known during the many years we have had graphite on the free list, and there is no new argument for giving protection to the product.

No other industry is asking for protection from products that sell in this country for a higher price than the domestic article. No matter how high the tariff may be it can not force crucible makers to use an unfit raw material. It might hamper the business by adding cost, but it can only serve the Alabama interests as an advertisement. The tax can not increase the consumption of Alabama graphite.

Increased cost of crucibles will work to the disadvantage of manufacturers who have small capital. The electric furnace and the crucible have been going nip and tuck in the matters of cost efficiency, but if expense is added to the crucible by a tariff which does not apply to electric furnaces there will be a positive advantage for manufacturers of large capital, because they can change to the electric furnace. Men operating on a small scale will of necessity continue to use the crucible if they remain in the business.

Alabama graphite is valuable for making lubricants and paints, and for these purposes it is practically without competition, from high prices during the war. For

not now suffering any more than is the crucible industry, which looks to lowering its as a means for reviving its business.

Our graphite trade with Ceylon is now giving return cargoes to American ships that carry our products to the Orient.

It has been suggested that we should develop our graphite deposits as a preparation for war, but until some one can make a satisfactory crucible of this graphite it can not be used in war time. Necessity caused the most thorough tests of this material in crucible making during the recent war and proved that it was unfit for that purpose, beyond a small mixture along with the binding clay.

We trust the crucible industry will be permitted to continue with the conditions under which it was built up.

STATEMENT OF H. M. RIDDLE, REPRESENTING THE ASBURY GRAPHITE MILLS, ASBURY, N. J.

Mr. RIDDLE. We have one of our mills in the northern part of the State of New Jersey. We have been in the business for 26 years, grinding, refining, preparing, or manufacturing graphite for foundry facings, stove polish, electrical, and other purposes; and I want to say to you, gentlemen, that in all my experience of 26 years I have found no graphite that will take the place of the Ceylon product. I ask that Ceylon graphite be allowed to come in free of duty.

There are 4,000 foundries in this country. More than half of them use Ceylon graphite, and it is impossible to make good castings without that product.

Senator McLEAN. What do the other half use?

Mr. RIDDLE. Some do not use facings; they may use coal facings.

BRIEF OF H. M. RIDDLE, REPRESENTING THE ASBURY GRAPHITE MILLS, ASBURY, N. J.

A very serious situation confronts not only the manufacturer and refiner of foreign crystalline graphite but all users of this material, including nearly 4,000 foundries in the United States, stove-polish manufacturers, and the large crucible and electrical interests.

The Fordney bill, as passed by the House of Representatives, calls for a 10 per cent ad valorem duty on foreign graphite. Let me beg you to use your best endeavor to have foreign graphite come in free of duty. There has never been a duty on foreign crystalline graphite, for the simple reason that we can not get along without this material.

There is something about the texture of Ceylon graphite that American graphite does not contain. Aside from that, there is only about 2 per cent of graphite in the American rock as mined, while the Ceylon product comes to us from 60 per cent to 98 per cent pure. Just think of this difference!

During a portion of the war our mills had the contract to supply the United States Navy with all the graphite they used for lubricating purposes. We experimented with every form of graphite mined in this country. We sent a man into the Alabama field and the Canadian field. We were especially anxious about the Alabama field, hoping the American product might answer our purposes, but our experiments proved there was absolutely no graphite to be found that would take the place of the Ceylon product.

There was a vein in Canada which came nearer the Ceylon product than anything we were able to find, and we, as well as all other refiners in the country, were put to our wits' end to get a graphite that would work during the war. Fortunately, some of us had a supply of Ceylon graphite on hand, and by mixing this with the Canadian and the American product we were able to pull through, but the prices we had to ask were simply exorbitant.

There are 19 refiners of Ceylon graphite in America, and their business is at a standstill. Aside from these, the thousands of foundries and other interests which can not possibly get along without Ceylon graphite are overburdened. We know this, because they can not pay their bills, and everything connected with iron is at its lowest ebb. Our business this month is about 10 per cent of what it was last year at this

time. This gives you an idea of the iron business in general, because we usually are the first to feel any change for the better in a business way.

You are, no doubt, aware that the smallest motor operating an electric fan, as well as the largest one propelling our stupendous battleships, is lubricated by a brush or brush composed principally of Ceylon graphite, and the graphite contained in this brush must be from 96 to 98 per cent pure. There is no other graphite that will perform this work.

Our experience with American graphite leads us to believe that it is injurious to the health of the men who work in it, for the reason that the dust is of a different nature than the Ceylon dust, because of the rock contained in it. The waste in refining is also very great, as it is next to impossible to hold the American graphite in any container. You throw a bag of it on the floor, and before you can look up it is in the air.

Let me assure you, there is nothing in America to take the place of the Ceylon product. If the duty is imposed the price to all consumers of iron will be increased accordingly, and not only to the iron manufacturers, but the manufacturers of crucibles, stove polish, and electrical appliances will have an additional burden placed upon them, and you are aware that these interests are large in our country, running into many millions of dollars.

Let me ask, if the gold found in the United States did not make good money would you place a duty or tax on the gold we import from South Africa to make American money?

In view of the above facts, will you not do your best to have graphite admitted into this country free of duty?

STATEMENT OF GEORGE A. SHARPE, ASHLAND, ALA., REPRESENTING THE ALABAMA GRAPHITE PRODUCERS.

Senator SMOOT. Give your name for the record, please.

Mr. SHARPE. George A. Sharpe, Ashland, Ala. I represent the Alabama graphite producers.

Mr. Chairman and gentlemen of the committee, I have a brief here which I would like to submit and just a few remarks to offer on two points.

Senator SMOOT. It will be printed. What duty do you want?

Mr. SHARPE. We want the schedule as originally introduced, running from 1 cent a pound on crude graphite ores up to 6 cents a pound on the finished product; that is, 1 cent a pound on crude and 6 cents a pound on flake. I have this schedule set out in my brief in full. I favor a tariff on American graphite because we have unlimited quantities of graphite in this country, and because the quality of the graphite we have in this country is as good for practically all purposes as any other graphite produced anywhere.

In the testimony given this morning by Mr. Pettinos he stated that the manufacturers of graphite crucibles do not want or need a tariff on their manufactured products at all. The same statement was made by Mr. McNaughton of the Dixon Co. in his testimony before the Ways and Means Committee.

The crucible makers have been enjoying a tariff of 20 per cent ad valorem on their graphite products for years. Now, although they do not want or need even that 20 per cent they are reported in this bill H. R. 7456, under paragraph 216, on a basis of 35 per cent ad valorem on the same graphite products. In other words, although they do not need it at all they have had it increased. They have had it increased 75 per cent above what they had before. Now they say that if the producers of graphite get even the small 10 per cent reported out for them in this same bill it will encourage the electric furnace and ruin the crucible business. If the consumers of graphite crucible will turn to electric furnaces because of 10 per cent, what

Will this 35 per cent do? If 10 per cent will ruin the crucible business, what will happen to it on the 35 per cent basis?

The other point which has been raised—and it has been raised and argued on from the very beginning—is that American flake graphite will not make a good crucible of itself. The crucible makers only concede that a small portion of American flake may be used in crucible mixtures. I propose to show the committee that American flake graphite will not only make a good crucible of itself, but that it will make a better crucible than a crucible made of Ceylon graphite, which the crucible makers claim to be the best and in fact the only graphite for crucible use. It is time to expose this fetish of the crucible makers. Mr. Kern said he searched the entire United States in a diligent effort to find a crucible maker who was making crucibles out of American flake graphite, and he could find none.

His search was careless because he overlooked the Electro-Refractories Corporation of Buffalo, N. Y. This concern is making crucibles out of nothing but American flake graphite, mixed with American clay and other American materials; in other words, they are making an all-American crucible. They are selling from 1,500 to 2,000 of these all-American crucibles a month to one of the largest consumers of graphite crucibles in the United States. Instead of getting 6 heats to the crucible, as Mr. Pettinos testified this morning was the limit for a Ceylon crucible, this large consumer is getting an average in carload lots of 85 heats to the crucible.

Senator WATSON. That letter is already in the record?

Mr. SHARPE. Yes. I am simply comparing the number of heats that crucibles made from the American material yields with the number of heats obtained from the use of the Ceylon product which so many of our crucible manufacturers advocate.

Senator WATSON. Is that the only establishment in the United States using the American graphite?

Mr. SHARPE. That is the only one I know of at present.

Senator WATSON. If they can do that, why don't more use it?

Mr. SHARPE. I think they will. This result was obtained by the Electro-Refractories Corporation of Buffalo, N. Y., and is in keeping with and supported by the reports of Dr. Stull, of the Bureau of Mines, in which he says that Alabama flake graphite tops the list for crucible use. If we get the tariff we ask—from 1 cent on crude up to 6 cents on flake—we shall be satisfied. Flake is the particular grade which goes into crucibles, and with our tariff the consumer will get a better and a cheaper crucible. I will prove this to you. Take a No. 70 crucible, which contains about 17 pounds of graphite. If we charge the full tariff of 6 cents a pound to this it would mean an additional cost of \$1.02 for the crucible.

Senator SMOOT. That is the No. 70 goods?

Mr. SHARPE. Yes; the No. 70 crucible, containing 17 pounds of graphite, would cost \$1.02 additional. If that crucible is made of Ceylon graphite it will stand not more than 30 heats. Mr. Pettinos, a crucible maker, says 26 heats, but we still say 30 heats for good measure and to be perfectly fair to the foreign material. If that crucible is made of American flake graphite, it will stand 85 heats, according to the people who are using them. They have gotten as high as 148 heats, but they are averaging 85 heats in carload lots, so we will use 85 and be conservative.

In a No. 70 crucible each charge of metal will weigh about 30 pounds. Melted in the Ceylon crucible, taking a total of 90 charges we then get a total melt of 90 by 30 equals 2,700 pounds of melted metal.

Melted in the American flake crucible, taking a total of 85 charges we get a total melt of 90 by 85 equals 7,650 pounds of melted metal.

I thought crucibles were selling to-day for 7 cents a number. Mr. Pettinos says 10 cents, but we will again be fair and use 7 cents. The price of a No. 70 Ceylon crucible is therefore \$4.90; add the tariff of 6 cents per pound, which we ask on flake, \$1.02, and we have the cost of the American flake crucible \$5.92. Melting 2,700 pounds in the Ceylon crucible, at a cost of \$4.90, means a cost of 0.18 cent per pound of metal melted. Melting 7,650 pounds in the American flake crucible at a cost of \$5.92 means a cost of 0.08 cent per pound of metal melted, less than one-half the cost of melting in a Ceylon crucible.

Senator WATSON. Have you some one from that institution testify?

Mr. SHARPE. Nothing but a letter placed in the record yesterday by Mr. Johnson signed by the secretary-treasurer of the company.

The facts which I have laid before you will be appreciated by the consumer of crucibles. The crucible makers, of course, having associated the consumers to the idea that the crucibles made from Ceylon graphite are the best, naturally do not wish to disturb it, especially because of the shorter life of the Ceylon crucible, when they can get the consumer twice as many Ceylon crucibles as they could American flake crucibles. So by granting us the schedule we ask in our bill and adding on the full 6 cents per pound which we ask on our flake the consumer will be able to buy his crucibles at half the present cost. The inroad of the electric furnace which the crucible makers fear will be checked, an important American industry will be preserved and developed to the safety and independence of the Nation, and employment will be provided for thousands of American citizens.

That is all I have to say, and I thank you for the hearing.

BRIEF OF GEORGE A. SHARPE, REPRESENTING THE ALABAMA GRAPHITE PRODUCERS.

Before the World War the development of the extensive bodies of graphite in Alabama was insignificant because of the fact that the graphite could not be profitably produced in competition with the cheap, free oriental product. There was then a total investment in the State of only about \$150,000 and a producing capacity of only about 1,500 tons of graphite a year.

During the war the requirements of the country in graphite were extremely heavy and it would have been unfortunate if we had not had an adequate supply of our own because the usual foreign sources of supply were cut off by reason of the shortage of bottoms. The Government turned to Alabama, where 90 per cent of the American deposits of graphite is located, and appealed for the graphite to meet the vital needs of the country and its allies. In every possible way they encouraged investment in the erection of new mills, the extension of old mills, and the development of the Alabama graphite deposits generally to the limit. The cry was for graphite and still more graphite. They called the Alabama operators to Washington; sent and kept sending representatives to Alabama from the Bureau of Mines and the Geological Survey to urge production and still more production. They promised us price fixing with our cost of production, but we never received them; they refused to fix prices for graphite; they included us in the Mineral Control Act, under which we were to receive adequate protection for two years after peace was signed, but the bill never became operative; they settled with many other producers of war materials for their losses incurred under similar circumstances and refused to consider

um, and instead of protecting us on the large stocks of graphite which we had on hand ahead of requirements at the signing of the armistice, and which were produced at peak war costs, on the 16th day of January, 1919, two months and five days after the armistice, they removed the embargo which they had placed against the importation of the foreign graphite and allowed thousands of tons of this foreign product to be dumped into New York at a fraction of the cost of our accumulated stocks. This ruined us completely. Every graphite plant in Alabama shut down and a great many of them were forced into bankruptcy. These plants are still closed and will remain closed unless we get adequate protection against the unfair competition of the foreigner through the medium of a tariff, though it is by no means certain that there will be no more war. At the end of the war our investment in graphite mines and mills in Alabama was between \$4,000,000 and \$5,000,000 and our producing capacity had risen to over 15,000 tons of graphite a year.

We prepared a schedule showing our needs in the way of protection, and our bill was first introduced by Mr. Heflin and afterwards reintroduced in somewhat modified form by Mr. Fordney. On the 20th of April, 1921, our needs were finally presented to the Ways and Means Committee by the Southern Tariff Association in the following form:

Schedule.—Crude graphite ores, crystalline or amorphous, 1 cent per pound of ore or ores containing 50 per cent or under of graphitic carbon; 2 cents per pound of ore or ores containing over 50 per cent of graphitic carbon. Lump and ship crystalline graphite 3 cents per pound of graphite of a size which will not pass through a screen with openings one-fourth of an inch square. Flake crystalline graphite, 6 cents per pound of graphite of a size which will pass through a screen with openings one-fourth of an inch square. All other products, manufactured materials and compounds containing graphite, 5 cents per pound for the graphite therein, in addition to any duties assessed and collected under existing law.

This schedule as presented by the Southern Tariff Association is exactly what we want and what is necessary to enable us to operate. It means an average of about 3 cents per pound on all imported graphite and will merely put us on an even footing with the foreigner in our own market, and that is all we ask.

When we first appeared before the Ways and Means Committee in September, 1919, to state the case for the producers of Alabama graphite, and to show why it was necessary to have protection for the graphite industry if it was to survive, we were opposed only by the crucible makers and the importers of foreign graphite. These men conceded that Alabama flake graphite was superior to any other graphite for lubricating purposes, but they all contended that it was quite unsuited to the purposes of crucible manufacture of itself, and were of various opinions as to the quantity of Alabama flake that could be successfully used in crucible mixtures. They made these statements but they have never been able to produce facts or figures to substantiate them. On the other hand, we met their argument with the following facts:

1. Dr. Stull, of the Bureau of Mines, was selected by the Government, at the request of the Alabama graphite producers, to carry out a series of parallel tests to determine whether or not Alabama flake graphite would make a good crucible of itself, and how such a crucible would compare with crucibles made from foreign graphite. The result of Dr. Stull's tests, made on the floor of the foundry, showed that Alabama flake graphite, of itself, made not only a perfectly satisfactory crucible, but made a better crucible than any foreign graphite.

2. The Jonathan Bartley Crucible Co. asserted, and advertised the fact to the American public, that a crucible made of American flake graphite mixed with American clay was superior to any other crucible, and did not hesitate to sell these all-American crucibles under that representation.

3. All foreign crucible manufacturers everywhere had changed their formula which formerly called for the use of Ceylon graphite, and for some years has used nothing but flake graphite, similar to the American flake, in their crucible mixtures, and were consequently making better crucibles.

4. The Japanese have for a long time been shipping Japanese crucibles into the Birmingham (Ala.) district, made from flake graphite similar to Alabama flake, and have been selling them f. o. b. Birmingham, after paying a duty of 20 per cent ad valorem, for from 1 cent to 1½ cents per number cheaper than the factory price of the American crucible makers who use the Ceylon graphite. The Japanese crucibles stand an average of 50 per cent more heats than the crucibles made from the Ceylon graphite.

5. Mr. Guthrie, the practical head of the crucible department of the Crucible Steel Co., of America, made the open statement before a number of reputable producers in Ashland, Ala., that a perfectly good crucible could be made from 100 per cent Alabama flake, that he had demonstrated this, and that if his company could

be assured of the necessary quantity of the quality called for by their specifications they would change their formula and use nothing in their crucible mixtures but Alabama flake. Mr. Guthrie repeated this statement in his testimony before the Committee on Mines and Mining, United States Senate, 65th, H. R. 11259, page 284.

6. Some of the crucible manufacturers, who object to Alabama flake because of the flat shape of the flake particles, are now using the more modern rolls system of crushing the Ceylon graphite and are thereby actually producing a flake so similar to the Alabama flake that, as Dr. Stull remarks, the resemblance is startling.

7. The crucible makers were not even able to agree on the quantity of Alabama flake which they thought could be successfully used in crucible mixtures.

The crucible makers attempt to belittle the result of Dr. Stull's experiments on the ground that they are laboratory tests and therefore unreliable, and claim that the only practical test of a crucible is on the foundry floor. Our answer to that is that Dr. Stull's tests were made precisely where the crucible makers say they should be made—on the foundry floor.

Mr. Jonathan Bartley, in his testimony before the Ways and Means Committee, flatly denies the statements and advertisements of the Jonathan Bartley Crucible Co. although the company had successfully sold their all-American crucibles to the American public under their representations of superiority. This fact should be sufficient answer to Mr. Bartley's personal testimony.

The only other attempt to refute the facts with which we support our argument for the use of Alabama flake in crucibles was made by Mr. Mathews, president of the Crucible Steel Co. of America, in his testimony before the Ways and Means Committee. This attempt is rather weak in that it doesn't fairly meet our argument, and our answer to it is that the statements of Mr. Guthrie, made openly at a time when there was no talk about a tariff on graphite and frankly repeated before the Committee on Mines and Mining, are entitled to rather more consideration than the present argument of the company.

In his testimony before the Ways and Means Committee Mr. George Pettinos, a large importer of foreign graphite and an investor in foreign graphite fields, introduced the question of electric brushes and attempted to show that flake graphite was totally unsuited to this purpose, but the assertions and advertisements of the Joseph Dixon Crucible Co., who are successfully using flake graphite for this purpose, completely answer the argument of Mr. Pettinos.

For the most part the crucible makers and the importers of foreign graphite do not attempt to meet the facts advanced by the producers of American graphite at all, and where they do make the attempt they invariably contradict each other and their own argument. The evidence all the way through shows that the crucible makers and importers of foreign graphite have entirely failed to substantiate their statements and completely vindicate the contention of the producers of American graphite.

More recently the manufacturers of foundry facings have come to the assistance of the crucible makers and importers in the effort to defeat the tariff on graphite, and they have adopted a very ingenious but not particularly ingenious method of attack.

The users of foundry facings are of course, the foundry men, and the manufacturers of foundry facings have sent letters to practically all of them in the country urging them to write vigorous blind protests to their Senators and Congressmen against the proposed tariff on graphite. One of these letters is on record with the Ways and Means Committee together with a complete exposure of its subtleties. The letter cleverly informs the foundryman, who will probably not see a copy of the graphite schedule himself, not by direct statement, but by subtle inuendo, that the producers of American graphite are seeking a tariff of 6 cents a pound on the grade of graphite used in foundry facings, which the writer of the letter, if he has read the bill himself, must know is not true. The only answer this seems to call for is exposure.

And that is the sum and substance of the opposition to the effort of the producers of American graphite to get merely enough protection against the cheap foreign product to enable the American graphite mines to operate. The opposition to the tariff is backed by men who made millions of dollars out of graphite products during the war and who themselves are protected on their manufactured products, while the producers of the graphite went broke and into bankruptcy. This opposition has so far succeeded that our graphite bill has been reported out by the Ways and Means Committee on a basis of 10 per cent ad valorem, which, of course, is no basis at all.

In the testimony taken before the Ways and Means Committee Mr. McNaughton representing the crucible makers, made the statement that the crucible makers cared nothing for the 20 per cent protection which they enjoyed, but in the tariff bill H. R. 7456 paragraph 216 not only preserves to them their 20 per cent which they admit they do not need, but it increases it to 35 per cent. The producers of graphite in Alabama do need the protection they ask for, and none of the 37 mills in the State can operate at a profit without it.

STATEMENT OF EARL J. DAVIS, REPRESENTING THE UNITED STATES GRAPHITE CO., SAGINAW, MICH.

Senator SMOOT. You have a brief, I presume?

Mr. DAVIS. I have; but there are one or two additions that I want to submit to the committee. May I have the privilege of making some additions to that brief?

Senator SMOOT. Yes.

Mr. DAVIS. I would like to reserve that privilege.

I am Earl J. Davis, of Saginaw, representing the United States Graphite Co. of Saginaw, Mich. This concern has been in business for a period of about 30 years. They own and operate mines in Mexico. The graphite in which we are interested is just the amorphous graphite. They go down to Mexico for their product for the reason that there is no product known to us in this country that will satisfy the purposes for which we use amorphous graphite. They furnish probably 95 per cent of the graphite that is used for lead pencils. We have gone in and tested practically all the known forms of graphite in the United States and we do not find any that we can use satisfactorily to compare with the Mexican graphite.

The reason that we go down there is that that is a product that is best adaptable to our purposes.

Senator SMOOT. You want free graphite?

Mr. DAVIS. Free amorphous graphite, Senator.

If we could use the American amorphous graphite we would be buying it in this country, because it sells here, according to the latest pamphlet of the Geological Survey, for about \$10.60 a ton. The freight on the Mexican product alone is more than \$16. So that our going down there for our graphite is not a matter of choice.

These are American-owned mines produced by American capital, and we bring the graphite here and manufacture it and put our product on the market.

I think that practically covers the situation; and if I am allowed to submit a few amendments to my brief I should be very glad to do that.

Senator SMOOT. Very well. You may. Thank you.

BRIEF OF EARL J. DAVIS, REPRESENTING THE UNITED STATES GRAPHITE CO., SAGINAW, MICH.

There are two kinds or varieties of graphite, viz, (1) flake or crystalline; (2) amorphous.

The flake or crystalline graphite is used chiefly for making crucibles.

Amorphous graphite is turned into such graphite products as paints, lubricants, stove polish, foundry facings, motor and generator brushes, graphite for pencil making, powder glazing, etc.

According to the latest records of the United States Geological Survey there was imported by the United States during the years 1913 to 1920, both inclusive, only about 62,251 tons of amorphous graphite, of which amount the United States Graphite Co., of Saginaw, Mich., used about 63 per cent, or nearly two-thirds.

Graphite has been on the free list for more than 50 years. For 30 years the United States Graphite Co., of Michigan, has owned and operated in the State of Sonora, Mexico, an amorphous graphite mine, shipping the crude ore to their factory at Saginaw.

In this connection we might state that the United States Graphite Co., of Saginaw, Mich., is the world's only manufacturer using exclusively amorphous graphite in the preparation of its various products, a fact possible only because of the superior quality of the amorphous graphite owned and mined by themselves in Mexico.

Amorphous graphite of the quality suitable for their purposes can not be obtained in the United States. This is evidenced by the fact that during the 30 years of its existence the United States Graphite Co. has, in the hope of finding a source of supply adaptable to their purposes in our own country, investigated hundreds of graphite deposits in the United States, but without success. Some years ago, for instance, they took an option on the graphite mines in Gunnison County, State of Colorado, which mines produce probably the best amorphous graphite mined in the United States, and had shipped to their plant in Saginaw, Mich., several hundred tons of the ore, which they tried to use in the preparation of those graphite products hereinbefore mentioned, but with unsatisfactory results. This concern has investigated all graphite deposits known in the United States, and after exhaustive tests extending over many years have satisfied themselves that the amorphous graphite mined in this country can not be satisfactorily used in the manufacture of their products. This is entirely due to the inferior quality of American amorphous graphite, which is freely offered at very low prices.

A pamphlet just issued by the United States Geological Survey entitled "Graphite Industry in 1920," a copy of which is submitted herewith (see p. 1512), among other things says: "Operators in Colorado, Nevada, and Rhode Island reported sales of 4,694 short tons of amorphous graphite in 1920, at an average rate of \$10.60 a ton. This was \$3.52 per ton less than the average price in 1919." Most of this tonnage was produced in Rhode Island. The freight alone on amorphous graphite mined in Mexico and shipped to Saginaw, Mich., is \$16.70 per ton. Then why should this company go down into Mexico, particularly under present distressed conditions, pay the heavy freight, and invest their money in these Mexican mines if the lower-priced American amorphous graphite could be used by them? Is it not quite apparent therefore that there are in this country no miners of amorphous graphite whom a tariff would benefit?

In order to get some idea of the revenue which a tariff on amorphous graphite would bring to the Government we will take the figures of the pamphlet referred to above, which show that in the year 1920 there was imported only 4,469 short tons of amorphous graphite. The House bill provides (par. 211, p. 39) a duty of 10 per cent *ad valorem* on graphite, and accordingly any revenue the Government may get from amorphous graphite will be very small, and two-thirds of it would be levied on American-owned graphite mined in Mexico with American money and would fall directly on the United States Graphite Co.

Further than this, it is reasonable to presume that if the United States Government places an import duty on amorphous graphite then Mexico will retaliate with an equal or higher export duty on this graphite, which would mean that any revenue which the United States Government may collect through a tariff on amorphous graphite would be a smaller amount than this company would have to pay under such conditions.

The United States Graphite Co. invested its money some 30 years ago in mines in Mexico and in a large plant in Saginaw and have become the largest importers of amorphous graphite and one of the largest manufacturers of graphite products in the United States. This concern is not a war baby that came into existence by reason of high prices and excessive demands for graphite during the war, but is an old company established solely on its merits.

It seems plain therefore that amorphous graphite should be on the free list.

The Fordney bill, however, as passed to the Senate, reads (par. 211) as follows: "Graphite or plumbago, crude or refined, not specially provided for, 10 per centum *ad valorem*."

As there are no "special provisions," it is suggested that amorphous graphite be either placed on the free list or the words "except amorphous graphite" be substituted for the phrase "not specially provided for."

SUPPLEMENTAL BRIEF.

PRICE FOR 1920 AMORPHOUS GRAPHITE.

Colorado, Nevada, Rhode Island: Product sold at \$10.60 per short ton on an average. (See pamphlet, Geological Survey, dated Mar. 29, 1921.)

Mexico product valued at \$36.03 per short ton. (Freight alone from Mexico to Saginaw, Mich., is \$16.70 per ton.)

Chosen (Korea), valued at \$36.95 per short ton. (See pamphlet, Geological Survey, dated Mar. 29, 1921.)

Statistics regarding amorphous graphite, 1913-1920.

Year.	Mined in Mexico by United States Graphite Co.	Imported (high grade).			Domestic (low grade), mined in United States.
		From Mexico.	From Korea.	Total.	
	Tons.	Tons.	Tons.	Tons.	Tons.

merican-owned Mexican graphite mined and imported by the United States Graphite Co. (as above).....	Tons. 34,489
orean graphite imported by the United States Graphite Co.....	4,887

Total imports account United States Graphite Co. (8 years)..... 39,376

Percentage of amorphous graphite mined and imported during 8 years by the United States Graphite Co., 65 per cent.

The United States Graphite Co. also purchased as much of the domestic amorphous as could be utilized in the manufacture of certain products. .

Average value per ton domestic amorphous.	
918.....	\$10.59
919.....	14.12
920.....	10.60

The United States Graphite Co.: (1) Uses amorphous graphite exclusively. (2) Owns its mines in Mexico. (3) Operates these Mexican mines with American money. (4) Uses 65 per cent of all amorphous graphite coming in United States. (5) Tariff will not aid producers of American amorphous graphite, because it can not be successfully substituted for imported amorphous graphite for manufacturing purposes.

The imported graphite possesses peculiar physical characteristics which render it superior for use in certain of the more important graphite products—pencils, motor and generator brushes, lubricants, etc., etc.

Now, while it may be somewhat difficult for a layman to clearly understand just what is meant by this term “physical characteristics,” their importance is only too well understood by persons experienced in the manufacture and sale of graphite products and particularly those who, having engaged in the business over a long period of years, have endeavored to find a source of supply here in the United States.

It will help, however, to an understanding to explain that for commercial purposes the purity of graphite is usually determined by placing a given weight, generally one-half gram, in a platinum crucible, placing same over a flame and burning off the “carbon contents.” Then the ash (silica and other substances which will not burn) is weighed and the remainder (“carbon”) is called graphite. Thus, if say 15 per cent of the weight placed in the crucible will not burn, then the remainder (85 per cent is called “graphite.”

The point which we wish to make is this:

There are a number of forms of carbon; for example, coke, coal, diamonds, and graphite are each different forms of carbon.

If, then, the amorphous graphite mined in the State of Colorado, for instance, when tested in the above manner assays about the same as Mexican graphite, namely, 80 to 85 per cent carbon contents, it might seem to a layman to possess an equal manufacturing value; whereas, as a matter of fact, it can not be successfully substituted for Mexican graphite in that it does not possess the necessary physical characteristics. That is to say, while having about the same carbon content (80 to 85 per cent), it physically resembles coal or coke more than graphite—is not, for example, slippery, and consequently little more satisfactory as a lubricant than coal would be. Neither

does it afford a bright luster or polish when rubbed on to a surface, and for such reason is not suitable for stove polish or powder glazing. And it is about as suitable for pencil leads as would be coke or coal.

The purpose of these statements which we have just made is to help make clear to this committee the position in which a tariff on amorphous graphite would place a long-established industry, and particularly one concern, the United States Graphite Co., of Saginaw, Mich.

STATEMENT OF FLOYD WEED, BIRMINGHAM, ALA.

Senator SMOOT. You desire to talk on graphite?

Mr. WEED. Yes, sir.

Senator SMOOT. Will you make your statement as brief as possible?

Mr. WEED. We have not had a hearing.

Senator SMOOT. No; you have not.

Mr. WEED. We expected a notification from the committee but did not get it until Wednesday of this week, and I came here just as quickly as I could.

Senator SMOOT. If you have any kind of a brief that you desire to file we shall be glad to have it.

Mr. WEED. I brought one, but I decided not to file it, because the subject has been covered so thoroughly. There are only two or three points that I want to bring out; three phases, and I will let it go at that.

Senator SMOOT. All right.

Mr. WEED. It has been said by those opposing a tariff on graphite that the tariff will increase the cost to many of the basic industries of the country, the inference being that these increases will re-establish high prices.

The facts are that the prices of graphites in the forms used by manufacturers supplying these basic industries are to-day in some instances less than one-half the lowest prices ever known in the industry. In all instances they are much below the prewar levels.

We contend that the imposition of the rates asked for will only reestablish the prewar prices and, in respect to prewar conditions will not increase costs in the slightest degree.

Another phase: We are asking for this tariff to prevent the further unrestricted importation of enormous war accumulations. All countries manufacturing graphite products before the war were dependent upon imports in whole or in part for their base material, and the origin of the supplies was completely in British and French territory. When England and France imposed embargoes on exports in 1914, extraordinary efforts were made throughout the world to increase production.

I will not go over what happened in the United States. That has been touched upon. Suffice it to say that our capacity was increased five to seven fold and new and improved methods were evolved which would have made the industry highly efficient if it had been able to function.

The Central Empires, Germany and Austria, shut off by the blockade, made themselves independent of foreign supplies, and in 1918 produced one-half the entire world's output. Germany alone produced 64,000 tons against 35,000 tons credited to Madagascar and 27,000 tons credited to Ceylon. France in Madagascar increased production from 7,000 tons in 1913 to 35,000 tons in 1918. In Indo-

China she built up an industry from nothing in 1916 to 15,000 tons in 1918.

Great Britain met her requirements and accumulated a surplus equivalent to a full year's supply for this country.

Following the armistice the removal of the embargoes and restrictions threw the American market wide open to these surpluses and these enormous accumulations, and they were dumped on our market until it was glutted. They are still hanging over to-day.

If any benefit were to accrue to the American public through having unrestricted access to this abundance of cheap foreign material commensurate with the losses that would be sustained by the domestic industry a possible argument might be advanced for admitting it, but it is certain that no material reduction in prices of graphite products will reach the public, as its cost is a minor factor in the total cost, and of the graphite products that reach the public such the cost of the raw graphite is negligible.

I have here a brief table showing what the cost of graphite means to the public.

A box of flake graphite selling for 75 cents contains 5 cents worth of graphite. A box of amorphous graphite selling for 40 cents contains 2 cents worth. A gallon of graphite paint selling for \$2.50 contains 6 cents worth. A box of graphite grease selling for 15 cents contains one-half a cent's worth. A package of pencils selling for 50 cents has one-tenth of a cent's worth of graphite.

The committee has had presented to it a calculation that I made some time back of the cost of smelting in a graphite crucible. Without going into details, it is one-fortieth of a cent a pound.

The following table was prepared to show that the rates asked for will only reestablish prewar prices——

Senator SMOOT. Do you want to put that in the record?

Mr. WEED. I can put this whole thing in. I am just speaking from it.

Senator REED. There is no need of repeating it.

Mr. WEED. The present price of the lump is 3½ cents. The prewar price was an average of 7 cents. That is true all the way down the line. Madagascar, 2 cents to-day; 6 and 7 cents before the war.

We ask for 3 cents on lump and 6 cents on flake; 4 cents on the flake to bring it back to prewar prices and 2 cents, making 6 in all, to discourage importation.

Senator SMOOT. Lump 3 cents and flake 6?

Mr. WEED. Of which 4 cents on the flake is to bring it back to prewar prices. The 2 cents is to discourage the importation of this utterly needless product.

We do not need to import a single pound of flake graphite, and no one appearing before you has claimed that we do need to.

The other phase of the situation has been presented to the committee, and we believe it has been unfairly presented; that is, the troubles experienced during the war in the use of graphite crucibles.

The facts are these: These troubles started when foreign and domestic graphites were used as formerly. The German clays were off the market and domestic clays were being substituted. The fault was in the clay and not in the graphite.

In substantiation of that condition I can only refer you to the statement of the mineral resources of the United States in 1915 that

it preceded any of this trouble. It preceded the introduction of the domestic graphite. They say that "the Klingenburg clay was cut off. None of this clay was imported in 1915, and the accumulated reserves are now practically exhausted. American crucible makers have conducted extensive tests to determine the stability of certain American clays as substitutes, and many of them have husbanded supplies of Klingenburg."

It goes on in more detail, but it shows it was a live question in 1915. In 1917, two years later, it was still a live question.

They say that "the difficulties encountered since 1914 in finding supplies of clay have now been largely overcome. A part of the great demand for crucibles has been due to the fact that crucibles made with domestic clays did not stand as many heats as those made with the Bavarian clay."

Finally, one of the witnesses before you made specific reference to the trouble in the Portsmouth Navy Yard, the trouble that was experienced there with graphite crucibles. Here are the facts [reading]:

"In June, 1916, many attempts to increase the life of the crucibles became discouraged, the only consolation being in the fact that the trouble was universal and up to maker and user to tax his wits to master the situation if possible. Something had to be done and done quickly to save the day. The writer undertook to solve the problem of preventing the flaking and cracking of the crucibles, and in one week's time succeeded in overcoming the difficulty. The life of the crucibles went up to 20 heats immediately.

"From January 1, 1917, to May 1, 1918, the supply department invoiced to the small plant 376 crucibles, giving a total average of 54 heats per crucible."

This shows that one of the principal factors in the use of the crucibles during the war period was that the crucibles were not properly prepared for use, were used while still green, and were carelessly used.

American graphite makes the best small and medium sized crucibles that it is possible to make. Only in the large sizes is it advantageous to use an admixture with Ceylon graphite.

EARTHENWARE AND CHINA.

[Paragraphs 212 and 213.]

STATEMENT OF THEODORE JONES, PRESIDENT OF JONES, McDUFFEE & STRATTON CORPORATION, BOSTON, MASS.

The CHAIRMAN. Mr. Jones, you reside in Boston?

Mr. JONES. I do, sir; in Brookline.

The CHAIRMAN. What do you speak on—crockery?

Mr. JONES. Crockery and china; yes, sir.

The CHAIRMAN. That is paragraph 212. What is your occupation?

Mr. JONES. We are wholesalers of crockery and china.

The CHAIRMAN. What do you want in this bill?

Mr. JONES. Well, the present tariff, we believe, is high enough for the protection of the domestic potters. Several of them have told us so.

The CHAIRMAN. Who told you so?

Mr. JONES. Mr. W. E. Wells, of East Liverpool, Ohio, told me so.

Senator SMOOT. Do you mean that the Underwood rates are what you want?

Mr. JONES. Yes, sir.

Senator WALSH. Mr. Jones is one of the leading crockery merchants in Boston, and perhaps in the country.

Mr. JONES. If the American valuation plan were to be in use we would want the Fordney rates reduced.

The CHAIRMAN. We are going on the assumption that the American valuation is going to prevail.

Mr. JONES. Then, what we would ask would be that the rates be at least one-half what the present rates are under the ad valorem system.

Senator WALSH. Will you state your reasons for that briefly, Mr. Jones?

Mr. JONES. Briefly, that would produce more revenue than is produced to-day.

Senator WALSH. Under the provisions of this bill?

Mr. JONES. Yes, sir. I shall in a few days file a printed brief here, Mr. Chairman, but I think I can hurry matters by reading what I have to say, if you will allow me to do so.

The CHAIRMAN. Would you not rather have it printed in the record?

Mr. JONES. I shall have another brief printed; this is not a brief, but there are some facts in here that I want to bring to the attention of the committee.

The CHAIRMAN. How long will it take you to read it?

Mr. JONES. About eight or nine minutes.

Senator SMOOT. Before you go on with that, will you let me know what capital you have invested in your concern?

Mr. JONES. \$750,000.

Senator SMOOT. What profits did you make last year?

Mr. JONES. As my father said here once before, that was a subject on which he only talked with his wife.

Senator SMOOT. You are asking for certain things here, and I would like to know.

Mr. JONES. I have not the figures with me.

Senator SMOOT. You know approximately what your profits were for the last year.

Mr. JONES. I do not think that I ought to be asked to state that here.

Senator SMOOT. You refuse to do it.

Senator McLEAN. What percentage of your turnover is composed of imported goods?

Mr. JONES. I should say one-half. We are large dealers in American wares.

Senator McLEAN. Is that percentage largely high-class goods?

Mr. JONES. It is goods of all kinds, the cheapest, the medium, and the best.

Senator McLEAN. What percentage is high-class, what we call luxuries, high-class tableware and things of that kind?

Mr. JONES. The smaller proportion. I should think 20 per cent, roughly. We cater largely to the medium grades of ware, but we have the cheapest. We wholesale a very large amount of cheap domestic ware and the best grades of domestic ware.

The CHAIRMAN. Could you not call our attention to the salient features in the brief and then have it printed?

Senator SMOOT. I want to ask just one more question in that connection. Were your profits 50 per cent last year?

Mr. JONES. No, sir.

Senator SMOOT. They were more than that during the war, weren't they not?

Mr. JONES. As I said before, I have not the figures before me. I will state this, Senator: Our business was established in 1810. My father was in that business for 63 years, and he was at the head of it nearly 50 years. I have been there nearly 38 years, and I can assure you that in the run of years there are no abnormal profits in the business. As a boy my father wanted me to enter that business, and I said, "Father, I would rather be in some other business because the profits are not large enough in this business."

Senator SMOOT. Your father's advice was very good.

Senator WALSH. Your father was a wise old gentleman and a good Democrat.

Mr. JONES. He was, sir. If you will allow me, I will read a few paragraphs from this paper which I have prepared.

The CHAIRMAN. Go ahead.

Mr. JONES (reading):

The potteries of the United States produce a very limited variety of the wares required by the consumers of this country, so that it is necessary for us to import many kinds of wares from abroad.

No well-conducted crockery and china business could be maintained without a stock of import wares. In fact, outside of the staple lines of English semiporcelain wares the great bulk of imported goods is entirely different in character and quality from those produced in the United States—

Senator WATSON. Do you know why they do not produce them in the United States? Is it because they have not the clay, the raw material, or the skilled labor, or is it because they have not been protected?

Mr. JONES. They have been protected, sir.

Senator WATSON. Do you mean protected on all these things that they do not make?

Mr. JONES. Yes; I think they have.

The CHAIRMAN. Not on the higher grades, however.

Mr. JONES. I was coming to that point. Nearly every earthenware and china manufacturer in the United States imports more or less foreign clays. They mix them with the domestic clays, but they cannot produce finished china or fine earthenware without the English clay.

Senator WATSON. That is to say, the highest grades of chinaware can not be produced from the American clay.

Mr. JONES. I believe that is true.

Senator WATSON. Then, they do not produce the highest grades out at East Liverpool, Ohio?

Mr. JONES. No, sir; not the highest grades, but they do not make much chinaware there.

Senator WATSON. Where do they make most of the china that is made in the United States?

Mr. JONES. There is a large amount of china made in Trenton, N. J.

Senator WATSON. Do you buy any of that and sell it?

Mr. JONES. Yes, sir; a large amount of it.

Senator WATSON. How does that compare with the foreign-made china?

Mr. JONES. The Lenox china is as fine as any foreign-made china. Reading:]

One notable exception is the fine china made by the Lenox pottery of Trenton, which competes directly and successfully with the finest English chinas. The Lenox pottery enjoys the enviable position of having more business than their factory can take care of and has stated that they are unafraid of any competition and do not need any higher protection. Also some of the largest and most successful earthenware American manufacturers have stated that they need no further protection than they are having at present. We recognize the great progress that has been made by the manufacturers in this country and which is evidenced by the following statistics:

Comparison of imports and domestic production of earthenware and china.

	Imports.		Domestic production.	
	1913	1920	1913	1920
Earthenware.....	\$3,047,000	\$4,200,000	\$15,066,000	\$39,360,000
China.....	6,900,000	6,650,000	2,424,000	11,060,000
Total.....	9,947,000	10,850,000	17,490,000	50,420,000
Increase.....per cent.....		9		190

Exports from the United States.

Earthenware and china:	
1913.....	\$550,000
1920.....	2,800,000
Increase, 400 per cent.	

Senator WATSON. How many of the varieties that you sell can not be made and are not being produced in the United States?

Mr. JONES. Well, the cheap grades of china are not being produced in the United States.

Senator WATSON. Why? Would they have to have foreign clay with which to make them?

Mr. JONES. I think they would, yes.

Senator WATSON. Could they not be made in the United States?

Mr. JONES. I think they could be made in the United States, yes, sir.

Senator WATSON. We have the raw material, have we not?

Mr. JONES. Combined with the foreign.

Senator WATSON. Well, the great variety of the products that you sell can be made in the United States, can they not, so far as the raw material is concerned?

Mr. JONES. I do not think they could without combining with the foreign clays.

Senator WALSH. And the extreme high grade is imported also, is it not?

Mr. JONES. It is, but the extreme high grade is made by the Lenox Co. in Trenton.

Senator McLEAN. Where do they get their raw material?

Mr. JONES. They import some foreign material.

Senator WATSON. Do you know what proportion of foreign or domestic raw material is used in the manufacture of the Lenox china, at Trenton, N. J.?

Mr. JONES. No, sir; I do not. The imports for 1920 were from the following countries:

France.....	\$500.00
Germany.....	850.00
Japan.....	4,300.00
United Kingdom.....	3,800.00
Other countries.....	1,100.00
Total.....	10,850.00

The CHAIRMAN. We have all that information. You can have that printed in your remarks.

Mr. JONES (reading):

In view of these figures, showing immense development and prosperity of the United States pottery industry, we, therefore, feel that we may dismiss the question of an additional protection being required, and believe that a moderate reduction of the rates on earthenware and china would result in bringing an increased revenue to the Government, and would, at the same time, assist in reducing the selling prices to the consumer. The present high prices are very onerous on the public, and the demand for reduction is loud and emphatic throughout the land.

We desire to register our most earnest protest and disapproval of the American valuation plan of assessing duties. We are absolutely opposed to any such method and for the same reasons expressed against the same proposition in 1908 and noted in the tariff hearings of the Sixtieth Congress before the Ways and Means Committee, for print, No. 13, November 23, 1908. It is impracticable and unworkable.

As previously stated, only limited staple lines of English earthenware are directly comparable with American production and the vast variety of imports are not comparable.

Senator WATSON. I do not think it is necessary for you to submit anything on the question of valuation. We have been all over that and have adopted the American valuation plan.

Senator WALSH. Notwithstanding the Democratic caucus.

Senator WATSON. Notwithstanding the Democratic caucus.

Mr. JONES (reading):

If duty is assessed on these noncomparable imports at American valuation, it would mean an enormous increase in selling prices to the public at a time when reductions are hopefully expected and demanded.

The CHAIRMAN. The committee does not want to hear any more on the subject of American valuation, because they have passed on that.

Mr. JONES. All right, sir. [Reading:]

Whilst the rates of the Fordney bill are nominally lower than the existing tariffs they actually mean a heavy advance in the duty assessed.

The present rates are—on decorated earthenware 40 per cent and on decorated china 55 per cent on the foreign cost. We append statistics of importations which show that under the American valuation plan the rates on earthenware would vary from 48 to 100 per cent and on china from 88 to 125 per cent. This is not protection—it is prohibition, pure and simple.

For instance, as shown in this appended table of statistics of importation, an English Doulton china dinner set costs, landed, in the year 1914, \$13.74. At present, owing to the factory advances in England, the same set costs, landed, \$38.52, which is certainly a sufficiently heavy burden for the consumer to bear. This at a duty of 40 per cent on foreign cost.

Under the American valuation plan, at 28 per cent duty on wholesale selling price this same set would cost, landed, \$43.93 per set, which is equivalent to 64 per cent duty on foreign cost, and this at a time when the consumer is expecting a reduction in prices.

We desire to emphasize the very striking fact that in all of the calculations that we have made so far, it is evident that the wholesale selling prices in the United States markets are very substantially more than double the foreign cost.

The Fordney rates are based on foreign cost plus duty only, ignoring all other costs and expenses (freight, insurance, selling expense and profit) which go to make up the wholesale selling price.

It is, therefore, obvious that any rates assessed on the American valuation plan would be less than half what they are at present on foreign costs.

Senator SMOOT. Of course, that statement is not correct as to the plan we are going to adopt. That is not what the Senate is going to agree to.

Mr. JONES. That is as far as we know, of course.

The CHAIRMAN. Have you made this statement before the Ways and Means Committee?

Mr. JONES. No, sir; I was before the Ways and Means Committee, but I did not make that statement. [Reading:]

Drastic reduction of the proposed Fordney rates must be made unless importations are to be largely prohibited. Frankly, the whole plan is deceptive—

The CHAIRMAN. My dear sir, we can not take the time this hot afternoon to listen to things on which we spent 10 days. Of course, we want to treat you with every consideration and courtesy.

Senator McLEAN. I see that the importations have increased rapidly in the last year or two.

Senator SMOOT. Yes; I was going to ask him if he knew how much the imports had increased from June, 1918, to June, 1921.

Mr. JONES. I can only say that our importations have been very much less.

Senator SMOOT. I mean the importations to the United States.

Senator WALSH. I suppose it is difficult for the witness to separate his argument.

The CHAIRMAN. I know it is, and if the witness will only permit his statement to be printed I can assure him that it, together with all other statements that are printed, will have the most careful scrutiny of the experts and of those of the committee who can give attention to them. But it is not necessary to tell us the same old story about the deceptive character of valuation. That has been induged into our ears for quite a while, and we are impressed with the fact that it does not make the duties look quite as big as under other circumstances. However, Mr. Jones, we want to give you every facility.

Mr. JONES. I have only a few more words to say.

The CHAIRMAN. Go ahead.

Mr. JONES (reading):

When this committee appeared before the Fordney subcommittee, Mr. Fordney stated that it was not their intention to enact rates under the American valuation plan higher in effect than the Payne-Aldrich bill. We demonstrate in the table of statistics that the proposed Fordney rates on china and earthen ware will in many instances be more than double those of the Payne-Aldrich bill and are utterly indefensible from any standpoint of fairness.

Senator WALSH. Are the sentiments that you express the sentiments of the wholesale dealers in crockery and china in America, so far as you know?

Mr. JONES. They are.

Senator WALSH. Is there an organization of wholesale dealers?

Mr. JONES. Yes, sir.

Senator WALSH. How many wholesalers are there in that organization?

Mr. JONES. Between 40 and 50.

Senator WALSH. How much of the crockery and china business do you think they do in the whole country, approximately, a half or three-quarters or more?

Mr. JONES. Do you mean as wholesalers?

Senator WALSH. Yes.

Mr. JONES. I should think that they did about three-quarters.

Senator WALSH. And the statement that you have left with the committee represents their views upon this tariff situation?

Mr. JONES. It does; yes, sir.

BRIEF OF THEODORE JONES, REPRESENTING THE TARIFF COMMITTEE OF THE WHOLESALERS OF EARTHENWARE AND CHINA.

We address you on paragraphs 212 and 213. This committee represents wholesalers of earthenware and china throughout the United States, whose business is the distribution of both domestic and imported wares, and in both classes of these products we are all heavily interested.

We all buy and sell large quantities of the American goods, whilst at the same time we import and distribute foreign crockery and china, so that we feel we are in a position to discuss this question fairly and intelligently.

The potteries of the United States produce a very limited variety of the wares required by the consumers of this country, so that it is necessary for us to import many kinds of wares from abroad.

No well-conducted crockery and china business could be maintained without stock of imported wares. In fact, outside the staple lines of English semiporcelain dinnerware, the great bulk of imported goods are entirely different in character and quality than those produced in the United States.

One notable exception is the fine china made by the Lenox Pottery, of Trenton, which competes directly and successfully with the finest English chinas.

The Lenox Pottery enjoys the enviable position of having more business than the factory can take care of and have stated that they are unafraid of any competition, and don't need any higher protection. Also some of the largest and most successful earthenware American manufacturers have stated that they need no further protection than they are having at present.

We recognize the great progress which has been made by the manufacturers in this country, and which is evidenced by the following statistics:

Comparison of imports and domestic production of earthenware and china.

	Imports.		Domestic production.	
	1913	1920	1913	1920
Earthenware.....	\$3,047,000	\$4,200,000	\$15,086,000	\$19,000,000
China.....	6,900,000	6,650,000	2,424,000	11,000,000
	9,947,000	10,850,000	17,490,000	30,000,000
Increase (per cent).....		9		72

EXPORTS FROM UNITED STATES.

Earthenware and china:	
1913.....	\$15,086,000
1920.....	2,424,000
Increase (per cent).....	72

Figures quoted above represent tableware, and do not include domestic production of sanitary ware. Chemical porcelain, and stoneware, yellow and rockingham ware amounting to about \$55,000,000, on which lines there are practically no imports.

e freight alone on such wares being practically prohibitive. The total pottery production of the United States for 1920 was \$105,000,000, in comparison with imports less than \$11,000,000, dutiable value.

The imports for 1920 were from the following countries:

France.....	\$800,000
Germany.....	850,000
Japan.....	4,300,000
United Kingdom.....	3,800,000
Other countries.....	1,100,000
	<hr/>
	10,850,000

In view of these figures, showing immense development and prosperity of United States pottery industry, we, therefore, feel that we may dismiss the question of any additional protection being required, and believe that a moderate reduction of the rates on earthenware and china would result in bringing an increased revenue to the Government and would, at the same time, assist in reducing the selling prices to the consumer. The present high prices are very onerous on the public and the demand for reduction is loud and emphatic throughout the land.

If duty is assessed on these noncomparable imports at American valuation, it would mean an enormous increase in selling prices to the public at a time when reductions are hopefully expected and demanded.

As American factories do not produce these kinds of wares, it would bring no benefit to them, whilst on the other hand, reducing the Government revenue by decreased importations and also seriously crippling the crockery dealers of the whole country. Whilst the rates of the Fordney bill are nominally lower than the existing tariff, they actually mean a heavy advance in the duty assessed.

The present rates are, on decorated earthenware, 40 per cent and, on decorated china, 55 per cent on the foreign cost. We append statistics of importations which show that under the American valuation plan the rates on earthenware would vary from 48 to 64 per cent, and on china from 88 to 125 per cent. This is not protection; it is prohibition, pure and simple.

For instance, as shown in this appended table of statistics of importation, an English Gilt earthenware dinner set cost landed, in 1914, \$13.74; at present, owing to the pottery advances in England, the same set costs landed \$38.52, which is surely a sufficiently heavy burden for the consumer to bear. This at a duty of 40 per cent on foreign cost.

Under the American valuation plan at 28 per cent duty on wholesale selling price, the same set would cost landed \$43.93 per set, which is equivalent to 64½ per cent duty on foreign cost, and this at a time when the consumer is expecting a reduction in prices. We desire to emphasize the very striking fact that in all of the calculations that have been made so far it is evident that the wholesale selling prices in the United States markets are very substantially more than double the foreign cost.

The Fordney rates are based on foreign cost plus duty only, ignoring all other costs and expenses (freight, insurance, selling expense, and profit) which go to make up the wholesale selling price.

It is, therefore, obvious that any rates assessed on the American valuation plan would be less than half what they are at present on foreign costs, and drastic reduction of the proposed Fordney rates must be made unless importations are to be largely prohibited.

When this committee appeared before the Fordney subcommittee, Mr. Fordney stated that it was not their intention to enact rates under the American valuation plan higher in effect than the Payne-Aldrich bill. We demonstrate in the attached table of statistics that the proposed Fordney rates on china and earthenware will in many instances be more than double those of the Payne-Aldrich bill, and are utterly indefensible from any standpoint of fairness.

We still believe that the present system of assessing duty on the wholesale market price in the country of production is the only fair and proper method, and respectfully suggest that rates of 40 per cent on decorated earthenware and 55 per cent on decorated china based on foreign cost are ample to fully protect the American pottery interests.

We, therefore, earnestly urge that the present method of assessing duties be not changed, in the interest of all concerned—the consumer, the Government, as well as the distributing trade.

Illustration of duty under American valuation.

Decorated English china.	Duty at 40 per cent.		American valuation, duty 28 per cent on whole-sale selling price.	Duty under American valuation, equal on foreign cost—
	1914	1921		
Salad set, 1 dozen plates No. 7; 1 salad bowl, Wedgwood, Doulton & Co.; (noncomparable with American product):				Per cent
Duty paid.....	\$0.80	\$2.48	\$3.19
Total cost.....	3.19	8.12	8.83
Dinner set, 100 pieces, Copeland, Doulton, etc.; (noncomparable with American product):				
Duty paid.....	3.98	11.12	16.53
Total cost.....	13.74	38.52	43.93
Dinner set, 100 pieces, Johnson-Meakin-Grindley; (comparable with American product (K. T. K.—Pope Goser):				
Duty paid.....	2.49	6.02	7.18
Total cost.....	9.22	22.31	23.47
Assorted crate for restaurant and hotel use, 30 dozen plates No. 5, 30 dozen plates No. 7, 20 dozen coffee mugs, 20 dozen fruits, 40 dozen cups and saucers, Maddock-Grindley; if comparable with American product (Shenango & Carr China):				
Duty paid.....	28.00	85.60	108.50
Total cost.....	104.50	313.88	336.78

Above comparisons are made on present wholesale selling prices. If these additional duties were paid, the wholesale price would be advanced accordingly and automatically still more duty assessed—an endless chain of higher prices.

Illustration of duty under American valuation.

	Duty at 55 per cent.		American valuation, duty, 40 per cent on whole-sale selling price.	Duty under American valuation, equal on foreign cost—
	1914	1921		
Imported English china:				Per cent
Assorted packages of ornamental birds, noncomparable with American product—				
Duty paid.....		\$43.45	\$81.48
Total cost.....		133.60	171.62
Table china, 12 cups and saucers, 12 plates, 10-inch, Worcester, minton, etc.; noncomparable with American product—				
Duty paid.....	\$5.46	17.16	28.00
Total cost.....	15.60	49.40	60.24
Decorated French china:				
Assorted package of decorated French china, noncomparable with American product—				
Duty paid.....	29.07	60.73	139.92
Total cost.....	89.10	182.16	261.38
Decorated German china:				
Dinner set, 100 pieces, "Electro"—				
Duty paid.....	3.54	12.62	29.30
Total cost.....	11.25	38.17	54.73
Decorated Bohemian china:				
Dinner set, 100 pieces, "Carlton"—				
Duty paid.....	2.40	7.07	16.78
Total cost.....	7.87	21.75	31.46

Above comparisons are made on present wholesale selling prices. If there additional duties were paid, the wholesale price would be advanced accordingly and automatically still more duty assessed—an endless chain of higher prices.

STATEMENT OF DAVID WALKER, REPRESENTING MORIMURA BROS., NEW YORK CITY.

The CHAIRMAN. Where do you reside?

Mr. WALKER. New York City.

The CHAIRMAN. What is your occupation?

Mr. WALKER. I am customs manager for Morimura Bros., importers of chinaware.

The CHAIRMAN. You are an importer?

Mr. WALKER. Yes, sir.

The CHAIRMAN. What do you want in this bill?

Mr. WALKER. I am addressing my remarks to paragraph 213.

The CHAIRMAN. What do you advocate?

Mr. WALKER. I want to be satisfied with the rate of duty upon the American valuation plan that will afford the same protection to the American industry that was given by the Payne-Aldrich law.

The CHAIRMAN. In your opinion, what amount of protection does the pending bill give?

Mr. WALKER. I have those figures here. It gives the rate of duty on some samples I will be glad to show the committee, and it equals 81 per cent.

Senator SMOOT. Did you say you were for the American valuation?

Mr. WALKER. I say I am willing to have the rate under the American valuation plan that gives the American industry the same protection as was afforded under the Payne-Aldrich law.

Senator SMOOT. There has not been a more active opponent to the American valuation than you, has there?

Mr. WALKER. Perhaps not, but I accept it as a good American.

The CHAIRMAN. This is an entirely logical position to be taken by Mr. Walker.

Mr. WALKER. I may say to the Senator from Utah that I was 17 years in the Government service and resigned the position of Government examiner four years ago, and my experience there taught me that you will never be able to make it work.

Senator SMOOT. You think it will not work with Japanese prices?

Mr. WALKER. I am speaking about the administration of the law. But I am accepting it, and all my remarks here are based upon it.

Senator McCUMBER. Are you a manufacturer?

Mr. WALKER. I am an importer only.

Let me say in passing that a record of the hearings before the Ways and Means Committee, Mr. Wells talking for the American Potteries Association, which can be found on page 578, that he will be satisfied with the protection of the Payne-Aldrich law; also page 579 of the printed hearings before the Ways and Means Committee; so I am taking it that that is a good starting point. I have here a plate which I have marked "Exhibit 1901," because that is our import number [exhibiting plate to the committee]. A great deal has been said about the low cost of Japanese production. I have here some printed sheets showing the scale of prices since 1914 up to the present time. You will notice that the years are placed at the extreme left. The cost price, taking the year 1914 as a basis, is, of course, 100 per cent, and you will find in 1921 the ratio of prices with prewar is 260. That is upon 90 per cent of our importations.

The upper point of the irregular line is resting on 260 per cent of the par value of 1914. The raise starts in the middle of the year 1916. There are some extra copies if other members of the committee should care for them.

Now, take this plate [indicating]. All my remarks are based upon a 100-piece dinner set. That [indicating] is Japanese soft biscuit porcelain. I have also prepared a set of sheets showing the whole history of that dinner set. It is not our best quality; it is not our cheapest; it is as honest and as fair a statement of facts as I am able to make. I do not believe in coming before the Finance Committee with statements that do not hold water.

The CHAIRMAN. What is this paper?

Mr. WALKER. I will explain it to you, Senator, in one moment. That dinner set comes packed three sets in a case.

The CHAIRMAN. It is a Japanese set, is it?

Mr. WALKER. Yes, sir.

The CHAIRMAN. What is this set over here [indicating the first diagram]?

Mr. WALKER. That is the general trend of the Japanese market in chinaware since 1914, and it is as nearly accurate as I could possibly make it.

EXHIBIT 1901.

TABLE B.—*Dinnerware, 100-piece set.*

Cost per set.....	yen..	22 18
Cost per case (3 sets).....	do....	66 54
Size of case.....	cubic feet..	15
Weight of case.....	pounds..	290
Freight:		
Ocean, from Japan to Pacific coast.....	per 100 pounds..	85
Rail, from Pacific coast to—		
East of Chicago.....	do....	\$2.665
West of Chicago.....	do....	\$2.300

	Amount.	Per cent.
Cost of case, exchange at \$50, 50 per cent.....	\$33.273	100
Purchasing commission, 7 per cent.....	2.330	7
Packing and casing, 22 cents per cubic foot.....	3.300	10
Duty on cost, 55 per cent.....	18.301	55
Duty on packing and casing, 55 per cent.....	1.815	5
Freight (ocean, \$0.85; rail, \$2.665).....	10.194	31
Shipping, insurance, and landing charges.....	1.491	4
Landing cost per set (3 sets).....	70.704	211
Landing cost per set (3 sets).....	23.57
Selling gross profit per set (including operating expenses), 29.4 per cent on selling price and 41.7 per cent on cost.....	9.82
Selling price.....	33.39
Selling price per case.....	100.17

You take the cost at the present time as shown on this table, which is 22.182 yen, at the top; cost per case for the three sets, 66.546 yen; size of case, 15 cubic feet; weight of case, 290 pounds; ocean freight from Japan to Pacific coast, 85 cents per 100 pounds, and rail freight from the Pacific coast to east of Chicago, \$2.665, and west of Chicago \$2.300 per 100 pounds.

Coming down to the cost of the case—and I have taken the yen at 50 cents, which is scarcely correct, because the yen is 49.85, but it is so close to 50 cents that for the purpose of this calculation it is correct; we have no depreciated currency.

Exchange, 50 cents, makes the entire case cost \$33.273; purchasing commission, 7 per cent, \$2.33; packing and casing, 22 cents per cubic foot, \$3.30; duty on the cost, 55 per cent, \$18.301; duty on packing and casing, 55 per cent under the Underwood bill, is \$1.81; freight, ocean, at 85 cents, and rail, \$2.66, making a total freight charge of \$10.194; shipping, insurance, and landing charges, \$1.49, making a total landed cost of \$70.704 per case of three sets; and landing cost per set, \$25.57; selling gross profit per set of 29 per cent, including operating expenses—and let me say that 29 per cent covers overhead and selling cost; you might add the entrance and clearance charges at the port in our profit, and all included, making a gross profit of 9.82; selling price, \$33.89; selling price per case, \$100.17.

If you apply the American selling price, we have to start out, first of all, to find what the American selling price is, and we are in somewhat the same position the man was yesterday on scientific instruments.

Senator SMOOT. You have "cost of case, exchange at \$50"?

Mr. WALKER. That means 50 cents per yen.

Senator SMOOT. I knew it did, by the figures.

Mr. WALKER. \$50 per 100 yen.

Senator SMOOT. And then you immediately add 100 per cent duty, what is for that changed value.

Mr. WALKER. How do I do that?

Senator SMOOT. That is what you do do.

Mr. WALKER. I add 55 per cent upon foreign cost of merchandise.

Senator SMOOT. I see you do that, but that is not what I am talking about, because the cost at 50 per cent is \$33.27.

Mr. WALKER. That is in dollars for the three sets.

Senator SMOOT. You carry it out and claim that is 100 per cent duty.

Mr. WALKER. No; I do not. Do not try to confuse me. One hundred per cent is the base. I have reduced all the costs of landing in terms of percentages.

Now, starting with my case and 100 per cent, I wanted to find out what my landing cost is in terms of my cost. The cost is 100 per cent; it costs 7 per cent to buy; it costs 10 per cent to pack; it costs 55 per cent duty; duty on cost of packing and casing 2½ per cent. You will find that freight and ocean is 31 per cent, and that the insurance, and so on, is 4.4 per cent; in other words, 213 per cent of the purchase of my dinner set is my cost landed.

Senator SMOOT. That is the reason I called the attention of the committee to the fact that the exchange on the money is not touched.

Mr. WALKER. It is absolutely fair. There is no exchange shown here.

Senator SMOOT. It is not the difference in the exchange value.

Mr. WALKER. A yen is not worth more than 50 cents. There is no exchange shown there.

Senator SMOOT. It is not the difference in the exchange value. A yen is not worth more than 50 cents.

Mr. WALKER. But \$33.27 is \$33.27.

Senator SMOOT. Go on, if that is the only way you figure it.

Mr. WALKER. That is the only answer.

Senator SMOOT. No; it is not. You are trying to put in 100 per cent value of the money at home, while 50 cents on the dollar is all

it is worth, and in making that plate they pay in yens when it is only 50 per cent.

Mr. WALKER. Senator Smoot, I will ask you a question, if I might. I pay \$33.27 for my three sets of dishes.

Senator WATSON. American money?

Mr. WALKER. American money, 100 cents to the dollar.

Senator SMOOT. In other words, you take \$33.27 of American money that you do pay and you can buy yen 66.54 worth, can you not?

Mr. WALKER. That is my first start off, Senator.

Senator SMOOT. That is what I say.

Mr. WALKER. There is my initial investment, \$33.27, American money. I want to find out what my other landing costs are, in terms of percentage. I can not eliminate that; I must call that some per cent of the total cost. It costs me 7 per cent to do this, and it cost me 10 per cent to do that, and then I find my landing cost is 213 per cent of my total purchase price, and you will find that if you will go to the bottom of the page, the total cost is \$70.70. Now, \$70.70 is 213 per cent of my original cost of \$33.27. What is the matter with it?

Senator WATSON. Exchange, 50 per cent, has no place in there!

Mr. WALKER. It has not anything to do with it.

Senator WATSON. Then why do you put it in?—

Senator SMOOT (interposing). That is, why did you add and make 213?

Mr. WALKER. I start with the cost of my dishes.

Senator SMOOT. It has nothing to do with it, and you add the whole price.

Mr. WALKER. Leave off the right-hand figures. My set of dishes cost me \$33.27, and the three sets cost me \$70.70.

Senator SMOOT. Instead of 213 per cent, it is 113?

Mr. WALKER. Yes; it is 113 per cent on top of my purchase price if that is what you are trying to get at.

Senator SMOOT. That is what you are trying to get at.

Mr. WALKER. What is the difference between 213 of my purchase price or add 113 per cent to my purchase price? One is multiplication, the other is addition: the result obtained shows no difference.

Senator SMOOT. Just 100 per cent.

Mr. WALKER. There is not a bit of difference mathematically. I take exception to the Senator from Utah.

I want to find the rate of duty; I want to find out what my landing cost is. Supposing I had a case of that china to-day to enter at the customhouse at New York. I do not know what the duty is until I know the selling price; I do not know the selling price until I know the duty; I do not know the profit until I know what the landing cost is. But there are certain things we do know.

I know that the rate of duty under this bill is 40 per cent. On the price of that plate that you have there our profit is 29 per cent including 10 per cent overhead, 10 per cent selling cost and some incidental charges for landing, making a total of 69 per cent. Now 69 per cent of our selling price is our duty and our profit; therefore, 31 per cent, or the balance, must be our cost apart from duty and profit. That is clear, is it not?

Taking the charges on this set of dishes, leaving out, for instance, items four and five which show the present duty and just taking the

op three, merchandise, purchasing commission, and packing charges, and the lower two, freight charges and shipping charges, etc., you find you have \$50.59—that is the bare, naked cost of a case of merchandise laid down, without any duty added to it. Now, that represents 31 per cent of our selling price and it therefore follows that our selling price must be \$166.32, obtained by dividing 31 into \$50.59, as shown in the following calculation:

TABLE C.

Actual landed cost, without duty, \$50.59.
Duty, 40 per cent of selling price; profit, 29 per cent of selling price; total, 69 per cent of selling price.
It is evident that the balance of the selling price, or 31 per cent of it, must be represented by the cost of the merchandise, which is \$50.59.
The total selling price is therefore \$166.32.
The duty is 40 per cent of \$166.32, or \$66.53.
The original cost of the merchandise is \$33.27; case and packing, \$3.30; total, \$36.57.
Now, a duty of \$66.53 on a value of \$36.57 is 181½ per cent.

I have, then, a new selling price of \$166.32, on which a duty must be paid of 40 per cent. It does not take any expert to figure that 40 per cent of \$166.32 is \$66.53. The original cost of the merchandise is dutiable under the Payne-Aldrich bill would be cost plus packing. If you add those two together, you will find that the cost of the merchandise being \$33.27 and the cost of packing \$3.30, the total dutiable cost under the Payne-Aldrich bill is \$36.57; in other words, you are asking under this proposed bill to make \$36.57 of foreign value pay a duty of \$66.53, and if \$36.57 is compelled to pay a duty of \$66.53, then you are assessing a rate of duty of over 181 per cent, and there is no other way out of it.

I want to supplement and support a remark made by Mr. Jones, of Jones, McDuffy & Stratton, the other day, that the rate of duty should be about 20 per cent under the American-valuation plan. I have computed the actual duty that 20 per cent would raise, and it about equals the present duty of the present act. I have taken 60 per cent, the rate in the Payne-Aldrich law, based on foreign cost, and I find it means 21½ per cent. The Underwood bill shows 20 per cent. Mr. Jones found 20 per cent for the Payne-Aldrich law, and I find 21½ per cent.

I have some samples here I would like to show to the committee [distributing samples of plates upon the committee table].

Senator WATSON. Will you make that last statement over again?

Mr. WALKER. I would be glad to.

Senator WATSON. That last statement about the equivalent duty.

Mr. WALKER. You take the duty, as shown in Table D, of 60 per cent under the Payne-Aldrich law.

TABLE D.—Comparison of rate of duty between foreign cost and American selling price on average fancy china.

Table A proves 55 per cent duty on foreign cost is equal to 20 per cent on present American selling price.

Cost (yen).....	1. 00
Landed cost.....	\$1. 10
Profit, 36.4 per cent on landed cost, or 26.67 per cent on selling price.....	\$0. 40
Selling price.....	\$1. 50

Duty, 55 per cent on 1 yen. Cost (sen).....
 Duty, 55 per cent on 0.10 yen. Packing and casing (sen).....

Duty (sen).....
 Equivalent United States currency (cents).....

Duty of 30½ cents is equal to 20 per cent on American selling price.

Table B proves 60 per cent duty on foreign cost is equal to 21.4 per cent on American selling price.

Duty, 60 per cent on 1 yen. Cost (sen).....
 Duty, 60 per cent on 0.10 yen. Packing and casing (sen).....

Duty (sen).....
 Equivalent United States currency (cents).....

To make same rate of profit, selling price should be raised to \$1.53½; 60 per cent cost, or 33 cents, is equal to 21.4 per cent on selling price.

Mr. WALKER. You will find if you compare the price shown in the table submitted that the initial price of the set was around \$33; our selling price was \$100.17 per case of three sets. So it is pretty safe to say—and I find that is true as we run through our merchandise—and the selling price is about three times the foreign cost—foreign purchase price. Therefore, if we take \$1.50 as representing the selling price of a yen, I have this result: Duty at 60 per cent on a yen is 60 sen; 10 per cent for the packing and the duty on that is 6 sen making a total of 66 sen, and reducing it to American currency is 33 cents. If you take the same rate of profit on the selling price under the Payne-Aldrich duty as we do under the present law, then we should sell that \$1.50 article for \$1.53. Sixty per cent on the cost or 33 cents, is equal to 21.4 on the selling price; 21.4 per cent of \$1.50 will give you the same result as taking 60 per cent on the purchase price.

Senator SMOOT. That is, providing you make 200 per cent.

Mr. WALKER. There is no 200 per cent, Senator. Our profit is 29 per cent, and your statement is not borne out by any fact or any figure that I have shown. I will be glad to have the Senator show where it is.

The CHAIRMAN. Mr. Walker, your time has expired.

Mr. WALKER. If I may have just a word more, the Tariff Commission says in a statement I have before me—and I will give you the page. Tariff Information Surveys, revised, page 47—I will introduce these samples. Take these two patterns here [referring to samples on plates on committee table]. There is American-made ware, and there [indicating] is the Japanese ware. It is practically the same pattern. The Tariff Commission said in its report that "Japanese chinaware is competitive in that it displaces domestic chinaware and earthenware. The prices charged for Japanese ware of similar decoration are fully 25 per cent higher than the domestic china, and three times that of earthenware."

Senator SMOOT. You have here the wholesale price on this No. 4 plate, \$13; retail price, \$25. Is that all the retailers make?

Mr. WALKER. That is the actual price as given.

Senator SMOOT. That is just a little less than 100 per cent and of course, Mr. Jones gets not only the retail price, but 100 per cent. Here is one marked \$22.06 and that retails for \$40. No wonder the American people are burdened with debt.

Mr. WALKER. We sell this pattern of ours in 100-piece sets. Our set lettered D corresponding to exactly their pattern No. 4. W

wholesale ours for \$45.29; the retail price of the American patterns \$40; selling price wholesale, \$22.06.

Senator CALDER. Do they sell that in this country for that price?

Mr. WALKER. This pattern 4 is domestic made and wholesales at \$22.06, retails for \$40; our wholesale is \$45.25. This shows the imported set is \$5.25 higher wholesale than the American retail price. There is no unfair competition there.

Senator SMOOT. This is a larger plate and a white plate.

Mr. WALKER. This sample 4 is American earthenware [indicating], and this [indicating] is chinaware—imported.

Senator SMOOT. That is exactly the reason; that is no comparison.

Mr. WALKER. I want to call attention of the Senate committee to the fact that that American earthenware plate is marked by the manufacturer "chinaware," as you can see by looking at the bottom; and I stood in a department store in New York and watched four customers come in and buy that as American china, and it is not American china.

Senator SMOOT. I can see that across the table, and I should think anybody could.

Mr. WALKER. They mark it for china, and they sell it for china.

I want to say this, in closing, that the American potters have dragged in old letters, 6, 7, 10, and 13 years old, in their vain attempt to show questionable practices on the part of American importers; and if I, as an importer, should attempt to put anything over the customs as crooked as that I would go to jail, and I ought to go.

The CHAIRMAN. The statute of limitations has run on it. [Laughter.]

Mr. WALKER. They are practicing that fraud to-day. I would be glad, if the chairman will permit me, to put this in better form and then submit it.

The CHAIRMAN. That may be inserted at the proper place in the record when you revise your statement.

CHEMICAL STONEWARE.

[Paragraph 213.]

STATEMENT OF MAURICE A. KNIGHT, REPRESENTING MANUFACTURERS OF CHEMICAL STONEWARE, AKRON, OHIO.

Senator McCUMBER. You may state your name to the committee.

Mr. KNIGHT. My name is Maurice A. Knight.

Senator McCUMBER. Where do you reside?

Mr. KNIGHT. Akron, Ohio.

Senator McCUMBER. And whom do you represent?

Mr. KNIGHT. I am a manufacturer of chemical stoneware in Akron, and I represent the manufacturers of chemical stoneware in that city—no other manufacturers, the Acid Proof Clay Products Co., and the United States Stoneware Co.

Senator McCUMBER. And you speak of paragraph 213, relating to chemical stoneware?

Mr. KNIGHT. Yes; and I wish to refer to paragraphs 210, 212, and 215, particularly 213.

This is our first appearance. We have not been before the Ways and Means Committee of the House, and have never been before any

other tariff regulation body or tribunal, because we are so small. We are one of the most childish infant industries in existence.

We are asking for 200 per cent, or practically an embargo, which is quite startling, I assure you, quite paralleling the dye industry. I feel that we are of as much importance, and probably more so, to the country in peace or in war, than the dye industry.

Perhaps I should explain what chemical stoneware is. I don't say there are very few who have ever heard of it or know what it is. You may confuse it with sewer pipe, common jugs, or crockery, butter or meat tubs and things of that kind. It is not. Although it is made of clay, it is made in special shapes and designs, probably 80 per cent from blueprints. It is made entirely by hand from start to finish. We can not employ machinery only in some of the more common forms. It is not bulk production. We may make an order of 12 pieces; 100 pieces would be a very large order. There is not a week in the year in which we are not making something that has never been made before. It is used by the large manufacturers of acids, chemicals, dyes, and pharmaceuticals, and it is also used by plants which handle acids and chemicals and corrosive materials such as steel plants in galvanizing, etc. It is something that even the purchasing departments of companies know very little of. They have to refer to the chemical engineers as to what is wanted.

In relation to the importance of the industry in war or in peace I might mention the fact that Edgewood Arsenal, Nitro, West Virginia, and Muscle Shoals and poisonous gas stations could not have been built if it had not been for chemical stoneware. Poisonous gas could not have functioned without chemical stoneware, and we were slow in production and held up by the Government on deliveries because we were not large enough and big enough at that time to take care of the demand so suddenly, all because of the tariff or protection we had before was not sufficient to allow us to get strong and build ourselves up. So the Government was forced to use other material, such as sewer pipe, and common ware, which only lasted a short time and needed replacement continually.

Now, chemical stoneware is the only material that will handle acids and chemicals, hot or cold, weak or strong. There are some materials that are made that will handle one acid of certain strength, under certain conditions, for a certain length of time, but chemical stoneware will handle any of those acids or chemicals or alkalis under any conditions. We to-day and a year ago are still furnishing the Edgewood Arsenal and Government stations like Indianhead and Edgewood Arsenal, and chemical manufacturers such as the General Chemical Co., the Grasselli Chemical Co., and the Du Pont Co. with this material.

There are only four of us in the business to-day. Three of the oldest concerns, that had been in the business for 25 years making not only this material but making some common stoneware or other clay products as a side issue to keep themselves going, have gone out of business. One was a concern in Brooklyn, Charles Graham. They went out of business. They were ready to go out before the war, and they went out as soon as the war was over. The first was R. C. Rhemmy, in Philadelphia, who went out before the war. Why? Because Germany and England both imported chemical stoneware into this country cheaper than they could make it. Then the new

as A. J. Weeks, of Akron, Ohio, in business for 25 years, and who went out as soon as the war was over. The reason they went out was that the protection afforded before the war was not sufficient to let them build themselves up into a strong organization.

Three of us that are left are located in the West at Akron, Ohio, whereas 75 per cent of our business is in the East. You will say if your business is in the East why are we not in the East?

We established ourselves in Akron because it was known as a clay center, on account of the clay and the labor and the factory building and kilns already built. The East was taken care of by importations from England and Germany. So these concerns in the East were first to go out of business.

The freight rate at the present time from our district to the East is 60 cents a hundred pounds less carload and 45 cents a hundred pounds in carload. Our labor is 80 per cent of our cost. That is startling. It costs 90 cents an hour. They are experts. They are men that can not be trained unless it is born in them, and it takes years to train them; even then they have to be able to read complicated blue prints. In regard to labor rates or wages, I refer you to an address in the issue of the New Jersey Ceramics by Mr. Burgess, of the United States Tariff Commission, pages 80 to 87. For instance, here we pay 90 cents an hour for chemical stoneware men, according to Mr. Burgess's report, 70 cents an hour for china, Germany pays 60 cents an hour for the same kind of work, and a good deal of it is done by women. They have been in the business a long time. Great Britain pays 18 cents an hour. We have reduced our wages 20 per cent since 1920, so that now we are paying about 75 cents an hour.

It is carried into this country as ballast, because salt water or anything of that kind does not deteriorate or damage it, because it is not deteriorated or damaged by acid and chemicals. We use no machinery in making it from beginning to end, other than grinding the clay. We should have a separate classification or heading setting forth just what chemical stoneware is. Paragraph 210 says: "Common, yellow, brown, or gray earthenware made of natural, unwashed, and unmixed clay, plain or embossed; common salt-glazed stoneware; stoneware and earthenware crucibles."

That is the way common stoneware is made up, and, as this chemical stoneware is also salt glazed, few people know what chemical stoneware is, and importers can get into the ports under "salt glazed," under "earthenware," and "crockery."

We are in the list with porcelain and other vitrified ware. The process of manufacturing is nothing like it. The labor is different, and the method of manufacturing. The only similarity is that it is made of clay, but it is made of a different kind of clay.

Senator WATSON. You think you are incorrectly classified?

Mr. KNIGHT. We think we are incorrectly classified.

Senator WATSON. Where should you be?

Mr. KNIGHT. We should be in a classification by ourselves. It would be difficult to determine what the American valuation is on chemical stoneware. That is one of the reasons I have asked for 200 per cent.

Senator SMOOT. Do you mean to say you want 200 per cent instead of 35 per cent?

Mr. KNIGHT. Absolutely.

Senator SMOOT. You had 60 under the Payne-Aldrich bill, and now you want 200?

Mr. KNIGHT. We believe that is the only way in which we can be built up and be in a position to take care of future demands by manufacturers of acids and chemicals and our Government in time of war.

The CHAIRMAN. That is a new doctrine in protective tariff, is it not?

Mr. KNIGHT. In what way, Senator?

The CHAIRMAN. It seems very new to some of us old protectionists that a duty should be an embargo.

Mr. KNIGHT. I am frank to say that we are green and ignorant of this. We could not figure out what the ad valorem or American valuation would mean to us, and we run a chance of getting our materials in under 10 or 15 per cent instead of 35. They have gotten into this country before in that way.

Senator McCUMBER. Is your raw material imported?

Mr. KNIGHT. No; our raw material is American.

Senator SMOOT. What do you request on gas retorts?

Mr. KNIGHT. Chemical stoneware of a certain class——

Senator SMOOT (interposing). What do you want on gas retorts?

Mr. KNIGHT. We do not want anything at all.

Senator SMOOT. Lava tips for burners. What do you want on those?

Mr. KNIGHT. No; we do not want anything under that. All I am bringing that forward for is that some of our materials could come in under 15 per cent. What we want is a separate paragraph for chemical stoneware and a definite definition of what it is.

Senator SMOOT. You referred to paragraph 210, relating to common yellow, brown, and gray earthenware. What request do you make on that?

Mr. KNIGHT. Chemical stoneware might come in under common salt-glazed stoneware. It has before, and the same way under earthenware. It has been done in earthenware at 25 per cent ad valorem.

Senator SMOOT. Chemical stoneware was under the same paragraph in the Payne-Aldrich bill as china, porcelain, and other vitrified ware.

Mr. KNIGHT. Yes.

Senator WATSON. Under paragraph 210 what rate are you asking for?

Mr. KNIGHT. We do not want the same rate or anything under 210. The point is that under 210, 212, and 215 there is an opportunity to bring in chemical stoneware by classifying it as salt-glazed stoneware or earthenware. It is hard to determine what chemical stoneware is.

Senator SMOOT. You want a separate definition of it?

Mr. KNIGHT. We want a separate definition of what chemical stoneware is. Take sewer pipe, which is vitrified and salt glazed. It would be classified as a nonabsorbent body. If it is sewer pipe, it is made by machinery, and a 24-inch pipe costs \$1.80. A chemical stoneware pipe of the same size looks just like sewer pipe, just the same glaze as sewer pipe, but, being made by hand, costs us \$12.50 manufacture. The German cost of a 50-gallon condenser is about \$4. Our cost, on account of the difference in labor, is \$40. They make it for 10 per cent of our cost.

All our labor, as I said before, is expert, and the same thing as sculpture. He has to hand mold. The training is necessary.

We do not sell at retail or to the general public directly, or hardly indirectly; that is, our material is plant equipment; it is not a raw material that is used and then sold to the public. I think that is an important point when we are speaking of embargo or high tariff.

Senator McLEAN. Why should it cost you ten times as much?

Mr. KNIGHT. Because our labor is 90 cents an hour against the foreign labor at 6 cents an hour. The material is shipped from foreign countries as ballast, and there is no deterioration in shipping; it is handled here on the eastern coast, and 75 per cent of the chemical business is in New Jersey, New York, and down through Philadelphia; and we have a 60-cent a hundred freight rate, which practically puts us out of business if we do not have a high tariff. Why did all these men go out of business who were in business before the war? They were in the East, and there are only four of us left, three in Akron, Ohio.

DEF OF MAURICE A. KNIGHT, REPRESENTING MANUFACTURERS OF CHEMICAL STONEWARE, AKRON, OHIO.

Foreword.—There is now before the Congress of the United States, House bill 7456, a paragraph of which a proposed duty of 35 per cent ad valorem is provided for chemical stoneware, also that chemical stoneware is not in a classification by itself it is grouped with other articles made from clay to which it is not related. The paragraph referred to is No. 213, on page 40.

Argument.—That this proposed duty of 35 per cent ad valorem is positively not enough to protect the American chemical stoneware industry from foreign competition, and that chemical stoneware should be placed in a classification by itself. Following we propose to submit reasons why our argument should be upheld and the suggested changes made.

The chemical stoneware industry in the United States.—Prior to 1914 there were engaged in this business about eight concerns of various size, all of whom had a hard struggle to compete with foreign aggression, and of whom four could not survive, and went out of business prior to the beginning of the war, or since. The remainder, being somewhat stronger, were able to survive but could not have done so for long, had not the war put a stop to foreign importation, and at the same time called on them for equipment for the chemical, dye, explosives, and poison gas plants. Four concerns still remain in business, being ourselves, the United States Stoneware Co., the Acid Proof Products Co., and the General Ceramics Co. The first mentioned three are located in or near Akron, Ohio, the latter at Keasbey, N. J. Although we are still in business, there are all indications that we will not long so remain, if imports are permitted on a basis whereby it is impossible to compete, as we shall endeavor to show in subsequent paragraphs, and also, why the loss of this industry to the United States will mean more than just the actual loss of the chemical stoneware industry.

Uses of chemical stoneware.—Chemical stoneware is primarily used by the acid, alkali, dyestuff, pharmaceutical, chemical, explosive, poison gas, and allied industries as plant equipment, and is used by practically every industry in the country besides who use, handle, or manufacture corrosive chemicals. Chemical stoneware is not to be confused or confounded with ordinary or common stoneware used for ink cases, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, pens, lamps, and the like, but is a distinct and separate type of material and used in large sizes as equipment for manufacturing, hence is an indispensable necessity for the industries above enumerated.

Method of manufacture of chemical stoneware.—Whereas common forms of stoneware are sold in hardware, china and novelty stores, and the like, are made on machines and the human element has but little effect on the cost, and can therefore be turned out in quantities very cheaply without the extreme hazard or great percentage of waste incidental to the manufacture of the special and complicated pieces of chemical stoneware apparatus. The production of aforesaid common stoneware is based on quantity and not on quality; with chemical stoneware it is just the reverse, in that the pieces are hand molded or built up by hand, requiring expert labor specially trained after years of patient effort. Such expert labor is limited to probably 200 in the entire country who can be considered proficient, and whose present means of livelihood would be taken away if the industry should perish, as they are experts commanding expert wages, and for whom the common stoneware manufacturers would have no use. Roughly about 50 per cent of these men originally came from England and Germany (the two main competitive countries), the balance being trained here after years of patient and expensive effort on the part of the manufacturers. The reason why chemical stoneware must be built up by hand instead of being made by machinery is: First, because the pieces are too large and complicated to be made on a machine; secondly, because there are no standard sizes or pieces; and thirdly, they are mostly made to order and blue print to suit the customers' requirements; and

thirdly, in order to stand the abuse they receive in plant operation they must be very carefully and slowly constructed by expert workmen who know just the mixture and temper of the clay to use, and how the piece should be molded and to withstand the work for which it is designed.

Why is chemical stoneware a necessary industry?—During the war, practically the entire output of the chemical stoneware plants here was taken by the explosives, nitric acid, poison gas, and affiliated industries, and was placed in the priority list by the Government for that reason, as a necessary industry required to supply the above-mentioned industries with their equipment. Without the chemical stoneware industry places like Hopewell, Muscle Shoals, Edgewood Arsenal, and experimental poison gas stations could not have been planned or operated. The requirements for chemical stoneware were such that France, who before the war was mainly dependent on Germany and England for their chemical stoneware, made offers to buy the production for two years of some of the American plants in order that their manufacturers of war munitions could properly function. Numerous instances, in addition to Hopewell and Muscle Shoals, and poison gas stations could be cited, but we think that the mention of these three places in this short brief is sufficient to clearly indicate the importance of the chemical stoneware industry to the welfare of the United States. This is a fact that is known to Government officials connected with the work—all the chemical stoneware manufacturers were from a year to 18 months behind on Government orders at the close of the war.

Why is an ad valorem duty of 35 per cent considered insufficient.—The two chief sources of competition at present are England and Germany, Germany ranking by far ahead of England, and to be considered in many ways, to be explained as follows as the most serious competitor to be met. At present, the rate of exchange between Germany and the United States is in the ratio of about 1.4 cents to 23.6 cents, 23.6 cents being the value of the mark in United States currency before the war. This is a ratio of nearly 1,700 in favor of the German manufacturer, whose cost of labor and the cost of living in Germany has not risen in proportion to the differential in exchange, it thus being possible for him to lay down goods in this country at what is an enormous profit to him, but an unlivable price for us. Previous to the war, and when conditions were normal in most countries, the German workman was earning from 2 to 3 marks per week (about \$5 to \$10), whereas his competitor in this country, the American workman, was earning about \$6 to \$8 per day in making chemical stoneware. Adding to that the fact of the exchange being in their favor, it can be readily seen that the American industry has no chance of surviving even with 35 per cent protection, and once out of business they will probably stay out of business for the reasons stated under the heading, "The chemical stoneware industry in the United States." "Method of manufacture of chemical stoneware." Added to this is the cheap freight rate, as the material is bulky and not affected by sea water or dampness and the willingness of the foreign manufacturer, especially the German, to sell at or below at this time, if necessary, in order to drive out competition here and leave the field free to later on charge prices that will not alone recuperate him in so doing, but furnish him an extra profit as well, as has been seen in quite a number of other industries in the country. Therefore, in order that this chemical stoneware industry may survive and be ready to supply the industries of the United States with equipment required for the manufacture of explosives, poison gas, dyes, nitric and hydrochloric acids, photographic supplies, pharmaceutical drugs, chemicals, alkalies, and all of the other immense number of related industries should be protected with an ad valorem duty of not less than 200 per cent, and with immediately antidumping legislation prohibiting the sale of chemical stoneware at a price not less than the cost of production in this country.

Why a separate classification?—In paragraph No. 213, chemical stoneware is grouped with bisque and parian wares, clock cases, plaques, ornaments, toys, charms, statues, statuettes, mugs, cups, steins, lamps, etc. As has been explained in the first part of this brief, the chemical stoneware industry is in no way similar to any of the articles enumerated in the paragraph, either in the method of manufacture or its use, and would therefore lead to confusion and misunderstandings should it become a law as it now reads. We therefore feel that in justice to the interests of the chemical stoneware manufacturers and the users of same, that it be given a separate and distinct classification.

Summary.—Some of the concerns who are now out of business, and others who are still making chemical stoneware, started in business 25 or more years ago, making common stoneware, sanitary ware, or other products and added chemical stoneware to their line. In nearly every case, outside of some of the simpler pieces required in a hurry, they were unable to compete with the foreign competition, in other words make chemical stoneware their entire production, being forced to manufacture some other lines to continue in business. As previously stated,

water number could not even survive with the side line to help them through, but are forced to close and have not since resumed operations. Those that still survive are those who could manage to carry themselves until the outbreak of hostilities in Europe when foreign importations were cut off, so in a few words, the industry as it exists to-day is a real "infant" industry struggling hard to keep resumed and insufficient protection afforded which would unquestionably be the case with a 35 per cent duty. In the event that the industry is wiped out in this country, and should conditions be such that our key chemical industries would be called on for assistance in case of war, and the supply from Europe of chemical stoneware be shut off, conditions here would certainly be critical, as it would be impossible to start the chemical stoneware industry again (as is possible in some other lines) owing to the lack of skilled workmen as well as the special plant lay out and expert supervision. Besides, were the industry wiped out, the users of chemical stoneware during times of peace ultimately would be forced to pay exorbitant prices for their apparatus by the foreign manufacturers. A separate classification is required so that the entire matter may be clear and prevent chances of misunderstanding or possible purposeful misstatement of the nature of the goods, if bunched with other articles to which it is not related. The manufacturers of chemical stoneware, hereby undersigned pray for an opportunity to appear before a congressional committee, fully prepared to present their case and to explain in more detail than is possible in the brief, the reasons for the desired increase in duty rates and a separate classification, as herein stated, and trust that the seriousness of the matter will cause it to receive from Congress the careful attention that it deserves, and that a hearing will be given so that the truth of our contentions may be plainly and fully brought out.

SUPPLEMENTARY BRIEF.

We beg your earnest consideration in placing chemical stoneware under a separate heading and definite paragraph instead of under paragraph No. 213 as it now stands under the Fordney bill, House of Representatives, No. 7456, as here it is classed with material that is in no way similar in method of manufacture, in kind of clay, labor, or use and, further, so that there may be no misunderstanding at United States port entry as to proper interpretation of chemical stoneware, so that it may not be confused with common yellow, brown, or gray earthenware, common salt glazed stoneware as now under paragraph 210, nor with earthenware and crockery ware, non-vitrified, etc., as under paragraph 211, nor with china, porcelain, and other vitrified wares as now under paragraph 213, or as gas retorts as under paragraph 215, as it has in the past and could in the future be confused unless we have a specific and separate classification setting forth correctly chemical stoneware.

Therefore, we respectfully suggest that the specific classification and separate paragraph or heading for chemical stoneware include the following:

"Chemical stoneware or earthenware acid proof and resistant to corrosive liquids and chemicals, salt glazed or unglazed, or glazed or enameled in any color, vitrified and nonabsorbent, or semivitrified or semivitreous, as well as bisque or chamott body texture in all shapes, sizes, and designs, in complete units or parts thereof, finished or unfinished, assembled or unassembled."

Further, as chemical stoneware is principally about 75 per cent plant equipment apparatus being set up or joining of many different pieces of chemical stoneware, such as pipe, vats, kettles, tanks, jars, receivers, faucets, valves and fittings, it is not essential that the duty on chemical stoneware be applied to each and every piece or article imported, assembled and unassembled, and parts thereof, finished or unfinished, such as grinding of joints or parts.

GLASS AND GLASSWARE (TABLE).

[Paragraphs 217, 218, and 230.]

STATEMENT OF W. A. B. DALZELL, MOUNDSVILLE, W. VA., REPRESENTING THE AMERICAN ASSOCIATION OF GLASS MANUFACTURERS.

Senator McCUMBER. Mr. Dalzell, the committee will be glad to hear from you.

Mr. DALZELL. Mr. Chairman, I am here representing the American Association of Glass Manufacturers. Their headquarters are in Pittsburgh, Pa.

Senator DILLINGHAM. In what paragraph are you interested?

Mr. DALZELL. I shall confine my remarks to paragraphs 217, 218 and 230. This association had its forty-sixth annual meeting last month; so it is an old association. It represents practically the entire interest of the table glassware manufacturers in the United States. The production of these factories amounts to about \$100,000,000 a year. Their pay rolls amount to \$55,000,000 a year. It is an industry in which labor constitutes more than 50 per cent, and it should, perhaps, have special attention, but we feel as though we have been sadly neglected because we have not come here, I suppose, and told our story and explained to you gentlemen what the trouble is.

Senator SMOOT. You have been here in the past a good many times.

Mr. DALZELL. This is the first time that I have appeared, Senator.

Senator SMOOT. Yes; but I mean your association.

Senator SUTHERLAND. Did your association appear before the House Ways and Means Committee?

Mr. DALZELL. Yes, sir; it did, but they do not seem to have paid any attention to us, and we hope that before we get through we will understand each other better. We take the raw materials in the United States and with this labor make the finished articles of glass that are in demand. We use only seven-tenths of 1 per cent of foreign materials in the manufacture of all this glassware.

Senator WATSON. What kind of glassware do you make?

Mr. DALZELL. Just table glassware; tumblers, water goblets, water bottles, oil bottles, all kinds of glassware that is used on dining tables in hotels, restaurants, and private families.

Senator SUTHERLAND. Is that what you call flint glassware?

Mr. DALZELL. Yes, sir; that is flint glassware. Ninety-nine and three-tenths per cent of this \$100,000,000 goes to increase the monetary value of the United States. It is that much increase every year, in this glass industry, and we think it is an industry that should be taken care of. We ask for 60 per cent.

Senator SUTHERLAND. Do you know what the importations have been of foreign wares in competition with your wares?

Mr. DALZELL. We do not.

Senator McLEAN. The record shows that there were imported in 1921, 8,450,000 pounds; in 1920, 3,634,000 pounds. Evidently the importations are on the increase. I do not see table glassware designated here specifically.

Mr. DALZELL. It is not mentioned in the tariff, although it is a very large industry.

Senator McLEAN. And you do not know what the importations are.

Mr. DALZELL. We can not get the information. That is one reason why we want the paragraph that we are told that our goods are classified under remodeled.

Senator SMOOT. There are very few importations, though, of glassware of that kind.

Mr. DALZELL. There are enormous quantities.

Senator McLEAN. I should suppose the importations would be very large.

Mr. DALZELL. I shall show you later on when I come to discuss the paragraphs that cover this table glassware. The statistics

ate it as bottles in one instance and in another instance they state under paragraph 230, the catch-all clause.

Senator SUTHERLAND. Do you suppose the importations will be much as the total domestic production in this country?

Mr. DALZELL. Hardly.

Senator SUTHERLAND. Half as much?

Mr. DALZELL. You can guess as well as I can.

Senator SUTHERLAND. I was wondering whether you had an approximate idea of it.

Mr. DALZELL. I have no idea because there have never been any statistics taken, and that is one reason why we appear here; we would like to have the paragraphs that are supposed to cover this class of goods so mentioned. There are very few bottles coming to this country.

Senator SMOOT. The tableware and bar glassware imported into this country for 1920 amounted to \$39,347. The rate of duty was 15 cents and we collected a duty of \$17,256.15.

Mr. DALZELL. Senator, I believe there was more than that came almost every month of the year.

Senator SMOOT. Well, that is what the Government statistics say.

Mr. DALZELL. I have been inquiring about that. One of the Government experts said he did not think there was any reliance to be placed on those figures.

Senator McCUMBER. How do you account for that?

Mr. DALZELL. I believe glassware and bar glassware are not mentioned in the tariff, so what paragraph do they take it from?

Senator SMOOT. They take it under the 45 per cent rate of duty and under the same paragraph here as globes and shades for gas and gas lights, and chimneys for gas lamps, trimmings for same, chimneys for oil lamps. They are all separated, and as they come here they are accounted for just the same as every other item of importation that comes into this country. They are taken under the tableware and bar glassware; and that is the amount of importations for the year 1920 that I have already stated.

Mr. DALZELL. Not much bar glassware came in during the year 1920.

Senator SMOOT. Then, we will say that it is all table glassware.

Mr. DALZELL. There was very much more than that. I was only giving you the information that was given to me by the Government experts.

Senator McCUMBER. Where did you get your information, Mr. Dalzell, that is not open to the Government?

Mr. DALZELL. We see it around everywhere. Our factories are all idle and have been since this spring. There is hardly a furnace making blown table glassware in operation at the present time in the United States.

Senator McCUMBER. I suppose these statistics are for the calendar year 1920 and that these importations have mainly come in since the calendar year 1920.

Mr. DALZELL. Yes, sir; they seem to be increasing every month.

Senator SMOOT. Even in 1918, the importations, all articles of every description, including bottles and bottle glassware, composed wholly or in chief value of glass, blown, either in a mold or otherwise,

not specially provided for in the paragraph under this section, amounted to \$381,898. Now, that includes everything, blown glassware of every kind.

Mr. DALZELL. That is during the war period, too.

Senator SMOOT. Yes; during the war period, and that is the highest that we have ever had.

Mr. DALZELL. You see, European glassware is all made in the war zone.

Senator SMOOT. Then, we will go back to 1913. The amount in 1913 was \$273,782; in 1914 it was \$775,908.

Senator WATSON. Have you the amount for 1920?

Senator SMOOT. No. This is for 1920 of table glassware and bar glassware alone.

Mr. DALZELL. I think, Senator, you are agreeing with me, only we are looking at it from different angles. Now, let me read you paragraph 230:

Stained or painted glass windows, and parts thereof; all mirrors, not exceeding in size 144 square inches, with or without frames or cases, and all glass or manufacture of glass or paste, or of which glass or paste is the component material of chief value, not specially provided for, 30 per centum ad valorem.

They tell us that practically all our glassware is coming in under that paragraph.

Senator SMOOT. Then, under this paragraph that I have just read here, blown glassware, including not only what you have read there, but of the brown as well and all not specifically mentioned and provided for in this section, the amount, as I say, for 1918 was \$381,898.

Mr. DALZELL. Can you tell me how much comes in under that paragraph?

Senator SMOOT. This is the whole of it, not only including what you mentioned but every sort of blown glassware, and the amount that I gave you in the first place was simply on the table glassware and the bar glassware, but this is the whole of the blown glassware.

Mr. DALZELL. Oh, there must be some mistake about it, either undervaluations or something else. There is something wrong.

Senator SUTHERLAND. Do you attribute the present idleness of your plants and other similiar plants to the influx of foreign goods?

Mr. DALZELL. Principally to that.

Senator SMOOT. Were there as many purchases of your goods in the last three months as there were three months a-year ago?

Mr. DALZELL. No, sir.

Senator SMOOT. Is not that where the trouble comes?

Mr. DALZELL. No, sir; there have been more importations in the last three months than there were three months a year ago.

Senator SMOOT. That is one of the reasons why you are closed up.

Senator McLEAN. Your competition comes from Austria, in a large measure, does it not?

Mr. DALZELL. Czechoslovakia, Belgium, and Germany.

Senator McLEAN. They make very fine glassware and make it very cheaply, do they not?

Mr. DALZELL. Yes, sir; their labor is very cheap. Statistics that I have—I can not vouch for them myself—show that over there the labor cost on a hundred pieces was 5 cents. In this country on similar goods the labor cost was \$1.65. So you can imagine how much tariff we would need to meet that.

Senator REED. You do not think that is a correct statement, do you? I do not mean you have not told what you think is true, but do you think this report which you repeat to us could possibly be correct?

Mr. DALZELL. I know the fact is that their wages were much lower than ours in 1914, and they have practically cut their wages in half in United States money; and our wages have doubled.

Senator REED. Our wages have doubled; their wages used to be half of ours, and they have them now so that they would be one-eighth of ours; but, as you stated a moment ago, they were getting 12 cents and we were paying \$1.65.

Mr. DALZELL. On special goods. Our men only make so much. There are lots of things that they will make in three hours; that is, they work a turn in three hours.

Senator REED. Do you not think it would be well for them to work a little longer?

Mr. DALZELL. We would like it very much, but we can not induce them to do it. We work under union rules.

Senator REED. If the union rules of America limit the labor that a man can produce so that he can get it out in three hours' work a day, and we have come to that sort of a condition, do you think we ought to pass a law to make up for any inequalities in the cost of labor that is based upon that sort of a condition?

Mr. DALZELL. Well, there are conditions surrounding it that perhaps you would think ought to be tolerated.

Senator REED. I work about 16 hours a day myself.

Mr. DALZELL. The president of the glass workers' union was scheduled to appear here, and you can take it up with him. Perhaps you can be of some assistance to us, Senator.

Senator REED. I am not making any war on labor, of course.

Senator McLEAN. Is the character of labor very intense?

Mr. DALZELL. It is, sir.

Senator REED. Let me ask you this: You spoke of the difference in wages. Do you think there ought to be a tariff to make up for the difference?

Mr. DALZELL. No. If we came here asking for something like that we would have to ask for a thousand per cent or more. We are asking for only 60 per cent.

Senator REED. There is no thousand per cent difference in the cost of labor, is there?

Mr. DALZELL. Yes, sir; there is more than that, between German labor, Czechoslovakian labor, and United States labor.

Senator REED. More than a thousand per cent?

Mr. DALZELL. More than 60 per cent, I said.

Senator REED. I thought you said you would have to ask for a thousand per cent.

Mr. DALZELL. On most items; yes, sir. On lots of things we are paying in wages ten times as much as they are.

Senator REED. Do you think the difference in wages ought to be made up by a tariff?

Mr. DALZELL. I do not think we ought to ask the American workman to work on wages that they pay every day over there and ask him to live under their standards. I believe in maintaining the American standard of living.

Senator REED. You would apply that to all of the American labor the same as you would in your own business, of course?

Mr. DALZELL. Certainly.

Senator REED. There is no American labor that you know of that does not get more than the labor abroad, is there?

Mr. DALZELL. No.

Senator REED. That means, then, that we have to have protection on everything?

Mr. DALZELL. Yes, sir.

Senator REED. Then how are we going to do any business with the world at all?

Mr. DALZELL. We make goods that they can not make elsewhere. Take our factory alone. We manufacture this blown ware and we also manufacture pressed glass, but they do not manufacture pressed glass in Europe to amount to anything. We do not ask you to make any special tariff on pressed glass because it is American ingenuity and we export this pressed glassware, on which only a minimum amount of labor is required, to every civilized country on the globe but some pressed glassware is imported which requires a large amount of labor to manufacture.

Senator REED. Part of this stuff that you compete with that comes from abroad is the result of foreign ingenuity, is it not?

Mr. DALZELL. Not any more than our own. We have as skilled workmen as there are in the world in the glass industry, and we can produce anything that other factories can, and we do produce the equal of any glass made in the world.

Senator McCUMBER. I would suggest to the witness that the time allotted to him has about expired.

Senator WATSON. He has not even gotten started yet.

Senator McCUMBER. I hope, then, we will allow him to finish in a short time, as there are a great many other witnesses yet to be heard.

Senator REED. I know; but, Mr. Chairman, I might as well say now, that, so far as I am concerned, if I sit on this committee a man is not going to be permitted to come in here and state his side of the case and the members of the committee not be permitted to get light from him. If you are going to have that sort of a hearing, we might as well adjourn.

Senator McCUMBER. I will say to the Senator that the matter was taken up some time ago and a resolution was passed by the committee limiting the time of each witness to 15 minutes. The hope was, of course, that the witness would be given as much of that time as possible to present his own case rather than having the time consumed by argument, and the present acting chairman is simply attempting to carry out the desires of the committee. The number of witnesses which are listed for each day's hearing are set down to conform to a schedule of 15 minutes for each witness.

Senator REED. Well, that may be, and I do not care to have any differences over it; but nothing can be conceived more ridiculous than a hearing where parties come in to present their side and no questions are permitted to be asked them. I can prove any case in the world if you will let me put my witnesses on in that way.

Senator McCUMBER. I think if we would follow the rule of allowing a witness to present his case first and delay our questions until he has gotten through, we may then find that possibly many questions have been answered and we will thus gain much time. I know every

nator desires to expedite matters, and if we are going to give hearings on all these subjects to almost all who request hearings, we will have to limit the time of the witnesses or we will never get the work reported.

Senator SIMMONS. I was not here when the rule was made, but I thought a proper conception of the rule was to give the witness 15 minutes to state his case and then not confine members of the committee to any definite time for cross-examination. Mr. Chairman, I think these hearings will be worth mighty little if these parties are permitted to come in and make their statements without any interrogatories on the part of the members of the committee. We might desire to develop certain facts as a test of truth.

Senator McCUMBER. The Senator can see that it is impossible for anyone to just say this half minute was taken up by the witness and the other half minute by a Senator in asking questions and keep any record of that kind.

Senator SIMMONS. What I had in mind was that we would let the witness go on for 15 minutes and then his statement would be condensed and any Senator could then ask him questions.

Senator McCUMBER. Even in that case we would have to have just as many witnesses. But go ahead, Mr. Dalzell, and try and present your case.

Mr. DALZELL. We will take up paragraph 217.

Senator SMOOT. To complete my question—you need not answer—the Government information says on the manufacture of blown and pressed glassware, consisting of blown tumblers, stem glassware and bar goods, lamps and lamp chimneys, cut glass, pressed jelly tumblers, and goblets, the production value was \$30,279,290 in 1914, increasing in quantity 16 per cent and in value 87 per cent in 1917. The value in 1918 was \$649,346. I just wanted to show that that is the information the committee has from the department.

Mr. DALZELL. There is one part of paragraph 217 with which we agreed, and it is what we think was intended—“*Provided further, that the terms ‘bottles,’ ‘phials,’ ‘jars,’ ‘demijohns,’ and ‘carboys,’ as used herein, shall be restricted to such articles when suitable for use as and of the character ordinarily employed as containers.’*”

Now, that is good. But at the beginning of the article it mentions plain green or colored, molded or pressed, and flint, lime, or lead glass bottles,” etc. That part of it is contradictory. That takes in the very best class of bottles that is made in the United States or abroad. We think that should be eliminated so as to confine it to the other paragraph and not have the paragraphs contradictory.

Senator WATSON. Confine it to what other paragraph? You mean confine it simply to the proviso?

Mr. DALZELL. No. Cut out the first line and the word “lead”; then start the paragraph with the words “glass bottles, vials, jars, and covered and uncovered demijohns.” That is all we are asking on that; cut out the words “molded or pressed, and flint, lime, or lead.”

Senator REED. May I ask a question. Would that cover goods that you can manufacture and ship abroad?

Mr. DALZELL. Some of it; yes, sir.

Senator REED. Well, you do not want a tariff on something that you can manufacture and ship abroad?

Mr. DALZELL. We do not want that. We want that cut out.

Senator REED. That is what you are asking to have cut out?

Mr. DALZELL. Yes, sir.

Senator SMOOT. It is the exact wording, however, of the Payne-Aldrich bill, and you want that cut out?

Mr. DALZELL. Yes, sir. We would like to have added the words "not to include bottles for table service use or thermos bottles" because we have been informed that they are coming in under that paragraph on account of the wording of it.

Senator DILLINGHAM. Where should that come in?

Mr. DALZELL. It should come in under paragraph 218. Now, I am through with paragraph 217. You will notice that paragraph 217 covers bottles. We come again to paragraph 218 and that is bottles. Where is table glassware? We have always been told that this is in paragraph 218 and the corresponding paragraph in the Underwood bill and the corresponding paragraph in all tariffs in recent years were for goods that we manufacture; but table glassware is not mentioned and bottles are repeated. We would like to have paragraph 218 changed from bottles to table glassware, and all articles of every description, not specially mentioned elsewhere, so that we can have intelligent statistics on table glassware.

I have discussed the matter with your experts and they tell me that this paragraph 218 is extended to and does cover not only decorated glassware but undecorated glassware. You will find in our brief that we have suggested that paragraph 218 remain just about as you have it; but in another paragraph, number 218½, we would call for undecorated ware, because all undecorated ware is thrown into paragraph 230 whenever there is a decision in the courts. That is the only way we know of that. The courts decided under paragraph 230. Instead of 45 per cent under the Underwood bill it is 30 per cent. There is no warrant for claiming that, because the court has said that the appraisers can not add one word or change the sense in any way. When you folks get through that is the end of it and they have to take it just as it is worded.

Further down in that paragraph it states: "*Provided, That the foregoing containers of merchandise,*" etc. Your experts agree with us that all this glassware if it is not containers of merchandise it is not covered. There is one word left out there; that is the word "if." If it read: "*Provided, That the foregoing if containers of merchandise,*" etc., it would make the paragraph of some account to us.

I will say that these paragraphs have been used for I don't know how many tariffs. It was back in the McKinley tariff. An occasional word has been dropped out, which makes them jokers. We are charged with getting a high rate of duty, but we are not. We are only getting a small rate of duty.

Senator SMOOT. If they are containers, I do not see what the difference is.

Mr. DALZELL. They are not containers.

Senator SMOOT. Then this does not apply. If you use the word "if" there, it would not apply.

Mr. DALZELL. We would like to have that reworded so as to cover this business.

Senator SMOOT. I think that is what is intended.

Senator SUTHERLAND. The language that he points out refers to the foregoing as though all articles were containers, whereas they are not all containers.

Senator SMOOT. Then it does not apply. It applies to containers as written.

Senator SUTHERLAND. It is clearly intended to cover them if they are containers.

Senator SMOOT. It is the same thing.

Senator SUTHERLAND. I beg your pardon, but it is not the same thing. It does not seem to me to be the same thing, nor does it seem to the appraisers or the courts.

Have the courts construed that along the line of your argument, Mr. Dalzell?

Mr. DALZELL. I understand the appraisers have, but they have never carried it to the courts because the courts say, "You have to take the bill as written by Congress and use the wording as it is; you can not add a word or leave one out." So what is the use of taking it to court?

Senator SMOOT. The basis of the ad valorem rate in this bill is that it is on content. If you will read the whole thing you will not want to put "if" in there. It says, "the foregoing containers of merchandise subject to an ad valorem rate of duty"—that is the qualification. Then it continues, "or to a rate of duty based in whole or in part upon the value thereof." Containers may come in with different articles of merchandise in them. It is only the containers.

Senator SUTHERLAND. But he states that unless these items are containers they are not covered. That is a condition and not a theory.

Senator McLEAN. His idea is that if they come in empty they do not get protection; is that right?

Mr. DALZELL. That is right.

Senator McLEAN. You are clearly right about that, as I read it.

Senator SMOOT. That is not the intention of the law.

Mr. DALZELL. We would like to have it brought up to the present day.

Senator DILLINGHAM. Have you made a draft of what you would like in your brief?

Mr. DALZELL. Yes.

Senator McLEAN. We will give that attention.

Mr. DALZELL. I have talked to your experts here. They said they would get together and go over it again a little later. They said that they would go over it when they had more time. They thought they could change this wording so as to make it stronger, if that was the wish of the committee—even stronger than I have made it.

Senator McLEAN. It would help if it were clear as to what it embraces.

Mr. DALZELL. Yes; it would be wonderfully improved. Now, the difference between the rate in paragraph 230 and in 218——

Senator SMOOT. What experts have you reference to? I am asking so that we can send for them.

Mr. DALZELL. The name of one is Mr. Davis, I believe.

Senator SUTHERLAND. Have you anything further?

Mr. DALZELL. Yes; paragraph 230. That is intended, as you can see, for stained and painted glasses or painted glass windows, and parts thereof; all mirrors, not exceeding in size 144 square inches,

with or without frames or cases, etc. We think that should be confined to sheet or plate glass, so that our own paragraph would be the "catch-all" clause.

Senator SUTHERLAND. Have you suggested the wording of that paragraph also in your brief?

Mr. DALZELL. Yes, we have.

Senator SMOOT. That is to give you a greater rate of duty?

Mr. DALZELL. Yes.

The Fordney bill provides for only 40 per cent ad valorem duty. We asked for 60, on account of the difference in wages paid in the United States and the wages paid in Europe and Japan, and so on. Anything less than 60 per cent will not be sufficient, even under the American valuation. Under American valuation, paragraph 402, it provides for "comparative and competitive."

Senator SMOOT. That has been changed entirely.

Mr. DALZELL. It has?

Senator SMOOT. Yes.

Mr. DALZELL. It says "comparative and competitive."

Senator SMOOT. That is out entirely.

Mr. DALZELL. If it were "comparative or competitive," it would help.

Senator REED. May I ask you one question on the point you were discussing?

Mr. DALZELL. Yes.

Senator REED. You get 40 per cent under the old law or under the present law, do you not?

Mr. DALZELL. Under the old law?

Senator REED. Well, what do you get under the present law?

Mr. DALZELL. 45 per cent.

Senator REED. And under the Fordney law you get 40?

Mr. DALZELL. Yes, 40.

Senator REED. And you want 60 per cent?

Mr. DALZELL. Yes, 60 per cent.

Senator REED. And 45 per cent was levied upon the European valuation, was it not?

Mr. DALZELL. Yes, sir.

Senator REED. The 40 per cent was contemplated to be upon the European valuation, was it not?

Mr. DALZELL. Yes, sir.

Senator REED. And you want 60 per cent on the American valuation, do you not?

Mr. DALZELL. Yes; 60 per cent on the American valuation.

Senator REED. What is the difference between the European valuation and the American valuation to-day?

Mr. DALZELL. Well, I am not thoroughly posted on that.

Senator REED. You are asking for 60 per cent. You say that is what you want. Therefore, you ought to be able to give us some idea of it.

Mr. DALZELL. I can give you a particular case.

Senator REED. Couldn't you tell us, in your line of business, speaking generally of it, whether it is twice as much or three or four times as much?

Mr. DALZELL. On the average our labor costs four times over foreign competitors' cost of labor.

Senator REED. Four times?

Mr. DALZELL. In some instances, yes.

Senator REED. Then, if we give you four times as much, or rather if we base our tariff upon a value which is four times higher than the European value, you would have a 240 per cent tariff on the European valuation, whereas you were doing business under a 45 per cent tariff.

Mr. DALZELL. The war was helping us out.

Senator REED. We will take before the war.

Mr. DALZELL. In 1913 and 1914 we were not doing very much.

Senator REED. What were you doing in 1909, 1910, 1911, 1912, and so on?

Mr. DALZELL. We had 60 per cent.

Senator REED. All right. You are asking 240 per cent protection as against 60 per cent protection under which you did business at a great profit.

Senator McLEAN. He is only asking for 60 per cent now.

Senator REED. He is asking for it based upon the American valuation, which is four times as high as the European valuation.

Is it your idea—and I want to get your idea—that the tariff should be so high as to keep out all foreign goods in your line?

Mr. DALZELL. Oh, no, sir.

Senator REED. Are you willing to have the tariff fixed so that there shall be an actual and potential competition in this country between your goods and foreign goods?

Mr. DALZELL. Yes, sir.

Senator REED. On all lines?

Mr. DALZELL. Yes, sir.

Senator REED. And do you think you have to have 240 per cent on the European valuation to continue to compete?

Mr. DALZELL. At the present time we need that.

Senator REED. I will ask you this further question. You have spoken about the closing of plants and the closing down of sales. That has been practically universal to some degree throughout the entire country. It has not been true to the same extent in all cases, but a diminution of business in every line in the United States in the last eight or nine months has been going on; that is true, is it not?

Mr. DALZELL. I think so.

Senator REED. Prices went down on farm products to less than half what they were during the war. Retail stores are forced to reduce prices, so that sales and business generally have been somewhat slack. Are you considering that? Don't you think that element should be considered in your business, too?

Mr. DALZELL. We are paying the highest peak of wages. The workmen will not consent to a reduction in wages.

Senator REED. Let us see about that. They may have to consent some day. I am trying to get at this point: In speaking of the fact that your plants have been closed down and that you are charging it up to competition from abroad, is it not at least in part due to the general depression in this country?

Mr. DALZELL. Yes. But we hear of more importations of glassware this year than ever before in my experience.

Senator REED. I thought that Senator Smoot produced the figures.

Mr. DALZELL. I say we hear.

Senator REED. Of course, the records show that.

Senator WATSON. We have no figures for 1921.

Mr. DALZELL. It is worse this year than in 1920.

Senator WATSON. Did Senator Smoot give the figures for 1921?

Senator SMOOT. I did not give them, but they are here for this year, in part at least.

BRIEF OF THE AMERICAN ASSOCIATION OF FLINT AND LIME GLASS MANUFACTURERS (INC.), PITTSBURGH, PA.

Acting as a committee representing the American Association of Flint and Lime Glass Manufacturers (Inc.) of Pittsburgh, Pa., having for its membership 93 glass manufacturers engaged in the production of table glassware, as covered by Schedule B of the tariff act of October 3, 1913, we beg to submit the following for consideration:

Our objections to paragraph 217 are as follows: We approve the following: *Provided further*, That the terms 'bottles,' 'vials,' 'jars,' 'demijohns' and 'cartons' as used herein, shall be restricted to such articles when suitable for use as and of the character ordinarily employed as containers for the holding or transportation of merchandise; but the first of the paragraph, "plain green or colored, molded or pressed and flint, lime, or lead" is objectionable, because that is contradictory to the above that we mention as approving, so we have eliminated it in the paragraph we suggest as a substitute, because with that wording of the paragraph it included every glass bottle that can be made, and is therefore contradictory. We have added "and also to include bottles for table service use or thermos bottles." Bottles for table service use are bottles used in hotels and restaurants and include water bottles, oil bottles, vinegar bottles, salt bottles, pepper bottles, etc.

Paragraph 218: The table glassware manufacturers have always been told that this was their paragraph, designed to cover goods they manufacture. Statisticians give bottles credit and all goods that come in under this paragraph because it begins with "bottles." We have changed it and started it off with "table glassware," and bottles are only mentioned incidentally, and, of course, would include bottles when decorated. Paragraph 218 is designed to cover decorated and ornamented glassware. We can see no force in mentioning colored cut, engraved, etched, frosted, gilded, ground, painted, printed in any manner, sand-blasted, silvered, or stained, but to cover the same broadly (when decorated or ornamented in any manner).

We have added a new paragraph that we call "paragraph 218½" to cover table glassware that is not decorated or ornamented in any manner, not specially provided for for the reason that in former and present tariff table glassware that is undecorated has always been classed in paragraph corresponding with paragraph 230, the "catch all clause," and all that glassware is credited by the statisticians to stained or painted glass windows. The net result of this is that no one knows what table glassware is being imported from the statisticians reports, but we manufacturers know that there is a very large volume of it constantly being imported and will continue.

Paragraph 230: We have eliminated, "or of which glass or paste is the component material of chief value, not specially provided for," and have substituted "or of which sheet or flat glass or paste is the component material of chief value, not specially provided for."

Rates of duties.—The table glassware manufacturers will not make any suggestion as to the rates of duty in paragraph 217. You will have recommendations from the American bottle manufacturers as to that. As to paragraphs 218 and 218½, it will be absolutely necessary to have a higher rate of duty on this glassware than that provided under the Payne-Aldrich tariff, for the difference between wages paid by the American manufacturers and wages paid by our foreign competitors has been trebled. In this country it is not permissible to use child labor of any kind in making glass; whereas abroad it is customary to make use of such labor for certain processes. We have to employ men to do the work formerly done by children and have to pay correspondingly high wages. The difference of the wages paid by American manufacturers and our foreign competitors ranges from 7 to 10 times greater and our pay roll is more than 7 per cent of our selling price.

H. R. 7456, paragraph 75. Potassium: Carbonate (chemical used very extensively in the manufacture of glassware) provides for 25 per cent ad valorem and that for a period of five years, beginning on the day following the passage of this act, there shall be levied, collected, and paid on all the foregoing an additional duty of 15 per cent ad valorem, so that is equivalent to 50 per cent when the ocean freight is added, and will be a very heavy increase to the American manufacturers of glassware. The chemi-

they use is hydrated carbonate of potash, and the members of the association we represent use annually between four and five thousand tons, most all of which comes from Germany. Before-the-war price was less than 4 cents per pound, f. o. b. New York; during-the-war price was advanced to 80 cents per pound, because there was none produced in the United States or elsewhere other than in the war zone. Congress on several occasions has appropriated money, trying to develop potash industries, but we have not heard of any hydrated carbonate of potash being manufactured in the United States being placed on the market. Heretofore, hydrated carbonate of potash has always been on the free list, but the new bill provides the above rate of duty.

New York City importers have boasted that the American table glassware factories would have to shut down once German glass could be shipped here, no odds how high rate of duty the new tariff bill contains, for the reason that they have such an advantage over us in the difference of wages paid. We pay a much higher rate of wages than they formerly paid when both countries' money was on a gold basis. We continue to pay on a gold basis, and while they are paying a somewhat higher rate of wages, on account of it being in paper marks, they actually pay a very much lower wage than they ever paid before. There is a great deal of truth in their statement, because they always did import large quantities of table glassware to the United States, and to-day they are in better shape to import table glassware than they ever were, and the American glass factories are all closed down, largely due to large importations of competitive goods at ridiculously low prices.

We approve of the American standard of valuation, but we shall need that on top of a high duty rate to in a measure overcome the vast difference in wages paid workmen in foreign countries as compared with ourselves.

The value of the entire production of this branch of the industry is, approximately, over \$100,000,000; the number of skilled workmen employed in this industry is, approximately, 7,000; the number of unskilled help employed is, approximately, 30,000. The approximate wages paid to labor is about \$55,000,000.

We claim our industries should have special consideration and higher duty rates, because more than 50 per cent of the price we sell our product at is in the pay roll and the other half is composed of fuel, material, general incidentals, taxes, and a small profit.

Table glassware is a production of manual labor. There is no possibility of quality glassware being made by machinery. Machines will make common run but not such as American families and hotels will use for table service.

The American table glassware manufacturers and their workmen are as capable of producing the best grades of glass as any foreign manufacturers. The rates we ask are not unreasonable but are absolutely necessary to enable us to pay American standard of wages to our workmen. Lower rates will not. And, permit us to emphasize, we have never had rates of duty high enough to pay wages equivalent to other artisans in America and low duties and low wages will keep young American men from learning this trade.

GLASS BOTTLES.

[Paragraphs 217 and 218.]

STATEMENT OF JAMES MORRISON, TOLEDO, OHIO, REPRESENTING THE NATIONAL BOTTLE MANUFACTURERS' ASSOCIATION.

Senator SMOOT. Do I understand that you will speak for Mr. Porter and Mr. Stevenson?

Mr. MORRISON. Yes, sir. Mr. Chairman and gentlemen, with the gentlemen who are here with me I am representing the National Bottle Manufacturers' Association. I myself am directly connected with one of the companies as division sales manager of the Owens Bottle Co., Toledo, Ohio. We are here in connection with paragraphs 217 and 218.

The bill as prepared in the House provides for certain specific rates on bottles and a 28 per cent ad valorem duty. The specific rates, when figured out, would amount on the present day market value of bottles, equivalent to 28 to 30 per cent; so there is really no difference based upon to-day's market price between the specific rates and the ad valorem rates.

The bottle industry is a part of a very big industry in this country. The glass industry is one of the major industries, and is a business that requires very considerable skill. It takes from two to six years to train the labor, and it is all high-priced labor. The prices of labor to-day are particularly high, and will no doubt continue high for some time. Workmen are resisting all efforts toward reductions, and I think it will be a long time before wages get back to anything approaching—if they ever will approach—the standard of four or five years ago.

Senator SMOOT. Do you want this 28 per cent increased?

Mr. MORRISON. We would like to see the rate made 60 per cent.

Senator SMOOT. You think that would be reasonable, do you?

Mr. MORRISON. We do think it would be reasonable. We are quite convinced that there are conditions developing that will make that probably not adequate, in view of the competition that we are encountering from both Germany and Japan. I had a little bottle that I brought up here as an exhibit, but it disappeared very quickly.

Senator McLEAN. It must have had something in it.

Mr. MORRISON. No; it happened to be an empty one, Senator.

Here [producing a bottle] is a bottle the present American selling price of which is \$2.15 without a cap. I saw a letter this morning dated July 14 from Kobe, quoting that bottle at 86 cents a gross, laid down in New York. The blowers' wages alone almost equal 86 cents on that bottle.

Japan is coming forward as a very active competitor in glass of all kinds, particularly bottle glass. We are going to feel the effect of that competition more and more, and we feel quite certain that we will be able to adjust the affairs of the industry to meet that competition, provided that we are given something like a fighting chance against them.

Senator McLEAN. What will 60 per cent ad valorem duty add to the cost of that bottle?

Mr. MORRISON. Sixty per cent based upon a \$2.15 price would be \$1.20, which would be added to that 86 cents——

Senator McLEAN. That bottle is used largely by druggists, I suppose?

Mr. MORRISON. Used largely by druggists. The price I gave you is a carload price. We sell these bottles almost invariably direct to users. There are very few of them sold to jobbers; \$2.15 would about represent the prevailing price. You are all familiar with Bayer's aspirin tablets. They are put in that identical bottle. The price of the bottle is \$2.15.

The wages of the workmen in the bottle industry run about \$22 to \$25 per week for the unskilled. The skilled workmen draw from \$35 to \$40 per week. Considering the class of labor, that has never seemed to me to be too high. It is quite certain that we will never get it very much lower if we intend to maintain the class of skill required in the glass industry. I think we are far in advance of all the foreign countries in the making of useful glass of all kinds. Decorative glass is probably a little in advance of us. We have attained that position because we have been careful in the selection of the young men, trained in the art, and we have made the industry attractive for them. So long as we can do that we think that with

proper tariff assistance we can maintain our supremacy in the American market.

Senator McLEAN. How do present prices compare with the prices year ago?

Mr. MORRISON. I will cover that a little more broadly, Senator, you wish. Take the range from 1915 to to-day. The increase has been about 120 per cent over 1914-15 prices. At that time the prices were extraordinarily low; 120 per cent would represent about the increase from 1914 to to-day. As compared with a year ago the prices are 20 per cent higher than they were, but are now tending downward. There has been in the last several months a noticeable reduction in price. There will be further reductions, because we realize that in order to make the use of bottles and glass packages attractive we have got to keep the price down to a point that will make their use attractive to the people who desire them.

Senator DILLINGHAM. Are you paying the same wages that you paid during the war?

Mr. MORRISON. There has just been concluded at Atlantic City a series of conferences between workmen and manufacturers on the question of wages. In 80 per cent of the different brackets, the different classes of labor, we failed to reach any agreement whatever. The workmen in some cases demand still higher wages than they have been receiving, and in some other cases they demand the same and are resisting any effort to lower them. In a few cases they submitted to some reductions, in the largest case, I do not think, exceeding 15 per cent.

Senator DILLINGHAM. How do the wages now compare with the wages you paid immediately preceding the war?

Mr. MORRISON. They are considerably higher now. I do not know what I have the figures, but I will say that they are probably 80 per cent higher. I give that as an estimate.

We understand from the best information we have—we are not in position to give you a definite figure on it, but Mr. Clark, the president of the American Flint Glass Workers' Union, completed a four months' trip through Germany, Austria, Czechoslovakia, and other foreign countries, looking into the question of wages and investigating wages from the workmen's point of view, not from the manufacturers' point of view. From him we have the information that the wages in those countries for this class of work run from \$3 to \$5 per week expressed in American values, as compared with our wages of from \$25 to \$40 per week.

Labor is a very large part of any glass article, because it follows all through the raw materials which invariably come out of a hillside. It costs nothing at all to put them there. The only cost is for the labor in getting them out, and then the labor on the completed raw product.

In the case of a bottle, just to illustrate how these differences in price would operate, the selling price in this country to-day of a 16-ounce bottle is from \$6 to \$7 per gross. Their costs will run from \$5.50 to \$6.50. If plants are running full—that is to say, up to 85 or 90 per cent of capacity—profits would run around 15 per cent.

In Germany and the other countries I have mentioned, from the best figures obtainable, the same bottle would cost from \$1.10 to

\$1.40 per gross. If we add the 28 per cent duty proposed in the H. R. 7456 bill to the present selling price of that bottle, we would find a total cost, laid down in New York, of \$4.32 per gross for a 16-ounce bottle—that is costing us from \$5.50 to \$6.50 per gross.

What is true of the countries I have mentioned is true also of Japan. Somehow—I do not know whether it is personal with me or whether I feel differently on this subject from some—somehow I fear the Japanese more than I do the other countries mentioned, because they do some things a little differently there. The Japanese catalogue prices are fully 50 per cent lower than the prices quoted in this country. Their illustrations are copies, almost altogether in their entirety, from American catalogues. In other words, they come into this country and pick up catalogues of American business and catalogue them and then come in and quote below us on the things that we in this country have created.

Mr. Chairman, I do not think I need to take up more of your time. I have here a brief that I will leave with the committee.

BRIEF OF JAMES MORRISON, TOLEDO, OHIO, REPRESENTING THE NATIONAL BOTTLE MANUFACTURERS' ASSOCIATION.

The bottle industry of this country is very much concerned with the inadequate rates proposed in Schedule 2, paragraphs 217 and 218, in H. R. 7456.

The specific rates provided for in paragraph 217 are with two exceptions equivalent to less than a 30 per cent ad valorem, so that the net effect of the paragraph is practically to make the 28 per cent ad valorem rate apply to all bottles. The 28 per cent ad valorem duty will not protect the bottle industry.

Foreign competition in the bottle industry comes from two main sources: Germany, Austria, and Czechoslovakia, the industrial conditions in all three countries being so nearly alike that they may be considered as a unit from competitive standpoint; and, secondly, from Japan.

Wages in the bottle industry of this country average from \$35 to \$45 per week for skilled labor and from \$22 to \$27 per week for unskilled labor, making a total average for the industry as a whole of from \$25 to \$30 per week. The wages of skilled labor in Germany, Austria, and Czechoslovakia do not amount to more than \$6 or \$7 per week, the wages of unskilled labor amount to from \$3 to \$4 per week, making an average for the labor as a whole of from \$4 to \$5 per week. Our authority for these statements rests upon a report prepared by W. P. Clark, president of the American Flint Glass Workers' Union, who made a special trip to Germany, Austria, and Czechoslovakia this spring for the purpose of investigating glass-workers' wages in these countries.

Labor is an exceedingly important part of the cost of a bottle, but the raw materials which enter into the manufacture of a bottle—namely, lime, sand, soda ash, and coal—are all very much more expensive here than they are abroad, owing to the fact that the cost of these raw materials, which next to labor are the most important factors in the glass cost, are built up largely from labor, and the cost of these commodities is lower abroad in about the same proportion as foreign wages are lower than our wages.

As total costs depend finally upon the sum of all of the labor costs which are entered into the raw materials and the final fabrication of the article in question, it is evident that Germany, Austria, and Czechoslovakia are able to produce glass bottles at about one-fifth to one-sixth of our American cost. Let us see how this will work out on a definite bottle.

For the purpose of illustration let us take a pint bottle. The selling price in this country to-day is between \$6 and \$7 per gross. Our domestic cost runs from \$5.50 to \$6.50 per gross. Based on the relation between the earnings of American and German labor it is evident that this bottle can be produced in Germany, Austria, and Czechoslovakia for from \$1.10 to \$1.40 a gross. Let us estimate then that the profit added the foreign selling price would be about \$1.50. To this we would have to add duty and ocean transportation. On the basis of the duty suggested in H. R. 7456, paragraph 217, this duty would be 28 per cent on the average American cost of \$6.50, equivalent to \$1.82. Add this to the foreign cost of \$1.50 and we

1.32. Let us add \$1 for ocean freight, insurance, etc., and we have a cost of \$4.32 gross laid down in New York.

It is absolutely impossible for the American manufacturer to sell on anything approaching this price and live. Already firm quotations on German-made bottles about this ratio have been made in this country and these quotations are only a preliminary index of what will happen if the present rate as proposed by the House of Representatives goes into effect.

Let us now consider the case of Japanese competition. Japan is becoming exceedingly active in the manufacture of bottles and is at the present time exporting considerable quantities to England. They are now beginning a drive to secure business in this country. Quotations are being furnished American importers and jobbers in large numbers and considerable quantities of Japanese ware have already made their appearance on the American market. Japanese wages are even lower than the wages paid in Germany, Austria, and Czechoslovakia.

As an example of Japanese competition, let us call your attention to a firm quotation recently made by a Japanese export house on a tablet bottle, sample of which has been handed to your committee marked "National Bottle Manufacturers' Association Exhibit A." This bottle is quoted without cap and cork at 86 cents a gross, i. e. New York. The American selling price is about \$2.15 and the American cost around \$1.85. If the 28 per cent ad valorem proposed in H. R. 7456, which amounts to 60 cents, is added, we see that the selling price of this bottle laid down in New York is \$1.46 as compared with the American cost of \$1.85. It is evident that it is impossible for the American bottle manufacturer to meet this competition. In other words, gentlemen, the bottle industry of this country will be seriously curtailed in the same way as the toy industry has been if we can not secure through the tariff adequate protection against these German, Austrian, Czechoslovakian, and Japanese bottles.

To protect the industry adequately, we should have at least a 60 per cent ad valorem duty in paragraph 217 and a 60 per cent ad valorem duty in paragraph 218, and even with these percentages we do not believe that the industry will be protected unless the principle of American valuation is adopted.

We believe that the amount of capital and the number of men employed in the bottle industry of this country entitle us to your careful consideration. For your information we submit the following figures bearing upon the size and importance of the industry:

Employees.

Number of employees at normal capacity, average.....	32,051
Wages of employees, average year.....	\$30,000,000

Size of industry.

Capacity, gross of bottles per year.....	25,000,000
Actual production, average year.....	21,775,000
Approximate value.....	\$108,875,000

One further point which we wish to urge very strongly on your consideration is our approval and appreciation of the action of the House in excluding all articles of glassware covered by paragraphs 217 and 218 from the free list, as now allowed by paragraph 573 of the tariff act of October 3, 1913. Prior to the war practically no glassware for chemical and scientific uses was made in this country, owing to the fact that chemical and scientific glassware intended for the use of educational institutions was admitted free. This practically meant that all scientific and chemical glassware was admitted free.

During the war our industry developed and built up the manufacture of a complete and exceedingly high-grade line of chemical and scientific glassware, which freed us from the domination of foreign manufacturers in this important matter. Since the war, however, foreign manufacturers have again come into the market, and the industry which we built up during the war is being rapidly wiped out. The exclusion of these articles from the free list, as provided by the House, will enable us to make up the ground we have lost in the last three years and to maintain and develop further this important branch of the industry. We believe you will agree with us that it is vitally essential to the public welfare that America should have a strong and well-developed scientific and chemical glass industry.

Coming back to the main consideration, then, we urge you to earnestly consider what is going to happen to our industry unless your committee affords us the relief that we ask. We believe that unless your committee does afford us this relief that

this great industry is going to be seriously curtailed, that the capital invested in the industry will be destroyed, that the men whom we are now employing will be thrown out of employment, and that we will become dependent upon foreign sources for our supply of bottles.

Knowing that you and your committee desire to protect American industry and to conserve the capital and employment which our industries now use and furnish we feel safe in leaving our case in your hands.

GLASSWARE (ILLUMINATING).

[Paragraph 218.]

STATEMENT OF NICHOLAS KOPP, PITTSBURGH, PA., REPRESENTING ILLUMINATING-GLASS MANUFACTURERS.

Senator McCUMBER. Will you give your full name?

Mr. KOPP. My name is Nicholas Kopp. I live in Pittsburgh. I represent about 26 manufacturers of illuminating glass.

Senator McCUMBER. Whom did you say you represent?

Mr. KOPP. I speak in behalf of about 26 manufacturers of illuminating glass.

Senator WATSON. What is the paragraph?

Mr. KOPP. Paragraph 218. We are not listed now as such. There is a great deal of contention on account of that. We believe that there are a great many importers who would like to have better statistics.

The capital invested in our branch is \$20,000,000. We produce about \$25,000,000 worth of glass. We pay for labor \$12,500,000 for material about \$5,000,000; for coal about \$2,500,000.

Senator REED. What did you say your capital is?

Mr. KOPP. \$20,000,000.

Senator REED. And you produce what?

Mr. KOPP. \$25,000,000 worth of glass.

Senator REED. And how much is the labor?

Mr. KOPP. \$12,500,000.

Senator REED. What was the rest?

Mr. KOPP. Material, \$5,000,000; coal, \$2,500,000.

There is about 20 per cent left for overhead, sales costs, taxes, and all those things.

Senator WATSON. What is illuminating glass? What is it that you want specially classified?

Mr. KOPP. In the last 20 years we have made improvements in illuminating glassware in the scientific and artistic line. I have some pictures here, if you care to see them.

Senator WATSON. No; you can tell us about it.

Mr. KOPP. We make shades, globes, reflectors, bulbs, and so on.

Senator SMOOT. Have you any idea what the importations were for 1920?

Mr. KOPP. No.

Senator SMOOT. I will tell you. They were \$7,951.

Mr. KOPP. Yes. If you look at this industry from the American point of view you will find we have been thoroughly investigated by the Government and that we do not show an excessive profit. Our costs only about \$25,000,000 to the people, or a little over 25 cents per capita.

Senator WATSON. In what countries are they making this glassware? I mean the countries with which you are in competition.

Mr. KOPP. Czechoslovakia, Germany, Belgium, and some in France.

Senator WATSON. The same kind that you make?

Mr. KOPP. Yes, sir.

Senator WATSON. What were the imports in 1921?

Mr. KOPP. I can not say.

Senator SMOOT. I will tell you.

Senator McCUMBER. While Senator Smoot is looking that up, you may proceed.

Senator REED. Just what is your contention? I did not catch that at first.

Mr. KOPP. As conditions exist to-day, they can pay the present duty and lay it down here for one-half of our labor cost.

Senator McCUMBER. Why are they not doing it now?

Mr. KOPP. Our price is higher. They get paid about half of what we get paid. They will do it more every day, but there is not a big demand for it just now.

I have tried to analyze the situation and give my views on it.

We have two main requests in our brief:

First, a special classification for illuminating glassware under schedule B; and

Second, a duty equal in amount to the difference in the cost of labor between the United States and Europe and Japan or other countries.

Our reason for the first request is that on account of the great development in the glass industry in general, in volume, process, and variety, during the last 40 years since the present tariff classification was entered in Schedule B, it is a fallacy to continue to list every kind of glass under bottles, jars, etc., when these bottles, jars, window glass and other items are now mostly made by automatic machinery and form by far the greater portion of the volume and value of the total products of the glass industry.

For this reason such goods are in a different position than the handmade goods, hence we have prepared a special classification for illuminating glassware and ask that you give it a place under schedule B.

Our reason for the second request for a duty equal in amount to the difference in labor cost is based on facts and figures our representatives have recently obtained in the various countries of Europe.

While in the illuminating glassware branch of the industry we also show great progress and development, it is, however, more apparent in the scientific and artistic direction. Our goods are produced by highly skilled as well as artistic labor, and hence we are more directly affected by the difference in cost of such labor between the United States and Europe, Japan, and especially Germany and Czechoslovakia, which countries can to-day lay illuminating glassware (after paying the present duty of 45 per cent) at our doors at less than one-half of our labor cost. While the German and Czechoslovakia glassworker has received from 1,000 per cent to 1,200 per cent more mark wages, yet as the mark to-day is only one-fifteenth of its prewar value, these laborers actually receive from 20 per cent to 33 per cent less dollar wages than in 1914, while the value of their product is on a gold or American dollar basis.

We have carefully computed their actual dollar wages and have averaged the wages of blowers, blockers, and gatherers, and find the

average wage is about 80 cents per day of 8 hours, or a yearly wage of from \$200 to \$240 at the present value of the mark.

We have also computed our wages in the same manner and find our men receive from \$8 to \$9 per day of eight hours, or ten to eleven times more than in Germany, or a possible yearly earning of from \$1,800 to about \$2,400, in our branch.

We have likewise made comparisons of the unskilled and semi-skilled laborers and find that wages in the United States are from seven and one-half to eight times greater.

After a careful comparison of the average wages of all skilled and other labor in our industry, we arrive at an average factor of nine times the labor scale of central Europe.

We will, however, make a further allowance and take eight only as our average factor.

The German glass manufacturer claims that 40 per cent of his sales value represents labor cost. Hence, in \$1 of German sales, 40 cents is labor cost. If we multiply this by eight we have \$3.20 as American labor cost, and as in our sales value one-half is labor cost, we would have to sell a like article for \$6.40. With 40 per cent duty this would amount to \$2.56 plus \$1 German value—\$3.56 against our \$6.40. For this reason we believe that at least 60 per cent is necessary, or \$3.84 plus \$1, German value, equals \$4.84 for plain glassware and 65 per cent for ornamented glassware, making \$4.16 plus \$1, or \$5.16, against our \$6.40.

France, Canada, Italy, and most foreign countries have already established, according to the German official paper, *Sprechsaal*, pages 191 to 241, inclusive, the following coefficient multiple for tariff purposes, to be added to German values of glass:

	Volume.	Page.
France used a coefficient multiple from 3 to 4, or 300 to 400 per cent, and a specific duty.....	17	17
Italy, 4 to 4½, 445 per cent and a specific duty.....	18	20
Roumania, 4, 400 per cent and a specific duty.....	18	20
Belgium, 3 to 6, or 300 to 600 per cent, and a specific duty.....	18	20
Canada, 50 per cent of normal value, 600 per cent and a specific duty.....	21	21
Czechoslovakia, 2 to 15, or 200 to 1,500 per cent and a specific duty.....	21	21

We also call to your attention and consideration the fact that the manufacturers of Europe, and specially those of Germany, Czechoslovakia, and Belgium, enjoy greater privileges than we do. They have the full support of their Governments to combine and form syndicates, cartels, and trusts. They are permitted to and do regulate sale prices and production. They insure members against loss caused by strikes and from export policies. Thus in many ways they secure advantages which we, as separate commercial units, can not possibly obtain.

It must also be remembered that while our labor organizations have similar privileges of regulating wages and terms of their services in the United States, the American manufacturer has no such equal rights in this respect. The foreign manufacturer can do business in our country under methods and practices which are not only denied to our own manufacturers, but are, in fact, considered unlawful.

I have here a table, taken from the official published statements, showing the dividends paid by German glass manufacturers in 1921, the profits ranging from 100,000 marks to 6,000,000 marks.

	Per cent dividend.	Per cent bonus.	Per cent total.	Volume.	Page.

Fifteen companies paid an average of 32½ per cent dividends.

Senator SIMMONS. For when?

Mr. KOPP. For this year. Some of them say that they made as high as 6,000,000 marks.

Senator SIMMONS. To whom have they been selling?

Mr. KOPP. They get us.

Senator SIMMONS. We are the best market in the world. I should think they would come here.

Senator McLEAN. If this product is included under the designation "all other glassware materials imported in 1920 and 1921," the reports are increasing very rapidly. They were, in 1919, valued at 442,000. The amount is not given—that is, the character of the importation—but just the value. In 1920 it was \$998,000 and in 1921 \$2,668,000.

Senator SIMMONS. Where did you find that, Senator McLean?

Senator McLEAN. On page 11 of the Monthly Summary.

Senator SIMMONS. What is your production? What is the American production of these goods?

Mr. KOPP. Our production is about \$25,000,000.

Senator SIMMONS. \$25,000,000?

Mr. KOPP. Yes.

Senator REED. In regard to the point made by the Senator from Connecticut, I think this is the case, that in the tables for 1919 and 1920 these articles manufactured by this gentleman's houses are specified and their value is given, but in 1921, that being the table from which the Senator has read, they have not been segregated, but they have been thrown into the general clause, "all others," so that those figures do not guide us as to these particular articles.

Just one further question: Did you take into consideration the difference in the value of the mark in your testimony?

Mr. KOPP. Yes. It is 1½ cents.

Senator REED. Did you also take into consideration that the wages paid in marks are very much higher than they were before the war?

Mr. KOPP. The wages paid in marks?

Senator REED. Yes.

Mr. KOPP. They are 1,000 per cent higher. But the value is fifteen times lower.

Senator REED. The mark has gone down 1,500 per cent?

Mr. KOPP. No; not down 1,500 per cent—fifteen times.

Senator REED. That is 1,500, is it not?

Mr. KOPP. Not when you figure downward.

Senator REED. You are right about that. The mark has gone down fifteen times, you say, and the wages have gone up ten times. That is going up! If you figure the mark down—and it does not go by hundreds of per cent—you come to a point where the man is getting in value the same wages——

Mr. KOPP (interposing). It is 33 per cent lower than before the war.

Senator REED. Not unless they go down at the same rate.

Mr. KOPP. He gets fifteen times less, but only ten times more.

Senator REED. I never figured that out mathematically. I think you would find they were getting the same wages as before.

Mr. KOPP. It makes it lower.

Senator REED. Have the Germans any advantage over the Americans in the matter of machinery?

Mr. KOPP. No, sir.

Senator REED. You say they have not?

Mr. KOPP. We have the best machinery in the world.

Senator REED. Is it better than that of Germany?

Mr. KOPP. They are using our machines for glassware over there now.

Senator REED. So that the sole difference that you complain about is the difference in wages?

Mr. KOPP. Yes; for artistic goods, but not on other goods. The bulk of the products made in the United States are cheaper. They have about \$250,000,000 in production. The biggest part is cheaper.

Senator REED. But the industry has always clamored for protection, has it not?

Mr. KOPP. I do not believe they have.

Senator REED. You are asking for this protection on that class of goods upon which a considerable per cent of the cost is labor?

Mr. KOPP. Yes, sir.

Senator REED. You do not think you need protection on glassware where labor is not a large percentage of the cost, because we have superior machinery; is that the idea?

Mr. KOPP. Under automatic production. I would not want you to legislate for that and get killed by it.

Senator REED. I am simply asking for information. We do not want to kill anybody here. I just want to get at the facts. The automatic work embraces what, generally, in the glassware industry?

Mr. KOPP. There is some percentage of labor.

Senator REED. Of course. How much is made by what you call the automatic process?

Mr. KOPP. I would say that out of \$250,000,000 it would be \$180,000,000.

Senator REED. That is automatic?

Mr. KOPP. Purely automatic.

Senator REED. Of course, nothing is absolutely automatic. There is some labor in everything. Then you come to a class where it is not automatic and where there is an element of labor.

Mr. KOPP. Yes.

Senator REED. And then you come to another class, in which you all, where there is a large amount of labor.

Mr. KOPP. Yes.

Senator REED. Do you represent in any way the Pittsburgh Plate Glass Co.?

Mr. KOPP. No, sir. It is not automatic. The biggest part of the plate-glass industry is not an automatic proposition.

Senator REED. Then we differ on what is automatic.

Mr. KOPP. Well, you take Libby & Owen machines. They pull the glass out of tanks without the aid of the human hand. They pull it clear to the other end and it is then cut in sections.

Senator REED. Your idea is that you would not call the manufacture of an article in a modern plate-glass factory automatic because there is some labor that intervenes in the different steps?

Mr. KOPP. Yes. There are the polishers and others, and those people are all skilled to a more or less degree.

Senator REED. As a matter of fact, the element of labor is very small, is it not?

Mr. KOPP. Comparatively it is; yes, sir. I would say that.

Senator REED. I have been through some of these plants. You can hardly find a man in some of them.

Senator McLEAN. Are these high-priced goods?

Mr. KOPP. They range all the way from \$1.20 a dozen to \$60, \$70, and \$100 a dozen.

Senator McLEAN. I had an idea that they were rather expensive goods and possibly might be considered as luxuries.

Mr. KOPP. They are in a way and to a certain extent. They make beautiful things for the home.

Senator SIMMONS. There is one question that I want to ask this gentleman before he leaves.

Under the heading of the goods to which you have reference, as I understand it, there were imported during the year 1921, we will say, 2,688,834 worth.

Mr. KOPP. In one month?

Senator SIMMONS. No; during this entire calendar year.

Mr. KOPP. Yes; 1921. We have not been working all year.

Senator SIMMONS. I say there were imported into this country a little over \$2,000,000 worth. There was exported in the same period from this country \$12,325,613 of that material. That is under the heading "All others."

Mr. KOPP. "All others" means an awful lot of things.

Senator SIMMONS. It is "All others" in both cases. You come under the heading "All others."

Mr. KOPP. We want to get a special classification.

Senator SIMMONS. That is the only special classification you have.

Mr. KOPP. That is the trouble.

Senator SIMMONS. I want to ask you now if the Germans are making these products, these glass products, at about one-quarter our labor cost—

Mr. KOPP (interposing). One-half.

Senator SIMMONS. Well, one-quarter or one-half. If that is the case, where are we selling this enormous amount of exports?

Mr. KOPP. I do not believe we are selling them.

Senator SIMMONS. We exported of this glassware, during the year—1921—\$25,000,000 worth.

Mr. KOPP. Exported?

Senator SIMMONS. Yes, exported. That went to France, Canada, Mexico, Cuba, the Argentine, Brazil, Chile, Uruguay, China, Japan, New Zealand, and other countries. If Germany is making this stuff and putting it on the market at one-half or one-quarter the price that we are able to put it on the market at, how do we meet this competition in the market?

Senator McLEAN. They are entirely different products.

Senator SIMMONS. I am talking about the whole glass schedule. That last question was as to the whole glass schedule.

Senator McLEAN. The exports are limited largely to automobile products.

Mr. KOPP. Yes.

Senator SIMMONS. This is the proposition that I was trying to present to him: The records show that we exported last year \$25,000,000. We sold that largely in European markets. Now if Germany can undersell us on all these products to the extent that you have been telling us they can, how can we go to the European markets and sell our products?

Mr. KOPP. We will not be able to do it.

Senator SIMMONS. You have been doing it.

Mr. KOPP. Not on lighting glass.

Senator SIMMONS. I was not talking about lighting glass. I was talking about it all. Every witness who has appeared here has told us that Germany was producing a product that they could produce at enormously reduced prices compared with ours and that we could not possibly live in competition with Germany, and yet we are selling \$25,000,000 worth of our glass products largely in Europe right at the door of Germany.

Mr. KOPP. Where in Europe did you say?

Senator SIMMONS. I read the names of the countries. I will read them again if you want me to.

Senator SUTHERLAND. Senator Simmons, will you ask Mr. Dalzell that question? He says he can answer that question.

Senator REED. Before he does that, I would like to say that the figures put in here under the heading of general glass and all other glass are to show the heavy rate of increase of importations. Now when we seek to compare the same items as to exportation, the result is that it is not fair. If it is not fair on exports, it is not fair on imports.

Senator McLEAN. In the one case it is a hand-made product; in the other case it is a machine product. They have no relation to each other whatever.

Senator REED. Put the machine products in this section.

Senator McLEAN. That is what this gentleman wants.

Mr. DALZELL. Glassware that is exported from the United States is press-made and machine-made. The glassware imported into the United States is hand-made glassware.

Senator SIMMONS. The whole importations into the United States are about \$11,000,000 considering all glassware, and the whole exportations \$25,000,000. That was for 1921. There was more than twice as much exported as was imported.

Mr. KOPP. That may be correct.

Senator McLEAN. Is there any automatic glassware imported?

Mr. KOPP. No, sir.

Senator McLEAN. It seems to me that answers the question.

Senator SMOOT. Did you ask is any imported?

Senator McLEAN. Yes.

Senator McCUMBER. Did you export any of this glassware, this high-grade glassware, to Europe?

Mr. KOPP. No, sir. We can not do it. As to this press-made ware and machine-made ware, we export that all over the world.

Senator SUTHERLAND. There is no competition from Europe on that class of glassware?

Mr. KOPP. No, sir.

Senator SUTHERLAND. They do not manufacture that class of glassware?

Mr. KOPP. No, sir. Japan is trying to get started on that and make some of it.

**STATEMENT OF WILLIAM M. FRIEDLAENDER, REPRESENTING
THE IMPORTERS OF LIGHTING GLASSWARE.**

Senator SMOOT. Mr. Friedlaender, give your full name for the record.

Mr. FRIEDLAENDER. William M. Friedlaender, Brooklyn, N. Y. I am representing importers of lighting glassware. Lighting glassware, as we term it, consists of shades for electric lamps, oil-lamp chimneys, etc. The present tariff under consideration calls for a duty of 40 per cent based upon the American valuation. Under that clause importations of any lighting glassware will be prohibited.

Senator SMOOT. Will it be prohibited?

Mr. FRIEDLAENDER. It will be prohibited; yes.

Senator SMOOT. One witness testified that he had to have 240 per cent. Do you agree to that?

Mr. FRIEDLAENDER. No, sir; I do not. The three items that probably have the largest sale are the 16-inch white bowl that they use for indirect lighting, the ordinary little electric shade, and the commonly known Rochester lamp chimney. The 16-inch bowl is sold in this country by American manufacturers at from \$13 to \$13.70 a dozen. The cheapest price at which that same bowl can be imported to-day under the present act, taking the foreign valuation, is \$14.

Senator WALSH. You mean under the Underwood bill?

Mr. FRIEDLAENDER. Under the Underwood bill. The cheapest price is \$14. The importer has to add one-third to that. It costs 10 per cent for his overhead expense; it costs 10 per cent to sell his merchandise, whether he pays a commission man or pays traveling expenses and salaries. That leaves the importer a clear 5 per cent. Then we add 33½ per cent to the importers' landed cost and——

Senator REED (interposing). You mean 10 per cent, do you not? Don't you mean 10 instead of 5?

Mr. FRIEDLAENDER. If it costs 10 per cent for overhead and 10 per cent to sell the merchandise, that would leave 5 per cent net.

Senator REED. That leaves 10 per cent, doesn't it?

Mr. FRIEDLAENDER. No; 33½ per cent of the cost would be 33½ per cent of the selling price, and 5 per cent on the selling price is the profit the importer has to figure as the profit.

Senator REED. Do you figure the profit on the selling price?

Mr. FRIEDLAENDER. Yes; so much on the annual turnover. That leaves the importers' selling price at \$18.50 a dozen, as compared with the domestic price at present of \$13.

Senator REED. How do you import them at present?

Mr. FRIEDLAENDER. We have not had any since the war. We have not imported any since because they have advanced so greatly on the other side.

The little white electric shades are sold to-day at \$1.40 per dozen. Adding the importers' expenses and profits to that brings the selling price up to \$2, as compared with the American price of \$1.40.

The third item is the oil-lamp chimney. That is being sold to-day at \$1.10, and it costs to import, landed at the dock, without any expense whatsoever—not even carting—\$1.16. That oil-lamp chimney has also been barred. In addition to this actual price advantage the American manufacturer has a great advantage in the matter of prompt delivery. His customer can go to him and tell him he wants his goods in two months' time or two weeks' time, and he can get them. On the other hand, if he goes to the importer he has to wait three or four months. He also has a big advantage in the matter of breakage. The domestic manufacturer makes a shipment and if breakage occurs, due to rough handling. The customer complains to him, and he simply files a certificate under oath that these goods were packed in good order and shipped in good order, and the customer files a claim against the transportation company and gets a refund under the rough-handling clause. The importer can not do that. He can not show a certificate. No matter what the breakage is, he has to pay it.

Senator McLEAN. How does the present price compare with prices of last year?

Mr. FRIEDLAENDER. Of glassware on the market to-day?

Senator McLEAN. Yes.

Mr. FRIEDLAENDER. It is lower, sir. As an illustration. I may mention the ordinary green shade that you see in offices. That was imported before the war and made in this country. They sold for \$2 to \$2.50 and \$3 a dozen. With the outbreak of the war there were no importations. The domestic price on that article went from \$3 to as high as \$15 per dozen. With the termination of the war the first importation that was then offered on the market, the domestic price dropped about 50 per cent, and they can be bought for about \$1.50 to-day.

Senator REED. But that is very much higher than before the war?

Mr. FRIEDLAENDER. So are the imported goods. The imported goods have increased considerably. At the hearing before the House Ways and Means Committee Mr. Edward D. Barry, representing the National Association of Blown and Pressed Glass Manufacturers, made the statement that the American production was approximately \$100,000,000 per annum and the total imports amounted to about \$7,000,000. During the lunch hour I mentioned some of those facts, and I find that the total value, according

overnment statistics in 1914, was a little over \$123,000,000, or 23,085,019. The imports were 6.7 per cent of that. I have not been able to get the 1920 facts, but I understand that the total manufactures were \$267,000,000.

Mr. Joseph Gillooly, representing the Flint Glass Workers' Union, testified before the Ways and Means Committee of the House to the effect that the importations for the 11 months ended November, 1920, amounted to \$7,000,000. That would show, apparently, a big increase over the importations in 1914 and 1915, which averaged \$4,000,000, or somewhat over \$4,000,000, but when you stop to consider that the costs abroad have more than doubled—in many cases they have more than trebled—it shows a big decrease and not an increase.

There are also great quantities of ordinary lantern globes sold in this country, and of the ordinary cheap gas globes. Then there is the cheap lamp chimney, the pressed table glassware, and the lighting glassware. None of that can be imported to-day under the present act. In former years we imported trainloads, to-day none can be imported. Under the 40 per cent duty of the proposed tariff all imports will be similarly barred.

Senator SMOOT. Your claim is that the industry is sufficiently protected.

Mr. FRIEDLAENDER. Yes. The protection should be reduced. The 16-inch bowl, under the new act, would cost the importer \$16.25 a dozen, compared with the American cost of \$13. The importer has to add profit and expense. That bars the bowl entirely. The electric shades would cost the importer \$1.86. He would have to sell for \$2.40, as compared with the American price of \$1.40.

Senator McLEAN. Are the domestic articles equally as good as the imported articles?

Mr. FRIEDLAENDER. On the cheaper stuff there is so little difference that it is just a question of price. Our chimneys are better than those imported.

Senator McLEAN. Are the domestic manufacturers doing a good business?

Mr. FRIEDLAENDER. Their business is growing tremendously.

Senator McLEAN. That growth is in the automatic process, is it not?

Mr. FRIEDLAENDER. I do not quite understand your question.

Senator McLEAN. The cheaper pressed glass that they make with machinery here is made by a process that they do not use abroad, is it not?

Mr. FRIEDLAENDER. Yes.

Senator McLEAN. A very large percentage of our product is of that make, is it not?

Mr. FRIEDLAENDER. A good percentage, but not all, by any means. There is a great deal of hollow glassware made. A great deal of the glassware made here is made on machines, and the glassware made on these machines in this country can not be imported. As to the better class of glassware, we can compete, but only where there are no fine decorations, because the decorations made abroad are better than those put on here. Their execution is better, and the men who are doing that character of work have been doing it for generations.

Senator McLEAN. And when it is completed it is really a luxury and the labor cost is a large item?

Mr. FRIEDLAENDER. It is, sir.

I notice in looking at the fixtures in the room here those little drops [indicating]. They are sold in the market for about 10 cents. A few have been made here during the war. We had some made here because we could not get any others and we had to furnish them to keep our trade. We had them made here, but they were so poor and of such low quality that just as soon as the imported article came in we had to practically give away whatever we had left. We could not produce that item here.

That same article, if it is imported under the proposed act, would be worth at least 50 cents; that is, it would have to sell for at least 50 cents as compared with the present price of 10 cents.

Senator WALSH. Each one of them?

Mr. FRIEDLAENDER. Yes, sir.

Senator WALSH. What do you call them?

Mr. FRIEDLAENDER. Prisms. I made a smaller one than that known as a "U" drop, and I believe it was 12 cents. It was not usable excepting as a necessity.

Senator WALSH. They would have to sell for 50 cents apiece and nobody would be protected?

Mr. FRIEDLAENDER. No, sir; I do not believe anybody would be protected.

Senator SMOOT. I notice that your time is up. Have you a brief?

Mr. FRIEDLAENDER. I have just notations. We request that the committee give consideration to a duty under the American valuation plan of from 10 to 15 per cent ad valorem, or of not more than 4 per cent under the foreign valuation clause.

Thank you, gentlemen.

Senator WALSH. Based upon revenue rather than protection?

Mr. FRIEDLAENDER. Yes, sir.

Senator SIMMONS. Do you think, then, that the American valuation covers the difference between the 10 per cent and the 40 per cent that you would want if the foreign valuation were to be the basis?

Mr. FRIEDLAENDER. I do, sir.

Senator SIMMONS. The American valuation is worth 30 per cent to you?

Mr. FRIEDLAENDER. Yes, sir.

Senator SMOOT. Or, in other words, you think the American valuation is four times the amount of the foreign valuation?

Mr. FRIEDLAENDER. It would work out that way in a great many instances.

Senator SMOOT. In what instances?

Mr. FRIEDLAENDER. For instance, a prism of that sort could be made but it would have to be made at a very high cost, at a cost that would be almost prohibitive; and if duty had to be paid on that basis it would be about a 40 per cent difference.

Senator SMOOT. On items that we are not making in this country at the present time?

Mr. FRIEDLAENDER. And also on items that take artistic work.

Senator SMOOT. We are not artistic in this country?

Mr. FRIEDLAENDER. We have not the natural artistic trait that our workmen, sir.

Senator SMOOT. Only the importers have that.

BRIEF OF WILLIAM M. FRIEDLAENDER, REPRESENTING THE IMPORTERS OF LIGHTING GLASSWARE.

I appear before you in the interest of the importers of lighting glassware.

The tariff bill now under consideration by your committee, Schedule 2, paragraph 18, names an ad valorem duty of 40 per cent, based upon the American valuation.

Under the head of lighting glassware, the three items which are probably sold in the largest quantities are the 16-inch opal semi-indirect bowls, the ordinary opal electric shade, and the commonly used so-called No. 2 Rochester oil-lamp chimney. The American manufacturers sell the 16-inch opal bowl at from \$13 to \$13.75 a dozen, in carload lots, and are selling a large quantity. The lowest cost at which this opal bowl can be imported is \$14 a dozen. This represents actual cost on the steamer in New York, duty paid. The importer, in order to make a profit, must add 33½ per cent to this cost, which would make a gross profit of 25 per cent on the selling price. It costs 10 per cent to sell merchandise, whether this be in commissions or in salaries and expenses; it costs at least 10 per cent for overhead expenses, which represents wages, rents of show rooms or display rooms, and other expenses of conducting the import business. This leaves an actual profit of 5 per cent to the importer. Adding 33½ per cent to \$14 leaves a minimum price of \$18.50 a dozen. This, of course, eliminates importations in any large quantity.

The ordinary opal electric shades, which are commonly used items, are sold by the American manufacturer at \$1.40. The imported shades cost the importer \$1.50. Adding 33½ per cent to this gives us a selling price of \$2, as compared with \$1.40 for the American-made product.

The third item which I would like to illustrate is the commonly used oil-lamp chimney. These chimneys cost to-day \$1.16 to import. The American-made chimney is sold for \$1.10, and I might incidentally mention, gentlemen, that the American-made chimney is of a better quality. I merely mention these three items as illustrative of the general situation. This is true of practically all items in this industry.

In addition to the price advantages the American manufacturer has the very great advantage of being in a position to make prompt deliveries, make up any special orders his customer may require, and, of course, the fact that he is an American manufacturer selling American-made goods. In addition to this he has a very great advantage in the matter of breakage. He can pack his merchandise in smaller containers, which, of course, is a big advantage in handling the product. He furthermore, where there is breakage due to rough handling by the transportation company (and this, gentlemen, is quite an item), furnishes his buyer with a certificate signed by the packer, showing that they were carefully packed, and his customer obtains a refund from the transportation company for his loss. The importer, on the other hand, cannot produce such a certificate and must pay any loss out of his profits.

The American manufacturer of this commodity may need protection, but I quote from the statement made by Mr. Edward J. Barry, representing the National Association of Blown and Pressed Glass Manufacturers, made before the House of Representatives Ways and Means Committee, published in the Tariff Information, part 1, page 606. Mr. Barry stated before that committee that the value of the American production of that industry was approximately \$100,000,000 per annum, and that the total importations were about \$7,000,000 per annum. Mr. Joseph Gillooly, representing the Flint Glass Workers' Union, appeared before the same committee and presented figures showing a total importation for the 11 months ending November, 1910, of about \$7,000,000. A great number of articles that were imported before the war can not be imported to-day, as they can be made cheaper in this country. Mr. Gillooly further makes the statement that the importations of glassware into the United States for the period 1910-1914 was an average of \$4,177,133. This will give the impression that there has been a big increase in importations, but when you consider that the cost abroad has more than doubled, there is actually a considerable reduction in importations rather than any increase.

We are unalterably opposed to the American valuation plan, as it will cause untold confusion, and will absolutely bar out importations of foreign merchandise. Even to-day, under the present act, it is impossible to import ordinary lantern globes, gas globes, lamp chimneys, pressed table glassware, and lighting glassware, of which enormous quantities are sold in this country. If 40 per cent duty is assessed, as proposed, and assuming that the American manufacturer will not increase his selling prices (although there is no reason why he should not increase them to any limit he might desire, as he would have no competition), the items illustrated will show the following comparisons:

Sixteen-inch opal bowls: The imported merchandise would cost the importer \$16.35 per dozen, while the American manufacturer sells his merchandise, at a good profit, at \$13 to \$13.75.

Electric shades: The imported merchandise would cost the importer \$1.80, while the American manufacturer sells his merchandise at \$1.40.

Lamp chimneys: The imported merchandise would cost the importer \$1.42 dozen, while the American manufacturer sells his merchandise at \$1.10.

In order to enable foreign merchandise to be imported, and to place it on a competitive basis with merchandise made locally, we would ask you to consider an ad valorem duty of 40 per cent, based on the foreign market value, or of not more than 10 to 15 per cent, based on American values.

GLASSWARE (BLOWN).

[Paragraph 218.]

STATEMENT OF WILLIAM P. GRAHAM, NEW YORK CITY.

Senator SMOOT. You may state your name.

Mr. GRAHAM. William P. Graham, of Graham & Zenger, New York City.

Senator SMOOT. What paragraph are you interested in?

Mr. GRAHAM. Paragraph 218, known as glassware, which, I believe, includes blown stem ware.

Senator SMOOT. Yes.

Mr. GRAHAM. That is the only way I can find it in this schedule.

We are decorators of glass and we also import glass. We have been in the importing business for the last 20 years and manufacturing for the last 10 years. I brought with me a sample of the ordinary American goblet, which is the cheapest and most comparable article that we can get. I wish to show it to you gentlemen, an ordinary goblet that is more used than anything else, and I also show you a comparative article in foreign goods. It is the same with the foreigner, because he makes it for the same price, although he asks considerably more in this country.

Before the war, in 1918, these were made in this country for 75 cents. That was the trade price, and the importers' price was about 75 cents or 80 cents. To-day the importers' price is 200 per cent more from Holland. The American valuation is all kinds of figures. This is a goblet that is sold to-day by some of the leading manufacturers at \$3 a dozen, but that valuation is more or less mythical. It is more or less subject to possible decrease. It was up to \$4 during the war.

The labor in glassware is usually about one-third the cost of a completed article, the American labor and European labor as well. In this country the manufacturer has advanced the price to as high as \$4.25 a dozen during the war. They have come down now, and to-day the market is in rather a complicated situation. There are prices, some say, of \$1.60 for this article, but I know that the leading manufacturers to-day are asking \$3 for it. Under American valuation as proposed now we should have to pay \$1.20 duty on this article, instead of 45 per cent under the Payne-Aldrich bill. That would mean a difference of 15 per cent. It would mean the same duty. I mean, if the American valuation were 15 per cent duty would mean practically the same as 45 per cent under the Payne-Aldrich bill. It would figure out about the same.

Senator SMOOT. If you kept it at \$3.

Mr. GRAHAM. No. Do you mean if the American valuation is

Senator SMOOT. Yes.

Mr. GRAHAM. Yes; you are right, Senator Smoot.

Senator SMOOT. But you said there was a rumor they were selling at \$1.60.

Mr. GRAHAM. There are all kinds of prices on the market to-day.

Senator SMOOT. As soon as there is an active demand for the goods, at will right itself.

Mr. GRAHAM. So far as that is concerned, there is no active demand in the market to-day.

Senator SMOOT. If there was no active demand, that would be the use.

Senator WALSH. What is the cause of that situation? You say there is no active demand?

Mr. GRAHAM. It is caused by the general depression. There is no great demand to-day.

Senator SMOOT. That is the reason there is more than one price.

Mr. GRAHAM. That is the reason there is more than one price. You can buy from that same manufacturer to-day a decorated goblet at \$2 a dozen. In all the other countries with which I am rather familiar the price is practically the same as it is in Holland. We get a goblet from Holland costing us 9 or 10 cents, and the same thing can be bought in Germany, but they have all kinds of grades of glassware, and I find the rate according to American valuation that should be paid on glassware——

Senator SMOOT (interposing). I do not want you to spend any time in discussing American valuation. You are here to talk upon rates of duty. We have had hearings upon American valuation and that subject is closed.

Senator WALSH. He can show the kind of duty he desires placed upon this article, and how it will work out.

Senator SMOOT. He can refer to it, but not the advisability of it, anything of that kind.

Mr. GRAHAM. If it should be American valuation, then the duty would be 15 per cent.

Senator SMOOT. Instead of 40?

Mr. GRAHAM. Instead of 45.

Senator SMOOT. It is 40 per cent here.

Mr. GRAHAM. Forty per cent is correct.

Senator SMOOT. You want 15 per cent?

Mr. GRAHAM. We want 15 per cent. We are manufacturers of glass, as I say, and decorators, and we decorate them in different ways. We have to have the European glass, because of its texture. The American glass will not fire. It is necessary to have the European glass.

Senator SMOOT. You are more interested in your importing business than in your manufacturing business?

Mr. GRAHAM. No; I am more interested in the manufacturing business than in the importing business.

Senator SMOOT. You are a manufacturer of glass?

Mr. GRAHAM. And decorator of glass.

Senator SMOOT. Oh, yes.

Mr. GRAHAM. We import the glass for the other decorators in this country, largely. If the American valuation of 40 per cent is in it, it naturally creates quite a hardship on us and decorators throughout the country also.

Senator DILLINGHAM. Your point is that it is too high under American valuation?

Mr. GRAHAM. Yes, sir; if it is going to be American valuation, it should be 15 per cent.

Senator WALSH. How much of that glass is decorated?

Mr. GRAHAM. The whole business is very small. In 1919 there were \$267,000,000 worth of glass made in this country, but the importations of that kind of goods did not amount to more than \$600,000 or \$700,000.

Senator WALSH. Altogether?

Mr. GRAHAM. Yes, sir.

Senator WALSH. And those are mostly glasses that can not be made here and are used for decorative purposes?

Mr. GRAHAM. It is nearly all of that kind. There is a good deal imported for decorating, and if we are to pay a high duty on our plain glass that puts us under a handicap also. We would ask for 15 per cent instead of 40.

Senator WALSH. It is not a very serious problem, the matter of competition of glass with American manufacturers.

Mr. GRAHAM. It has never been at any time in the question of stem ware. The difference between the cost of manufacture has never seriously entered into it.

Senator SMOOT. You do not agree with the manufacturer here that said that with 40 per cent it was impossible for him to survive?

Mr. GRAHAM. I do not quite agree with him.

SHEET GLASS.

[Paragraph 219.]

STATEMENT OF OTTO W. HAMMER, REPRESENTING THE DRY PLATE INDUSTRY, ST. LOUIS, MO.

The CHAIRMAN. Mr. Hammer, where do you reside?

Mr. HAMMER. St. Louis, Mo.

The CHAIRMAN. What is your occupation?

Mr. HAMMER. I am vice president and counsel of the Hammer Dry Plate Co. of St. Louis, Mo.

The CHAIRMAN. What article are you interested in in this bill?

Mr. HAMMER. In unpolished sheet glass, commonly called photo dry-plate glass, paragraph 219.

The CHAIRMAN. What is it you want in connection with that?

Mr. HAMMER. I am here representing the Hammer Dry Plate Co., the G. Cramer Dry Plate Co., and the Central Dry Plate Co., all located in the city of St. Louis.

We are protesting and asking the assistance of this committee in connection with the tariff on unpolished sheet glass, commonly called window glass, but coming into this country under the tariff regulations as unpolished sheet glass, though the boxes in which these importations from Belgium are made designates the glass as "photo dry-plate glass." However, photo dry-plate glass, I may state for the information of the committee, is a high-grade window glass, devoid of all foreign substances, scratches, bubbles, etc.

I might also state for the information of the committee that there are four dry-plate manufacturing concerns in the United States—the Eastman Kodak Co., with its vast industries, manufacturing everything pertaining to photography, pays, of course, enough attention to the dry-plate industry, but devotes the most of its attention to its films, kodaks, cameras, sensitized paper, and at the present time they are manufacturing a dry plate made upon celluloid. They also, of course, manufacture a dry plate made upon glass.

The three companies, all located in the city of St. Louis, manufacture and derive their entire revenue from the manufacture and sale of photographic dry plates made upon glass. That is their entire source of revenue.

This paragraph, 219, which is as follows: "Cylinder, crown, and sheet glass, by whatever process made, unpolished, not exceeding 150 square inches, 1½ cents per pound; above that, and not exceeding 384 square inches, 1½ cents per pound," etc., until it goes down to this part of it: "That none of the foregoing shall pay less duty than 35 per cent ad valorem: *Provided further*, That unpolished cylinder, crown, and sheet glass, imported in boxes," etc., and it designates the size of the glass to be placed in the boxes that are imported.

Now, gentlemen, we have no objection to the poundage tariff upon this glass, but none of the poundage tariff would come close to the 35 per cent ad valorem. I might state in this connection that there is only one manufacturing concern in the United States that is attempting the manufacture of photo dry-plate glass. Many concerns have gone into this industry, but the intricate and technical work and the amount of rejects which the dry-plate manufacturing companies are compelled to throw out have caused these companies to continue merely in the window-glass business. We are not here protesting, nor are we saying aught upon any tariff on window glass or upon any other commodity. All we are asking is a protection from this tariff, because the company manufacturing the photo dry-plate glass in the United States does not produce an amount which will supply the demands of the dry-plate manufacturers of the United States, and the glass manufactured in this country is not of the the superior quality of the glass manufactured in Belgium, where we receive most of our importations from.

The "rejects" in this glass manufactured in the United States is such that we find in our company it amounts to about 20 or 30 per cent, and with the price of glass in the United States at \$9 per box of a hundred square feet of light, with the rejects, exceeds that amount greatly.

However, glass, I should say, of a superior quality can be imported from Belgium for \$8 per box, including tariff, taxes, freight, etc.

Senator WATSON. What is it you object to in this particular 219 paragraph?

Mr. HAMMER. Here is the situation, Senator: We object to the 35 per cent ad valorem on the price of American manufacture on the date of exportation.

Senator WATSON. You are not objecting to anything in that paragraph down to the first proviso?

Mr. HAMMER. We feel that the poundage tax is a little high. However, we would have no objection to that. But we have an

objection to the 35 per cent ad valorem, for this reason: That the manufacturer making this glass in the United States charges \$9 per box, and 35 per cent of \$9 would be \$3.15. The tariff on a box of 8 by 10 photo dry-plate glass to-day is 70 cents, under the Underwood tariff bill. Under the Dingley tariff bill it was about \$1.05 or \$1.10; under this proposed tariff bill there will be an increase of 350 per cent and would be \$3.15.

Senator WATSON. That is, American valuation?

Mr. HAMMER. American valuation, an unheard of proposition, and with the photographic manufacturers who through years and years of striving to build up an industry which ranks with the industries of the world in the manufacture of photographic dry plates now make a profit of \$2 upon a box of dry plates, which takes about two-thirds of a case of the raw material, and if this tariff of \$3.15 is allowed to prevail our profit will be gone and we will be compelled to cease manufacturing.

Senator WATSON (interposing). Of course, you understand that the American valuation is, of itself, not a rate; it is only a basis for a rate.

Mr. HAMMER. It is only a basis for a rate; I appreciate that.

Senator WATSON. What per cent there would represent the difference in the cost of production at home and abroad on American valuation—you are opposed to the 35 per cent?

Mr. HAMMER. Yes, we are opposed to it—to the 35 per cent, because there is no competition in this country.

Senator SMOOT. These rates are exactly the same as the Payne-Aldrich rate, just as we passed on them in the Payne-Aldrich bill. But you did not have the proviso there of the 35 per cent ad valorem!

Mr. HAMMER. That is the idea.

Senator SMOOT. You are not objecting at all to the rates above—the American valuation does not affect the rates, because they are all specific.

Mr. HAMMER. I understand that. I am not objecting seriously to these rates. But we are objecting to the 35 per cent, because the bill says——

Senator SMOOT. "Not less than 35 per cent."

Mr. HAMMER (reading):

Provided, That none of the foregoing shall pay less duty than 35 per cent ad valorem.

Senator WATSON. Then, you want the whole of that 35 per cent stricken out?

Mr. HAMMER. That is the idea. But you gentlemen can assist us—we are not here making a protest; we are merely trying to save a business which will be badly crippled, if not ruined, if we are not able to get this glass into this country, and if this 35 per cent ad valorem tax is going to be placed thereon.

If the committee here can in any way—I worked on the matter with the assistance of Mr. Cramer and with the other dry-plate manufacturers—if we could in some way differentiate between unpolished sheet glass, commonly known as window glass and photo dry-plate glass, in the regulation of the tariff, the matter would be simple and easily solved.

Senator SMOOT. We tried to solve that in 1909, and spent days working on it, and decided it could not be done.

Mr. HAMMER. It comes in designated on the boxes photo dry-plate glass, but I can understand, and you gentlemen appreciate as well as, that could be camouflaged and window glass could come into this country marked "photo dry-plate glass," and our only suggestion after working on this quite awhile——

Senator WATSON (interposing). Photo dry-plate glass could not come in marked "window glass," could it?

Mr. HAMMER. I say if the foreign manufacturers would not want to send it into this country if we differentiated between photo dry-plate glass and window glass. But the only way we could solve his proposition would be: The main sizes used in the manufacture of photographic dry-plate glass, with very few exceptions do not exceed 150 square inches. Now, if the ad valorem were eliminated, as I drew an amendment here, that might assist the committee. We propose that if the committee feels that it will protect the dry-plate manufacturers of the United States and a higher tariff must be placed on unpolished sheet glass than is now in force, the committee will devise some means of differentiating between window glass and photo dry-plate glass; or if that does not seem feasible the manufacturers would be satisfied with a table of rates proposed as follows:

PAR. 219. Cylinder, crown, and sheet glass, by whatever process made, unpolished, not exceeding one hundred and fifty square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding three hundred and eighty-four square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding seven hundred and twenty square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding eight hundred and sixty-four square inches, $2\frac{1}{4}$ cents per pound; above that, and not exceeding one thousand two hundred square inches, $2\frac{1}{4}$ cents per pound; above that, and not exceeding two thousand four hundred square inches, $3\frac{1}{4}$ cents per pound; above that, 4 cents per pound: *Provided further*, that unpolished cylinder, crown, and sheet glass, imported in boxes, shall contain one hundred square feet, as nearly as sizes will permit, and the duty shall be computed hereon according to the actual weight of the glass.

We make a little cut on the rates there and eliminate the ad valorem entirely.

Senator SIMMONS. Which one of these several brackets of section 219 is the article that you are interested in covered by?

Mr. HAMMER. The 35 per cent ad valorem.

Senator SIMMONS. I understand, but here is a paragraph that has a great many brackets in it, one is a specific duty of $1\frac{1}{4}$, another a specific duty of $2\frac{1}{4}$, and so on. Now, which one of those brackets is that?

Senator SMOOT. The first one.

Mr. HAMMER. The first one, I see.

Senator SIMMONS. The first one; that is, $1\frac{1}{4}$?

Mr. HAMMER. Yes, sir.

Senator SIMMONS. Now, you object to that?

Mr. HAMMER. No; we do not object to that if the ad valorem is eliminated.

Senator SIMMONS. Your objections to the ad valorem is that under the $1\frac{1}{4}$ rate the duty would be very much less than 35 per cent?

Mr. HAMMER. Yes, sir; that is the idea.

Senator SIMMONS. What you want is a product which you import and use in your business established at less than 35 per cent?

Mr. HAMMER. That is the idea. I might state for your information, Senator, that the main sizes used by dry-plate manufacturers of this

country are as follows: 5 by 7, 35 square inches; 6 by 8, 48 square inches; 8 by 10, 80 square inches; 10 by 12, 120 square inches.

These are the main sizes imported for the manufacture of dry plates. There are some sizes known as 11 by 14, 154 square inches, which goes 4 inches over 150 square inches, which we would be satisfied with if the per poundage was placed upon there, but if the ad valorem were eliminated.

And there are some sizes mainly used—not by our company, but by the Cramer Dry Plate Co.—known as 11 by 14, 154 square inches; 14 by 20, 360 square inches; and 20 by 24, 480 square inches.

Now, if an ad valorem of, say, 10 per cent were placed on sizes over 150 square inches, I think the matter could be easily solved in that way.

Senator SMOOT. That would be not less than 10 per cent, you mean?

Mr. HAMMER. Yes, sir.

Senator SMOOT. On sizes from what?

Mr. HAMMER. On sizes from 150 square inches, and no ad valorem on sizes to 150 square inches.

Senator SMOOT. In addition to the specific duty?

Mr. HAMMER. I know, in some the specific duty would prevail and in others on account of the weight, the specific duty would prevail.

Senator REED. What do you say the price of a box of this glass, a hundred feet, is?

Mr. HAMMER. In the United States at the present time it is \$9.

Senator REED. What was it before the war?

Mr. HAMMER. \$4.50, and then it went to \$5.40, and it went as high as \$13.25 during the war.

Senator REED. But it can now be bought in Belgium at what price?

Mr. HAMMER. At \$8. That includes tariff or duty, taxes, freight and all that.

Senator REED. Do you know what it can be bought for without these charges?

Mr. HAMMER. I would suggest that Mr. Cramer answer that.

STATEMENT OF G. A. CRAMER, REPRESENTING THE DRY-PLATE INDUSTRY, ST. LOUIS, MO.

Senator REED. The question I asked was what this glass could be bought for in Belgium without these charges.

Mr. CRAMER. In the neighborhood of \$6.50 f. o. b. Antwerp.

Senator REED. Is there a competitive article to this glass?

Mr. CRAMER. Made here in this country?

Senator REED. Yes.

Mr. CRAMER. By one manufacturer; yes, sir.

Senator REED. What is that?

Mr. CRAMER. The name of the concern?

Senator REED. Yes; and the name of the article.

Mr. CRAMER. Photo glass, which is a high-grade window glass, known as "photo glass," and made by the American Window Glass Co.

Senator REED. You say made by that one concern. Do you agree with Mr. Hammer that that one concern does not make a glass that is practical to use?

Mr. CRAMER. I would not go so far as to say that; it is practical, but not quite as good in quality as the Belgian.

Senator REED. Is there any article made that takes the place of glass?

Mr. CRAMER. Yes, sir.

Senator REED. What is that?

Mr. CRAMER. Celluloid.

Senator REED. Is that manufactured in this country?

Mr. CRAMER. Yes, sir.

Senator REED. By whom?

Mr. CRAMER. By the American Celluloid Co. and by the Eastman Kodak Co., themselves. We do not make films; that is used for films.

Senator REED. But is it used in the ordinary photographic business?

Mr. CRAMER. To a very small extent; for certain purposes; for instance, home portraiture.

Senator REED. Then that is really not in competition with your business?

Mr. CRAMER. No, sir.

Senator REED. The price has gone up to \$9 in this country. Is \$9 to-day, so that the ad valorem duty figured on the present value in this country would be about twice what the same rate of duty would be figured upon prewar prices. Prewar prices were about \$4.50, and now it is \$9. If you put a 35 per cent duty on the \$9 now, it would be about twice the charge that it would have been if it had been levied on the prewar price.

Mr. CRAMER. Had there been a 35 per cent ad valorem, but there was not.

Senator REED. This 35 per cent duty at this time upon these high prices amount to a rate of duty which would have been equivalent to about 70 per cent at that time on the prewar prices.

Mr. CRAMER. If there had been the same duty; yes, sir.

Senator REED. You object that this ad valorem duty levied upon these high prices would be so great that it will injure your business where you can get your raw materials?

Mr. CRAMER. Exactly, because the proposed rate increases the present duty 350 per cent, whereas the greatest protective duty that we know of that existed before was about 50 per cent greater than what it is now.

Senator SMOOT. That is only on certain sizes?

Mr. CRAMER. Those are the most salable sizes, Senator.

Senator SMOOT. Up to 150 inches?

Mr. CRAMER. Yes, sir.

Senator SMOOT. But below; that was above.

Mr. HAMMER. We might state also that importations on this glass are so small compared to the revenue which the Government will receive, compared to the damage which it will do the manufacturers—there are only from 100,000 to 120,000 boxes of dry-plate glass imported into the country each year.

Senator SMOOT. So that I may get what you really propose: You want the proviso taken out entirely, as your first proposition?

Mr. HAMMER. Exactly.

Senator SMOOT. But if the proviso is not taken out, then you want the ad valorem reduced to 10 per cent to take effect on all the sizes?

Mr. HAMMER. From 150 square inches.

Senator SMOOT. But up to 154 inches you want that to remain in the law just as reported in the House bill, which is the same as the Payne-Aldrich bill?

Mr. CRAMER. Excepting that you eliminate the ad valorem.
Senator SMOOT. That is the way I understood your proposition.

Senator REED. Mr. Cramer, do you want to say anything further?

Mr. CRAMER. No; I think Mr. Hammer has covered the ground thoroughly. But I am prepared to answer any further questions.

The CHAIRMAN. I do not think there are any questions further.

Mr. HAMMER. If I may be permitted, I would like to file this brief.

The CHAIRMAN. The brief will be filed and included in your statement.

BRIEF OF G. A. CRAMER, REPRESENTING THE DRY-PLATE INDUSTRY, ST. LOUIS, MO.

Some of the objections of the G. Cramer Dry Plate Co., Central Dry Plate Co., and Hammer Dry Plate Co. to that part of the tariff bill pertaining to unpolished sheet glass (par. 219) are as follows:

STATEMENT.

There are four dry-plate manufacturing companies in the United States, namely: Eastman Kodak Co., located at Rochester, N. Y.; G. Cramer Dry Plate Co., Central Dry Plate Co., and Hammer Dry Plate Co., located in the city of St. Louis, Mo. The Eastman Kodak Co., as no doubt the committee is aware, manufactures kodak cameras, sensitized paper, films, celluloid plates and photographic dry plates, and practically all articles pertaining to the photographic industry, while the last three named companies manufacture photographic dry plates (made upon glass) exclusively and rely entirely upon the production and sale of their products for revenue.

Unpolished sheet glass, as designated in paragraph 219, takes into account photo dry-plate glass, window lights, and all unpolished sheet glass. The photo glass is a finer quality of unpolished sheet glass and made by a more careful process than window lights, for the reason that it must be perfectly clear and pure, entirely devoid of foreign substance, scratches, bubbles, etc.

There is one company in the United States manufacturing, in connection with its vast industry, unpolished sheet glass, which can be used in the manufacture of photographic dry plates, but this branch of this company's business is a very small item compared to its vast industry and its manufacture of window glass and other glass articles, and it produces only about one-fourth of the photo glass consumed by the manufacturers of this country.

POINTS.

The main sizes used by the dry-plate manufacturers of this country are as follows: 5 by 7 (35 square inches), 6 by 8 (48 square inches), 8 by 10 (80 square inches), 10 by 12 (120 square inches). These are the main sizes imported for the manufacture of dry plates. There are some sizes known as 11 by 14 (154 square inches), 18 by 20 (360 square inches), and 20 by 24 (480 square inches), but these sizes are few in comparison to the sizes heretofore mentioned.

The main importations of unpolished sheet glass are from Belgium and England, the greatest importation being, however, from Belgium. The manufacturers of Europe designate this glass as photo dry-plate glass, but under the tariff regulations it comes into this country as unpolished sheet glass or window lights. The usual way of packing same is in boxes of 100 square feet or as near thereto as possible.

The importations of this photo dry-plate glass are about 100,000 boxes yearly. In the manufacture of dry plates the photo dry-plate glass comprises the main raw material contained in the manufactured product.

We submit herewith for your information the current rate of duty and the rate proposed:

Size of sheet glass.	Current rate.	New rate.	Increase.
	Cents.	Cents.	Per cent.
Not exceeding 150 square inches.....	1	1½	50
Not exceeding 384 square inches.....	1	1½	50
Not exceeding 720 square inches.....	1½	2½	66

And in addition to the foregoing, paragraph 219 proposes a 35 per cent ad valorem on the American valuation.

The duty under the law as it now exists is about 70 cents per box of 100 square feet, while under the proposed law it will be increased to \$3.15 per box.

ARGUMENT.

Our objection to this paragraph, especially to the tariff on glass of the sizes used for the manufacture of photographic dry plates, is that it will practically destroy the manufacture of dry plates if this proposed law is enacted.

Before the war this glass could be bought from the American manufacturer for about \$5.40 per box, and during the war it increased in prices of various amounts, increasing as high as \$14 per box. To-day the American manufacturer is charging about \$9 f. o. b. its factory, while the glass of a higher quality and with far less percentage of rejects can be bought in Belgium for \$8 per box, including freight, taxes, payage, duty, etc.

Let us see, for the sake of argument, how the tariff would work out if this proposed bill is enacted. Suppose, for the sake of argument, the manufacture of photographic dry plates in the United States of sizes 8 by 10 and 7 by 10 (hence those not exceeding 150 square inches) is \$9 per 100-foot box f. o. b. its factory and this value is, according to our understanding, the one which would be used in the assessment of a duty under the terms of this new bill. Net weight of this glass per 100-foot boxes in the sizes mentioned is approximately 80 pounds, and it follows therefore that when we import this material the duty based on the current rate of $\frac{7}{8}$ cent per pound is 70 cents; based on the new proposed rate of $1\frac{1}{4}$ cents it would be \$1; but with the proposed minimum 35 per cent ad valorem in effect (that is, taking the American manufacturer's goods at \$9 per box, it having the right at any time to increase this amount per box) it would make the actual duty 35 per cent of \$9 or \$3.15. In other words, the rate under the proposed changing would be increased from 70 cents per box to \$3.15 per box.

For the information of the committee we beg leave to advise further that many American manufacturing concerns in the United States have attempted the manufacture of photo dry-plate glass but without success.

As mentioned above before the war this glass could be bought for \$5.40 in the United States and at a lesser price imported from Belgium, but during the war we were unable to receive the importations and the American manufacturer raised its prices (not having any competition in this country) to the price mentioned above, while the dry-plate manufacturers were driven to purchase old negatives and use a chemical process to remove the film therefrom, and was also driven to buy this glass at any price fixed by the American manufacturer while said dry-plate companies did not increase the price of their productions.

The committee will realize that if this clause of the bill passes without a reduction of the duty per pound and an elimination of the ad valorem tax, the American manufacturer will have absolutely no competition and can fix the price of photo dry-plate glass at any amount and it will not be able to supply the demand of the dry-plate manufacturing companies of this country.

One case of photographic dry plates (the finished product) contains about two-thirds of a box of photo dry-plate glass, and if the manufacturers of photographic dry plates makes a profit of about \$2 on each box of photo dry plate you can readily see that with a tariff of \$3.15 on a box of photographic dry-plate glass the profit of the manufacturer of dry plates will be entirely wiped out, as there is no chance of increasing the price of dry plates at this time, but rather a tendency on the part of consumers demanding a reduction in prices.

We propose that if the committee feels that it will protect the dry-plate manufacturers of the United States and a higher tariff must be placed on unpolished sheet glass than is now in force the committee will devise some means of differentiating between window glass and photo dry-plate glass, or if that does not seem feasible the manufacturers would be satisfied with a table of rates proposed as follows:

"Par. 219. Cylinder, crown, and sheet glass, by whatever process made, unpolished, not exceeding one hundred and fifty square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding three hundred and eighty-four square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding seven hundred and twenty square inches, $1\frac{1}{4}$ cents per pound; above that, and not exceeding eight hundred and sixty-four square inches, $2\frac{1}{4}$ cents per pound; above that, and not exceeding one thousand two hundred square inches, $2\frac{1}{4}$ cents per pound; above that, and not exceeding two thousand four hundred square inches, $3\frac{1}{4}$ cents per pound; above that, 4 cents per pound: *Provided further*, that unpolished cylinder, crown and sheet glass, imported in boxes, shall contain one

hundred square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass."

If the committee insists that an ad valorem duty be imposed on unpolished sheet glass used by the dry-plate manufacturers, then we respectfully submit that the ad valorem tax should be eliminated on all sizes under 150 square inches (the size most commonly used and imported), and a fair and equitable ad valorem placed on the larger sizes which are used for photo dry plates. In this connection we might suggest the following amendment:

"Par. 219. Cylinder, crown, and sheet glass, by whatever process made, unpolished, not exceeding one hundred and fifty square inches, $1\frac{1}{2}$ cents per pound; above that and not exceeding three hundred and eighty-four square inches, $1\frac{1}{2}$ cents per pound; above that, and not exceeding seven hundred and twenty square inches, $1\frac{1}{2}$ cents per pound; above that, and not exceeding eight hundred and sixty-four square inches, $2\frac{1}{2}$ cents per pound; above that, and not exceeding one thousand two hundred square inches, $2\frac{1}{2}$ cents per pound; above that, and not exceeding two thousand four hundred square inches, $3\frac{1}{2}$ cents per pound; above that, 4 cents per pound: *Provided* That all glass exceeding 150 square inches shall pay not less than 10 per centum ad valorem: *Provided further*, That unpolished cylinder, crown, and sheet glass, imported in boxes, shall contain one hundred square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass."

By eliminating the ad valorem on sizes under 150 square inches and by placing a fair and equitable ad valorem on other sizes used for dry-plate purposes, the manufacturers making this protest would be permitted to exist, instead of having their business destroyed by this high tariff.

A further objectionable feature to this paragraph is contained in the clause compelling the importations to be in boxes of 50 square feet or as near thereto as the glass will permit, for the reason that at the present time the importations are received in boxes containing 100 square feet or as near as possible, which saves the manufacturers of this country an increase in packing charges and also in freight rates.

We trust the committee will give this matter its very careful consideration, because all statements herein contained are based upon facts and a desire on the part of the manufacturers to aid the committee in arriving at a fair and equitable tariff.

PLATE GLASS (SILVERED).

[Paragraph 223.]

STATEMENT OF ENOS PORTER, REPRESENTING THE SHELBYSVILLE MIRROR WORKS, SHELBYSVILLE, IND.

Mr. PORTER. I want to call your attention to paragraph 223 and to say that I represent mirror manufacturers in the United States who have a capital invested of from \$7,000,000 to \$8,000,000 and employ in normal times between four and five thousand men.

Senator SMOOT. Can you tell us now just briefly what change you want in that paragraph?

Mr. PORTER. There is no protection there for plate glass, silvered.

Senator WATSON. What is the paragraph in which you are interested?

Mr. PORTER. Two hundred and twenty-three. There is a 10 per cent on some of the sizes, but that is no protection whatever under the present conditions. Heretofore in all of the tariff bills there has been a protection of from 2 to 3 cents, but the conditions are different then. The mirrors that were used in this country were beveled and cut to pattern, and it was not feasible to buy them there and have them plated. Now 95 per cent of the mirrors are plain and they can bring them over here in the square and cut them to these patterns and put us out of business. They are offering to-day to sell these mirrors at 11 cents a foot above the price of plate glass, and it costs us about 22 to 25 cents a foot to do this work. Not very many of them have come in yet, but the reason for that is that there is no business in this country.

Senator SMOOT. On the smaller sizes do you want any increase?

Mr. PORTER. On all sizes we would like to have 10 cents a square foot, or 35 per cent ad valorem.

Senator SMOOT. Ten cents a square foot?

Mr. PORTER. Yes, sir. The conditions are different now. We have got to have that protection.

Senator SMOOT. You do not mean 10 cents a square foot and 35 per cent ad valorem?

Mr. PORTER. No; either one or the other.

Senator SMOOT. They are all higher than 10 cents a square foot.

Mr. PORTER. Not the silvered. There is no difference there. That includes polished plate glass. But I am interested in a rate 10 cents above the polished plate glass on silvered mirrors.

Senator SMOOT. It is paragraph 224, then.

Mr. PORTER. Cast polished plate glass, silvered or unsilvered, etc. When it gives the price. The price is just exactly the same in the first bracket as the polished plate glass. In the next it is one-half cent higher, and in the next $2\frac{1}{2}$ cents higher. That is no protection at all for the silver man.

Senator WATSON. There is no differential there?

Mr. PORTER. No differential there to protect us. I do not know what it costs them to silver over there. I have no data on that; but they are offering to sell here now at 11 cents a foot, when it costs us 2 to 25 cents a foot to do the work.

I have a very short brief that I would like to present, with your consent.

Senator SMOOT. Yes; it will be made a part of your remarks.

BRIEF OF ENOS PORTER, REPRESENTING THE SHELBYVILLE MIRROR WORKS, SHELBYVILLE, IND.

This brief is submitted on behalf of the mirror manufacturers of the United States, comprising approximately 150 factories, located in the towns and cities from Maine to California, where furniture and like merchandise is manufactured, requiring mirror plates.

These manufacturers represent a capital investment of from eight to ten million dollars and employ, when normally busy, from five to six thousand men.

Plate glass, polished, as well as cylinder, crown, and sheet glass, polished, represents a basic raw material and must of necessity be of a selected quality for mirror purposes. The production of finished mirrors is therefore a matter of labor and machinery, involving many processes entailing a production cost per square foot considerably in excess of the proposed assessed duty, under paragraph 223 of the Fordney bill.

Prior to the war period the importation of mirrors, except those silvered upon cylinder, crown, and sheet glass, known as German plates, was negligible, owing to the fact that at that period a very large percentage of mirror plates entering into the production of furniture were cut to pattern and beveled, since which time furniture styles have changed so that now approximately 98 per cent of all mirrors are plain, which would permit the importation of plain, square plates that can be easily cut to pattern by the American importer.

At the present time the syndicate of Belgian and French plate-glass manufacturers offering in this market finished silvered mirror plates at exactly 11 cents per square foot above their price for clear, polished plate glass. Such a condition without adequate tariff protection will seriously damage the mirror industry of the United States.

The Fordney bill, as passed by the House, allows an adequate protection on cylinder, crown, and sheet glass, silvered, over the specific assessment on the same product when imported, unsilvered, but in the case of polished plate glass when silvered there appears to be little if any differential allowed.

Since fully 95 per cent of all the mirrors used in the United States are silvered upon polished plate glass, and since it is this product that will come directly in competition when imported with this industry, we feel that a wider range of protection

should be allowed on cast polished plate silvered, than is now indicated in the Fordner bill.

We have no definite data to present as to the difference in cost in silvering between this and foreign countries, but to the best of our knowledge and belief the difference will amount to not less than 15 cents per square foot.

We do not ask for a tariff to cover the entire difference as mentioned above, but suggest a duty of 10 cents per square foot in addition to the specific assessed valuation of cast polished plate glass unsilvered, provided that none of the foregoing shall pay less duty than 35 per cent ad valorem.

OPTICAL GLASS.

[Paragraphs 227 and 228.]

STATEMENT OF HARVEY N. OTT, REPRESENTING THE SPENCER LENS CO., OF BUFFALO, N. Y.

Mr. OTT. Mr. Chairman and members of the committee, I came down with reference to paragraphs 227 and 228, one relative to optical glass and the other optical instruments.

In the present bill, as it passed the House, there is a duty of 35 per cent ad valorem on optical glass. That is, of course, based on the American valuation. It helps out considerably over what it would be under the old valuation, but the unfortunate part of it is that of six of the more important kinds of optical glass our average cost is now \$2.43 per pound, due to some extent to recent increase in cost of natural gas. On the other hand, the average import price, by quotations, other dealers have been getting on these glasses plus 35 per cent ad valorem American valuation amounts to \$2.20 per pound. In other words, the average cost of these six kinds of glass is 23 cents more than they can be imported for on the 35 per cent ad valorem rate. We therefore ask for a 50 per cent duty.

Senator SMOOT. You say you want 50 per cent?

Mr. OTT. Yes, sir.

Senator SMOOT. That is, on the optical glass.

Mr. OTT. On the optical glass; yes.

Senator SMOOT. What do you want on photographic glass?

Mr. OTT. On photographic lenses, do you mean?

Senator SMOOT. Yes.

Mr. OTT. Optical glass is glass that goes into photographic lenses.

Senator SMOOT. In paragraph 228 you have photographic and projection lenses.

Mr. OTT. On those instruments we should have a duty of 45 per cent instead of 35 per cent.

The facts are that at the present prices at which these goods are coming in we could get along with a 35 per cent duty, but we all know I think, that the Germans are getting all they can in this market and that they are not selling as cheaply in this market as they are at home. For instance, a gentleman of my acquaintance who has just returned from Berlin this last week, got a price on one of the instruments which he makes—the German price in Germany—which would be the equivalent of \$12, or 900 marks. That same instrument sells in this country for \$36. They are making it and selling it at \$12 in Germany. As you know, these manufacturers in Germany have united and formed what they call “bunds.” The manufacturers who make these instruments which are alike have agreed upon certain export

prices. These agreements are fixed by the association and are backed up by the Government, and the Government will not allow a certificate of exportation to be issued unless these goods are billed at these prices.

So we can see that they are getting all they can out of the American market, out of the Swedish market, out of the Danish market, and every market in which they sell. They have special prices for each country. If they can make these instruments and sell them in Germany at a low price, we know what they can do when they are compelled to, in selling in the American, South American, and any other market in the world.

One instrument that this gentleman spoke about, he could buy as a German consumer for \$21.75. He said to the manufacturer, "I want to buy at wholesale. I want to buy by the dozen. What price can you make by the dozen?" The producer said, "Where are you from?" My friend answered, "America." The man took down his schedule and said, "They will cost \$52.40 per dozen." This gentleman said, "You are making this and selling at a profit here at \$21.75, are you not?" He said, "Yes." Then he asked "What do you do with the difference? Does it go to the Government or the workman or where does it go?" The producer said, "We put it right down here" [indicating pocket]. And that is what they do with it. They are going to put much less there as the market changes. However, they are not going to let the different markets get away from them. That is perfectly evident. One of the largest factories in Germany was paying its men only 7 marks an hour. They struck. They wanted 1½ marks more an hour. They struck in January and when they finally compromised. They struck for 8½ marks an hour. At the present value of the mark they get about 12 or 13 cents an hour, whereas we are paying our skilled workmen 30, 40, 60, and 75 cents an hour.

STAINED OR PAINTED GLASS WINDOWS.

[Paragraph 230.]

STATEMENT OF OTTO HEINIGKE, OF NEW YORK CITY, REPRESENTING THE NATIONAL ORNAMENTAL GLASS MANUFACTURERS OF THE UNITED STATES.

The CHAIRMAN. Where do you reside, Mr. Heinigke?

Mr. HEINIGKE. New York City.

The CHAIRMAN. What is your business?

Mr. HEINIGKE. I am a manufacturer and designer of stained-glass windows.

The CHAIRMAN. What is it you want?

Mr. HEINIGKE. I want an increased rate on stained-glass windows.

Senator McLEAN. What is your paragraph?

Mr. HEINIGKE. Paragraph 230.

The CHAIRMAN. How much increase do you want?

Mr. HEINIGKE. I would like to be permitted to make a statement about the difference in cost of production in this country and Germany, and then let you gentlemen decide what we ought to have.

The CHAIRMAN. You have no suggestion to make as to the increase?

Mr. HEINIGKE. I will tell you of the differences in the cost of production, and we hope we will get that, of course.

The CHAIRMAN. What kind of stained glass do you make?

Mr. HEINIGKE. Painted and stained window glass, glass for completed windows for churches.

The CHAIRMAN. Where is your establishment?

Mr. HEINIGKE. My own establishment is in New York City. It is a small industry, numerically. We are scattered all over the country in almost every State, and it is hard to secure statistics for that reason; the plants are small. The status of our protection in the bill is that the Underwood law gave us 30 per cent protection, and then put us on the free list, taking away all our protection.

Senator WATSON. I do not know what you mean by the bill giving you 30 per cent and taking it away at the same time.

Mr. HEINIGKE. In the dutiable list they gave us 30 per cent ad valorem, and under paragraph 655, works of art—that is in the Underwood bill; it is now under 1688—they took away that 30 per cent by putting stained-glass windows on the free list when presented to churches. Churches are our whole market. We have no other market. So it virtually took away our whole protection. There was no protection.

Senator McLEAN. You have no protection at all?

Mr. HEINIGKE. We had no protection under the Underwood bill, and now we have none under the present bill, owing to the amendment on the floor of the House. There was 30 per cent protection in paragraph 230, but an amendment on the floor of the House put us back on the free list.

Senator McCUMBER. Put it back on the free list or simply provide the same as the Underwood bill, that it could not apply to those works of art and stained window glass?

Mr. HEINIGKE. That was the wording of it; yes; but it amounts to our whole market.

Senator McLEAN. You are satisfied with 30 per cent ad valorem?

Mr. HEINIGKE. No, sir; it does not represent the difference in cost of production.

Senator WATSON. Let us have that.

Mr. HEINIGKE. The difference in cost of production is 63 per cent, and the reason for that is that there is no possibility of using a machine in any part of our process. It is all handwork. It approximates very closely the work of portrait or landscape painting. Seventy per cent of our total cost of production is wages. I do not know of any other industry that has no possible way of using machinery. We need more protection as a matter of scientific tariff-making than any other industry with which I am familiar.

Senator DILLINGHAM. What did you say your labor cost was?

Mr. HEINIGKE. Seventy per cent of our total manufacturing cost.

Senator McLEAN. Would not the American valuation help you?

Mr. HEINIGKE. It does.

Senator McLEAN. Thirty per cent ad valorem—would not that help you?

Mr. HEINIGKE. Thirty per cent ad valorem is less than half what we need to make up the difference.

Senator McLEAN. Under the American valuation?

Mr. HEINIGKE. Yes, sir. We arrived at these figures in this way: Two American manufacturers, who had big establishments in America up to 1913, opened factories in Munich, Bavaria, under the Underwood bill, and they were forced to do that because their whole market was taken away from them; they could not compete. There are several other men in the country contemplating the same action if this goes through as it is shown. Those men had been negotiating with German manufacturers and they have turned over to us the letters and the designs which these German manufacturers sent to them, showing exactly what they are willing to lay down windows for in New York. We have taken those prices and those designs and taken the man who manufactures most economically, probably, the most practical manufacturer we have, and had him figure out what those same designs would cost. The details of that are all given in the hearings of the Ways and Means Committee of the House.

Senator WALSH. In a word, what is the difference?

Mr. HEINIGKE. Sixty-three per cent of the American valuation.

Senator WALSH. You mean that it would cost 63 per cent more than the German price to produce the stained glass window in America?

Mr. HEINIGKE. Yes, sir.

Senator McLEAN. Do the importers have their offices here and take orders? What is the degree of your competition here with the importers of this product?

Mr. HEINIGKE. The German houses have agents in this country.

Senator McLEAN. What is the yearly value of the product?

Mr. HEINIGKE. A canvass showed that in 1914 the production in America was \$212,000. I would like to correct the record of the Ways and Means Committee. The brief showed that in 1920, when we had the protection of the war, our industry increased to \$500,000. That was incorrectly printed as \$500,000,000.

Senator McLEAN. Upon what page is that of the House hearings?

Mr. HEINIGKE. It is on page 680 of the House hearings?

Senator McLEAN. What is the value of the importations?

Senator Walsh. In 1914?

Mr. HEINIGKE. It is impossible for us to find that, Senator, because we are grouped with mirrors under the dutiable list and with all works of art under the free list. The Bureau of Statistics will not give us permission to segregate them.

Senator McLEAN. What is the effect of the competition upon our business?

Mr. HEINIGKE. During 1920, before the German importations began to come in after the war—of course, they were shut off entirely during the war—we had built up from \$212,000 to \$500,000, approximately. I was told the other day by one of the men who has opened this plant in Germany that he has now \$140,000 worth of orders to be executed in his German plant; almost none in his American plant. He has discharged one man after another until he is down now only to repairing.

Senator WATSON. Is Germany your principal competitor?

Mr. HEINIGKE. Yes; it is practically our only competitor.

Senator WALSH. Is not the claim made also that the German stained glass is superior?

Mr. HEINIGKE. It is.

Senator WALSH. Is that a fact?

Mr. HEINIGKE. No, sir.

Senator WALSH. But that is a popular notion?

Mr. HEINIGKE. That is the claim of the importers' agents in the brief.

Senator WALSH. But is it not pretty generally thought among particular ecclesiastics—I have discussed it with many of them—that the German window glass is superior?

Mr. HEINIGKE. That is propaganda, but in our supplemental brief before the Ways and Means Committee of the House we filed letters from upward of a dozen clergymen, who expressed their preference for American windows. We have ordered from Germany a window and we hoped to have it here for this hearing, but it has not yet arrived. We were going to let you judge for yourselves. It is a small window that could be placed on exhibition.

Senator McLEAN. What is the state of your business to-day?

Mr. HEINIGKE. I just had a statement the other day for the first six months of this year, and we have lost \$260 on six months' work.

Senator McLEAN. What is the total value of that business?

Mr. HEINIGKE. On my personal plant?

Senator McLEAN. Well, the plants with which you are acquainted. What is the condition of the trade to-day? Are they doing anything, and if they are, are they doing it at a loss?

Mr. HEINIGKE. They are working at about 30 per cent of their capacity. There are about 70 per cent of the men walking the streets, appealing to us for some means of getting a livelihood.

Senator McCUMBER. What do you pay your men?

Mr. HEINIGKE. A dollar an hour is, I think, about the average. \$1.50 for the flesh painters, and the same class of men get 20 cents in Germany. The men to whom we are paying \$1.50 get 20 cents in Germany. The details of the comparative wage scales in Germany and America are found on page 673 of the printed hearings of the House Ways and Means Committee, and the details of the comparative costs, all figured out in minute detail, are shown on page 674 of the printed hearings of the House Ways and Means Committee.

Senator DILLINGHAM. You say that you are running at about 30 per cent of your capacity?

Mr. HEINIGKE. Yes, sir.

Senator DILLINGHAM. That is a complaint that comes to us from substantially all of the different branches of industry.

Mr. HEINIGKE. Yes, sir; that is true.

Senator DILLINGHAM. Is that because of the lack of orders that come in owing to the fact that the people are economizing, or is it because of the duty?

Mr. HEINIGKE. I think it is because the bulk of the business is going abroad. My reason for saying that is that one of the small importers has \$140,000 worth; another of the comparatively small importers had \$80,000 worth of orders six months ago. He told me so himself. There are two larger importers who would ordinarily do four times as much business as those two. I should say that if

are \$800,000 worth of orders for windows now being executed in Germany.

Senator McLEAN. Is this expensive glass window used extensively in private dwellings as well as in churches?

Mr. HEINIGKE. They do not import stained-glass windows.

Senator WALSH. I was thinking that there has been quite an increase in the use of stained-glass windows in private residences in the past 5 or 10 years. Is that true?

Mr. HEINIGKE. It is comparatively small in volume; they are usually selected by architects of discrimination and all bought in America. They have them designed here. We have always had a very considerable amount of private-dwelling work, but it does not run into any volume. We could not run one-quarter of our plant on it. It is a comparatively small portion of the business.

Senator McCUMBER. Are these men to whom you are paying \$1 an hour artists? Do they design the works and draw the figures, and so forth, for these windows?

Mr. HEINIGKE. No, sir. As a usual thing, the employer does. I am a designer. I am the head of the firm, and my partner is also a designer. We employ these men; some of whom are entitled to be classified as artists; they are really artists.

Senator McCUMBER. Does it require years of special study in order to become proficient in that work?

Mr. HEINIGKE. Yes. Most of these men, as young men, study for years in the art schools. They go to the classes in drawing and spend all their leisure time there. They are really artists. They study for the work just as the portrait painter studies for his work.

Senator McCUMBER. I mean the men that do the physical work.

Mr. HEINIGKE. So do I, sir. That is what I do mean. Those men study just as hard as a professional man studies, and they are entitled to the standing of a professional man, but they do not get it.

Senator McCUMBER. But they are not designers.

Mr. HEINIGKE. No, sir. Of course, the designers are creators of designs, and they have the standing of professional men, usually.

Senator WATSON. For the calendar year 1920 the report of importations of works of art, including pictorial painting and paintings on glass, including stained or painted windows, to be used in houses of worship, etc., amounted, in the aggregate, to \$163,000 only. Are some coming in now?

Mr. HEINIGKE. They are increasing all the time.

Senator WATSON. How do you know that?

Mr. HEINIGKE. I know it from the statements of these men, who are manufacturers here and abroad. They are both members of our association, and they are perfectly frank. They say that they would a good deal rather manufacture here and that they would close up their business abroad if they could manufacture here at a profit. One of those men is in Europe now, and the other, when we went before the Ways and Means Committee of the House, gave us letters and telegrams which are printed in the brief.

Senator WATSON. Would the importation of \$163,000 of your product interfere with your business?

Mr. HEINIGKE. Yes, sir; on a \$212,000 basis. You see, that was our total output in 1914.

Senator WALSH. Of course, there has been a great reduction in building operations.

Mr. HEINIGKE. Yes, sir. In erecting a church building for the Roman Catholic Church, for instance, there are two grooves in the window, one for the protection glass, the sheet glass, which they can put in while the building is being erected. Then they can wait indefinitely for the luxury windows, the windows that are entirely luxurious. They have been doing that all through the war. The sentiment against buying luxuries has prevented them from buying any kind of stained-glass windows. They have just had these temporary windows in. Now they have the money that they have been accumulating for this purpose, and they are buying them in great numbers. There is no limit to the market just now, and we are not getting it. I do not believe that all of us together in this country have at present \$150,000 worth of work. I canvassed 15 of the largest shops for that information, and the indications are that they have not as much as one of these smallest importers has.

Senator WALSH. Is Tiffany in your association?

Mr. HEINIGKE. No, sir.

Senator WALSH. Is he independent?

Mr. HEINIGKE. He is independent in every way.

Senator WALSH. He does some of this work, does he not?

Mr. HEINIGKE. He does, but he does not compete. He does not make painted windows. He makes the opalescent window and runs that department as a sort of a play toy. It has been stated that he has never made a profit on his stained-glass window department. The Gorham Manufacturing Co., with practically unlimited capital, made up their minds to close their department.

May I file a brief, Mr. Chairman, showing some additional figures that we have accumulated?

The CHAIRMAN. Yes, sir.

LIMESTONE.

[Paragraph 235.]

STATEMENT OF H. S. BRIGHTLY, BEDFORD, IND., REPRESENTING THE INDIANA LIMESTONE QUARRYMEN'S ASSOCIATION AND THE INDIANA LIMESTONE INDUSTRY.

Mr. BRIGHTLY. The speaker represents the Indiana Limestone Quarrymen's Association and a majority of the quarry producers and allied interests in southern Indiana.

We are interested in paragraph 235 and also in paragraph 232. At the present time we are classed in with freestone, granite, and sandstone in paragraph 235.

We feel that we are improperly classed and that that error has existed for a long time; also that the tariff rate proposed in the Fordney bill is entirely inadequate. I appeared before the Ways and Means Committee in February last—in order to present the facts to substantiate this and to present the need of safeguarding our industry.

Senator SMOOT. You want limestone to be put in paragraph 232, with marble, breccia, and onyx?

Mr. BRIGHTLY. Yes, sir; under a divided classification, as I will explain later. I pointed out to the Ways and Means Committee at a hearing in February that the freight alone on Indiana limestone, from the quarries in the Bedford-Bloomington district to our great eastern markets, New York, Boston, and Philadelphia, Washington, and other points in the East, was greater than the entire cost of the North, England, limestone, or other foreign limestones, on the dock in the United States, including the inland transportation, wharfage, dock dues, ocean freight, insurance, lighterage, and all expenses attendant to laying it down on this side, as well as the cost of the material.

Senator WALSH. That is, your cost for sending by freight limestone from Indiana to New York or Boston is more than the cost of production abroad and of freight by sea and by land?

Mr. BRIGHTLY. Yes, sir. Since that time the Interstate Commerce Commission has seen wise to authorize a reduction in freights to eastern points, which took effect July 25, but that only affects the delivered cost of our commodity by reducing it on an average about 16 cents per cubic foot. We asked that we be classed with marble, at that time under the 50-cent rate, and we showed that that would not put us on an equal competitive basis with the imported product but that foreign limestone would still enjoy an advantage. We had in mind that this unfair advantage might be overcome by these probable freight-rate reductions, which have since taken effect.

Senator SMOOT. You are talking just about limestone?

Mr. BRIGHTLY. Just limestone; yes, sir.

Senator SMOOT. American limestone?

Mr. BRIGHTLY. Limestone such as you see on the facing of the Court wall outside—Indiana limestone. Indiana limestone, however, is also extensively used for interior purposes. The unfair element in previous tariff bills is the line of definition drawn between what is classed as limestone and what is classed as marble. No really clear line has ever been drawn. They say that marble is a limestone that can be polished. Indiana limestone can be polished. Then they tried to define it by saying marble is a crystalline limestone. The line of demarcation between crystalline limestone and noncrystalline limestone is very hard to draw because the two kinds often are merged in part crystalline or semicrystalline stones. The consequence of this is that in past years all of the various fancy French and Italian limestones, which are used principally for elaborate interior work, have been brought over in the rough block under the low limestone tariff rate and then been sawed up and sold under their various trade names as fancy French and Italian marble, chiefly for the more costly interior work.

Senator McLEAN. What is the cost of limestone as compared with the cost of marble?

Mr. BRIGHTLY. The cost of the Indiana limestone as compared with marble? I can not inform you accurately as to the cost of imported marbles. I would say the cost at the quarries would vary from somewhere around 70 cents, or probably considerably less than that in view of depreciated exchange, up to probably around \$2 per cubic foot. Indiana limestone sells at the quarry at from 45 to 55 cents per cubic foot, for the different regular grades.

Senator McLEAN. What is the cost of the domestic marble?

Mr. BRIGHTLY. The price of domestic marble will probably run from well under a dollar up to \$2 or \$3 at the quarries, for standard grades. Some of the highly colored and figured varieties of both domestic and foreign would sell at a higher price. I refer to standard grades, as the great bulk of the marble used would be of this kind and fall within the lower range of price.

We feel that our product belongs in with this other, or marble classification, not necessarily at the higher rate which has been proposed for marble, but that as marble is a limestone and both are used for similar purposes that limestone belongs with marble and that this paragraph should be divided into two classifications. Let the marble and crystalline limestone, breccia, and onyx, in block, be the first division and take the 65-cent rate. The noncrystalline limestones suitable for use as a monumental or building stone, rough or squared only, and embracing all of these foreign limestones be the second division, at another rate. The rate for this division need not be so high as that for marble, but should be substantially higher than the rate which would apply under the Fordney tariff bill. It is obviously unfair to keep limestone in the freestone, granite, and sandstone class.

Senator McLEAN. It is used for facings in expensive buildings largely?

Mr. BRIGHTLY. No; limestone is not. It is a universally-used stone. In fact, it constitutes about 70 per cent of all the stone used in the United States outside of marble and granite. It has created the impression of being an expensive stone because it is used for so many fine buildings; but it is also used very extensively for moderate-cost buildings, even for the cheaper houses, flats, and apartment buildings, not necessarily for the whole facade but for sills, steps, and other trim. It is a very universally-used stone. At the same time it is extensively used for elaborate carved interiors for churches and other fine interior work.

Senator REED. How much do you say it costs a foot?

Mr. BRIGHTLY. Between 45 cents and 75 cents.

Senator REED. What makes that great difference?

Mr. BRIGHTLY. The different grades.

Senator REED. What is the average?

Mr. BRIGHTLY. It would average between 60 and 65 cents.

Senator REED. Would 65 cents be a fair average?

Mr. BRIGHTLY. I think 62½ cents would be a fair average.

Senator REED. How much is your labor cost in that?

Mr. BRIGHTLY. The labor cost is about one-half of the cost, I would say at least one-half the cost.

Senator REED. That is to say, it would be 31½ cents. What would be the labor cost in England where you compete?

Mr. BRIGHTLY. I do not know that or think I can give it to you on a cubic-foot basis. I can only give it to you by way of a comparison. Our labor cost to-day will average around 60 cents an hour for labor employed.

Senator REED. What does theirs average?

Mr. BRIGHTLY. Twenty-nine cents under the present rates of exchange.

Senator REED. Can you not give this committee now the figures that will show the labor cost over there? That would be about 15 cents?

Mr. BRIGHTLY. I only have the wage rates; no knowledge of the rate of production and consequent cost under these rates, but we know the price for which it has been sold over there. There is a lot of it brought over to this country already. It can be brought over as ballast to a large extent at extremely low ocean rates.

Senator REED. Is their labor cost over there about 15 cents? Do they get it out more easily than you do?

Mr. BRIGHTLY. No; they do not get it out any more easily. In fact, they are putting in American machinery now to take full advantage of this market, which the inadequate tariff proposed assures them.

Senator REED. Their labor cost is then over 15 cents because they are changing to American machinery?

Mr. BRIGHTLY. It may be over that; we do not know.

Senator REED. They get 29 cents an hour?

Mr. BRIGHTLY. That would be the average cost of wage rates paid at the time our brief to the Ways and Means Committee was prepared. It may be less to-day.

Senator REED. Yours would average 60 cents?

Mr. BRIGHTLY. Sixty cents.

Senator REED. You use machinery more than they do?

Mr. BRIGHTLY. We use more modern machinery than they do.

Senator REED. Anyway, their labor cost is above 15 cents per cubic foot. What are your freight rates to New England?

Mr. BRIGHTLY. The freight rate to New York is 40 cents on the rough blocks, which weigh 200 pounds per cubic foot, which equals 80 cents per cubic foot. To Boston the freight rate is 42 cents a hundred pounds, which equals 84 cents per cubic foot. The freight rate to Philadelphia, Baltimore, and Washington is 38 cents, which equals 76 cents per cubic foot.

Senator REED. Eighty cents to New York and 84 cents to Boston?

Mr. BRIGHTLY. Yes, sir; and 76 cents to certain other eastern cities.

Senator REED. You want this committee to write this tariff bill so that, first, it will equalize the difference in wages, and, second, it will equalize the difference in freights?

Mr. BRIGHTLY. Yes, sir.

Senator REED. That is what you think ought to be done?

Mr. BRIGHTLY. Yes, sir.

Senator REED. So that the man in the East is to be denied the benefit of the natural proximity to the material—and when I say “natural proximity” I do not mean in miles, but in haulage.

Mr. BRIGHTLY. Indiana is not as far away as England or France.

Senator REED. No; not in miles, but in haulage.

Mr. BRIGHTLY. An American industry is obliged to pay American railroad rates. There is also the question of how it affects the rest of the country and also has reference to the preservation of American industry. We have been 50 years engaged in——

Senator REED. I understand. Let us stick to one thing. You want this tariff to be high enough so that the New Englander shall be denied the natural advantage of his situation, which is that he is

located where he can get water transportation. You want to add to the price enough so that he has to pay the high freight rates of this country and lose the advantage of cheap water transportation?

Mr. BRIGHTLY. Yes, sir; and of low foreign wages——

Senator REED. What is the capital stock of your concern?

Mr. BRIGHTLY. It is not one concern; there are 18 different companies represented by our association and other extensive interests affiliated therewith.

Senator REED. Are you connected with any one of them?

Mr. BRIGHTLY. No, sir. I am connected with the association representing all of those 18 companies.

Senator REED. It is the general effort of them all to raise their price and shut out this competition?

Mr. BRIGHTLY. Not to raise their prices.

Senator REED. To shut out competition?

Mr. BRIGHTLY. I may say that they are not making any money now, because they are working way below normal production. We do not seek an increase of price; we seek to preserve our business. With production on a normal basis, we can profitably serve all domestic needs without increasing the price. We have been 40 or 50 years developing these quarry properties and building up our industry.

Senator REED. What did they make last year?

Mr. BRIGHTLY. I could not answer that question, because, as a matter of fact, the general statement is that the industry has made no money during recent years. Our entire industry was "down on its back" during the war. They were not doing anything. Last year it was operated at around 40 per cent of normal. You can not make money under those conditions in any quarrying industry.

Senator REED. That is because all building practically stopped. Not all, but there was great diminution in building during the war.

Mr. BRIGHTLY. New England has her marble and her granite right at hand. It will not deny New England anything, nor oblige them to pay any more than they are accustomed and entitled to pay. It is simply denying the foreigner the advantage of coming into this country, exploiting our markets on the basis of low wages and depreciated currency and destroying a well-established American industry involving more than a lifetime of effort and a large capital investment. Furthermore, we do not need any foreign building stone; the United States enjoys a wealth of building stones of all classes.

Senator REED. Let us see. If this foreigner lands his goods in New York he would have to pay the freight, the ocean freight?

Mr. BRIGHTLY. Yes, sir.

Senator REED. Then, if he desires to ship it into the interior he would immediately begin to pay these high freight rates the same as you would?

Mr. BRIGHTLY. He could ship to——

Senator REED. Just answer the question. Just as soon as this material reaches these shores and is unloaded, he then, in order to ship from that point, has to begin to pay the higher freight rates?

Mr. BRIGHTLY. Yes, sir.

Senator REED. And of course he soon reaches the point where the railroad rates are prohibitive as to him.

Mr. BRIGHTLY. If he is shipping inland; yes, sir; although the rates inland from seaports are not nearly so high as rates for equivalent mileage for shipments moving toward the seaboard.

Senator REED. So that you would have left that vast zone of the country lying, we will say, approximately halfway between Indiana and the Atlantic coast free from his competition?

Mr. BRIGHTLY. That is true.

Senator REED. And you would be left all that vast territory which runs to the west until you come into competition with something which is produced domestically in this country?

Mr. BRIGHTLY. We compete with stone produced near to the Pacific coast. We compete with stone produced in New England and in the South, including Florida.

Senator REED. All of those points are many hundreds of miles away from you. You are not content with that part of the country which, because of high freight rates, itself has a protection against invasion of its territory from the Pacific coast or from Florida or from the East. That leaves you about one-quarter of the United States for your Indiana quarries alone, does it not, free from that competition?

Mr. BRIGHTLY. It leaves us a large part free from foreign competition, but that territory would not utilize even the major portion of our output, and we look upon these eastern markets as the most important markets of the country. We do not consider any portion of this country not our rightful territory. Our product is a universally used American building stone. The exploitation of a foreign product should not be allowed to destroy 50 years of development.

I should like to file a brief. I do not have it with me.

Senator SMOOT. You have that privilege.

HEARINGS
BEFORE THE
COMMITTEE ON FINANCE
UNITED STATES SENATE
ON THE PROPOSED
TARIFF ACT OF 1921
(H. R. 7456)

SCHEDULE 3
METALS AND MANUFACTURES OF

Revised and Indexed

WASHINGTON
GOVERNMENT PRINTING OFFICE
1922

COMMITTEE ON FINANCE.

BOIES PENROSE, Pennsylvania, *Chairman.*

PORTER J. McCUMBER, North Dakota.

REED SMOOT, Utah.

ROBERT M. LA FOLLETTE, Wisconsin.

WILLIAM P. DILLINGHAM, Vermont.

GEORGE P. McLEAN, Connecticut.

CHARLES CURTIS, Kansas.

JAMES E. WATSON, Indiana.

WILLIAM M. CALDER, New York.

HOWARD SUTHERLAND, West Virginia.

FURNIFOLD M. SIMMONS, North Carolina.

JOHN SHARP WILLIAMS, Mississippi.

ANDRIEUS A. JONES, New Mexico.

PETER G. GERRY, Rhode Island.

JAMES A. REED, Missouri.

DAVID I. WALSH, Massachusetts.

LEIGHTON C. TAYLOR, *Clerk.*

W. B. STEWART, *Assistant Clerk.*

NOTE.

Believing the greatest demand for the Tariff Hearings before the late Finance Committee on H. R. 7456 will be only for those schedules containing the particular items in which each individual is interested, the preliminary prints have been revised and indexed and printed by schedules.

The hearings are paged consecutively and comprise the following separate documents:

American Valuation.

Dyes Embargo.

Schedule 1.—Chemicals, Oils, and Paints.

Schedule 2.—Earths, Earthenware, and Glassware.

Schedule 3.—Metals and Manufactures of.

Schedule 4.—Wood and Manufactures of.

Schedule 5.—Sugar, Molasses, and Manufactures of.

Schedule 6.—Tobacco and Manufactures of.

Schedule 7.—Agricultural Products and Provisions

Schedule 8.—Spirits, Wines, and Other Beverages

} combined.

Schedule 9.—Cotton Manufactures.

Schedule 10.—Flax, Hemp, and Jute, and Manufactures of.

Schedule 11.—Wool and Manufactures of.

Schedule 12.—Silk and Silk Goods.

Schedule 13.—Papers and Books.

Schedule 14.—Sundries.

Schedule 15.—Free List.

Special and Administrative Provisions, and Appendix containing briefs received too late for printing in the volume containing the hearings upon the various schedules.

LEIGHTON C. TAYLOR, *Clerk.*

SCHEDULE 3.

METALS AND MANUFACTURES OF.

DIGEST OF INFORMATION RELATING TO MINERALS.

STATEMENT OF HERBERT W. SMITH, WASHINGTON, D. C., REPRESENTING THE AMERICAN MINING CONGRESS.

Mr. SMITH. My name is Herbert W. Smith, 841 Munsey Building, Washington, D. C. I serve as chief of the division of mineral tariffs in the American Mining Congress. I am here to suggest certain provisions for the consideration of the committee and certain changes in the schedules of H. R. 7456 which affect the mining industry. It will be necessary to touch briefly on all the different paragraphs which affect the 27 different minerals; and to conserve the time of the committee I have prepared for your reference a statistical chart showing the present tariff classification; the imports from foreign countries of the materials produced by these industries, based on prewar, war-time, and present figures; the countries from which imported; the labor cost per diem in those respective countries; the relative trade balance of those countries with the United States; their present exchange rates; the nature and extent of ore deposits, foreign and in the United States; the cost of production abroad and here; the prevailing prices for the commodities, prewar, war-time, and present; the annual production of the United States, prewar, war-time, and present; the States in which produced, showing the localization of production; the number of people dependent on the industry for support; the approximate investment in the industry; the present condition of the industry, and the particular problem it is facing. Therefore it needs a tariff; the probable relative percentage of mineral that will be consumed under a correct tariff, the tariff which has been requested by the industry for its protection, and the tariff recommended in H. R. 7456.

Senator LA FOLLETTE. Will you give the sources of your information with regard to foreign production?

Mr. SMITH. Yes. This chart gives these statistics on the following materials: Antimony, arsenic, asbestos, barytes, bismuth, cadmium, cerussite, feldspar, fluorspar, graphite, gypsum, kaolin, lead, lime, manganese, magnesite, marble, mica, molybdenum, monazite and cerium, pyrites, pumice, potash, quicksilver, talc, tungsten, and uraninite.

I shall not offer this for the record, because in my work with the Ways and Means Committee a great deal of this material has been submitted to the committee, and it is of record in different form. I offer it for the use of the members of this committee, and if you wish to make it a part of the record you may do so.

Senator SMOOT. You better put it in the record.

Senator WATSON. Yes; because that appears to be a very valuable statement.

Senator SMOOT. I have examined it, Mr. Smith, and I think ought to go into the record. You handed me one of those charts the other day.

Senator WATSON. Are you satisfied with the rates?

Mr. SMITH. Yes, on the whole. As to those in connection with which the issues involved have been carefully considered and adjusted satisfactorily by the rates fixed by the Ways and Means Committee, as far as possible I shall not take it up for discussion.

On arsenic, in Schedule 1, paragraph 1, the committee has recommended a duty of 25 per cent ad valorem—on arsenic acid, arsenious acid, or white arsenic.

The production of arsenic in this country was greatly accelerated by the cutting off of imports during the war, and both our by-product production from domestic smelters and our production from original arsenious ores were increased. The development of the original arsenious ores is the permanent and most valuable portion of the development. In western Nevada and eastern California, which produce the arsenious ores, millions of tons have been opened up and a large portion of a commercial grade suitable to refining for the arsenic alone.

Heretofore the production of arsenic in this country has been by-product smelter production, and a large volume of it still is.

The rate of 25 per cent ad valorem has two disadvantages: First, it has the disadvantage that an ad valorem rate always has, that it offers least protection when needed most; and, second, with the particular problem that the industry is facing now it would not give the industry under present conditions the protection that it needs to carry it over until times get back more nearly to normal.

An amendment is therefore suggested to paragraph 1, Schedule 1, lines 19 and 20. We suggest the following amendment:

Line 20, paragraph 1, Schedule 1, following the comma after the word "arsenic," insert "— cents per pound."

I do not suggest the rate per pound to the committee, but it will range between 3 to 5 cents, depending on the decision of the committee following its investigation of the subject. It should not be less than 3 cents per pound, and more than 5 cents a pound is not needed.

On barytes the Ways and Means Committee recommended a rate of \$4 per ton on crude barytes ore and \$7.50 on ground or manufactured barytes.

Senator WATSON. What paragraph is that?

Mr. SMITH. Schedule 1, paragraph 64.

I suggest for the earnest consideration of the committee the presentation which was made to you by the Hon. Marion E. Rhodes of Missouri, who is thoroughly conversant with the barytes problem, as to the rates which he suggested for your consideration.

Bismuth, which is now and always has been on the free list (page 1523), is a by-product smelter production, which was accelerated during the war and the continuance of which is vitally necessary not only chemically but for the reason that, being a by-product production, the price is not permitted to reach a point where it is worth while to save the bismuth it will not be produced. If the material is entirely lost, it goes off into the furnace slag, and the cost which is assigned to bismuth production as a by-product of smelting is always merely the cost of the last operation, the cost of converting it. There is no charge against it for mining, no charge against it for concentration, no charge against it for ore treatment.

Whenever the price of bismuth drops below the cost of the last process, not only is that portion of the industry lost, but that material is irrevocably lost also.

It is suggested, therefore, for the consideration of the committee, that bismuth be removed from the free list and placed in the metal schedule carrying a rate of 25 cents per pound.

Cadmium is a similar metal produced similarly by by-product production in smelting, and is also lost wherever the price is not sufficient to warrant the last process of manufacture. It is suggested, also, for the consideration of the committee, that cadmium be included in the metal schedule at a rate of 25 cents per pound.

I might say that neither bismuth nor cadmium was a mooted point before the Ways and Means Committee. This issue was brought before the committee too late for its consideration, and it is here presented for the first time. Briefs on these two metals will be filed with your committee.

On graphite the committee has indicated a rate of 10 per cent ad valorem, which has the same disadvantage that I have already spoken of as to ad valorem rates; and from the work that I have done on these mineral tariffs I only feel that I can unqualifiedly indorse the recommendations that have been made to you by the graphite producers for the protection of their product. The protection that they ask for is fully justified and will result, within, I suppose, 5 to 10 years, in an improvement even greater in the manufacturing graphite industry than would otherwise follow, because of the greater facility of use of the American graphite after the trade practice has once become accustomed to it.

Senator SMOOT. The producers have a number of suggestions. The last one wanted a rate on lump of 3 cents and on flake 6 cents.

Mr. SMITH. I would say that the lowest rate that the committee should consider which would offer any inducement to engage in graphite production was the rate recommended by Mr. Herbert Johnson. It was an ad valorem rate, having the disadvantages that ad valorem rates have. There appeared before you also Mr. Sharp, who recommended the rates in the original graphite bill. Those are adequate with the exception of the rate on amorphous graphite, which is not included therein.

Senator SMOOT. Mr. Sharp wanted 1 cent on flake graphite.

Mr. SMITH. The rates that Mr. Weed has recommended to you are particularly applicable to his portion of the flake-graphite industry. They also cover the amorphous industry of which I spoke.

It is probable that Mr. Weed's rates are arranged to mesh in together better than any of the other rates that have been suggested. Compared from a standpoint of relative highness there are differences both ways, especially when you include the 35 per cent ad valorem rate.

A side issue has come up with regard to the lead schedule which does not affect the lead schedule itself, but affects the manufacture of lead. That is paragraph 320, electric storage batteries.

Electric storage batteries are made up in their component materials of greatest weight and greatest value entirely of lead in the form of lead oxides and lead bars. Electric storage batteries have heretofore been in the basket class of the metal schedule. This time they ask for special consideration as a separate issue, and they were placed in a separate paragraph.

Senator WATSON. What paragraph?

Mr. SMITH. Electric storage batteries and parts thereof, paragraph 320, page 51. [Reading:]

Electric storage batteries and parts thereof, storage battery plates, and storage battery plate material, wholly or partly manufactured, all the foregoing not specially provided for, 30 per centum ad valorem.

The storage-battery manufacturers will petition your committee for an increase in that rate to 40 per cent ad valorem, for the reason that with the duties provided on lead, which are no more than adequate to protect the lead industry, in fact they are not sufficient to protect it in the present status of business, the basic part of a storage battery could come into this country in the form of busbars, which would bear, as a storage-battery part, a rate of 30 per cent ad valorem, which would be less than the duty on the same material if it were classified as pig lead.

That is, this schedule offers opportunity not only for false entry and misrepresentation in importing by simply a slightly different description of two articles that are very similar, but it offers opportunity for bringing it in in that way and then marking it "manufactures" of lead, which bear relatively a greater duty, and it puts the storage-battery manufacturers at a disadvantage which a rate of 40 per cent would take care of.

That is rather a detailed problem. If there are any questions that the committee wish to ask on that particular matter I should be glad to go into it.

Senator CURTIS. Have you a memorandum that you can leave with the committee? I notice that you are reading from some memorandum.

Mr. SMITH. No, sir. These are just odd memoranda that I have covering a list of the subjects I must take up with the committee to-day. The storage-battery people will file with your committee a brief covering the detailed issues fully.

On the question of manganese, that matter has been exhaustively gone into by your committee as it was by the Ways and Means Committee; and the rates on manganese were finally arrived at by the Ways and Means Committee after they had very vigorously trimmed down the original request. It was the feeling of the committee when the rates were finally arranged that they had cut them to the bone.

I wish to submit for the interested observation of the committee some maps on manganese production and manganese reserves in this country which have been prepared from data which we have accumulated in the past few years.

In the discussion of the manganese issue expressions were used such as "no deposits of manganese ore" and "no shipments of manganese ore except an occasional carload," which did not adequately represent the real situation.

This map [exhibiting] gives the production of manganese for 1918 from the following States: Alabama, Arizona, Arkansas, California, Colorado, Georgia, Minnesota, Montana, Nevada, New Mexico, Tennessee, Texas, Utah, Virginia, Wisconsin, and scattering States—showing a production for that year of 305,869 tons shipped to market and used, and 1,386,301 tons of ferruginous manganese; so that in 1918 the United States produced more high-grade manganese than any other country in the world except Brazil, which produced 350,000 tons.

counting the ferruginous manganese, the total of manganese ores produced in the United States was greater than the combined production of all the rest of the world for 1918.

Together with that is a map of potential manganese-ore reserves from the same States, which has been assembled from the consensus engineering statements from engineers who have been in charge of the properties and engineers who have investigated these properties on an independent basis. It does not bear the same authenticity as a Government report, but it has been honestly assembled, and the information in it has been vouched for as accurately as is at all possible. On the question of manganese and ferromanganese you raised the point yesterday, Senator Smoot, with regard to the dividing line; and you are quite right in saying that the dividing line is difficult of administration. They have set an arbitrary point of 45 per cent of manganese as the split between spiegeleisen and ferromanganese. That is not where the split occurs.

In the manufacture of alloys of manganese and iron there is manufactured a manganese pig iron which contains varying percentages of manganese, running from 1 per cent up to 10 or 12, depending upon the grade of the ore. The manganese contained in that type of pig is of equal value in furnace use, depending on the amount of the material that is in it. When you go up to 23 per cent of manganese you have the top limit of spiegel.

Senator SMOOT. Thirty per cent, is it not?

Mr. SMITH. I may be incorrect on that, but I have looked it up quite recently. The ranges on commercial grades with which I am familiar are from 18 to 23 per cent. Then there is a product of 80 per cent. Eighty per cent is the standard grade for ferro. During the war it was reduced to 70 per cent, so that our furnaces could be loaded up.

In the relative cost of manufacture you can take a ferruginous manganese ore and make a manganese pig; you can take a high-grade ferruginous manganese ore and make spiegel, or you can take a low-grade ferruginous manganese ore and by adding a little manganese make spiegel. But to make 80 per cent ferro requires at least 40 per cent manganese ore.

You know, metallurgically, that when you build an alloy up to this point your losses increase tremendously.

I would suggest for the consideration of the committee, therefore, that this 45 per cent arbitrary line be moved to 30 per cent, as you suggest, as being the top limit of spiegel.

Senator CURTIS. Have you verified your figures? Why not make what it ought to be—23 per cent, if that is the figure? Why can't you and Senator Smoot agree as to whether you are right or he is right?

Senator SMOOT. He is perfectly satisfied to take 30 per cent.

Senator CURTIS. If that is not the correct figure——

Senator SMOOT. I am quite satisfied that you will find it is 30 per cent, up to 30 per cent.

Mr. SMITH. There would be no grades between those two points of 30 and 80 per cent manufactured.

Senator SMOOT. Could you tell me what the real cost is for converting manganese ore into ferromanganese?

Mr. SMITH. Prewar costs on conversion were around thirty to forty dollars per ton of ferro, that is up to between 1914 and 1915.

Senator SMOOT. You mean ferromanganese, 80 per cent?

Mr. SMITH. Yes, sir; 80 per cent ferro.

Senator SMOOT. How many tons of ore did that take? Take an average of high grade, beginning with 40 per cent.

Mr. SMITH. It takes about $2\frac{1}{2}$ tons of manganese ore, 40 to 50 per cent ore, to make 1 ton of 80 per cent ferro.

Senator SMOOT. That is what I wanted to get at, the conversion cost.

Mr. SMITH. The ratio is 110 units of manganese to 80 units of ferro.

Senator SMOOT. That is true. They ask for \$15 difference. I know.

Mr. SMITH. Yes, sir.

Senator SMOOT. I will figure it out. I agree with you as to the percentages. I will figure it out later.

Mr. SMITH. These costs on the manufacture of ferro are a little difficult to give, because there are no independent producers of ferro operating. The latest costs on ferro were around \$65 per ton.

Senator SMOOT. I mean what it actually costs in labor to convert $2\frac{1}{2}$ tons of manganese ore into 1 ton of ferromanganese.

Mr. SMITH. That is the ratio that we would have to figure on.

Senator CURTIS. I wanted to ask you one question. I noticed running over your figures as to the cost of labor in the production of magnesite that in Austria it is 62 cents a day. The testimony before our committee last January was from the American company which owns Austrian mines, to the effect that they had to pay for labor \$1 a day.

Mr. SMITH. There has been a marked depreciation in exchange since then. This is my memory of it, but I can not verify it. There was also testimony introduced to show that there were a great many women employed in the mining industry in Austria which means a lower wage level than \$1 per day.

On pyrites the industry requests on cuprous and cupriferosus iron pyrites \$4 per ton. Pyrites is on the free list (par. 1663); and we recommend for the earnest consideration of the committee the inclusion of it in Schedule 3 or Schedule 2, whichever would be the proper classification, at the rate suggested.

On quicksilver a slight adjustment between the rate as suggested of 35 cents per pound and the rate provided in the chemical schedule will be necessary, because the rate now provided was introduced on the floor of the House too late for the rates in the chemical schedule to be altered in conformity with it. It is a difference of about 10 per cent ad valorem on the basis of American valuation.

On zinc we recommend for the consideration of the committee the changes suggested by Mr. Ruhl and the other gentlemen who appeared before you, one of which changes is due to a similar circumstance to the one I suggested, namely, the inclusion of the temporary provision as a permanent provision late in the consideration of the bill.

Senator SMOOT. Mr. Ruhl wanted the temporary provision made permanent?

Mr. SMITH. Yes; but there were two temporary provisions. One was made permanent, and one of them was not, which leaves a disparity there which should be adjusted.

On tin there has never been a duty before because in the consideration of other tariff bills we have never had a tin-smelting industry.

the United States. During the war three tin smelters started in operation using Bolivian ore, and the representative of one of those smelters appeared before the Ways and Means Committee and requested a duty on block tin and said he was willing, if it was the wish of the committee, to have included a duty on tin in ore. The rate asked for on tin in ore was 6 cents per pound and on block and pig tin 10 cents per pound, making a differential of 4 cents on the block tin. It was the conclusion of the committee that inasmuch as there was no tin ore in this country or no prospects of any, only the duty on the block tin should be provided. This was recommended at a rate of 2 cents per pound in paragraph 386.

We suggest for the consideration of the committee the revision of that to 4 cents per pound. It would still be no more than the rate of about 10 to 15 per cent ad valorem at the lowest market price of tin over a great many years; and this is an industry that is well worthy of fostering in this country. It represents an immense investment and is the only true development of the tin industry that we can have—that is, by smelting the Bolivian and South American ores—and these smelters, unless they are adequately protected, will surely have to give up this operation because they can not compete without protection with Straits tin. For a new industry the rate which they are asking is very reasonable indeed.

Witnesses have been before this committee on the schedules for aluminum with the allegation that the aluminum industry was a monopoly that was vicious and had affected the aluminum industry adversely. The mining industry has no complaint against the aluminum industry so far as its being a monopoly is concerned, either in the purchase of its raw material or the sale of its finished metal. There is no reserve of essential raw material which is as abundant in this country or in any country as the raw material of aluminum—bauxite. There are literally billions of tons of it in the United States, and the possibility of the control of the supply of this raw material would be absurd. It could not be done. We must determine whether we are going to foster competition in the aluminum business between the existing aluminum industry in this country and foreign imports or whether we are going to foster the foreign imports and not the domestic industry in this country.

There have been developed on the Pacific coast within the last two years immense aluminum industries which will use the water power on the coast rivers, particularly the Klamath River of Oregon, in the production of aluminum in large quantities from bauxite.

The development of aluminum in this country has resulted in a reduction in prices from \$8 per pound in 1889 to 25 cents per pound price of aluminum to-day. Protection of the aluminum industry by tariff will mean lower prices, rather than higher, because, as the prior statement of prices shows, aluminum prices are dependent entirely on quantity of production, the larger the possible production in this country the lower the possible price to the consumer. This has always been the record of the industry.

It was therefore recommended that aluminum be returned to the Payne-Aldrich basis of 7 cents per pound on block and pig and 11 cents per pound on sheets and strips. However, the committee finally decided on 5 cents a pound on the block and pig and 9 cents for strips, which, in view of the state of the industry and the fact that

it represents but from 16½ to 20 per cent ad valorem, is certainly as low a rate as the industry could stand.

My time is exhausted. I shall not give the committee any general observations on the tariff.

Senator CURTIS. If you want to close now and the members of the committee want to ask you questions, of course——

Mr. SMITH. I am at the service of the committee at any time.

The CHAIRMAN. You may print any statement you desire, Mr. Smith, as a part of your remarks.

Senator WALSH. I have been, unfortunately, out of the room during your excellent presentation of the subject. Did you discuss graphite?

Mr. SMITH. Yes, sir.

Senator WALSH. If you come here on Monday I would like to ask you some questions on that subject, because I have letters from certain men protesting against this proposed duty.

(The chart and maps referred to and submitted by the witness were filed with the committee.)

DIGEST OF INFORMATION ON MINERAL TARIFFS.

[Compiled by the tariff division of the American Mining Congress.]

ANTIMONY.

Present tariff classification:

Prepared—

Schedule C.

Paragraph 144.

Rate, 25 per cent ad valorem.

Unit of measure, short ton.

Ore—

Free list.

Paragraph 396.

Unit of measure, short ton.

Tariff proposed in H. R. 7456:

Schedule 3.

Paragraph 376.

Rate, 1½ cents per pound on antimony as regulus or metal.

Imports from foreign countries:

Prewar, 7,528 (1914).

War time, 15,233 (1918).

Present (latest available data), 10,143 (1920).

Imported from:

China.

Mexico.

Labor cost per diem:

China, 45 cents.

Mexico, \$1.10.

Relative trade balance of these countries with the United States:

China—creditor.

Mexico—debtor.

Present exchange rates of these countries with the United States:

China, 1 tael=71 cents.

Mexico, 1 peso=51 cents.

Nature and extent of ore deposits:

Foreign—

China—large and cheaply mined.

Mexican antimonial lead an important source.

United States—Large resources; antimonial lead stibnite deposits not developed.

ANTIMONY—continued.

Cost of production:

Foreign, 4½ cents per pound.

United States, 14 cents per pound.

Prevailing prices:

Prewar, 7 cents per pound.

War time, 21 cents per pound.

Present (latest available data), 11 cents per pound.

Annual production in United States:

Prewar, 2,705 short tons.

War time, 24,377 short tons.

Present (latest available data), 3,400 short tons (estimated).

States in which produced: Alaska, Arizona, California, Colorado, Idaho, New Mexico, Utah.

Number of people dependent on this industry for support: 11,000.

Approximate investment in this industry: \$10,000,000.

Present condition in this industry and particular problem it is facing: Low Chinese and Mexican labor costs.

Probable relative percentage of minerals that will be consumed under current tariff:

Foreign, 40 per cent.

United States, 60 per cent.

Tariff necessary to protect industry

10 cents per pound upon antimony salts and sulphuret.

10 cents per pound on antimony as regulus or metal or matte containing antimony, or in antimonial lead.

8 cents per pound antimony content in antimonial ores.

ARSENIC.

Present tariff classification:

Free list.

Paragraph 403.

Unit of measure, short tons.

ARSENIC—continued.

Tariff proposed in H. R. 7456:

Schedule 1.

Paragraph 1.

Rate, 25 per cent ad valorem on arsenic acid, arsenious acid or white arsenic.

Imports from foreign countries:

Prewar, 1,594 (1914).

War time, 1,847 (1918).

Present (latest available data), 4,000 (1920).

Imported from:

Canada.

Mexico.

Labor cost per diem:

Canada, \$2.50.

Mexico, \$1.10.

Relative trade balance of these countries with the United States:

Canada—debtor.

Mexico—debtor.

Present exchange rates of these countries with the United States:

Canada, \$1=89 cents.

Mexico, 1 peso=51 cents.

Nature and extent of ore deposits:

Foreign—

Canada—by-product from cobalt ores.

Mexico—smelter by-product.

United States—Large resources unassociated with other minerals and also as a by-product.

Cost of production:

Foreign, 6 cents per pound.

United States, 11 cents per pound.

Prevailing prices:

Prewar, 14 cents.

War time, 12 cents.

Present (latest available data), 10 cents.

Annual production in United States:

Prewar, 4,670 (1914).

War time, 6,323 (1918).

Present (latest available data), 6,000 (1920).

States in which produced: California, Colorado, Montana, Nevada, Utah, Washington.

Number of people dependent on this industry for support: 1,500.

Approximate investment in this industry: \$5,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Operating, but not extending, due to lower foreign costs jeopardizing investment.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 25 per cent.

United States, 75 per cent.

Tariff necessary to protect industry: 5 cents per pound of As_2O_3 (white arsenic).

ASBESTOS.

Present tariff classification:

Manufactured—

Schedule N.

Paragraph 367.

Rate, 20 per cent ad valorem.

Unit of measure, short tons.

Unmanufactured—

Free list.

Paragraph 406.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 14.

Paragraph 1401.

Rate, paper, millboard made of long fiber, electrical papers, not exceeding 0.05 inch in thickness, 8 cents per pound; made of other fibers, 1½ cents per pound; sheets and plates, 1–3½ cents per square foot; wick and rope, 18–56 cents per pound; yarn, 32 cents—\$1.68 per pound; textile fabrics, 42 cents—\$1.40 per pound; all other manufactures, 20 per cent ad valorem.

Imports from foreign countries:

Prewar, none.

War time, 134,108 (1917).

Present (latest data), 135,861 (1919).

Imported from:

Canada.

South Africa.

England (manufactured).

Labor cost per diem:

Canada, \$2.50.

Africa, \$0.50.

Relative trade balance of these countries with the United States: Canada—debtor.

Present exchange rates of these countries with the United States: Canada, \$1=89 cents.

Nature and extent of ore deposits:

Foreign—

Canada—Large low-grade deposits extensively developed.

South Africa—Both high and low grade deposits not so well developed.

United States—Large but undeveloped, need large capital investment.

Cost of production:

Foreign, 25 cents per pound.

United States, 37 cents per pound.

Prevailing prices:

Prewar, \$300 per ton (1914).

War time, \$1,800 per ton (1917).

Present (latest available data), \$2,000 per ton (1920).

Annual production in United States:

Prewar, 1,479.

War time, 1,683.

Present (latest available data), 1,500.

States in which produced: Arizona, California, Georgia, Maryland, New Mexico, Oregon, Vermont.

ASBESTOS—continued.

Number of people dependent on this industry for support: 100,000 (including manufactured).

Approximate investment in this industry: \$25,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Protection of manufacturer necessary to develop ore deposits for this market. No tariff asked on raw asbestos.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 95 per cent raw, 25 per cent manufactured.

United States, 5 per cent raw, 75 per cent manufactured.

Tariff necessary to protect industry:

Paper: 5 cents per pound, paper millboard and articles manufactured therefrom; 10 cents per pound, paper millboard manufactured from long-fiber asbestos, and electrical papers not exceeding 0.005 inch in thickness.

Sheets: 1½ cents per square foot, asbestos in plates, with hydraulic cement not over ¼ inch in thickness; 2½ cents per square foot over ¼ inch but not over ½ inch; 5 cents per square foot over ½ inch but not over ¾ inch; 6 cents per square foot corrugated or otherwise not flat. 50 per cent ad valorem in addition.

BARYTES.

Present tariff classification:

Schedule A.

Paragraph 51.

Rate, 15–20 per cent ad valorem.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 1.

Paragraph 64.

Rate, \$4 per ton on crude barytes ore; \$7.50 per ton ground or manufactured; 1 cent per pound precipitated barium sulphate.

Imports from foreign countries:

Prewar, 24,243 (1914).

War time, none.

Present (latest available data), 10,000 (estimated, 1920).

Imported from: Germany.

Labor cost per diem: Germany, 78 cents.

Relative trade balance of these countries with the United States: Germany—debtor.

Present exchange rates of these countries with the United States: Germany, 1 mark=1½ cents.

BARYTES—continued.

Nature and extent of ore deposits:

Foreign—German deposits large.

United States—Large deposits both developed and undeveloped in South and Middle West.

Cost of production:

Foreign, \$1.50–\$3.75.

United States, \$7.97.

Prevailing prices:

Prewar, \$3.37 f. o. b. mine.

War time, \$8.02 f. o. b. mine.

Present (latest available data), \$10–\$11.25 f. o. b. mine.

Annual production in United States:

Prewar, 52,747 (1914).

War time, 155,368 (1918).

Present (latest available data), 180,000 (1920).

States in which produced: Georgia, Illinois, Maryland, Missouri, North Carolina, South Carolina, Tennessee, Virginia (18 other States, making 26 in all).

Number of people dependent on this industry for support: 22,000.

Approximate investment in this industry: \$15,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Operating but not extending. Investment jeopardized by low German costs and unfair German competition.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 20 per cent.

United States, 80 per cent.

Tariff necessary to protect industry:

Barytes, crude, ½ cent per pound.

Barytes, ground, 1½ cents per pound.

Barium sulphide, 1½ cents per pound.

Barium carbonate, 2 cents per pound.

Barium binocide, 2 cents per pound.

Barium sulphate, 2 cents per pound.

Barium chloride, 2½ cents per pound.

Barium lithopone, 2½ cents per pound.

Barium nitrate, 5 cents per pound.

Barium peroxide, 8 cents per pound.

All other barium compounds, 25 per cent ad valorem.

BISMUTH.

Present tariff classification:

Free list.

Paragraph 418.

Unit of measure, long tons.

Tariff proposed in H. R. 7456:

Free list.

Paragraph 1523.

Imports from foreign countries:

Prewar, 133,190 (1914).

War time, 75,611 (1918).

Present (latest available data), 72,771 (1920).

CHROMITE—continued.

Tariff proposed in H. R. 7456:

Free list.

Paragraph 1544.

Imports from foreign countries:

Prewar, 80,736.

War time, 100,142.

Present (latest data), 61,404.

Imported from:

New Caledonia.

Rhodesia.

Canada.

Costa Rica.

Cuba.

Labor cost per diem:

New Caledonia, convict labor.

Rhodesia, 75 cents.

Canada, \$2.50.

Costa Rica, \$1.25.

Cuba, \$2.

Relative trade balance of these countries with the United States:

New Caledonia—creditor.

Rhodesia—creditor.

Canada—debtor.

Costa Rica—creditor.

Cuba—creditor.

Present exchange rates of these countries with the United States:

New Caledonia, 1 franc=7 cents.

Rhodesia, £1=\$3.83.

Canada, \$1=89 cents.

Nature and extent of ore deposits:

Foreign—

Rhodesia and Caledonia, extensive.

Canada, scattered.

United States—Extensive but undeveloped.

Cost of production:

Foreign, \$14 per ton.

United States, \$45 per ton.

Prevailing prices:

Prewar, \$14.75.

War time, \$47.99.

Present (latest available data), \$37.50-\$42.50.

Annual production in United States:

Prewar, 591 (long tons).

War time, 82,430.

Present (latest available data), 3,900.

States in which produced: California, Colorado, Maryland, Oregon, Pennsylvania, Wyoming.

Number of people dependent on this industry for support: 2,500.

Approximate investment in this industry: \$4,500,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Completely collapsed.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 60 per cent.

United States, 40 per cent.

CHROMITE—continued

Tariff necessary to protect industry:

Ore, 60 cents per unit Cr₂O₃.

Refractories, 65 cents per unit.

Ferrochrome, 11½ cents per unit Cr content.

Salts, 90 cents per unit Cr.

FELDSPAR.

Present tariff classification:

Not listed.

Rate, free.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 207.

Rate, \$1 per ton; clays or earthenware specially provided for.

Imports from foreign countries:

Prewar, 18,060 (1914).

War time, 19,488 (1916).

Present (latest available data) (1918).

Imported from: Canada.

Labor cost per diem: Canada, \$2.50.

Relative trade balance of these countries with the United States: Canada—debtor.

Present exchange rates of these countries with the United States: Canada, 1 franc=7 cents.

Nature and extent of ore deposits:

Foreign—Extensive deposits.

United States—Large, valuable deposits; should be more extensively developed.

Cost of production:

Foreign, \$3.25.

United States, \$5.15.

Prevailing prices:

Prewar, \$3.46 (1915).

War time, \$3.40 (1917).

Present (latest available data) (1918).

Annual production in United States:

Prewar, none.

War time, 126,715 long tons.

Present (latest available data) long tons.

States in which produced: Connecticut, Georgia, Maine, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Vermont, Virginia.

Number of people dependent on this industry for support: 7,500.

Approximate investment in this industry: \$5,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Large deposits but primitive operations and instability of market.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 20 per cent.

United States, 80 per cent.

FELDSPAR—continued.

Tariff necessary to protect industry: \$2 per ton crude; \$6 per ton ground or manufactured.

FLUORSPAR.

Present tariff classification:

Not listed.

Rate, free.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 207.

Rate, \$5 per ton: *Provided, That 1 year after the passage of this act duty on fluorspar shall be \$4 per ton.*

Imports from foreign countries:

Prewar, 22,682 (1913).

War time, 13,616 (1917).

Present (latest available data), 20,000 (1920).

Imported from:

England.

Canada.

Labor cost per diem:

England, \$2.

Canada, \$2.50.

Relative trade balance of these countries with the United States:

England—debtor.

Canada—debtor.

Present exchange rates of these countries with the United States:

England, £1=\$3.83.

Canada, \$1=89 cents.

Nature and extent of ore deposits:

Foreign—Large tonnage comes in as ballast.

United States—Large tonnage, good grade, widely distributed. Superior to foreign.

Cost of production:

Foreign, \$7.

United States, \$13.50.

Prevailing prices:

Prewar, \$6.37 (1913).

War time, \$10.45 (1917).

Present (latest available data), \$25 (1920).

Annual production in United States:

Prewar, 115,580 short tons (1913).

War time, 218,828 short tons (1917).

Present (latest data), 286,000 short tons (1920).

States in which produced: Arizona, Colorado, Illinois, Kentucky, Nevada, New Hampshire, New Mexico, Tennessee, Utah, Washington.

Number of people dependent on this industry for support: 8,500.

Approximate investment in this industry: \$16,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Large development, but could be greatly increased if protected.

FLUORSPAR—continued.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 10 per cent.

United States, 90 per cent.

Tariff necessary to protect industry: \$6 per ton on grade of 80 per cent CaF₂ or better.

GRAPHITE.

Present tariff classification:

Free list.

Paragraph 579.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 211.

Rate, 10 per cent ad valorem.

Imports from foreign countries:

Prewar, 21,990 (1914).

War time, 19,498 (1918).

Present (latest available data), 32,500 (1920).

Imported from:

Ceylon.

Austria.

Madagascar.

Labor cost per diem:

Ceylon, 24 cents.

Austria, 42 cents.

Madagascar, 32 cents.

Relative trade balance of these countries with the United States:

Ceylon—creditor.

Austria—debtor.

Madagascar—creditor.

Present exchange rates of these countries with the United States:

Ceylon, £1=\$3.38.

Austria, 1 krone=½ cent.

Madagascar, 1 franc=74 cents.

Nature and extent of ore deposits:

Foreign—Many years of development of large deposits gives them great advantage.

United States—Large reserves of all grades; development primitive; needs stabilized market.

Cost of production:

Foreign, 6 cents per pound.

United States, 10 cents per pound.

Prevailing prices:

Prewar, 6½ to 8 cents per pound.

War time, 10 to 17½ cents per pound.

Present (latest available data), 4 cents per pound (Madagascar flake).

Annual production in United States:

Prewar, 5,000 tons.

War time, 13,593 (1916).

Present (latest available data), 167,879 (1917).

States in which produced: Alabama, Colorado, Montana, New York, Pennsylvania, Texas.

Number of people dependent on this industry for support: 2,500.

GRAPHITE—continued.

Approximate investment in this industry: \$7,500,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Only two mines in the United States in operation and each of these on part time.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 45 per cent.

United States, 55 per cent.

Tariff necessary to protect industry:

Ore under 50 per cent graphite content, 1 cent per pound.

Ore over 50 per cent graphite content, 2 cents per pound.

Lump and chip, 3 cents per pound.

Flake graphitic content, 6 cents per pound.

Manufactured graphite products, graphitic content, 5 cents per pound and 20 per cent ad valorem.

GYPSUM.

Present tariff classification:

Schedule B.

Paragraph 74.

Rate, 30 cents per ton.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 205.

Rate, crude, 25 cents per ton; ground or calcined, \$1.40 per ton; white Portland cement, 8 cents per hundredweight; Keene's cement, \$3.50-\$14 per ton.

Imports from foreign countries:

Prewar, 369,214 (1914).

War time, 240,269 (1917).

Present (latest available data), 300,000 (estimated 1920).

Imported from Canada.

Labor cost per diem: Canada, \$2.50.

Relative trade balance of these countries with the United States: Canada—debtor.

Present exchange rates of these countries with the United States: Canada, \$1=89 cents.

Nature and extent of ore deposits:

Foreign—Old, well-established deposits, well developed.

United States—Resources vast; development progressing rapidly.

Cost of production:

Foreign, \$1.

United States, \$2.

Prevailing prices:

Prewar, \$1.75.

War time, \$2.74.

Present (latest available data), \$2.15.

Annual production in United States:

Prewar, 2,476,465 (1914).

War time, 2,696,226 (1917).

Present (latest available data), 2,340,000 (1919).

GYPSUM—continued.

States in which produced: Alaska, California, Illinois, Iowa, Michigan, Minnesota, Nevada, New York, Oklahoma, Utah, Washington, Wisconsin.

Number of people dependent on this industry for support: 8,000.

Approximate investment in this industry: \$17,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Operations expanded greatly during the war; need protection to continue.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 10 per cent.

United States, 90 per cent.

Tariff necessary to protect industry:

Crude gypsum, 50 cents per ton. Compensatory duties on advanced stages of manufactures.

KAOLIN (WHITE CHINA CLAY).

Present tariff classification:

Schedule B.

Paragraph 76.

Rate, \$1.25 per ton.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 207.

Rate, \$2.50 per ton.

Imports from foreign countries:

Prewar, 328,038 (1914).

War time, 241,029 (1917).

Present (latest available data), 180,591 (1919).

Imported from: England.

Labor cost per diem: England, \$2.

Relative trade balance of these countries with the United States: England—debtor.

Present exchange rates of these countries with the United States: England, £1=\$3.83.

Nature and extent of ore deposits:

Foreign—Old, established development; high-grade material.

United States—Immense reserves of high-grade material; development growing rapidly.

Cost of production:

Foreign, \$10.

United States, \$16.

Prevailing prices:

Prewar, \$5.88 (1914).

War time, \$5.46 (1917).

Present (latest available data), \$10.00 (1919).

Annual production in United States:

Prewar, 34,191 (1914).

War time, 31,885 (1917).

Present (latest available data), 32,000 (1919).

KAOLIN—continued.

ates in which produced: California, Delaware, Florida, Georgia, Missouri, North Carolina, Pennsylvania, South Carolina, Texas, Utah.

umber of people dependent on this industry for support: 10,000.

pproximate investment in this industry: \$12,000,000.

esent condition in this industry and particular problem it is facing wherefore it needs tariff: Business had large development recent years. Protection will give opportunity to use better refining methods and develop industry. Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 50 per cent.

United States, 50 per cent.

iff necessary to protect industry: \$9 per ton.

LEAD.

esent tariff classification:

Schedule C.

Paragraphs 152 and 153.

Rate, ore $\frac{1}{2}$ cent per pound, metal 25 per cent ad valorem.

iff proposed in H. R. 7456:

Schedule 3.

Paragraph 388.

Rate, lead in ores and mattes, $1\frac{1}{2}$ cents per pound; bullion, pigs, bars, scrap, etc., $2\frac{1}{2}$ cents per pound; sheets, pipe, shot, wire, etc., $2\frac{3}{4}$ cents per pound.

Imports from foreign countries:

Prewar, 11,452 (average, 1910-1915).

War time, 7,781 (average, 1916-1918).

Present (latest data), 158,802 (yearly rate Sept.-Dec., 1920).

ported from:

Mexico.

Spain.

Australia.

Germany.

Canada.

South America.

bor cost per diem:

Mexico, \$1.10.

Spain, 98 cents.

Germany, 78 cents.

Canada, \$2.50.

South America, \$1.25 (average).

lative trade balance of these countries with the United States:

Mexico—debtor.

Spain—debtor.

Germany—debtor.

Canada—debtor.

South America—creditor.

ent exchange rates of these countries with the United States:

Mexico, 1 peso=51 cents.

Spain, 1 peseta=14 cents.

Germany, 1 mark=1 cent.

Canada, \$1=98 cents.

Australia, £1=\$3.83.

LEAD—continued.

Nature and extent of ore deposits:

Foreign—Old, well-established industry.

United States—Mammoth deposits, well developed.

Cost of production:

Foreign, 4 cents pound.

United States, 6 cents pound.

Prevailing prices:

Prewar, \$4.37 (average, 1910-1915).

War time, \$7.69 (average, 1916-1918).

Present (latest data), \$4 (Feb. 25, 1921).

Annual production in United States:

Prewar, 457,500 (average, 1910-1915).

War time, 567,300 (average, 1916-1918).

Present (latest data), 430,000 (yearly rate).

States in which produced: Arizona, Arkansas, California, Colorado, Idaho, Illinois, Kansas, Missouri, Montana, New Mexico, Oklahoma, Tennessee, Utah, Washington, Wisconsin.

Number of people dependent on this industry for support: 300,000.

Approximate investment in this industry: \$400,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: 40-50 per cent of properties closed down. Practically all operations solely to keep organization together in hope of relief. Low foreign wage and ocean freight.

Probable percentage of mineral that will be consumed under correct tariff:

Foreign, 20 per cent.

United States, 80 per cent.

Tariff necessary to protect industry:

2 cents per pound on lead in ores, copper matte, etc.

$2\frac{1}{2}$ cents per pound on dross, bullion, pigs, bars, etc.

$2\frac{1}{2}$ cents per pound on sheets, pipe, shot, glazier's wire, etc.

3 cents per pound on white lead pigments.

LIME.

Present tariff classification:

Schedule B.

Paragraph 73.

Rate, 5 per cent ad valorem.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 204.

Rate, limestone, 5 cents per hundredweight; lime, 10 cents per hundredweight; hydrated lime, 12 cents per hundredweight.

Imports from foreign countries:

Prewar, 3,455 (1914).

War time, 7,353 (1917).

Present (latest available data), 6,650 (1918).

LIME—continued.

Imported from: Canada.
 Labor cost per diem: Canada, \$2.50.
 Relative trade balance of these countries with the United States: Canada—debtor.
 Present exchange rates with the United States: Canada, \$1=89 cents.
 Nature and extent of ore deposits:
 Foreign—Common mineral, widely distributed.
 United States—Common mineral, widely distributed.
 Cost of production:
 Foreign, \$6.50 ton.
 United States, \$8 ton.
 Prevailing prices:
 Prewar, \$3.92 (1914).
 War time, \$6.29 (1917).
 Present (latest available data), \$8.36 (1918).
 Annual production in United States:
 Prewar, 3,380,928 (1914).
 War time, 3,786,364 (1917).
 Present (latest available data), 3,206,016 (1918).
 States in which produced: Arizona California, Colorado, Kansas, Massachusetts, Michigan, Montana, New Mexico, Ohio, Pennsylvania, Tennessee, Washington, West Virginia, and others.
 Number of people dependent on this industry for support, 16,000.
 Approximate investment in this industry, \$30,000,000.
 Present condition in this industry and particular problem it is facing wherefore it needs tariff: Canadian competition offers special problem to border States industry to be corrected by tariff.
 Probable relative percentage of mineral that will be consumed under correct tariff:
 Foreign, $\frac{1}{4}$ per cent.
 United States, 99 $\frac{1}{4}$ per cent.
 Tariff necessary to protect industry:
 Quicklime, bulk, 30 cents per 100 pounds; 50 cents per 100 pounds on quicklime in cooperage.
 Hydrated, 40 cents per 100 pounds.
 Pulverized, \$1 per ton bulk, \$1.50 sacked.

MANGANESE.

Present tariff classification:
 Free list.
 Paragraph 540.
 Unit of measure, short tons.
Tariff proposed in H. R. 7456:
 Schedule 3.
 Paragraph 302.
 Rate 1 cent per pound on metallic manganese contained in ore; 2 $\frac{1}{2}$ cents per pound on manganese contained in ferromanganese.

MANGANESE—continued

Imports from foreign countries:
 Prewar, 283,294.
 War time, 491,303.
 Present (latest available data), 333,344.
 Imported from:
 India.
 Russia.
 Brazil.
 Cuba.
 Labor cost per diem:
 India, 24 cents.
 Brazil, \$1.
 Cuba, \$1.25.
 Relative trade balance of these countries with the United States:
 India—creditor.
 Russia—debtor.
 Brazil—creditor.
 Cuba—creditor.
 Present exchange rates of these countries with the United States:
 India, £1=\$3.83.
 Brazil, 1 milreis=14 cents.
 Cuba, 1 peso=\$1.
 Nature and extent of ore deposits:
 Foreign—Old established, undeveloped deposits.
 United States—Immense new development just begun, increased 3,000 per cent during war.
 Cost of production:
 Foreign, \$12 per ton.
 United States, \$35 per ton.
 Prevailing prices:
 Prewar, \$10.39.
 War time, \$35.
 Present (latest available data), \$35.
 Annual production in United States:
 Prewar, 2,635.
 War time, 305,869.
 Present (latest available data), 305,869 (1919).
 States in which produced: Arizona, Kansas, California, Colorado, Minnesota, Montana, Nevada, Mexico, Oregon, Tennessee, Utah, Vermont, Virginia, West Virginia.
 Number of people dependent on this industry for support: 7,500.
 Approximate investment in this industry: \$15,000,000.
 Present condition in this industry and particular problem it is facing wherefore it needs tariff: Operating at 10 per cent of capacity. Full production under protection enormous.
 Probable relative percentage of mineral that will be consumed under correct tariff:
 Foreign, 55 per cent.
 United States, 45 per cent.

MANGANESE—continued.

If necessary to protect industry:
 Ores, 40 cents per unit of manganese content.
 Ferro, \$1 per unit of manganese content.

MAGNESITE.

Present tariff classification:
 Schedule B and free list.
 Paragraphs 71 and 539.
 Rate, 10 per cent ad valorem.
 Unit of measure, short tons.
 Tariff proposed in H. R. 7456:
 Schedule 1.
 Paragraph 47.
 Rate, crude or ground, $\frac{3}{4}$ cent per pound; dead burned or grained.
 Imports from foreign countries:
 Prewar, 135,170.
 War time, 24,481.
 Present (latest available data), 15,852.
 Imported from:
 Austria.
 Canada.
 Greece.
 Mexico.
 Venezuela.
 Labor cost per diem:
 Austria, \$0.62.
 Canada, \$2.60.
 Greece, \$1.85.
 Mexico, \$1.10.
 Venezuela, \$1.25.
 Relative trade balance of these countries with the United States:
 Austria—debtor.
 Canada—debtor.
 Greece—debtor.
 Mexico—debtor.
 Venezuela—debtor.
 Present exchange rates of these countries with the United States:
 Austria, 1 krone= $\frac{1}{2}$ cent.
 Canada, \$1=89 cents.
 Greece, 1 drachma=12 cents.
 Mexico, 1 peso=51 cents.
 Nature and extent of ore deposits:
 Foreign—Large deposits in Austria; principal source of imports.
 United States—Large high-grade deposits in California and Washington. Immense resources.
 Cost of production:
 Foreign, \$10–\$12.50 per ton.
 United States, \$18–\$24 per ton.
 Prevailing prices:
 Prewar, \$15.20–\$15.72.
 War time, \$49.10.
 Present (latest data), \$30–\$35 (crude), \$50–\$60 (talc).
 Annual production in United States:
 Prewar, 11,293.
 War time, 231,605.
 Present (latest data), 164,696.
 States in which produced: California, Washington.

MAGNESITE—continued.

Number of people dependent on this industry for support: 3,000.
 Approximate investment in this industry: \$13,000,000.
 Present condition in this industry and particular problem it is facing wherefore it needs tariff: Completely shut down, due to foreign competition.
 Probable relative percentage of mineral that will be consumed under correct tariff:
 Foreign, 20 per cent.
 United States, 80 per cent.
 Tariff necessary to protect industry:
 Ore, $\frac{1}{2}$ cent per pound.
 Calcined, $\frac{3}{4}$ cent per pound.
 Brick, $\frac{3}{4}$ cent per pound.

MARBLE.

Present tariff classification:
 Schedule B.
 Paragraphs 97 and 98.
 Rate, 50 cents per cubic foot.
 Unit of measure, blocks, cubic feet; slabs, linear feet.
 Tariff proposed in H. R. 7456:
 Schedule 2.
 Paragraph 233.
 Rate, 40 per cent ad valorem.
 Imports from foreign countries:
 Prewar, blocks, 643,446 cubic feet (1913); slabs, 275,888 linear feet.
 War time, blocks, 267,250 cubic feet (1917); slabs, 124,935 linear feet.
 Present (latest data), blocks, 479,691 cubic feet (1920).
 Imported from:
 Italy.
 France.
 Mexico.
 Belgium.
 Labor cost per diem:
 Italy, \$1.76.
 France, \$1.12.
 Mexico, \$1.10.
 Belgium, \$1.80.
 Relative trade balance of these countries with the United States:
 Italy—debtor.
 France—debtor.
 Mexico—debtor.
 Belgium—debtor.
 Present exchange rates of these countries with the United States:
 Italy, 1 lira=4 cents.
 France, 1 franc=7 cents.
 Mexico, 1 peso=51 cents.
 Belgium, 1 franc=7 cents.
 Nature and extent of ore deposits:
 Foreign—Italy main source of imports; deposits large and well developed.
 United States—Deposits large and high grade; can successfully compete with Italian if protected.

MARBLE—Continued.**Cost of production:**

Foreign, \$1.50 per cubic foot.

United States, \$2.83 per cubic foot.

Prevailing prices:

Prewar, \$2.20 per cubic foot.

War time, \$3.85 per cubic foot.

Present (latest available data), \$3 per cubic foot.

Annual production in United States:

Prewar, 3,461,997 cubic feet (1914).

War time, 3,575,670 cubic feet (1918).

Present (latest data), 4,678,000 cubic feet (1920).

States in which produced: Alabama, Alaska, Arizona, Arkansas, California, Colorado, Georgia, Maryland, Massachusetts, Michigan, Missouri, New Mexico, New York, North Carolina, Oregon, Pennsylvania, Tennessee, Texas, Vermont, Virginia, Washington.

Number of people dependent on this industry for support: 15,000.

Approximate investment in this industry, \$32,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Operating, but needs protection to justify increased investment by assured continuous operation.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 15 per cent.

United States, 85 per cent.

Tariff necessary to protect industry:

Marble, onyx, and breccias and limestones susceptible of polish, in blocks, \$1 per cubic foot.

Slabs less than 1 inch in thickness, 8 cents per linear foot; over 1 inch, 10 cents per linear foot; over 1½ inches, 12½ cents per linear foot; over 2 inches, \$1 per cubic foot; 2 cents per foot additional if rubbed.

Finished marble, 75 per cent ad valorem.

MICA.**Present tariff classification:**

Schedule B.

Paragraph 77.

Rate, 4 cents per pound and 25 per cent ad valorem.

Unit of measure, pounds.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 208.

Rate, unmanufactured or rough trimmed, 4 cents per pound and 17 per cent ad valorem; cut, trimmed, and manufactured, 10 cents per pound and 17 per cent ad valorem; ground, 4 cents per pound and 20 per cent ad valorem.

MICA—continued.**Imports from foreign countries:**

Prewar, sheet, 260,880 pounds: scrap and ground, 404,848 pounds.

War time, sheet, 741,429 pounds: scrap and ground, 11,587 pounds.

Present (latest available data), sheet, 1,375,927 pounds: scrap and ground, 62 pounds.

Imported from:

India.

Canada.

Germany.

Brazil.

Labor cost per diem:

India, 24 cents.

Canada, \$2.50.

Germany, \$0.78.

Brazil, \$1.25.

Relative trade balance of these countries with the United States:

India—creditor.

Canada—debtor.

Germany—debtor.

Brazil—creditor.

Present exchange rates of these countries with the United States:

India, £1=\$3.83.

Canada, \$1=89 cents.

Germany, 1 mark=1 cent.

Brazil, 1 milreis=14 cents.

Nature and extent of ore deposits:

Foreign—Industry old and well developed; deposits large. Low-paid labor in India.

United States—Large, both high and medium grades. Development primitive; with protection can be made great industry.

Cost of production:

Foreign, sheet, 15 cents per pound; scrap, \$25 per ton.

United States, sheet, 40 cents per pound; scrap, \$100 per ton.

Prevailing prices:

Prewar, sheet, 25 cents per pound; scrap, \$82 per ton.

War time, sheet, 60 cents per pound; scrap, \$122 per ton.

Present (latest available data), sheet, 40 cents per pound; scrap, \$100 per ton.

Annual production in United States:

Prewar, sheet, 556,933 pounds: scrap, 3,730 short tons.

War time, sheet, 1,644,200 pounds: scrap, 2,292 short tons.

Present (latest available data), sheet, 1,500,000 pounds; scrap, 1,500 short tons.

States in which produced: Alabama, Colorado, Georgia, Idaho, New Hampshire, New Mexico, North Carolina, South Carolina, South Dakota, Virginia.

MICA—continued.

Number of people dependent on this industry for support: 5,000.
Approximate investment in this industry: \$5,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Sustained production, growing despite handicap of foreign competition. Protection imperative to interest investment.
Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 35 per cent.

United States, 65 per cent.

Tariff necessary to protect industry:

Crude, sheet, 30 cents per pound and 60 per cent ad valorem.

Cut or knife trimmed and all manufactured or manufactures thereof, 50 cents per pound and 60 per cent ad valorem.

Phonograph disks, 20 cents each and 60 per cent ad valorem.

Scrap, 2 cents per pound and 25 per cent ad valorem.

Ground, 4 cents per pound and 30 per cent ad valorem.

MOLYBDENUM.

Present tariff classification:

Schedule C.

Paragraph 102.

Rate, 20-25 per cent ad valorem on ferromolybdenum.

Tariff proposed in H. R. 7456:

Schedule S.

Paragraph 302.

Rate, ore or concentrates, 75 cents per pound on metallic molybdenum contained therein; metallic molybdenum compounds and alloys, \$1.25 per pound on metallic molybdenum contained.

Imports from foreign countries:

War time, 178,222 pounds.

Present (latest data), 106,743 pounds.

Imported from:

Canada.

Australia.

Norway.

Japan.

Peru.

Labor cost per diem:

Canada, \$3.50.

Australia, \$3.

Norway, \$1.

Japan, 67 cents.

Peru, \$1.25.

Relative trade balance of these countries with the United States:

Canada—debtor.

Australia—debtor.

Norway—debtor.

Japan—creditor.

Peru—creditor.

MOLYBDENUM—continued.

Present exchange rates of these countries with the United States:

Canada, \$1=89 cents.

Australia, £1=\$3.83.

Norway, 1 krone=18 cents.

Japan, 1 yen=49 cents.

Peru, 1 libra=\$4.73.

Nature and extent of ore deposits:

Foreign—Norway deposits large; reduced by hydroelectric power.

United States—Largest and most important deposits in the world.

Cost of production:

Foreign, sheet, 50 cents per pound MoS_2 .

United States, sheet, 95 cents per pound MoS_2 .

Prevailing prices:

Prewar, none.

War time, concentrates, \$1.45 per pound MoS_2 ; ferromolybdenum, \$4.50 (1917).

Present (latest available data), concentrates, 75 cents per pound MoS_2 ; ferromolybdenum \$2.25 (1920).

Annual production in United States:

Prewar, 1,297 pounds MoS_2 .

War time, 861,637 pounds MoS_2 .

States in which produced: Alaska, Arizona, Colorado, Maine, New Mexico, Texas, and Wyoming.

Number of people dependent on this industry for support: 1,000.

Approximate investment in this industry: \$6,500,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: While in expensive development stage and conducting educational campaign to increase use, needs protection from foreign low costs.
Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 20 per cent.

United States, 80 per cent.

Tariff necessary to protect industry: 50 cents per pound of MoS_2 in ores and concentrates; \$1 per pound of Mo contained in ferromolybdenum, calcium molybdate, and all other alloys and compounds of molybdenum, including molybdenum stick.

MONAZITE AND THORIUM.

Present tariff classification:

Schedule C.

Paragraph 154.

Rate, 25 per cent ad valorem.

Unit of measure, pounds.

Tariff proposed in H. R. 7456:

Free list.

Paragraph 1616.

MONAZITE AND THORIUM—continued.

Imports from foreign countries:

Prewar, monazite, 1,873,971 (1915);
thorium, 101,927.

War time, monazite, 5,828,270 (1917);
thorium, 1,188.

Present (latest available data), mon-
azite, 632,568(1919); thorium, 3,307.

Imported from:

Brazil.

India.

Labor cost per diem:

Brazil, \$1.25.

India, 24 cents.

Relative trade balance of these countries
with the United States:

Brazil—creditor.

India—creditor.

Present exchange rates of these countries
with the United States:

Brazil, 1 milreis=14 cents.

India, 1 rupee=28½ cents.

Nature and extent of ore deposits:

Foreign—Deposits of Brazil and India
in large beds of seacoast sand, so
labor cost is especially low.

United States—Deposits large and
high grade, but must be concen-
trated.

Cost of production:

Foreign, monazite, 6 cents per
pound; thorium, \$4.

United States, monazite, 21 cents per
pound; thorium, \$7.

Prevailing prices:

Prewar, monazite, 12 cents per
pound (1905); thorium, \$6.53.

War time, monazite, 6½ cents per
pound (1917); thorium, \$8.

Present (latest available data), mon-
azite, 7½ cents per pound (1919);
thorium, \$3.75.

Annual production in United States:

Prewar, 1,344,418 (1905).

War time, 22,000 (1917).

Present, none (1920).

States in which produced: Florida, Idaho,
North Carolina, South Carolina.

Number of people dependent on this in-
dustry for support: 250.

Approximate investment in this indus-
try: \$50,000.

Present condition in this industry and
particular problem it is facing where-
fore it needs tariff: Removal of pro-
tection in 1909 and 1913 ruined this in-
dustry; can be again built up under
protection.

Probable relative percentage of mineral
that will be consumed under correct
tariff:

Foreign, 25 per cent.

United States, 75 per cent.

MONAZITE AND THORIUM—continued:

Tariff necessary to protect industry:

15 cents per pound on monazite and
\$3 per pound on thorium nitrate.

\$2 per pound on gas mantle scrap.

PYRITES.

Present tariff classification:

Free list.

Paragraph 617.

Unit of measure, long tons.

Tariff proposed in H. R. 7456:

Free list.

Paragraph 1663.

Imports from foreign countries:

Prewar, 1,026,617.

War time, 496,792.

Present (latest data), 388,973.

Imported from:

Spain.

Canada.

Portugal.

Labor cost per diem:

Spain, 78 cents.

Canada, \$3.

Portugal, 85 cents.

Relative trade balance of these countries
with the United States:

Spain—debtor.

Canada—debtor.

Portugal—debtor.

Present exchange rates with United
States:

Spain, 1 peseta=14 cents.

Canada, \$1=89 cents.

Portugal, 1 escudo=21 cents.

Nature and extent of ore deposits:

Foreign—Spanish deposits principal
competitor, mined as by-product
of copper and sold regardless of
mining cost.

United States—Large and high
grade, with valuable by-product
capable of immense expansion
and development.

Cost of production:

Foreign—Spanish cost can be es-
timated at zero, as they sell for cost
of freight.

United States—11 cents per unit.

Prevailing prices:

Prewar, 9½ cents per unit of sulphur

War time, 25 cents to 33 cents.

Present (latest available data), 12 to
16 cents.

Annual production in United States:

Prewar, 336,662.

War time, 460,494.

Present (latest available data)
380,000.

States in which produced: California,
Georgia, New York, North Carolina,
South Carolina, Utah, Virginia.

PYRITES—continued.

Number of people dependent on this industry for support: 5,000.
 Approximate investment in this industry: 10,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Spanish mines will dump pyrites here for cost of freight as ballast. Protection against this dumping urgent.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 30 per cent.

United States, 70 per cent.

Tariff necessary to protect industry: 10 cents per unit of sulphur contained in cuprous, cuprififerous, or iron pyrites in recoverable quantity.

PUMICE,

Present tariff classification:

Schedule B.

Paragraph 75.

Rates, 5 per cent ad valorem.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 206.

Rate—Valued at less than \$15 per ton, 0.2 cents per pound; valued above \$15 per ton, 0.3 cents per pound; manufactured, 0.55 cents per pound; manufactures of pumice stone, 26 per cent ad valorem.

Imports from foreign countries:

Prewar, unmanufactured, 5,558 (1913).

War time, unmanufactured, 3,900 (1918).

Imported from: Italy.

Labor cost per diem: Italy, \$1.76.

Relative trade balance of these countries with the United States: Italy—debtor.

Present exchange rates of these countries with the United States: Italy, 1 lira=4 cents.

Nature and extent of ore deposits:

Foreign—Italian pumice a lava deposit that must be ground.

United States—Both ash and lump pumice of United States satisfactorily replace Italian material.

Cost of production:

Foreign, \$13.50 per ton.

United States, \$39.94 f. o. b. New York.

Prevailing prices:

Prewar, \$8 (1913) at Italian ports.

War time, not available.

Present (latest available data), \$13.50 (1920) at Italian ports.

PUMICE—continued.

Annual production in United States:

Prewar, 27,591 tons (1914).

War time, 35,293 tons (1917).

Present (latest available data).

States in which produced: Arizona, California, Colorado, Idaho, Kansas, Nebraska, Nevada, New Mexico, Oregon, Utah, Washington.

Number of people dependent on this industry for support: 1,200.

Approximate investment in this industry: \$5,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Sale of domestic pumice made possible by war. If industry is protected can continue to supply domestic markets ultimately at lower cost than Italian.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 25 per cent.

United States, 75 per cent.

Tariff necessary to protect industry: Unmanufactured pumice stone, manufactured pumice stone, or manufactures of pumice, 1 cent per pound.

POTASH.

Present tariff classification:

Free list.

Paragraph 580.

Unit of measure, short tons.

Tariff proposed in H. R. 7456:

Free list.

Paragraph 1635.

Rate, 2½ cents per pound on contained potassium oxide for a period of 2 years; 2 cents per pound for the third year; 1½ cents per pound for the fourth year; 1 cent per pound for the fifth year; thereafter, free.

Imports from foreign countries:

Prewar, 207,089.

War time, 7,957.

Present (latest data), 40,629.

Imported from:

Germany.

France.

Labor cost per diem:

Germany, 78 cents.

France, \$1.12.

Relative trade balance of these countries with the United States:

Germany—debtor.

France—debtor.

Present exchange rates of these countries with the United States:

Germany, 1 mark=1 cent.

France, 1 franc=7 cents.

POTASH—continued.

Nature and extent of ore deposits:

Foreign—German potash has monopolized all markets for years and is now trying to regain its domination.

United States—Reserves enormous enough to supply United States for generations if protected in development.

Cost of production:

Foreign, \$1 per unit K_2O .

United States, \$1.75 per unit K_2O .

Prevailing prices:

Prewar, \$1 per unit K_2O .

War time, \$6 per unit K_2O .

Present (latest available data), \$2 per unit K_2O .

Annual production in United States:

Prewar, nil.

War time, 54,803.

Present (latest available data), 36,899.

States in which produced: California, Colorado, Nebraska, New Jersey, Utah.

Number of people dependent on this industry for support: 15,000.

Approximate investment in this industry: \$45,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Industry developed from nothing to present size during war. Unless protected will disappear. One of the key industries.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 40 per cent.

United States, 60 per cent.

Tariff necessary to protect industry, 50 cents per unit K_2O .

QUICKSILVER.

Present tariff classification:

Schedule C.

Paragraph 159.

Rates, 10 per cent ad valorem.

Unit of measure, 75-pound flasks.

Tariff proposed in H. R. 7456:

Schedule 3.

Paragraph 383.

Rate, 35 cents per pound.

Imports from foreign countries:

Prewar, 8,198.

War time, 6,719.

Present (latest available data), 16,800 (1920).

Imported from:

Spain.

Italy.

Austria.

Labor cost per diem:

Spain, 78 cents.

Italy, \$1.76.

Austria, 62 cents.

QUICKSILVER—continued.

Relative trade balance of these countries with the United States:

Spain—debtor.

Italy—debtor.

Austria—debtor.

Present exchange rates of these countries with the United States:

Spain, 1 peseta=14 cents.

Italy, 1 lira=4 cents.

Austria, 1 krone= $\frac{1}{2}$ cent.

Nature and extent of ore deposits:

Foreign—Spanish and Italian deposits largely Government monopolies. Imports of quicksilver from these countries are embargoed.

United States—Deposits large. Grade of ore compels extensive refining. Operations possible with protection.

Cost of production:

Foreign, \$30 per flask.

United States, \$75 per flask.

Prevailing prices:

Prewar, \$48.35 (1913).

War time, \$123.47 (1918).

Present (latest available data), \$120 (1920).

Annual production in United States:

Prewar, 16,548 flasks.

War time, 32,883 flasks.

Present (latest available data), 21,000 flasks.

States in which produced: Arizona, California, Idaho, Nevada, Oregon, Texas.

Number of people dependent on this industry for support: 4,500.

Approximate investment in this industry: \$8,500,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Italian and Spanish Government monopolies have broken our market by dumping. Our quicksilver industry closed and imports 2,000 flasks per month.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 45 per cent.

United States, 55 per cent.

Tariff necessary to protect industry

Quicksilver, 50 cents per pound.

Manufactured mercurial products, 10 cents per pound of mercury content and 33 $\frac{1}{3}$ per cent ad valorem.

TALC.

Present tariff classification:

Schedule A.

Paragraph 69.

Rates, 15 per cent ad valorem.

Unit of measure, short ton.

TALC—continued.

Tariff proposed in H. R. 7456:

Schedule 2.

Paragraph 209.

Rate, crude, ½ cent per pound; ground, 1 cent per pound; cut or sawed, 1 cent per pound; manufactures not decorated, 25 per cent ad valorem; manufactures, decorated, 30 per cent ad valorem.

Imports from foreign countries:

Prewar, 18,882 (1916).

War time, 14,169 (1918).

Present (latest available data), 24,000 (1920).

Imported from:

Canada.

Italy.

France.

England (as merchant for Provinces).

Labor cost per diem:

Canada, \$3.

Italy, \$1.76.

France, \$1.12.

England, 75 cents (average).

Relative trade balance of these countries with the United States:

Canada—debtor.

Italy—debtor.

France—debtor.

England—debtor.

Present exchange rates of these countries with the United States:

Canada, \$1=89 cents.

Italy, 1 lira=4 cents.

France, 1 franc=7 cents.

England, £1=\$3.83.

Nature and extent of ore deposits:

Foreign—70 per cent from Canada; high-grade deposits cheaply mined.

Established industry.

United States—Large domestic resources discovered and developed during war. Able to supply our needs.

Cost of production:

Foreign, \$12.25 per ton (crude).

United States, \$17.50 per ton (crude).

Prevailing prices:

Prewar, \$9.51 per ton (1916).

War time, \$10.91 per ton (1918).

Present (latest available data), \$20 per ton (1920).

Annual production in United States:

Prewar, 193,309 tons (1916).

War time, 191,477 tons (1918).

Present (latest data), 213,000 tons (1920).

States in which produced: California, Georgia, Maryland, Massachusetts, New Jersey, New York, North Carolina, Pennsylvania, Vermont.

Number of people dependent on this industry for support: 7,500.

Approximate investment in this industry: \$8,575,000.

TALC—continued.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Canadian competition most serious. When talc is dumped here, domestic market is broken.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 10 per cent.

United States, 90 per cent.

Tariff necessary to protect industry: Talc, steatite, soapstone, and French chalk, crude and unground, ½ cent per pound; washed, powdered, or pulverized, 1 cent per pound; cut or sawed or in the form of blanks, cubes, or crayons, 2 cents per pound. (The rates in the Fordney bill.)

TUNGSTEN.

Present tariff classification:

Ferro—

Schedule C.

Paragraph 102.

Rates, 20 per cent ad valorem.

Unit of measure, short ton.

Tariff proposed in H. R. 7456:

Schedule 3.

Paragraph 302.

Rate, ore or concentrates, 45 cents per pound metallic tungsten contained; ferrotungsten, metallic tungsten, tungsten powder, and all other compounds, 72 cents per pound on tungsten contained, plus 15 per cent ad valorem.

Ore—

● Free list.

Paragraph 633.

Imports from foreign countries:

Prewar, 1,530 (1913).

War time, 11,750 (1918).

Present (latest available data), 4,320 (1920).

Imported from:

China.

Burma.

Bolivia.

Labor cost per diem:

China, 45 cents.

Burma, 40 cents.

Bolivia, 90 cents.

Relative trade balance of these countries with the United States:

China—creditor.

Burma—creditor.

Bolivia—creditor.

Present exchange rates of these countries with the United States:

China, 1 tael=71 cents.

Burma, 1 rupee=38 cents.

Bolivia, 1 boliviano=33 cents.

TUNGSTEN—continued.

Nature and extent of ore deposits:

Foreign—Surface deposits, hand labor at a few cents per day; before the war Germany monopolized tungsten refining.

United States—Extensive; enormous growth during war freed United States from German domination.

Cost of production:

Foreign, \$2.50 to \$10 per unit.

United States, \$17 per unit WO_3 .

Prevailing prices:

Prewar, \$7.32 (1913).

War time, \$30 and as high as \$92.50.

Present (latest available data), \$2.75 (1921).

Annual production in United States:

Prewar, 1,537 (1913).

War time, 6,144 (1917).

Present (latest available data), none (1920).

States in which produced: Alaska, Arizona, California, Colorado, Idaho, Montana, Nevada, New York, Oregon, South Dakota, Washington.

Number of people dependent on this industry for support: 8,500.

Approximate investment in this industry: \$15,500,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: Stabilized prices by protection against wide ranges foreign prices under dumping methods now used will permit operation of this key industry.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 25 per cent.

United States, 75 per cent.

Tariff necessary to protect industry:

On ores, \$9 per unit WO_3 contained therein.

On tungsten contained in ferrotungsten, tungsten metal, tungsten powder, and tungsten compounds, 90 cents per pound of tungsten contained therein; on high-speed tungsten tool steel and all alloy steels containing tungsten, 65 per cent ad valorem.

ZINC.

Present tariff classification:

Schedule A.

Paragraph 61.

Rate, 10–15 per cent.

Unit of measure, short tons.

Schedule C.

Paragraphs 162, 163.

Rate, 10 and 15 per cent.

Tariff proposed in H. R. 7456:

Schedule 3.

Paragraph 390.

ZINC—continued.

Tariff proposed in H. R. 7456—Contd.

Rate: Ore containing less than 10 per cent of zinc, free; 10 per cent or more and less than 20 per cent, $\frac{1}{2}$ cent per pound on zinc contained; 20 per cent or more or less than 25 per cent, 1 cent per pound; 25 per cent or more, $1\frac{1}{2}$ cents per pound; blocks, pigs, dust, $1\frac{1}{2}$ cents per pound; sheets, coated, plated, $1\frac{1}{2}$ cents per pound; scrap, 1 cent per pound: Provided, That 5 years after enactment of this act the rate shall be: Blocks, pigs, and scrap, 1 cent per pound; sheets, plate, or other forms, $2\frac{1}{2}$ cents per pound.

Imports from foreign countries:

Ore (average)—

Prewar, 61,348.

War time, 199,261.

Present (latest available data) 53,510.

Slab zinc (average) -

Prewar, 5,941.

War time, 420.

Present (latest available data) 2,590.

Imported from:

Mexico.

Belgium.

Germany.

Australia.

Labor cost per diem:

Mexico, \$1.10.

Belgium, \$1.44.

Germany, 78 cents.

Australia, \$3.

Relative trade balances of these countries with the United States:

Mexico—debtor.

Belgium—debtor.

Germany—debtor.

Australia—debtor.

Present exchange rates of these countries with the United States:

Mexico, 1 peso=51 cents.

Belgium, 1 franc=7 cents.

Germany, 1 mark= $1\frac{1}{2}$ cents.

Australia, £1=\$3.83.

Nature and extent of ore deposits.

Foreign—Mexican and Australian deposits immense: Belgian and German refiners export finished zinc to United States—Deposits large, rich and adequate for all domestic purposes and for export.

Cost of production:

Foreign, 5 cents per pound zinc.

United States, $7\frac{1}{2}$ cents per pound zinc.

Prevailing prices:

Prewar, \$6.08 per pound (average)

War time, \$12.22 per pound (average)

Present (latest available data) \$6.08 per pound (average).

ZINC—continued.

Annual production in United States:

Prewar. 332,916.

War time. 668,515 (1916-17).

Present (latest data). 464,000.

States in which produced: Arizona, Colorado, Idaho, Illinois, Kansas, Missouri, Montana, New Jersey, New Mexico, Oklahoma, Pennsylvania, Tennessee, Utah, West Virginia, Wisconsin.

Number of people dependent on this industry for support: 100,000.

Approximate investment in this industry: \$300,000,000.

Present condition in this industry and particular problem it is facing wherefore it needs tariff: More than 75 per cent of all operations closed down; higher American labor costs and 8-hour day and higher freight; foreign zinc is being dumped here.

ZINC—continued.

Probable relative percentage of mineral that will be consumed under correct tariff:

Foreign, 10 per cent.

United States, 90 per cent.

Tariff necessary to protect industry:

Ores less than 10 per cent zinc, free.

Ores over 10 per cent and less than 25 per cent, $1\frac{1}{2}$ cents per pound on zinc content.

Ores and drosses containing more than 25 per cent metallic zinc, 2 cents per pound on zinc content.

Blocks, pigs, or slabs, old and worn-out zinc, fit only to be remanufactured, $2\frac{1}{4}$ cents per pound.

Zinc oxide, pigment, containing zinc, not containing lead, dry, $2\frac{1}{4}$ cents per pound.

Sheets, plates, or otherwise fabricated zinc dust, $3\frac{1}{4}$ cents per pound

PIG IRON AND SCRAP STEEL.

[Paragraph 301.]

STATEMENT OF JOHN W. LOGAN, SECRETARY ALAN WOOD IRON & STEEL CO., PHILADELPHIA, PA.

Mr. LOGAN. Mr. Chairman, I appear as representing the Alan Wood Iron & Steel Co., of Philadelphia, with reference to paragraph 301 of H. R. 7456, which calls for an equal duty of a dollar and a quarter on pig iron and on scrap.

Senator SMOOT. Do you want to read your brief?

Mr. LOGAN. No; I am just using it as a matter of reference. We ask that the duty on pig iron be the same as that contained in the Payne-Aldrich bill, which was \$2.50 per ton, and that there be a differential on the duty on scrap, and that it should be at least \$1.50 a ton less than the pig iron. The pig iron, of course, is a manufactured product, and scrap comes from manufactures from the tearing down of buildings that have been replaced on account of obsolescence or otherwise. Why they should be put on the same basis of duty we can not quite conceive.

Senator McLEAN. What is the difference in the value?

Mr. LOGAN. Well, that varies very much. The value of scrap is very largely speculative. In other words, a number of years ago this condition arose: One of the railroads—I have forgotten which one it was—had contracted at a very low price for rails. The market changed and they sold scrap rails to the maker of their rails for more money than they were paying for the new rails.

Senator DILLINGHAM. Is scrap iron very largely imported?

Mr. LOGAN. No; very little of it is imported.

Senator McLEAN. That changes conditions. Other things being equal—

Mr. LOGAN. Other things being equal, scrap will sell for about two-thirds the price of pig iron.

In explanation of our request for a duty of \$2.50 on pig iron I want to make the following statement: We are located in eastern Pennsylvania, about 15 miles from Philadelphia. One factor of cost which enters into the manufacture of pig iron is transportation. Now, I know you gentlemen have nothing to do with transportation rates, but it is an element of cost, and to illustrate what the effect is in our location—and it applies to practically all the furnaces in eastern Pennsylvania—I will just state this: In 1914 pig iron was sold delivered in eastern Pennsylvania, for \$14 a ton. At that time the transportation charges represented about 50 per cent of that selling price. To-day pig iron is selling from \$19 to \$20 a ton, and 70 per cent of that selling price represents transportation. Now, that seems rather startling, but the fact is that you have two tons of ore to haul from Lake Superior; it is hauled by rail to the head of the lake, hauled down the lake, and then from the foot of the lake to our locality. You have a ton and six-tenths of coal that you have to haul from western Pennsylvania. You have half a ton of limestone and the freight outbound on your iron.

Altogether, in making 1 ton of pig iron there are about 6 tons of material handled, and the fact is to-day over 70 per cent of the selling price represents transportation. In other words, the transportation charge in Pennsylvania to-day on a ton of pig iron is greater than we sold the pig iron for in 1914, and it is also greater than the selling price to-day of basic pig iron in Belgium. That basic pig iron in Belgium can be brought to Philadelphia cheaper than pig iron can be brought from Pittsburgh to Philadelphia. You see we are hit on the high cost of our raw materials and foreign competition we have due to low ocean freights, and we feel that this justifies our asking for a rate of \$2.50 per ton, as provided in the Payne-Aldrich bill, which we think is fair and reasonable.

Senator SMOOT. You want your brief recorded in full, Mr. Logan?

Mr. LOGAN. Yes, sir; it is very short. There are three other items that I wish to mention. The first is calcined magnesite, which appears under paragraph 47; the second is fluorspar, which appears under paragraph 207; and the third is ferromanganese, which appears under paragraph 302. These are all raw materials to us, and we have no suggestions to offer, because it is not in our line of business to manufacture those materials. We do not object to any reasonable tariff on them, but we do feel that the rates proposed in the House bill are entirely high.

BRIEF OF JOHN W. LOGAN, REPRESENTING ALAN WOOD IRON & STEEL CO. PHILADELPHIA.

The Alan Wood Iron & Steel Co. respectfully submits that it is a corporation organized under the laws of the State of Pennsylvania, with general offices in Philadelphia, and with blast furnaces at Swedeland, Pa.; open-hearth steel plant, blooming mill, and plate mill at Ivy Rock, Pa.; and sheet mills at Shohocken, Pa. All the plants of the company are located near together in the Schuylkill Valley and about 15 miles from Philadelphia. Among the raw materials which we use are iron ore, steel scrap, fuel, limestone, ferromanganese, magnesite, and fluorspar. From these raw materials we manufacture and sell pig iron, steel billets, steel plates, and steel sheets.

We respectfully protest against paragraph 301 as submitted in H. R. 7466 calling for an equal duty of \$1.25 per ton on pig iron and steel scrap.

Pig iron is a manufactured product carrying in its cost a heavy proportion of labor charges, including not only the actual furnace labor, but the labor

involved in mining and transporting the ore, coal (used in the form of coke), and limestone.

Scrap steel is used in the manufacture of open-hearth ingot steel in conjunction with pig iron. It comes either as a manufacturing waste from plants making steel products, or from the tearing down, on account of age or obsolescence, of steel structures. But little labor is involved in its preparation.

To place two materials of such essentially different characteristics on the same basis of tariff duty is, we believe, wrong. We respectfully submit that there should be a differential in the duties on these two materials, and feel that this differential should be not less than \$1.50 per gross ton in favor of scrap iron.

Blast furnaces manufacturing pig iron located on or near the Atlantic seaboard (as ours are) are subjected much more severely to European competition than are those located further inland. Our costs are higher, due to the longer hauls and higher transportation charges on our raw materials. Lower transportation rates facilitate delivery of European iron and steel to the eastern seaboard markets, the ocean freight being frequently less than the cost of hauling from even Pittsburgh to the same points. On account of its character and adaptability as ship ballast pig iron is often carried across the Atlantic for comparatively trivial rates.

The Iron Trade Review of August 4, 1921, quotes Belgian basic pig iron at 105 francs per metric ton, which is equivalent to \$13.30 per ton. This price is for finished pig iron which can be delivered at the Atlantic seaboard for \$5 additional. We are compelled to pay for transportation charges alone on the materials required for the manufacture of 1 ton of pig iron (without figuring in at all the cost of the materials themselves, or the cost of labor and manufacture), a few cents per ton more than the Belgian price for the finished article.

In our appearance before the Committee on Ways and Means of the House of Representatives we asked for the reenactment of the duty on pig iron contained in the tariff act of 1909, which duty had proven, by several years' experience, to be fair and equitable, both as affording reasonable protection to the interests involved and considered as a means of revenue to the Government. This duty was \$2.50 per ton.

Under the circumstances as above outlined, we feel our requests are fair and just. We consequently urge your committee to recommend the reenactment of a duty on pig iron of not less than \$2.50 per ton. And that the duty on steel scrap should be at least \$1.50 per ton less than the duty on pig iron.

Leaving to other steel companies who have appeared, or expect to appear, before your committee with respect to duties on calcined magnesite, fluorspar, and ferromanganese the presentation of specific arguments and recommendations, we desire to record our protest against the rates proposed as being very much too high. We are not opposed to any reasonable protective duties on our raw materials, but the suggested duties on the three materials above referred to are so unprecedented that we feel we must protest. They are entirely out of line with the duties on various forms of finished steel contained in this bill, which duties we believe to be just and reasonable.

SILICON.

[Paragraph 302.]

STATEMENT OF HAROLD H. BURTON, CLEVELAND, OHIO.

Senator SMOOT. As I understand it, Mr. Burton, you speak for Mr. Day and Mr. Root?

Mr. BURTON. That is correct.

Senator SMOOT. And all on paragraph 302?

Mr. BURTON. Yes, sir. I represent Dr. Aladar Pacz, of Cleveland, and also the General Aluminum & Brass Manufacturing Co., of Detroit, and Mr. J. W. Knapp, of the Precision Die Casting Co., of Syracuse, N. Y.

We are urging an amendment to paragraph 302 of the Fordney bill.

The effect of this amendment is simply to keep free from duty, as it is now, silicon, which contains 5 per cent less of iron, as contrasted with ferrosilicon, to which the paragraph principally relates.

Senator Smoot. This bill provides, "Ferrosilicon containing 5 per cent or more silicon and less than 30 per cent, 2½ cents per pound on the silicon contained therein." What ferrosilicon do you have reference to?

Mr. BURTON. I have reference to that mentioned in about five or six lines below that. It begins at line 11, on page 40, you will notice.

Senator Smoot. "Ferrosilicon containing 8 per cent or more silicon, and less than 30 per cent, 2½ cents per pound on the silicon contained therein." Is that the one you are complaining of?

Mr. BURTON. No, sir. The bill continues: "Containing 30 per cent or more of silicon and less than 60 per cent, 2¾ cents per pound on the silicon contained therein; containing 60 per cent or more of silicon and less than 80 per cent, 3½ cents per pound on the silicon contained therein; containing 80 per cent or more of silicon and less than 90 per cent, 4 cents per pound on the silicon contained therein."

Then there is this next sentence: "Containing 90 per cent or more of silicon and silicon metal, 8 cents per pound on the silicon contained therein."

Senator McLEAN. What do you want that changed to?

Mr. BURTON. Amend that by striking out from paragraph 302 the words "and silicon metal" immediately following the words "90 per cent or more of silicon," in line 20, on page 40, and by inserting in paragraph 302, after the word "therein," in line 22, on page 40, the words: "*Provided, however, That the silicon containing 5 or less per cent of iron shall be classified as silicon metal, and that no duty shall be imposed upon it or upon its silicon content.*"

That grade of silicon is entirely distinct from the ferrosilicon spoken of in the rest of the paragraph. That grade of silicon is not used in any way in the manufacture of steel. All of the ferrosilicon referred to in the paragraph is used solely for the manufacture of steel.

Senator McLEAN. What is it used for?

Mr. BURTON. It is used in the making of a new alloy of silicon and aluminum, an Alpax alloy, which has been discovered by Dr. Parsons, whom I represent here, and which alloy is being developed by the General Aluminum & Brass Manufacturing Co., of Detroit.

Senator McLEAN. What is that used for?

Mr. BURTON. The new alloy is the alloy which has been sought for years in the aluminum industry and substitutes 15 per cent of silicon where there before has been copper in aluminum. The present No. 1 aluminum is 92 per cent aluminum and 8 per cent copper. This new Alpax alloy is 85 per cent aluminum and 15 per cent silicon.

Senator McLEAN. What do you use it for when you get it made?

Mr. BURTON. We use it for practically everything for which aluminum is now being made.

Senator McLEAN. Is it a cheaper substitute?

Mr. BURTON. It is from 10 to 30 per cent cheaper. It is also 10 per cent lighter.

Senator Watson. What is the name of the gentleman whom you say you represent?

Mr. BURTON. Dr. Pacz. He has been for 15 years one of the scientific staff of the General Electric Co., at Cleveland, Ohio.

Senator WATSON. Did he originally have a patent on some process manufacturing ferrosilicon?

Mr. BURTON. No, sir.

Senator WATSON. Did not somebody have such a patent? A patent on the manufacture of some sort of alloy?

Mr. BURTON. He has a patent on this Alpax alloy.

Senator WATSON. Has not that patent expired?

Mr. BURTON. No, sir; it was just granted on the 16th of this month. It is a new patent. These companies that are operating have been operating up until the last few days under the application for the patent.

Senator WATSON. Do these people whom you represent actually do manufacturing business?

Mr. BURTON. The General Aluminum & Brass Co., of Detroit, does; sir.

Senator WATSON. And you represent them?

Mr. BURTON. I represent them and also Dr. Pacz.

Senator WATSON. Have you really purchased any silicon?

Mr. BURTON. We have now in this country 150 tons.

Senator WATSON. Where do you buy that?

Mr. BURTON. That was bought in France and in Switzerland. It came in under the present law duty free.

Senator WATSON. Had not that been manufactured in the United States? Did you have to go to France to get it?

Mr. BURTON. Yes; that was the trouble. Dr. Pacz is an American citizen and has been for years. Before going to France after completing his investigation he tried to obtain it in this country. He started three ferrosilicon plants at Niagara Falls; the Carborundum Co., which is understood to be a subsidiary of the Aluminum Co. of America—

Senator WATSON. That is at Niagara Falls?

Mr. BURTON. Yes, sir. The Electro-Metallurgical Co. and the United States Ferro Alloy Co. Each one of those companies produce ferrosilicon, but they had never produced this grade of silicon. Dr. Pacz endeavored to obtain some from them. The Aluminum Co. of America became interested in his invention and for some time negotiated with a view to obtaining control of it. Those negotiations were not successful, however, but during those negotiations he obtained silicon from the Carborundum Co. in 500-pound lots. However, it did not prove to be satisfactory and he has not been able to use it. About the same time he applied to the Electro-Metallurgical Co. and they referred him to the Carborundum Co. He then went to the third company, and they negotiated for his patent but did not supply him with the metal. We reinvestigated those conditions there in July of this year. At this time each one of the companies has produced a slight amount of this metal, but they have not been able to obtain a test on it which has satisfied us that it would be satisfactory. They offered that metal, which they make there, at 15 to 17 cents per pound. It is now being bought by the General Aluminum & Brass Manufacturing Co. at 14 cents

per pound from abroad. That difference is slight, and they say they will be able to eliminate that.

Senator WATSON. Does this patent cover the process of combining silicon and aluminum?

Mr. BURTON. Yes, sir.

Senator WATSON. What effect would it have if that patent were granted to him and we gave you the tariff you want here?

Mr. BURTON. Let me point out the fact that we do not want a tariff; we just want it free.

Senator WATSON. You want free trade?

Mr. BURTON. We want free trade on the element for which we have created a market, which is the only market there is for it in the world.

Senator SMOOT. There may be other markets created. This is the way I understand what you want—I do not know whether I have got your wording exactly right, and that is the reason I am stating it—beginning on line 20, page 40, the way your amendment would read would be this: "Containing 90 per cent or more silicon, 8 cents per pound on the silicon contained therein, provided that silicon containing 5 per cent of iron shall be classified as silicon metal and that no duty shall be imposed upon it."

Mr. BURTON. Yes, sir.

Senator SMOOT. In other words, you want it to come in free?

Mr. BURTON. Yes, sir; as it is now.

Senator WATSON. Let me ask you this broad question: Has the Metallurgische Gesellschaft anything to do with this patent?

Mr. BURTON. They have nothing to do with the American patent. They are producing this now under Dr. Pacz's European patent in Germany, but he is not permitting importation into the United States. There is no possibility of that getting into the United States. The way it will come into competition with aluminum in the United States will be through the production here in the United States.

Senator SMOOT. In other words, if there is 5 per cent iron in it you want it to come in free?

Mr. BURTON. Yes; five or less, because we are the only one that make use of that here. So far as the silicon that is being imported is concerned, it would raise the price of it from 14 to 22 cents. The result of that would be to put this Alpax on a par with or make it more expensive than aluminum, and although it is a better alloy, it would meet with hard competition from the Aluminum Co. of America and would be unable, in the face of that slight differential against it, to build up the infant industry which is producing a better alloy. Therefore, there would be no revenue from it because it would cut out the importation.

As for the companies producing it here, if those companies actually need an 8-cent differential, then, of course, they will have to sell it at 22 cents per pound themselves, and there will be no market for Alpax and no market for the silicon.

This is produced not by labor but by water power. It is not a question of protecting American labor; it is a question of protecting competition of ideas. The importance of this to us is that we are now bringing before the country an improved alloy which we regard as one which will supersede to some extent copper and brass, more

sive elements, and supersede to some extent iron and steel, which are heavier and not so well adapted to some of the uses to which they are put as would be this lighter and stronger alloy. It seems to me that the only effect of this tariff would be to raise the price of the new alloy to such an extent that it would push it off the American market.

Senator WATSON. You say there is no labor involved in this?

Mr. BURTON. No; no labor.

Senator WATSON. That is, you mean the labor involved is a negligible quantity?

Mr. BURTON. In the production of the silicon it is really negligible, because it is a water-power production from silica or sand to this high-grade silicon.

Senator SMOOT. Is there anything else?

Mr. BURTON. There is just one more point. In developing this process and commercializing it, as these companies are doing, they naturally did so relying on the tariff situation as it then stood. When they started this was on the free list. There seems to be no reason why a commodity for which they created the only market should not remain on the free list. These parties prepared a brief which I would like to have permission to file.

Senator DILLINGHAM. Has this new alloy any trade name?

Mr. BURTON. It is called Alpax, meaning peace in the aluminum industry.

BRIEF OF HAROLD H. BURTON, CLEVELAND, OHIO.

The following parties respectfully submit this brief:

Dr. Aladar Pacz, director of scientific research, Alpax Research Laboratories, 3 East One hundred and fifty-second Street, Cleveland, Ohio, inventor of Alpax process and owner of Alpax patents on silicon-aluminum alloys.

Hon. William L. Day, Cleveland, Ohio, formerly judge of United States District Court for Northern District of Ohio, associated with Dr. Pacz in development of silicon-aluminum alloys.

Thomas E. Monks, Cleveland, Ohio, vice president of the Guardian Savings Trust Co.; interested in development of Alpax alloys.

J. W. Knapp, of Precision Die Castings Co., Syracuse, N. Y., part owner of Alpax die-casting license.

Frank C. Root, president of the General Aluminum & Brass Manufacturing Co., of Detroit, Mich., which company is owner of Alpax sand-casting license.

PRESENT TARIFF.

The present tariff law places an ad valorem duty of 15 per cent on ferro-silicon. There is no duty on any grade of ferrosilicon that contains 5 or less per cent of iron. Such a grade of silicon would be more properly classified as silicon metal, and is so referred to in this brief.

PROPOSED TARIFF.

Paragraph 302 of the Fordney tariff bill (H. R. 7456) proposes the following duties for ferrosilicon and silicon metal (without regard to its percentage of iron):

* * * ferrosilicon containing 8 per cent or more of silicon and less than 20 per cent, 2½ cents per pound on the silicon contained therein; containing 30 per cent or more of silicon and less than 60 per cent, 2½ cents per pound on the silicon contained therein; containing 60 per cent or more of silicon and less than 80 per cent, 3½ cents per pound on the silicon contained therein; containing

80 per cent or more of silicon and less than 90 per cent, 4 cents per pound on the silicon contained therein, containing 90 per cent or more of silicon and less than 95 per cent, 8 cents per pound on the silicon contained therein; * * * ferrosilicon, * * * and all alloys used in the manufacture of steel not specially provided for, 30 per cent ad valorem."

Paragraph 302 as a whole evidences an apparent intent to cover only silicon used commercially in the manufacture of steel. The above-quoted language, however, actually goes further. "Ferrosilicon" (or more properly, "silicon metal") that contains 5 or less per cent of iron is not now and never has been used commercially in the manufacture of steel. Nor is it conceivable that silicon metal with 5 or less per cent of iron will ever be used in the manufacture of steel. Such a use of it would require the elimination of the iron from ferrosilicon, and then the immediate restoration of the iron when making the steel. In 1919 no commercial use whatever had been discovered for a grade of silicon containing 5 or less per cent of iron. Up to that time the language now in the Fordney bill would have done neither harm nor good in so far as the language included that grade of silicon.

Since 1919 one of the country's leading scientists, for 15 years on the technical staff of the General Electric Co., has discovered a grain-refining process transforming a hitherto brittle and useless silicon-aluminum alloy into a new form of alloy known as Alpax. The name of this inventor is Dr. Aladar Patkoczy, citizen of Cleveland Heights, Ohio. His broad underlying United States patent on this alloy was formally issued to him on August 16, 1921. This new form of alloy has remarkable physical properties and high commercial value, as fully stated below. The manufacture of Alpax is an infant industry unable to compete with commercial aluminum, and in some cases with products of copper, brass, cast iron, or even steel. It requires for its manufacture silicon metal containing 5 or less per cent of iron, and it affords the only known commercial use for that grade of silicon. Silicon of that grade is not now and never has been produced in this country, except in insignificant quantities. Therefore there is no existing production of it to be protected.

The market for that grade of silicon accordingly depends solely upon the market for the above-named silicon-aluminum alloy, Alpax. It is now being manufactured, among other places, in France and in Switzerland, and it is being purchased at approximately 14 cents per pound by the General Aluminum & Brass Manufacturing Co., which is the principal present licensee under the United States Alpax patent above mentioned. The language of the Fordney bill would place a duty of 8 cents per pound on this grade of silicon, raising its price to 22 cents per pound. If it is contended that domestic silicon producers will require this tariff to produce silicon of this grade, nothing will be accomplished by the tariff, because this silicon at 22 cents per pound will artificially raise the price of Alpax so high as effectively to hamper or prevent its commercial production. For the same reason this tariff will cut off the sole United States market for imported silicon of this grade. The tariff provision accordingly would raise no revenue, would foster no silicon industry, and would accomplish nothing more than deprive the country of a new, improved, and cheaper alloy. It would compel United States manufacturers to use the inferior and more costly present grade of commercial aluminum while other countries could use Alpax.

This would be using the tariff neither for revenue nor for the protection of a new industry. It would be using the tariff for the artificial protection of well-intrenched producers of an inferior product which should be transferred to other than its present uses. It would not be protection against the cheaper foreign production of the same commodity. It would be protection against the cheaper domestic production of a better commodity, manufactured in part from a foreign material nowhere commercially produced in this country, and, judging from the tariff rate, impossible of production at any marketable price.

It is hoped by the owners of Alpax that the required grade of silicon can be produced in this country at less than 22 cents per pound. If it can be produced for less than 22 cents per pound the tariff should be less than 8 cents per pound. It has been hopefully suggested, but not demonstrated, that domestic producers can profitably produce it for 14 to 15 cents per pound. If so, there should be no tariff which would artificially force the price of imported silicon above that price. There can be no reason for overprotection except to artificially force up the price of Alpax. There can be no reason for thus unduly forcing

the price of Alpax except either to reap an undue profit upon the silicon or force Alpax out of competition with inferior commercial aluminum. Looking still deeper, there appears to be no good ground for a substantial protective tariff on this grade of silicon. It is produced from silica or sand by the use of a reducing agent and the application of electric current derived from water power. The silica or sand is available here equally as well as in Europe. The electrical current and reducing agents are available here equally as well as there. There therefore appears to exist no element of American labor cost and no substantial element of increased cost of any kind which would not be offset by the cost of transatlantic transportation. There accordingly appear to be no substantial reasons for a lack of competition by American silicon producers unless it be their intellectual inability or moral unwillingness to enter the field. None of us will concede the intellectual inability. We can see no reason for moral unwillingness to compete unless it be a desire artificially to preserve a substantial monopoly for allied interests controlling an inferior product which the new Alpax alloy might force into different channels of use. We therefore can see no good reason why our Government should use the present language of the Fordney bill to extend the steel alloy tariff over the grade of silicon required for the manufacture of Alpax. Such an extension would yield no revenue and would afford no protection to any existing industry. The proposed rate of 8 cents per pound would afford unrequired protection to a possible source of supply in America, and this source, by a continuation of its previous failure to supply this product, could substantially shut off the introduction and development in this country of a new and valuable alloy in competition with an inferior and more expensive alloy which has long been on the market.

RECOMMENDED AMENDMENT.

To meet the above situation the following amendment is suggested to the Fordney bill, which has been passed by the House of Representatives, has been read twice in the Senate, and is now referred to the Senate Committee on Finance:

"Amend by striking out from paragraph 302 the words 'and silicon metal' immediately following the words '90 per cent or more of silicon,' in line 20, page 40, and by inserting in paragraph 302, after the word 'therein,' in line 22, on page 40, the words: '*Provided, however,* That silicon containing 5 per cent or less of iron shall be classified as silicon metal, and that no duty shall be imposed upon it or upon its silicon content.'"

DR. ALADAR PACZ.

Dr. Pacz, the inventor of Alpax, is a native of Hungary. He came to the United States as a doctor of science in 1905. Since 1906 he has resided in Cleveland, Ohio, and its vicinity. Since 1912 he has been a naturalized citizen of the United States.

From 1906 to 1920 he served as one of the leaders on the scientific staff of the National Lamp Works of the General Electric Co., at Cleveland. During that time he made a number of scientific discoveries of the greatest practical value. Among these may be mentioned his discovery in 1907 of a new process for the manufacture of pressed tungsten filaments, which has proved to be the most efficient process of its kind and which was a forerunner of the drawn wire, now universally in use.

In 1914 he also discovered the "nonsag" tungsten wire, which is of great importance in the manufacture of coiled filament incandescent electric lamps. This wire has been the only means of making this type of lamps efficient and is now universally used. This wire also made possible the development of electron and pilotron tubes, which were of great value to the United States and its allies in wireless telegraphy during the war.

In about 1919 he became much interested in the development of metallic alloys and discovered an important improvement in aluminum alloys, which was patented in the name of the General Electric Co. These alloys were somewhat outside the regular line of development of the General Electric Co., and since that

date it has permitted Dr. Pacz, while doing some work for it, to maintain and operate on its property his private laboratories. Here he has devoted himself almost exclusively to the development of alloys.

Shortly after beginning his independent work he discovered a so-called grain-refining process, which has solved a problem in aluminum alloys which has been studied unsuccessfully by the aluminum industry for a number of years.

Aluminum and silicon are the two elements most commonly occurring in the crust of the earth. All technical efforts directed toward the combination of these elements had failed to be of any commercial value, because the resulting alloy had little tensile strength and elongation with high brittleness.

By means of the new grain-refining process Dr. Pacz created Alpax. This silicon-aluminum alloy, containing approximately 85 per cent of aluminum and 15 per cent of silicon.

ALPAX.

The above-mentioned silicon-aluminum alloy, named Alpax, is of the greatest commercial value. Among other things, as compared with No. 12 aluminum in general use, Alpax is 10 per cent lighter, has 50 per cent greater tensile strength, has between 300 and 400 per cent greater ductility, and is from 10 per cent to 30 per cent cheaper. It has a resistance to chemical influences higher than all known aluminum alloys and has the highest heat conductivity of any of all. Its coefficient of expansion is the lowest of all known aluminum alloys. It has a tensile strength of 26,000 to 32,000 pounds per square inch and an elongation of 5 to 11 per cent in sand castings without heat treatment. It has a resistance to corrosion equal to that of pure aluminum and greater than that of its alloys. It has an electrical conductivity 75 per cent of that of pure aluminum. It has a lower shrinkage in casting than any known alloy of aluminum, the shrinkage being the same as that of cast iron. It is the only nonporous aluminum alloy. Its casting qualities are excellent and are superior to those of all aluminum alloys now in use.

Upon this invention Dr. Pacz has expended and is expending his entire personal resources. His patent on the alloy has already been issued in the United States and in Canada, and his applications are pending in all civilized countries. His United States patent is No. 1,387,900 issued to him August 16, 1921.

Licenses have been issued by him to the General Aluminum & Brass Manufacturing Co., of Detroit, Mich., for sand castings, and to J. W. Knapp and E. N. Dollin, of the Precision Die Castings Co., of Syracuse, N. Y., for die castings. The alloy is now being used in the United States, particularly in the casting of automobile parts. Commercial development under the pending patent applications is also progressing rapidly abroad, but the United States rights are being reserved for domestic manufacturers. A great variety of successful castings have been made, all without the use of chills. Among castings successfully made may be mentioned automobile crank cases, gear housings, radiator parts, and many other light parts, wheels, etc., as well as a grand-piano frame. The latter casting is of a size never before successfully attempted with an aluminum alloy. It is also being rolled successfully into sheets.

ATTEMPTS TO OBTAIN REQUIRED SILICON IN THE UNITED STATES

In 1920, after completing the discovery of his grain-refining process, to insure the commercial success of his silicon-aluminum alloy, Dr. Pacz endeavored to locate in the United States immediately available supplies of silicon containing 5 or less per cent of iron. He succeeded in locating three ferrosilicon producers, all in the vicinity of Niagara Falls, N. Y. The Carborundum Co., understood to be affiliated with substantially the same interests as controlled the Aluminum Co. of America; the Electro-Metallurgical Co., understood to be a subsidiary of the Union Carbide Co.; and the United States Ferro Alloys Co. The latter company referred the matter to the Carborundum Co. The Carborundum Co. and the Aluminum Co. of America displayed an active interest in the new invention, and for some time negotiations were conducted with a view to the acquirement by the latter company of a substantial interest in the invention. These negotiations did not come to a successful conclusion, but Dr. Pacz obtained delivery in 500-pound lots of the silicon avail-

the Carborundum Co. for the manufacture of Alpax. After repeated tests silicon proved unreliable and of thoroughly unsatisfactory quality for the purpose. The Electro-Metallurgical Co. also conducted negotiations for the requirement of the invention. The negotiations, however, were not successful and Dr. Pacz was unsuccessful in obtaining silicon for his purposes. He then personally investigated sources of supply abroad and located satisfactory sources in France and Switzerland, from which he has since obtained his supplies of silicon and found the same satisfactory.

In July, 1921, in response to inquiries from the Niagara Falls district, Mr. C. Root, president of the General Aluminum & Brass Manufacturing Co., which then held a sand-casting license for Alpax, reinvestigated the sources of supply from each of the above-named companies at Niagara Falls. In each case the companies recognized the demand for the required grade of silicon to be a new proposition, and in at least two cases it was made plain that the supply of that grade of silicon could not be given with the same equipment and the same methods of production then in use for lower grades of silicon. Each of the companies stated that up to that time they had made only small quantities of the required metal, the Carborundum Co. about a carload, the United States Ferro Alloys Co. a few barrels, and the Electro-Metallurgical Co. a small quantity. Quotations for a future supply of the metal varied from 15 cents to 17 cents per pound with indications of lower prices upon increases of production.

FERROMANGANESE.

[Paragraph 302.]

STATEMENT OF WILLIAM DETTE, REPRESENTING CROCKER BROS., NEW YORK, N. Y.

Mr. DETTE. I represent the Crocker Bros. We ask to be heard in opposition to the rate proposed on ferromanganese in paragraph 302.

May I read from this manuscript?

Senator SMOOT. If you will leave it with the committee, it will not be necessary. You may simply state what you want, and that will be just as well.

Mr. DETTE. It is hardly in shape to present as a brief.

Manganese ores have always been admitted free. The domestic supplies are limited, inferior in quality, and far from consuming amounts.

Senator SMOOT. You want that free now?

Mr. DETTE. Yes; except possibly for revenue.

Even under the stimulus of war necessity and high prices domestic production furnished only a small part of our total needs, and that only by a sacrifice in quality of the smelted product.

Senator LA FOLLETTE. What is the total consumption?

Mr. DETTE. About 300,000 tons, I should say, normally.

It is safe to say that the steel trade must depend for all time on foreign ores or foreign ferromanganese for at least 90 per cent of its requirements. The proposed duty of 1 cent per pound content, or about \$11.20 per long ton on average ores, would be merely a subsidy to one or two ore producers. We recommend that manganese ores be taxed not more than \$1 per ton for ores containing 45 per cent manganese and over.

Senator LA FOLLETTE. Did you state that during the war period we produced only a negligible quantity of manganese ore?

Mr. DETTE. Of ore, yes.

Senator LA FOLLETTE. I have a memorandum here which states that we produced 306,000 tons of manganese ore.

Mr. DETTE. In 1918.

Senator LA FOLLETTE. I understood you to say just now that the total consumption was 300,000 tons.

Mr. DETTE. The total consumption of ferromanganese.

Senator LA FOLLETTE. Oh, that is the extract?

Mr. DETTE. Yes. That is the smelted product; that is, as it is used in the steel trade.

Senator LA FOLLETTE. Then, the 306,000 tons we produced, if it was 35 per cent ore, would be 35 per cent ferromanganese?

Mr. DETTE. Well, you could not make 80 per cent ferromanganese out of 35 per cent ore.

During the war period, the standard of ferromanganese was reduced to 70 per cent. Of course, the 35 per cent ore mined in this country was probably mixed with the richer ores brought from abroad.

We contend that ferromanganese is improperly classified.

Senator JONES. I do not believe you have given clearly the information which the Senator from Wisconsin wanted.

Do I understand that your ferromanganese can be gotten out from ores of 70 per cent or above in purity?

Mr. DETTE. Eighty per cent ferromanganese, which is the standard, can be made only from about 45 to 50 per cent manganese ore. During the war the ore we got in this country was not rich enough to make 80 per cent.

Senator SMOOT. Our manganese ores, for instance in California, run about 35 per cent?

Mr. DETTE. Thirty-five or forty per cent.

Senator SMOOT. They are rich enough to smelt?

Mr. DETTE. Well, if they run to 45 per cent, yes; but they have always mixed them with richer ores from outside.

Senator JONES. The Senator wanted to get at the tonnage produced in this country during the war, and the amount imported. If you consider it on the basis of ore running as high in percentage as you now mention, it seems to me your information does not accord with that which the Senator has.

Senator SMOOT. The average of American production is 40 per cent.

Senator JONES. I may say that the matter was gone into fully by the Committee on Mines and Mining during the war.

Mr. DETTE. In the period 1914 to 1918, inclusive—a period of five years—the imports were 2,294,875 tons, or 82.8 per cent. The production in the United States was 478,996 tons, or 17.2 per cent, so that the greater part of the United States production was in 1918. The total in five years was 478,000; and in 1918, 306,000 tons.

We contend that ferromanganese is improperly classified. It should be included in paragraph 301 with pig iron, iron kentledge, spiegeleisen, and so on. It is not a ferro alloy in the sense of other alloys in paragraph 302, which are made either by the electric furnace or the thermite processes, and which are added to special steels for the properties conferred by the metals, such as tungsten, chrome, etc.

Ferromanganese is used in steel making mainly as a deoxidizer and recarburizer. Any improvement in strength or rolling quality

ies obtained by its addition is incidental, and not the main reason for its use. Its purpose is to free the molten metal from oxygen and to restore the required amount of carbon. Ferromanganese is a product of the blast furnace, made by smelting manganese ores in a coke-fired blast furnace, the same as pig iron. There is no difference in furnace construction or equipment. There is no difference in operation, except that more fuel is required and more limestone for fluxing. The product is cast in a bed and is broken into lumps instead of being cast in pigs, as this is the most convenient form for use. Otherwise, there is no difference between making pig iron and ferromanganese.

Commercial ferromanganese contains about 80 per cent manganese and from 5 to 7 per cent carbon; the balance being iron, a small percentage of silicon, sulphur, and phosphorus. It is always sold by the gross ton, as is pig iron, and never by the pound, as are the electric-furnace ferro-alloys.

The classification in the Fordney bill is misleading, inasmuch as it includes ferromanganese with manganese metal and thermit products, whose values depend on a low carbon content.

Standard ferromanganese always contains 5 to 7 per cent carbon. It can not be made in a blast furnace with any lower carbon, and it is this carbon content which makes it valuable as a recarburizer.

For these reasons we recommend that it be restored to its proper place in paragraph 301 with pig iron and other blast-furnace products.

The rate of $2\frac{1}{2}$ cents per pound on manganese content, reduced to the proper gross ton equivalent, is \$39.42.

From 1903 to 1916 the highest annual average price of ferromanganese was \$61.27 in 1907, the year of the Russian-Japanese war. The lowest average annual price was \$32.41 in 1904. In 1914 the average price was \$43.61, and for the 10 years preceding the average price was about \$47.50. The price to-day is about \$65. The proposed duty, therefore, is 80 per cent of the prewar price, or 60 per cent of the present price. In addition, the duty is misleading and confusing when stated in cents per pound on a tonnage product, which is a raw material to most steel makers. The effect of this duty would be to increase greatly the cost of ferromanganese to American steel makers.

The United States Steel Corporation, and perhaps one or two of its larger competitors, might make their own ferromanganese, but the great body of about 250 steel-melting plants in the United States, which always buy ferro in the markets, would be taxed to create a monopoly for one or two domestic merchant producers. The smaller independent steel makers, already at a disadvantage as compared with their larger competitors, would be further burdened, and by reason of increased costs would be absolutely barred from export markets.

The interests of these independent manufacturers require the restraining influence of foreign competition to prevent a repetition of the unreasonable prices which prevailed on this product when competition was temporarily reduced. The rates in the present bill are not only high but are not proportionate. It requires about 2.2 tons of 50 per cent ore to make 1 ton of ferromanganese, or about

110 units of manganese in the ore, making 80 units in a ton of ferromanganese.

Thus, at the present rates of \$11.20 on ore, the tax on the ore to make 1 ton of ferromanganese is \$24.64, while the finished product is taxed \$39.42.

One dollar per ton on ore and \$2 on ferromanganese would be fair and approximately proportionate.

BRIEF OF WILLIAM DETTE, REPRESENTING CROCKER BROS., NEW YORK N. Y.

We respectfully protest against the rates of duty carried by the Fordney bill on manganese ores and ferromanganese and against the imposition of any excessive duties on these commodities.

It is the purpose of this brief to show: 1. That the proposed duties on manganese ores are unnecessary, uneconomic, and opposed to the public interest. 2. That American producers of ferromanganese do not need the protection of a tariff inasmuch as that a high duty would impose a burden on many for the benefit of few; that such a duty would be prejudicial to public interest. 3. That if any duties are imposed, they should be in order to produce revenue and to prevent discrimination should be reasonable specific duties levied proportionately upon manganese ores and ferromanganese.

MANGANESE ORES.

Manganese ores are those containing more than 35 per cent manganese. Commercially, ores with less than 45 per cent manganese are not used for making standard ferromanganese. Manganiferous ores—that is, ores with 10 per cent to 35 per cent manganese and the low-grade manganese ores—are generally used for the manufacture of spiegeleisen and high manganese pig iron.

United States ores.—Reserves of high-grade manganese ores are limited and are located far from points of consumption. The proven reserves probably do not exceed 800,000 tons. The cost of mining and transportation is too high to render them economically available. The best domestic ores are inferior in quality to foreign ores. Their use, therefore, must wait until the development of steelworks in the Rocky Mountain and Pacific slope States creates a natural market for them.

Foreign ores.—The largest reserves of manganese ores are found in Russia (Caucasus), India, Brazil, and Cuba, in the order named. The known reserves of these countries exceed 133,000,000 tons. Mining costs are low, and, owing to the natural movements of world trade, costs of transportation to consuming countries also are low.

Ores to make ferromanganese should be high in manganese and low in silica. The average analysis of foreign and domestic ores in a dry state is as follows:

Ores.	Manganese.	Silica.	Phosphorus.	Iron.
Brazilian.....	46.84	5.00	0.004	60
Indian.....	51.60	6.52	.005	55
Russian.....	50.00	10.25	.17	50
United States.....	40.75	12.21	.067	45

The average prewar price of manganese ores was \$8 to \$10 per ton c. i. f. Atlantic ports. The present price (Sept. 1, 1921) is 22½ cents per unit, or from \$10 to \$12 per ton.

Total consumption of manganese ores in the United States: domestic production, and importations.

Tariff period.	Total consumption.	Domestic production Mn. 35 per cent and over.	Per cent of total.	Importations Mn. 45 per cent and over.	Per cent of total.

Manganese ores have been admitted free in the United States since 1872, nearly 50 years. They are also admitted free by nearly all other countries. It is significant that none of the great steel-producing countries—United States, Great Britain, Germany, or France—have any extensive manganese-ore deposits within their own boundaries. They must all depend on imported ores. Considering the natural movements of world trade and the position of the United States as a creditor nation, it is fair to assume that the United States will always be in as favorable a position for securing cheap ores as any other country.

No important bodies of manganese ores have been discovered in the United States in the past 50 years, although the leading ore-mining and steel companies have sought them continuously. Even the stimulus of war necessity failed to develop supplies of adequate quantity or satisfactory quality. We must always look to foreign ores for from 90 to 95 per cent of our needs. Any high duty on manganese ores will therefore restrict the manufacture of manganese alloys in the United States and increase the cost of making steel here.

We recommend that manganese ores be admitted free, or if a duty be needed for revenue then not more than \$1 per gross ton.

FERROMANGANESE.

Ferromanganese of the usual standard commercial grade is a metallic compound composed of manganese, 78 to 82 per cent; carbon, 5 to 7 per cent; silicon, 0.50 to 1 per cent; sulphur, under 0.03 per cent; phosphorus, 0.10 to 0.30 per cent; iron, 8 to 10 per cent.

Ferromanganese is used in steel making mainly as a deoxidizing and recarburizing agent. It is added to the molten metal in the ladle, after the melt has been tapped from the Bessemer converter or the open-hearth furnace. At this stage of manufacture practically all of the carbon has been eliminated from the steel, but the molten metal retains much oxygen. Ferromanganese at the same time removes this oxygen and raises the carbon to the desired limit. It also removes some sulphur and adds to the strength of the steel as well as improving its working properties, but, as stated before, the main function is deoxidization and recarburization. Under present conditions of manufacture no steel can be made without ferromanganese, and there is no known

substitute for it. About 34 per cent of all the products of manganese are used in steel making.

Ferromanganese is made by smelting manganese ores in a blast furnace, using coke as fuel. The furnace is the usual type of pig-iron furnace. There is no difference in construction or equipment. There is no difference in operation, except that more fuel is required and more limestone for fluxing. It is quite common practice to make pig iron, spiegel-eisen, and ferromanganese in the same furnace, and to change from one product to another as market requirements, ore stocks or operating conditions render expedient. Ferromanganese is cast in a lad and broken into lumps, instead of being cast in pigs, this being the most convenient form for use. Otherwise, there is no difference between making pig iron and ferromanganese.

The cost of making ferromanganese in the United States and in England is substantially the same, and has been so for many years.

Labor represents a very small percentage of the total cost. Normally British labor is cheaper, but this is largely offset by larger furnaces in the United States and greater output per man employed.

Coke is better and cheaper in the United States.

Ores are derived from the same sources, and are approximately the same.

The present prices for the material and fuel elements in making ferromanganese in the United States and in England are given below. English figures are converted into United States currency at rate of \$3.70 per pound sterling.

Indian manganese ore, 45-50 per cent manganese

C. i. f. Atlantic seaboard United States..... \$0.225 per unit.

C. i. f. United Kingdom ports, 1s. 2d..... .216 per unit.

Furnace coke:

F. o. b. ovens Pennsylvania..... \$2.75 to \$3.00 per ton.

F. o. b. ovens Yorkshire, England, 30s..... 5.55 per ton.

That there is little difference in costs of production in the two countries is well evidenced by the fact that the leading steel interest in the United States has made ferromanganese for its own use for more than 20 years. Considerable quantities have also been made also by other producers.

¹ No figures given.

At the present time ferromanganese is quoted at about \$65 per ton for both foreign and domestic product, showing the tendency to return to normal values and usual avenues of supply.

The importance of ferromanganese to the steel industry has already been shown, since no steel can be made without it. The steel industry as a whole, and including the employees of mining and transportation companies owned and operated by steel producers, employs about 1,500,000 men. All of the merchant ferromanganese used in the United States could be produced in furnaces employing from 1,500 to 2,000 men.

The capital investment in the steel business of the United States is difficult to estimate, since there are many small producers whose statements do not appear in the financial manuals. Considering only steel makers whose financial status can easily be determined, the capital investment, which is the excess of assets over uncapitalized liabilities, amounts to about \$4,500,000,000. This investment may be divided into three general groups: 1. United States Steel Corporation, with an investment of about \$2,000,000,000. 2. Eleven of the larger independent steel companies, with an investment of about \$1,000,000,000. 3. About 160 small independent steel companies, with an aggregate investment of about \$1,100,000,000, and in addition to this group 10 or more large manufacturing enterprises who make steel for their own use but are not commercial producers, with an investment of about \$400,000,000.

The Steel Corporation manufactures its own ferromanganese. Some of the larger independents occasionally make ferromanganese and could easily cooperate to do so. The third group, and the largest in point of numbers, must always purchase ferromanganese in the open market, as must also about 100 small steel makers not included in above figures.

We have shown that there is no reason why ferromanganese can not be made here as cheaply as abroad. The facilities for manufacture exist wherever there is a blast furnace. The United States in this respect is in exactly the same position as other steel-producing countries, and in time of national necessity our production could be increased as rapidly as needed.

The rate proposed in the Fordney bill of 2½ cents per pound on manganese contained in ferromanganese amounts to \$39.42 per gross ton. The proposed tax of 1 cent per pound on manganese contained in ores (figuring that 2.2 tons of 50 per cent ore are required to make 1 ton of ferromanganese) would impose a duty of \$24.64 on the ore required for 1 ton of ferromanganese. This would give an advantage of approximately \$15 per ton to the United States Steel Corporation and other large producers. The great independent group, which always purchases in the open market, whose costs by reason of their size are always higher than those of the great companies, would thus be burdened with this extra cost, placing them at a serious disadvantage and tending in times of depression to the creation of a monopoly. The interest of these independent manufacturers requires the restraining influence of foreign competition to prevent a repetition of the unreasonable prices which prevailed when this competition was temporarily reduced. The proposed rates are not only too high but, as shown above, are not proportionate.

We recommend that ferromanganese be admitted free, or if a duty is necessary for revenue purposes that same shall not exceed \$2.50 per gross ton. We further recommend restoring ferromanganese to its proper classification with pig iron and spiegeleisen in paragraph 301.

In the testimony before the Committee on Ways and Means of the House of Representatives and before the Finance Committee of the Senate various statements were made which were misleading. We wish to correct some of these statements, particularly those appearing in the brief submitted to your committee by the Lavino Furnace Co., E. E. Marshall, American Manganese Manufacturing Co., and Southern Manganese Co.:

Capital investment in ferromanganese production.—The claim was made in the brief submitted to the House Ways and Means Committee that heavy capital (approximately \$10,000,000) has been invested in the production of ferromanganese and that this investment is threatened by foreign competition.

This investment was made at the time of unheard of high prices, ferromanganese ranging from \$250 to \$400 per ton. It was not an altruistic move but a commercial one, that we believe yielded huge profits. The subsequent abandonment of ferromanganese production by some furnaces was a logical recognition that war conditions had ended. The return of these furnaces to pig-iron production is similar to the change of the great steel companies from munitions work to ordinary commercial products. To ask the public to assume a tax burden of approximately \$14,000,000 per annum on the entire steel trade, or \$7,000,000 on the independent trade, for the benefit of two producers with a total investment (figured at war time prices) of less than \$10,000,000 is patently absurd.

Competition with British sellers.—In both the original briefs submitted to the Ways and Means Committee and in the combined brief submitted to the Senate Finance Committee reference is made to unfair methods practiced by foreign producers and particular reference to an alleged British pool, which it is stated has at various times reduced prices in the United States to below the cost of production "with the avowed purpose of destroying the industry in America."

Reference to the table of comparative prices previously shown herein demonstrates that the prices have been approximately the same in both British and American markets and that ferromanganese has been freely sold without discrimination by the British makers. They continued to do so during the war in substantial quantities. It is also shown by reference to the table of consumption, production, and imports of ferromanganese for the period from 1914 to 1920, inclusive. There was no embargo established by the British Government on the exportation of ferromanganese, but said exportation was licensed only to consumers who would give a signed undertaking that the steel made from this ferromanganese would not go into enemy hands.

In the brief submitted to your committee by the American manganese producers reference is made to quotations appearing in *The Iron and Coal Trades Review* of England under date of August 12, 1921, quoting prices on British ferromanganese as follows: 76/80 per cent for home consumption, £18 per ton; 76/80 per cent for export, £14 per ton; followed by the conclusions drawn by these gentlemen, as follows: "It is perfectly evident, therefore, that the members of the British pool are resorting again to their pernicious habit of dumping in this country to destroy the ferromanganese industry, in this case the difference being £4 sterling per ton lower than they will sell consumers in their own country."

The conclusion drawn is unwarranted, misleading, and deceptive. The true facts are as follows: British ferromanganese is freely quoted for export to all other countries than the United States at £14 per ton. No quotations have been made by us and no sales made by us at less than \$65 c. i. f., which is the equivalent of £18, and so far as we know no quotations have been made by the representatives of other British producers at less than this figure. The reason for this is obvious. The antidumping provision of the emergency tariff act might possibly be invoked against any seller who offered ferromanganese at less than the open quoted price for home consumption in British markets. The strict observance by the British makers and their representatives in the United States of the intent of the emergency tariff act has in effect prevented American steel makers from purchasing ferromanganese at as low figures as their competitors in Canada, Mexico, Japan, France, Germany, and other steel producing countries are able to purchase. The injury to the American steel trade is evident, and the only benefit accrues to American ferromanganese producers who are unwilling to meet the competitive figures prevailing in the leading markets of the world. At the same time that British producers are refusing to quote low prices in the American markets certain German makers, by reason of the depreciation of the mark in the United States and its higher value in Germany, are able to quote prices approximately \$15 per ton below the British and American market without any

danger of coming within any provisions of the antidumping section of the emergency tariff law.

We wish further to state that the British trade-paper quotations referred to are merely nominal and do not represent actual business. The entire steel trade of Great Britain has been paralyzed by the coal strike and is to-day operating at less than 10 per cent of capacity. One month ago the production of steel in Great Britain was only about 1 per cent capacity. At such a time trade-paper quotations do not represent a market, because a market does not exist. It may be assumed that the future British prices will follow the same course as in the past and that a resumption of home demand will witness substantially the same quotations for home consumption and for export, allowing always for the usual and natural differential between the retail lots constituting home-market sales and the larger wholesale quantities in which the commodity is exported.

We quote again from the brief of the American manganese producers as follows: The dominating factor of the foreign producers is the British pool, whose avowed purpose is to reclaim the American trade and to drive the American maker out of business by unfair competition. This unfair competition has already been brought to the attention of the United States Government and is in process of investigation by the Federal Trade Commission."

This complaint was brought before the Federal Trade Commission in 1919, presumably by the same gentlemen who have asked for unreasonably high duties on ferromanganese. After an investigation by the Federal Trade Commission covering a period of two years and including a complete and thorough examination of the records of sales, shipments, and prices by the respondents, the examiner for the Federal Trade Commission sitting in this case has recently rendered his report to the commission, concluding same with the following paragraphs:

"22. There is not a scintilla of evidence that the respondents or their principals commonly or systematically imported and sold ferromanganese in the United States at prices substantially less than the actual market value of ferromanganese in England.

"23. There is no evidence that the importing and selling of ferromanganese by the respondents or their principals into the United States was done with any intent to injure the industry of manufacturing ferromanganese in the United States, and there are no facts and circumstances proven from which such intent can logically or legally be inferred.

"CONCLUSION.

"From the foregoing findings as to the facts, the examiner holds that the respondents are not guilty of using any unfair methods of competition in commerce as charged in the complaint and that there is no proof of any violation of section 5 of an act of Congress approved September 26, 1914, entitled 'An act to create a Federal Trade Commission, to define its powers and duties, and for other purposes.'"

The reference to this proceeding by these gentlemen, before a finding was made or a final decision rendered, in an attempt to influence legislation, speaks for itself.

In the original brief submitted by the American manganese producers to the House Committee on Ways and Means they requested that the rate be made specific and fixed for a duty of 2 cents per pound, at the same time asking that ores be retained on the free list. In their latest brief submitted to your committee, and doubtless influenced by the pronounced opposition of witnesses from the steel trade, they recede from this position and request a 25 per cent ad valorem duty with free ores.

Such a duty can not be justified by differences in cost of production, since all evidence tends to show that costs are substantially the same. The British manufacturer and must always remain at a disadvantage to the extent of the ocean freight, and to this degree the American manufacturer is automatically protected. If the costs of the American producers are so high as to require protection to this degree, it is an admission on their part of ineptitude in manufacture or of inflated capital charges, high salaries, and other excessive overhead costs which unduly burden the production of the metal. It has never been the policy of the United States Government to subsidize incompetence or to indemnify against the penalties of commercial errors.

STATEMENT OF RADCLIFFE ROMEYN, VICE PRESIDENT AMERICAN MANGANESE MANUFACTURING CO., PHILADELPHIA, PA.

The CHAIRMAN. Please state for the record where you reside.

Mr. ROMEYN. I am vice president of the American Manganese Manufacturing Co., with offices in Philadelphia.

The CHAIRMAN. What is your business?

Mr. ROMEYN. We are independent manufacturers of ferromanganese.

The CHAIRMAN. Will you proceed briefly to state your views to the committee.

Mr. ROMEYN. I just want to bring out three points about the ferromanganese proposition, and it will only take five minutes:

In connection with the duty on ferromanganese you have three alternatives. The first one is to leave ferromanganese where it is, on the free list. And if you do that, the industry will be entirely wiped out.

We have been in the business for seven years. An attempt was made yesterday in the testimony more or less to give the impression that this was not a very large industry in this country, or that the industry was not adequate to supply the demand. We employ about 1,000 men. We have our own coal mines, we have our own railroad, and we make our own coke, and our pay rolls amount up to from \$700,000 to \$1,000,000 a year. We have paid to the railroads alone in freight in the last four years \$1,250,000. Our plant is appraised at over \$4,000,000, and our inventories amount to \$2,500,000.

The CHAIRMAN. Where is your plant?

Mr. ROMEYN. Our plant is in the heart of the coke region near Connellsville. We are located at Dunbar, Pa.

The CHAIRMAN. How many men do you employ?

Mr. ROMEYN. From 700 to 1,000. We have produced ferromanganese that has entered into the manufacture of 4,500,000 tons of steel. I also represent Edward E. Marshall, who is an independent producer of ferromanganese, and who has made ferromanganese that entered into the production of 8,500,000 tons of steel. His pay rolls in 1917 were \$500,000, and in 1918 they were \$1,000,000. I have not got the figures that show the revenue he paid to the railroads.

Enough of that. If we do not get any duty on ferromanganese and it remains on the free list, we will have to go out of business in the next six months. Our operations for the last seven years up to date, due to British competition, have shown a loss of \$380,000, and we are at the point to-day, gentlemen, where we are going out of business before this year is over, if we do not get protection. It is up to you gentlemen to decide.

Senator SMOOT. How about the manganese-ore situation?

Mr. ROMEYN. It does not affect us. I will get to that in a moment.

You have two alternatives. You either can have a duty on ferromanganese or you can have it on the ore and ferromanganese, as suggested in the tariff. If you have the duty on ferromanganese and leave the ore on the free list, we will have to have an ad valorem duty of 25 per cent or a specific duty of not less than \$15 a ton.

The steel people yesterday said that they were in favor of a specific duty on ferromanganese, and suggested it be the same as on pig iron, or about \$2.50 a ton. Our greatest competitor is England. Before the war they had all the business in this country; since 1914 we have been producing it, and we were of great assistance to the steel companies during the war, because they could not get English ferro. Their business in this country is only 40 per cent of their total production. Our business is with 50 per cent of the steel makers in

s country, because the steel corporation makes their own. The English can afford to sell away below their cost of production for a year or two in order to get this market back. They are doing it today, and they are going to do everything possible to get us out of business.

Senator WALSH. You say your production is 50 per cent of the consumption?

Mr. ROMEYN. Yes, sir; because the steel corporation makes their own. We have adequate facilities in ferromanganese to supply the demand, eliminating the British entirely.

Senator WALSH. Well, leaving out the Steel Corporation, who make their own, your production is enough to take care of all the consumption?

Mr. ROMEYN. Yes, sir. In 1913 and 1914 the average price of ferromanganese was a little over \$60 a gross ton; to-day it is about \$65. We will take the prewar price as a conservative estimate. If ferromanganese at \$60 is imported and sold by the British here, they get an additional revenue of \$15, or 25 per cent, by virtue of exchange. Therefore I say that we must have a duty, on a conservative basis, 25 per cent ad valorem or a specific duty of \$15.

If you have a \$15 specific duty—assuming you do not have any duty on the ore—the United States Steel Corporation would not be affected, and they would have that advantage. But if you have a specific duty of \$15 it means an increase to the steel companies in the United States of only \$2,250,000 a year, gentlemen, and that is nothing—absolutely nothing. The annual steel business in this country amounts to two and a half billions of dollars, and all we want to protect this industry is a duty that will raise the cost to the steel consumer \$2,250,000 a year. That is my second point.

My third point is this: We are satisfied with an adequate specific duty or an ad valorem duty on ferromanganese, with free ore; we are also satisfied with the bill as written. The bill as written means a duty of \$39.42 a ton on ferromanganese. Out of that duty \$24.64 goes to the ore people. The duty on imported ore would be paid by the ferromanganese producer. The price of domestic ore would be raised correspondingly. Therefore the advantage we get out of the present duty as written amounts to only \$14.78 a ton. That corresponds very closely to a specific duty of \$15 a ton, which I have asked for. Gentlemen, that duty of \$39.42 a ton amounts to less than 30 cents a ton increase in the cost of steel, and if you figure the production and consumption of ferromanganese as 300,000 tons a year you have only increased the present cost of ferromanganese to the steel consumer \$8,000,000 or \$9,000,000 a year, and when we consider the millions and millions of dollars that go into the steel business that figure is not to be considered at all.

The CHAIRMAN. There are a number of duties on other materials that would run it up, as testified yesterday, to \$25,000,000.

Mr. ROMEYN. Yes, sir; quite right. We do not know anything about the other alloys. We make ferromanganese and nothing else, and ferromanganese is the biggest item and involves the largest amount of capital. Moreover, it is the most essential industry. You can not make steel in this country without it. If we have no ferromanganese industry in this country and we have a sudden war, you can not turn to making ferromanganese immediately. It takes time

to get ore; it takes six weeks to ship ore from India and from the Caucasus, to say nothing of getting it from the mines to the docks and would take months to get the mining operations going in this country.

Senator WALSH. How about the imports of ferromanganese at the present time?

Mr. ROMEYN. Imports of ferromanganese? We are glad to see ferromanganese in competition with the foreign producers to-day. A 100 per cent loss in order to get money to meet our pay rolls.

Senator WALSH. You have not reduced your rates of wages to your help?

Mr. ROMEYN. I am glad you asked me that. Our men have voluntarily taken the largest cut of any men in the steel business in the United States to-day, and our common labor is working at 22 cents an hour.

Senator WALSH. What was it two years ago?

Mr. ROMEYN. It corresponds to the iron and steel wages, which were 46 cents, and were cut down corresponding to everybody else, and our men are taking that because they know the situation and they are trying to keep going until we can get some action down here.

Gentlemen, that is all I have to say.

Senator WALSH. Is that on account of imports?

Mr. ROMEYN. It is on account of the operations of the British people.

Senator WATSON. You mean by that that the imports of ferromanganese are greatly increasing at this time?

Mr. ROMEYN. Ferromanganese imports have always taken the business away from us; they always undersell us.

Senator SMOOT. The reason you have not sold as much ferromanganese is that the steel industry is only operating at about 25 per cent; that is the real reason that you can not sell at all, is it not?

Mr. ROMEYN. That is the reason this year. We have not made a pound this year. But I have not included this year's figures. I have taken them from 1914 to 1920.

Senator WALSH. Normally you employ from 750 to a thousand men. How many employees have you to-day?

Mr. ROMEYN. To-day we have 300 men.

Senator McLEAN. You have only spoken about two companies—yours and one other. What does the entire industry amount to?

Mr. ROMEYN. There are four companies in the business to-day. During the war there were 10. The other people have been forced out of it.

Senator McLEAN. There are only four to-day?

Mr. ROMEYN. Yes. We had enough surplus money to keep running, and now we have eaten all of that up and we are about to close down.

Senator McLEAN. As I understand it, the two companies represent what percentage of the total product?

Mr. ROMEYN. The two companies I mentioned represent about 30 per cent of the production.

Senator McLEAN. Only about 30 per cent?

Mr. ROMEYN. Mr. Howard, representing the Lavino Furnace Company, who will testify next, are the largest producers. They produce about 50 per cent of the domestic production, excluding the Steel Corporation.

Senator McLEAN. Then, together, you represent 70 or 80 per cent.

Mr. ROMEYN. Yes, sir.

Senator SMOOT. And that is without the United States Steel Corporation, they making their own?

Senator McLEAN. You supply, I suppose, the smaller steel men?

Mr. ROMEYN. We supply the men who testified here yesterday, —all the large steel companies excepting the United States Steel Corporation. We have spent \$1,000,000 in equipment to make ferromanganese in our plant alone. We can make ferromanganese to-day cheaper than any of these steel companies who were here and testified yesterday that ferromanganese can be made in any blast furnace. It can not be made in any blast furnace.

Senator McLEAN. They said if this tariff were left on they would be compelled to manufacture their own ferromanganese, and they could not buy it of you.

Mr. ROMEYN. All right; if you leave that tariff on, it will suit us. We will make ferromanganese cheaper than they can do it, and we will sell it to them. We are perfectly willing to accept the present tariff.

STATEMENT OF JOHN HOWARD, GENERAL MANAGER LAVINO FURNACE CO., PHILADELPHIA, PA.

The CHAIRMAN. Are you the other speaker referred to by Mr. Romeyn?

Mr. HOWARD. I am the other speaker on the producers' side.

The CHAIRMAN. Mr. Howard, will you state for the record your occupation or business?

Mr. HOWARD. I am general manager of the Lavino Furnace Co.

The CHAIRMAN. Where is that located?

Mr. HOWARD. We have offices in Philadelphia.

The CHAIRMAN. Where is your furnace?

Mr. HOWARD. Our furnaces are at Lebanon, Pa.; Marietta, Pa.; Meridan, Pa.; and Lynchburg, Va.

The CHAIRMAN. We want those things for the record. How many men are employed by your several concerns?

Mr. HOWARD. Just now?

The CHAIRMAN. In ordinary times.

Mr. HOWARD. About 600.

The CHAIRMAN. And how many just now?

Mr. HOWARD. Nine. We have a watchman on day and night at each one of the plants and a couple of men besides.

We are going to file a brief and state why we want a duty. I was hoping yesterday that I would be able to present our views while the opponents of the bill presented theirs on the same day.

The CHAIRMAN. It is practically the same thing.

Mr. HOWARD. May I refer to a man who testified at the close of yesterday's meeting?

The CHAIRMAN. Yes.

Mr. HOWARD. No one asked the gentleman who he was or who he represented. I would like to tell you.

The CHAIRMAN. What was his name and whom did he represent?

Mr. HOWARD. It was Mr. Dette, representing Crocker Bros. He was neither a producer nor a consumer of ferromanganese. He was simply an importer, and for months this firm has been sending out

propaganda to all the different steel people asking them to oppose this proposed duty on ferromanganese.

Senator SMOOT. He did not conceal that. I understood that he was an importer. There was not any doubt about that.

Mr. HOWARD. I was sitting close, and I did not hear him say he was an importer.

Senator SMOOT. I have him down here as an importer.

Mr. HOWARD. You got it and I did not. He recommended a slight duty on the ore and a slight duty of about \$2 a ton on the ferro-

It is self-evident that as he is an agent of the British producers that he was not going to recommend a duty that would be satisfactory for the American industry.

The CHAIRMAN. I think the committee fully realizes that.

Mr. HOWARD. I hope so.

Senator WATSON. We all know that.

Mr. HOWARD. He made a statement asking that ferromanganese be put back along with pig iron, and I have listened to a good deal of testimony in regard to ferromanganese and was pleased to note that the Ways and Means Committee finally cut it out of paragraph 301 and put it where it belonged.

Senator SMOOT. Will you tell the committee where spiegeleisen ends and where ferromanganese begins? What is the difference between the manufacture of one as against the other?

Mr. HOWARD. In one case we use an iron ore containing manganese and in the other case we use manganese ore.

Senator SMOOT. I am speaking as to the actual labor that is involved. What is the difference? Do you not think there would be some little trouble in arriving at the tax to be imposed?

Mr. HOWARD. On the line of demarcation?

Senator SMOOT. Yes.

Mr. HOWARD. Yes; I do. I mention that in our brief.

Senator SMOOT. You do mention it in the brief?

Mr. HOWARD. Yes, sir.

Senator SMOOT. Nobody has yet mentioned it, and I thought I would ask you. On the one they gave \$1.25 and on ferromanganese containing more than 1 per cent of carbon they gave 2½ cents per pound on the metallic manganese contained therein.

Mr. HOWARD. That is contained manganese?

Senator SMOOT. Yes. I would like to have you, if you can, explain to me how it is going to be administered?

Mr. HOWARD. In what way?

Senator SMOOT. By the customs officials.

Mr. HOWARD. They have put a line of demarcation, have they not?

Senator SMOOT. They have not here. They say anything containing more than 1 per cent of carbon, and the same identical thing with the ferromanganese. Where are you going to divide it, that is what I want to know, for administrative purposes, and I thought maybe you could tell. You are a manufacturer of it, and I would like to know.

Mr. HOWARD. The bill carries 45 per cent.

Senator SMOOT. Yes; I know that. But the rates of duty are entirely different. In the past they have been the same. Therefore there has been no trouble in the administration of that, because they have been under the same paragraph.

Senator SMOOT. Now they are separated. Supposing you were an administrative officer to impose these duties, how would you tell under these two sections?

Mr. HOWARD. They would have to be analyzed; the metal would be analyzed.

Senator SMOOT. That is exactly where it will be difficult. Not only will the one have to be analyzed, but both—not for the amount of carbon, but as to whether one is spiegeleisen or ferromanganese.

Senator WALSH. Mr. Romeyn would like to answer that.

Senator SMOOT. I do not care who answers it.

Mr. ROMEYN. It is a very important thing with us. We claim that the line of demarcation as now made in your tariff bill is not in accordance with the customs of the trade. We want the line of demarcation between spiegeleisen and ferromanganese instead of being 45 per cent to be 18 per cent. It could be 16 to 18 or 18 to 22 per cent. Eighteen to 22 per cent is the standard grade for spiegeleisen. If it is 45 per cent it is not spiegeleisen; although that line of demarcation was taken during the war by the War Industries Board. It is ferromanganese at 45 per cent, and not spiegeleisen; spiegeleisen is 18 to 22; anything above 22 per cent is ferromanganese, and we have asked that you change the bill.

Senator SMOOT. Can you tell me why there should be a difference in that case of only \$1.25 and in the other, as provided in paragraph 3, you asked that you have free ore and a duty on ferromanganese of \$15 a ton?

Mr. HOWARD. You want to know why there should be that difference?

Senator SMOOT. Yes. Spiegeleisen, \$1.25; and ferromanganese, the former witness said that even if they had free ore it would want \$15 per ton protection—in one case \$1.25 and in the other \$15. Please tell the committee why you want that \$13.75 increase?

Mr. HOWARD. They are two different things. Spiegeleisen is from an ore containing manganese; ferromanganese is made from manganese ore which contains just enough iron to hold the manganese when going down into powder.

Senator SMOOT. Your process in the two is very similar?

Mr. HOWARD. Except that the losses on ferromanganese are very much greater. In the blast furnace for making spiegeleisen you do not lose any iron; every bit of iron you put in the top will come out at the bottom. But in making ferromanganese you can have as much as 50 per cent loss of manganese if the furnace is not run properly.

Senator SMOOT. You can have, but you do not have?

Mr. HOWARD. Some of them did, Senator.

Senator SMOOT. Some of them did, but they are not doing that today, because you would not be in business if you did.

Mr. HOWARD. No.

Senator SMOOT. Therefore, why mention that thing?

Mr. HOWARD. Well, they are two different products. If you want to get back at the real reason, ferromanganese has always been wrongly classified; it is an alloy.

Senator SMOOT. For duty purposes, you say?

Mr. HOWARD. Yes.

Senator SMOOT. That is, they have not had enough duty upon it.

Mr. HOWARD. No; it has not been classified with ferrophosphorus and ferrosilicon.

Senator SMOOT. The reason for that is the mode of handling it.

Mr. HOWARD. No; it is a blast-furnace product.

Senator SMOOT. I know it is. There is not any doubt about that. But it has always been held to be very cheaply handled as compared with the other ferro products.

Mr. HOWARD. It may have been held so, but it really is not so. It is a ferro alloy and should have been classed with the other alloys. But there was no industry in this country prior to the war.

Senator SMOOT. Spiegeleisen is a mixture of iron and manganese.

Mr. HOWARD. Yes; and silicon and carbon.

Senator SMOOT. Up to 30 per cent it is spiegeleisen?

Mr. HOWARD. Recognized as that in the trade.

Senator SMOOT. Up to that point it is exactly the same and so is ferromanganese a mixture of manganese and iron. Now, why the difference of \$1.25 in the one case and \$15 in another? I think the committee wants to know that.

Mr. HOWARD. It is for protection, Senator.

Senator SMOOT. I know it is for protection, of course. But why the necessity of the difference? Is spiegeleisen duty of \$1.25 too low or is the \$15 duty on ferromanganese too high?

Mr. HOWARD. The spiegeleisen can be made from ores that can be mined in this country and are accessible with light freights the same as iron ores. Ferromanganese hardly can be made in the same way.

Senator SMOOT. In other words, you have got to have foreign manganese ore to make your ferromanganese?

Mr. HOWARD. We do not have to have it. I am an operating manager. I used thousands of tons of domestic ore during the war when I could get them. I have used manganese ores from nearly all parts of the world.

Senator SMOOT. The reason you can not make it is because you can not get manganese ore enough?

Mr. HOWARD. Right now there is no demand for ferromanganese.

Senator SMOOT. How has it been in the past?

Mr. HOWARD. We never could get enough domestic ore to satisfy our requirements.

Senator SMOOT. And that is the reason. Therefore, the reason is not because of the difference in cost of producing it?

Mr. HOWARD. The difference in the cost of producing ferro with domestic instead of imported ores comes in with losses. Domestic ores are nearly always high in silica, and if you have a high silica ore you have an enormous slag volume with resultant increase of manganese losses.

Senator McCUMBER. Does it cost \$13 more to produce one than the other? That is simple.

Mr. HOWARD. Does it cost \$13 more?

Senator SMOOT. \$13.75.

Senator McCUMBER. Does it cost \$13.75 more per ton to produce ferromanganese than it costs to produce the spiegeleisen?

Mr. ROMEYN. Yes; it does.

Senator McCUMBER. I want to know if it does?

Mr. ROMEYN. Yes, sir; manganiferous ore is used to make spiegel-
 en. When manganiferous ore is smelted you can get a production
 200 tons a day.

Ferromanganese is made from manganese ore which is an entirely
 ferent ore. When you use manganese ore in a blast furnace, you
 n not get a production of more than 70 tons a day out of the same
 nace. Ferromanganese costs more to make because your labor
 arges are four times as large while your production is reduced to
 e-third.

Senator SMOOT. The only difference is the percentage of manganese
 the product. It is spiegeleisen up to 30 per cent, is it not—so
 cognized by the Government of the United States?

Mr. ROMEYN. To 23 per cent.

Senator SMOOT. Thirty per cent is what it is.

Mr. ROMEYN. All right.

Senator SMOOT. Now there is 15 per cent difference there, and you
 can to say that the difference in the loss and the difference between
 e 15 per cent would make \$13.75?

Mr. ROMEYN. When you get to 23 per cent; you jump immediately
 80 per cent. There is no midway. You do not make ferroman-
 nese of all those grades in between.

Senator SMOOT. If it was 60 per cent it would only be twice 30 per
 cent.

Senator McCUMBER. If it cost \$13 a ton or more difference a ton
 between the two in actual cost?

Mr. HOWARD. I would like to quote here from a brief filed in the
 Ways and Means Committee by the steel men themselves, referring
 to this same subject:

We further state that ferromanganese is a blast-furnace product like pig iron, but
 e manufacture of ferromanganese requires about three times as much coke, about
 ur times the labor cost, while the output of the furnace is about one-third that of
 g iron and the cost of ferromanganese above the manganese ore charge.

Senator SMOOT. There is no doubt in my mind but what it costs
 ore than pig iron, because of losses and everything else. But I am
 eaking now of spiegeleisen. I want to know that. I want to
 protect the ore producer, and I want to protect the ferromanganese
 manufacturer. But I do not want it put all in one place, and that is
 why I have tried to get this information. I can not see where that
 difference of \$13.75 comes in. If you have got it in your brief,
 will not say another word, because I would examine your brief.

Mr. ROMEYN. We will submit that brief this afternoon and the
 figures in it will show that.

Mr. HOWARD. I brought out the contention of the importers that
 his was always on the free list or carried a low rate, and it should be
 ee now. We want to state that in times past when the other bills
 ere framed there was no one who came here and asked for a duty
 n ferromanganese. There was no industry except what was pro-
 uced by the United States Steel Corporation and possibly by the
 Bethlehem Steel Co. That is why we are now asking for a duty.

They say that ferromanganese can be made in any blast furnace
 hat makes pig iron. That is true, if you do not care what it costs.
 ne of these importers secured a blast furnace in Pennsylvania and
 ried to make ferromanganese. He did not succeed in making a ton,
 lthough he hired an expert.

We simply want to bring out that in the equipment of our plant to produce ferromanganese we have the ability to produce it cheap enough so that the American steel producers will not have to wait and try to make it themselves.

The question was asked here of Mr. Romeyn about no ferromanganese coming into this country at this time. I have here a memorandum for an order of 200,000 pounds that was placed by the United States Navy Department in July 20, 1921, that was taken by an agent of the English ferro at a price lower than we quoted although we quoted more than \$15 below our cost.

This shows that the English are again striving to secure the American market and are selling below cost to-day. I was told yesterday by the president of one of the largest steel producers that he could buy English ferro at \$54 a ton. We can buy foreign ore as cheap as they can and our cost of manufacture is not a great deal higher. So we know they are using the same methods they used prior to the war to discourage American production. And since they consume only about 60 per cent of their total production of ferromanganese at home, they can afford for a time to sell here below their cost in order to stifle the domestic production.

Ferromanganese can not be made at any such price to-day, and the steel producers have in their mind that they will get the same price they did prior to the war. But if this American industry is put out of business the British will quickly jump their price to recoup their losses and the American steel makers will have to pay the bill.

Senator SMOOT. What was your quotation?

Mr. HOWARD. Our quotation on it was \$0.0375 cent a pound as against their \$0.0332 cent.

I want to indorse what Mr. Romeyn stated in his request for a duty.

The CHAIRMAN. You concur in his statement?

Mr. HOWARD. Yes, sir.

Mr. ROMEYN. Mr. Chairman, I represent Mr. Edward E. Marshall and I testified. But since I have been sitting down I understood Senator Smoot's question, and if you will give me one minute I will answer the question. You asked why spiegeleisen only requires \$1.25 and ferromanganese \$15 a ton. The answer is this: Spiegeleisen is not an imported article. The American Manganese Manufacturing Co., of which I am vice president, owned a manganiferous mine in the Cuyuna Range containing 100,000 tons of manganese ore, and we make spiegeleisen. There is no need for a duty on spiegeleisen. There is no competition. Spiegeleisen is made in this country and nobody can compete. Ferromanganese is imported.

Senator SMOOT. Now you have told just exactly what I wanted you to tell.

Mr. ROMEYN. Just one more point: Where a witness gets up and says there is 100,000,000 tons of manganiferous or manganese ore of 5 to 35 per cent manganese—that may be true, but you can make ferromanganese out of ore.

Senator SMOOT. We are not going to legislate on it. I will tell you that.

BRIEF OF THE AMERICAN MANUFACTURERS OF FERROMANGANESE.

Lavino Furnace Co.—Plants located at Sheridan, Pa., Lebanon, Pa., Marietta, Va., Rousens, Va.

E. E. Marshall.—Plants located at Harrisburg, Pa., Newport, Pa.

American Manganese Manufacturing Co.—Plants located at Dunbar, Pa.

Southern Manganese Corporation.—Plant located at Anniston, Ala.

In a communication from the Senate Committee on Finance, under date of July 1921, we were advised that in order to avoid duplication of arguments and suggestions relative to any tariff item that one representative be agreed upon to present our views.

We take it that this applies likewise to the brief, and in order to save the time of the committee we are submitting but one brief, signed by the above independent ferromanganese producers who are interested in the tariff, setting forth a general appeal.

These manufacturers are all independent producers, and while it was not easy to collect the views of each individual manufacturer, we have condensed the same into the smallest possible space in order to comply with the request of the committee, and we tried to omit any repetition of our testimony or our brief which was filed with the Ways and Means Committee.

DESCRIPTION OF FERROMANGANESE.

Ferromanganese is an alloy of manganese with iron, used for deoxidizing, scavenging, and hardening steel. Ferromanganese has in previous bills been improperly classified, chiefly because there was no ferromanganese industry in this country to request proper classification. Ferromanganese is truly a finished product. It is used by the steel man to complete his operation on the purification of pig iron, but does not have to refine the ferromanganese in any way. He takes nothing out of it nor does he add anything to it.

This alloy in former tariffs has been classed along with what may be called raw materials in schedule 3, but the Ways and Means Committee of the present Congress recognized the fact that it was a distinct alloy, and put it where it rightfully belongs. As this is a steel-producing country and we must have a steel industry in order to make any progress, and to protect ourselves in time of need, it is also clear that to maintain the steel industry we must also have a ferromanganese industry. This was very clearly demonstrated in the Great War, when the supply from abroad was suddenly cut off from this country. As steel requires protection, it is self-evident that ferromanganese equally deserves protection.

Unless the American producers of ferromanganese are given proper protection at this time, they must go out of business and sacrifice the furnace plants they have equipped for this product, entailing the loss of millions of dollars to the owners, loss of earnings to the American employees, and loss to the country of a vitally essential industry.

Wars such as the recent one break out suddenly, but an industry like the ferromanganese industry can not be developed overnight nor are the ores available on short notice.

Shortly after the outbreak of the European War and before this country entered it there was practically no ferromanganese available for steel makers in this country outside of that produced by the United States Steel Corporation for their own use, so that the foreign producers could not continue to supply the needs of this country in addition to the European requirements. Therefore it was only through the acquisition of furnace plants and knowledge of where to secure suitable manganese ore in the foreign ore markets by the American ferromanganese producer that the industry was developed here to meet the situation.

For the proper protection of the country we should be independent of any other country for our supply of ferromanganese on account of its vital necessity in the production of steel.

To be in accordance with the custom of the trade, we recommend to have the wording in paragraph 301, lines 5, 6, and 7, page 39 of tariff bill H. R. 7456, Schedule "Metals and manufactures of," which now reads:

"Provided, That spiegeleisen for the purposes of this act shall be an iron manganese alloy containing less than 45 per cent of manganese."

changed so that it shall read:

"Provided, That spiegeleisen for the purposes of this act shall be an iron manganese alloy containing less than 30 per cent of manganese."

and to have the wording in paragraph 302, lines 19, 20, and 21, page 39 of H. R. 7456, Schedule 3, "Metals and manufactures of," which now reads

"*Provided, That ferromanganese for the purposes of this act shall be such manganese alloys as contain 45 per cent or more of manganese.*"

changed so that it shall read:

"*Provided, That ferromanganese for the purposes of this act shall be such manganese alloys as contain 30 per cent or more of manganese.*"

This line of demarcation, having 44 per cent in manganese as the limit for spiegeleisen, is not in accord with the custom of the trade, as the standard grade of spiegeleisen is that testing from 18 to 22 per cent in manganese, although metal analysis up to 30 per cent manganese is classed as spiegeleisen. By placing the maximum limit on spiegeleisen at 44 per cent manganese content, it appears that some overprotection was made, in view of the intention to give protection to the ferromanganese industry and to correct the error the duty on ferromanganese should be applied on all metal containing over 30 per cent of manganese. It should be clearly understood, however, that metal containing 44 per cent in manganese should not be classed or considered as spiegeleisen.

Enormous quantities of manganiferous and ferruginous manganese ore exist in this country; therefore spiegeleisen does not need protection, whereas ferromanganese does. This will explain why a protective duty on ferromanganese is necessary and not necessary on spiegeleisen.

Due to our experience during the war, when we were unable to maintain an adequate ore supply for our furnaces, we became convinced that there was not a sufficient supply of domestic ore (a fact strongly supported by the independent steel interests and their testimony before the Finance Committee).

It is the consensus of opinion on the part of the steel interests and the American ferromanganese manufacturers, based on actual experience in the past, that high-grade manganese ore of the quality necessary for the manufacture of ferromanganese does not exist in sufficient quantity or quality in the United States to support the ferromanganese industry, and even such small quantities as may be available in remote districts, principally in the Western States, from where the railroad transportation charges per ton alone to bring the ore to the Eastern States (where practically all the ferromanganese is manufactured and consumed), are in excess of the price per ton at which high-grade foreign manganese ore can be landed at our eastern seaboard ports.

In other words, it is the contention of the independent steel interests and the American ferromanganese manufacturers that a duty of no less than 100 per cent on manganese ore will be necessary to afford any kind of protection to a few mining interests in the Western States who are laboring under the belief that with protection they will be able to produce and market high-grade manganese ore for the manufacture of ferromanganese.

Even were we to assume that a certain tonnage of high-grade manganese ore could be produced in the Western States, as was claimed by certain engineers and property owners who appeared before your committee, nothing short of an exorbitant duty on manganese ore would afford them sufficient protection to enable these western mines to compete, since the American ferromanganese manufacturers will always be able to obtain their supplies of manganese ore in the foreign markets of the world at a lower price delivered at their plants on the eastern seaboard notwithstanding the duty they would have to pay thereon, as the railroad freight charges from the producing points in the West on domestic ore to eastern points would exceed the duty that would have to be paid on imported manganese ore.

It seems to us that a duty on manganese ore will not serve the purpose desired to protect the domestic miner, but only burdens the steel industry with a higher duty on ferromanganese, since the ferromanganese makers would naturally have to include in their cost of production the duty they would have to pay on the manganese ore.

The market price for high-grade foreign manganese ore to-day, delivered f. o. b. at eastern seaports, is between 20 and 25 cents per unit, which, calculated on an ore containing 50 units of manganese, is equivalent to from \$10 to \$12.50 per gross ton. On the other hand, the railroad freight rates on manganese ore from California consuming points, from the Butte and Phillipsburg, Mont., district and from the Baterville Ark district (where limited quantities of high-grade domestic manganese ore are reported to exist) to eastern consuming points (say, Pittsburgh district) amount to \$14.18, and \$16.02, respectively, per gross ton.

The above-mentioned market price for foreign high-grade manganese ore averaging 50 per cent and over in metallic manganese of from 20 to 25 cents per unit may be considered as a normal price and not a price necessarily due to the present depressed state of business. The average price of foreign high-grade ores over a period of 10 years

to the war did not exceed 25 cents per unit, or \$12.50 per gross ton delivered on the Atlantic seaboard.

It is obvious from this comparison that unless a duty of over 100 per cent is placed on manganese ore that no domestic ore will be produced.

At the hearings before the subcommittee on metals of the Ways and Means Committee the question was asked of a representative of the United States Steel Corporation whether they thought there was sufficient ore in this country to take care of the requirements. In replying he stated the best answer to that question is that the Steel Corporation purchased a manganese ore mine in Brazil within the past year, and their only regret was that they had not done so 10 years ago (the inference being that during the many years they had been purchasing the ore from Brazil they had paid enough in profits to the Brazilian mine owners to have paid for the mine). This is conclusive evidence that they concluded the ore did not exist in this country.

During the hearings before the Ways and Means Committee we asked for free manganese ore and a protective duty on ferromanganese. However, even though we knew the ore did not exist in quantity in this country, if Congress wished to impose a duty on ore for revenue purposes we were satisfied if they put on a compensatory duty on ferromanganese.

In filing this brief with the Senate Finance Committee we do not presume to know what form the final bill will take, but we are still convinced there is not an adequate domestic ore supply and that manganese ore should remain on the free list, and urge that a duty be imposed on ferromanganese of 25 per cent ad valorem, based on the American valuation. It must be borne in mind, however, that should your committee recommend a duty on manganese ore that there must necessarily be an adequate compensatory duty on ferromanganese, adhering to ratio specified in the H. R. bill 56.

The unfair methods practiced by the foreign producers in the past leads us to conclude that only an exorbitant specific duty would afford the American industry adequate protection. It is for this reason that we should have an adequate ad valorem duty, with the added advantages of the American valuation plan to meet the situation.

As the result of pernicious propaganda on the part of the American agents of the English ferromanganese producers the question has arisen as to why, when former tariff bills did not carry a higher duty than \$4 a ton it should now be necessary to propose a duty that would protect the manufacture of ferromanganese. We would like to again emphasize the fact that in former years there were no independent makers of ferromanganese in this country and consequently there was no industry that needed protection as there is at this time.

In the copy of the Iron and Coal Trades Review, the leading iron and steel trade journal of England, issue of August 12, 1921, there appears on page 217 quotations on British-made ferromanganese, as follows: 76 to 80 per cent "for home consumption," \$18 per ton; "for export," £14 per ton.

It is therefore perfectly evident that the British pool is again resorting to their pernicious habit of dumping in this country to destroy the ferromanganese industry, in this case the differential being £4 sterling per ton lower than they will sell consumers in their own country.

The steel interests admit that ferromanganese is one of the chief constituents and essential in the manufacture of steel, and it is therefore highly important that the United States should have its own ferromanganese industry by proper protection and that we should not be dependent on other countries for the supply of this most essential article.

The steel interests, as evidenced by their testimony before the Finance Committee, were not opposed to a duty on ferromanganese. They, however, oppose the high rate of duty of 2½ cents per pound on the metallic contents, as proposed by the Ways and Means Committee, on the basis that it would add too much to the cost of their steel. The proposed duty on ferromanganese is necessarily high because it is burdened with a duty of 1 cent per pound on the metallic manganese in the ore.

The duty proposed in bill H. R. 7456 on ferromanganese carries protection to both manganese ore and ferromanganese in the proportion of about two-thirds for the ore and one-third for ferromanganese; therefore it is evident that if ore is permitted to remain on the free list and an ad valorem duty of 25 per cent imposed on ferromanganese that about 66 per cent of the high duty objected to by the steel producer will be eliminated and the necessary protection can be accorded to ferromanganese.

It would hardly be consistent for the steel interests to request that their own industry be protected and deny adequate protection to the ferromanganese industry. They assume that ferromanganese would cost them less if a small duty or no duty is placed on the product, overlooking the fact that unless a duty giving adequate protection is

granted the American industry will cease to exist and they will have to pay the foreign producer an amount equivalent to the duty that would be necessary to protect the industry in this country. With the American industry out of the way the British producers would be able to fix the price for American consumption, as has been the practice in the past.

We contend that the position of the American steel producer would not be changed, for in one case he pays a price for his ferromanganese which includes protection for the American industry, and on the other hand, with no duty, he will pay the same amount to the foreign producer to sustain a foreign industry.

The dominating factor of the foreign producers is the British pool, whose avowed purpose is to reclaim the American trade and to drive the American maker out of business by unfair competition. This unfair competition has already been brought to the attention of the United States Government and is in process of investigation by the Federal Trade Commission.

The American producers of ferromanganese have at present ample furnace capacity to supply all the independent steel makers in this country even under war-time consumption.

The table given below will show the production over a period of only four of the producers, and as the output was governed by what was sold it is only fair to say that this tonnage would have been materially increased had the demand been sufficient.

If the steel makers' memory were not so short, and if they would adhere to actual facts, we feel sure they would all plead for protection for a ferromanganese industry. Just one illustration: When the war broke out the foreign supply was curtailed and stocks here rapidly diminished, so that there threatened a famine in ferromanganese. The result was that the price of the small amount of ferromanganese available jumped to unheard of prices and threatened a shutdown of practically every independent steel plant in the country. Shortly after this the American ferromanganese producers came to their rescue, and by gradually increasing the production the price was brought down to a reasonable war-time level and remained there.

In conclusion, if the ferromanganese industry is permitted to survive by reason of an adequate duty, then the steel producers would not be subjected to any undue hardship and the great United States—the largest producer of steel in the world—by fostering a ferromanganese industry of its own would not be dependent on foreign countries for its supply of this vitally important element.

Production of American ferromanganese.

The above represents the tonnage of ferromanganese produced exclusive of that produced by the United States Steel Corporation and other steel companies, and does not include the production of several other companies who operated during the war but went out of business immediately after the armistice was signed.

MANGANESE AND MANGANESE ORE.

[Paragraph 302.]

STATEMENT OF A. C. DINKEY, PRESIDENT OF THE MIDVALE STEEL & ORDNANCE CO., NEW YORK, N. Y.

The CHAIRMAN. Mr. Dinkey, will you proceed to address the committee?

Mr. DINKEY. I want to address the committee on manganese and manganese ore.

Senator LA FOLLETTE. What are your initials?

Mr. DINKEY. A. C.

Senator LA FOLLETTE. And your post-office address?

Mr. DINKEY. No. 14 Wall Street, New York.

Senator LA FOLLETTE. And your official relation to the Midvale company?

Mr. DINKEY. President.

Senator LA FOLLETTE. How long have you been president of that company, Mr. Dinkey?

Mr. DINKEY. Not quite six years.

The CHAIRMAN. You have been associated with the company how long?

Mr. DINKEY. Since it was formed, about six years.

The CHAIRMAN. And prior to that——

Mr. DINKEY. I was with the Carnegie Steel Co.

The CHAIRMAN. You have been all your life in the steel business? That is the point I want to bring out. You are an expert and are thoroughly familiar with it?

Mr. DINKEY. Thirteen years president of the Carnegie Steel Co., and before that I was its manager.

Senator LA FOLLETTE. How long were you president of the Carnegie company?

Mr. DINKEY. Thirteen years.

Senator LA FOLLETTE. You passed from the presidency of that company to the presidency of this company?

Mr. DINKEY. To the presidency of the Midvale company.

Senator LA FOLLETTE. So that accounts for about 20 years of our life?

The CHAIRMAN. How long have you been in the steel business?

Mr. DINKEY. About 30 years. I started at the Homestead Steel Works, in minor positions, through the Homestead Steel Works to manager of the works, and then president of the company.

The CHAIRMAN. You worked yourself up to the head of the company by a knowledge of the industry?

Mr. DINKEY. Yes, sir. The outstanding facts with respect to manganese ore and ferromanganese are that its use is absolutely necessary in the production of steel. You can make no steel without manganese. There are only three districts in the world with deposits of sufficient size to support the production of ore on anything like the scale commensurate with the needs of the industry, and these three places are India, Russia, and Brazil. Why the Lord put it so far from the iron I do not know.

The CHAIRMAN. There was not room enough for everything.

Mr. DINKEY. Within the borders of the United States no prospect has been found, even under the spur of war necessity, which it is reasonable to suppose will support a mining operation on an economic basis either as to quantity, quality, or cost.

That ore from India, Russia, and Brazil can be laid down at Atlantic ports for about \$12 per ton. Approximately this sum must be paid for railway freight alone from such small manganese-ore mines as there are in the United States to the chief domestic consuming point of such ore.

That the foreign steel industry—that is, England, Germany, France, and Belgium—draws its supply of manganese ore from these same far-off fields, the costs to them being about the same as to steel producers in the United States.

The present House bill would add about 30 cents per ton to the cost of all steel ingots produced in the United States. The folly of doing this while expecting the neutral markets of the world to absorb from 15 to 20 per cent of the finished steel output of this country, on a competitive basis, is apparent.

Senator LA FOLLETTE. You export about 15 to 20 per cent of your product?

Mr. DINKEY. We have exported as much as 15 per cent. At the present time we are exporting very little.

Senator SIMMONS. When you say "we have" you refer to the industry at large?

Mr. DINKEY. No; I am speaking of the Midvale Steel & Ordnance Co., but we are one of the group that organized under the Webb bill so as to get an exporting house that would have some strength and power and sufficient funds to establish themselves.

Senator SIMMONS. And that group exports from 15 to 20 per cent?

Mr. DINKEY. Ten per cent, the whole group.

Senator SIMMONS. What was it you said about 15 to 20 per cent?

Mr. DINKEY. We expect the steel industry to export 10 to 20 per cent now.

Senator SIMMONS. Not that it has been doing it?

Mr. DINKEY. Not that it has been done. They have exported nearly 15 per cent.

Senator SIMMONS. How much are you exporting now?

Mr. DINKEY. I should say it might be 5 or 6 per cent.

The CHAIRMAN. That is dependent on political and other matters settling down in other countries?

Mr. DINKEY. In other countries. We now have a sales organization which is planted in every neutral market in the world seeking all kinds of orders, just as they seek here, glad to accept the small ones, which are handled on a different basis from the large ones.

We have a collecting organization that has been put together at great expense, and they are doing some business even under the stress of conditions as they exist to-day.

Senator SIMMONS. Do you make your own ferromanganese?

Mr. DINKEY. We are making it now. We were forced to it during the war.

Senator SIMMONS. How many big concerns in that group make their own ferromanganese?

Mr. DINKEY. The Bethlehem Steel Co. and ourselves I think are the only two independents. I think Jones & Laughlin have made it at some time.

Senator SIMMONS. And the United States Steel Corporation?

Mr. DINKEY. The United States Steel Corporation has always made it for about 20 years, perhaps longer.

The United States Steel Corporation would be less disadvantaged than all the other steel producers in this country. The Steel Corporation makes its own ferromanganese almost entirely out of imported manganese ore. All other domestic steel producers generally buy their ferromanganese, either because they do not use ferromanganese in sufficient quantities to justify a blast furnace operation, or because they do not have the necessary facilities.

The much higher duty proposed for ferromanganese than for manganese ore would have this effect:

Every ton of ferromanganese used by the Steel Corporation would cost it, in duties, \$23.65 per ton. All other domestic steel producers would pay \$39.42 per ton in duty; that is, the duty on ferromanganese.

There is a difference of about \$16. We ask for free ore and a compensating duty on ferromanganese, something similar to the compensating duty you have on pig iron, and suggest \$2.50 per ton.

Senator SIMMONS. You say you ask for free ore and a compensating duty on ferromanganese. A compensating duty for what, if you have free ore?

Mr. DINKEY. It is to compensate the maker of ferromanganese in this country as against a maker in England about the same sum of money as represents the difference in labor cost here and in England. That is what I mean by compensating.

Senator SMOOT. On the same basis as iron?

Mr. DINKEY. On the same basis as iron.

Senator SMOOT. Can you tell me what success they are making in producing manganese in Cuba?

Mr. DINKEY. Yes, sir. In the early days of manganese production, our first source of supply nearby was Virginia. That was practically exhausted. There is nothing left there except small deposits pretty widely scattered.

Senator SMOOT. Pockets?

Mr. DINKEY. Yes, sir. The next near at hand supply was Cuba, and that has been running almost ever since, and there are still some deposits that are workable in Cuba. The Bethlehem Steel Co. drew a good deal of their supply from Cuba.

Senator SMOOT. About one-twentieth of the importations come from Cuba, and I was wondering whether they were going to increase or decrease.

Mr. DINKEY. I think they will continuously decrease. I think the quantity that is there is pretty well known and its location for cheap production is pretty well known. Are there any more questions on manganese?

[No response.]

Just a few general remarks about the situation of our industry.

We normally, based on our natural capacity to manufacture, employ about 40,000 men.

Senator SIMMONS. I want to ask a question or two.

The CHAIRMAN. I would like Mr. Dinkey to continue his statement about the situation of the industry before he is interrupted. It is a very important point.

Mr. DINKEY. We did employ about 40,000 men. To-day we are running about 11,000. The conditions, as you can easily imagine, are very distressing at nearly all points. This company owns one of the most favorably situated ore mines in Minnesota. You probably all know the name of it. It is the Mahoning mine. Since the Mahoning mine started to ship it has never failed to ship except this year. We have shipped this year about 350,000 tons. Our normal output is about two and a half to three million. The mine is doing nothing.

We have a very valuable mine in Michigan known as the Penn at Vulcan. That has shipped not a pound this year and will ship none.

Senator SIMMONS. You are referring to ore?

Mr. DINKEY. Yes, sir.

Senator CALDER. What has it shipped before?

Mr. DINKEY. Three hundred and fifty thousand tons. It is a de mine.

The CHAIRMAN. It employs about 700 men, and they have all be out of work this year and will continue out of work so far as that mi is concerned?

Mr. DINKEY. Except that that mine we are treating a little diffe ently. It is running under slow production and piling the ore. Th reason to move us in that direction is that it is an isolated distric The men have no place to go. There is no other industry there. is on a bleak range in the northern peninsula of Michigan; and rath than throw the organization away—because they would have to , away—we are running just as slowly as we know how and piling the or

Senator SMOOT. Giving them enough to eat?

Mr. DINKEY. Yes, sir.

Senator LA FOLLETTE. What were you paying common labor t the hour at the high point during the war?

Mr. DINKEY. Forty-two cents.

Senator LA FOLLETTE. The same as the other companies?

Mr. DINKEY. Yes, sir. They are generally alike.

Senator LA FOLLETTE. What are you paying now?

Mr. DINKEY. Twenty-five cents. That rate went into effect in t middle of August, the 15th of August.

Senator LA FOLLETTE. What were you paying before the war?

Mr. DINKEY. Depending upon how far you go back. Right ne the war it was about 20 cents.

Senator LA FOLLETTE. Back of that?

Mr. DINKEY. Before we got into the war, when the war was starte about 20 cents. Before that, 17½ cents.

Senator LA FOLLETTE. How long had it stood at 17½ cents?

Mr. DINKEY. \$1.75 was the common rate for four or five years, an then it moved to \$2 and that was the common rate for three or fo years.

Senator LA FOLLETTE. For example, what were you paying abo the time you took the presidency of the Carnegie Steel Co.?

Mr. DINKEY. \$1.20.

Senator LA FOLLETTE. That would be per hour?

Mr. DINKEY. Twelve cents per hour.

The CHAIRMAN. That was 20 years ago?

Mr. DINKEY. Twenty years ago.

Senator LA FOLLETTE. How long did the wages continue at th figure?

Mr. DINKEY. They moved up very slowly, 12½, 15, 16½, 17—

Senator LA FOLLETTE. Until you got within a few years of th war?

Mr. DINKEY. Yes, sir.

Senator LA FOLLETTE. And then they were about 17 for five or s years along in there?

Mr. DINKEY. Yes, sir.

Senator LA FOLLETTE. And then when the European war can on, but before we went in, they had moved up to about 20 cents?

Mr. DINKEY. Yes, sir; and in the height of it, after we got in, th went to about 42 cents.

Senator LA FOLLETTE. I suppose when we take the wage of the common labor all the other wages are relative to that, are they not?

Mr. DINKEY. Yes, sir. In ordinary steel work, if you will state a common labor rate I can nearly reproduce the whole scale for it, including mechanics and steel workers and handy men. It goes through gradations all the way through the works.

Senator LA FOLLETTE. Will you furnish a table that will show to the committee the scale of wages paid in the different departments?

Mr. DINKEY. Yes, sir; I shall be glad to do that. It is hard to interpret, because it is on a tonnage basis. Suppose I put it in figures?

Senator LA FOLLETTE. Per month or per hour. Earnings per ton would probably be better; and give the number of hours of work per day.

Senator SIMMONS. You own mines and mine your own ore?

Mr. DINKEY. Yes, sir; one of the largest, a splendid mine——

Senator SIMMONS. You do not think there ought to be any protection on ore. You do not buy any ore. You have a mine out of which you get your ore?

Mr. DINKEY. Yes, sir.

Senator SIMMONS. And you do not think you need any protection. You do not sell any ore, do you?

Mr. DINKEY. Only incidentally. We do not offer ore for sale.

Senator SIMMONS. Suppose you did not own that mine and somebody else owned it who had no factory. He would have to sell that ore in competition with this ore which you said came in here in large quantities from India, Brazil and Russia, would he not?

Mr. DINKEY. That is what he would.

Senator SIMMONS. He employs common labor just as you do, does he not?

Mr. DINKEY. Yes; but he has not——

Senator SIMMONS. Why do you think you ought to have protection against that sort of labor, when the man who owns this mine but has no factory as you have, who is not a manufacturer as you are, should have no protection as to his labor?

Mr. DINKEY. I want to go back and have you realize that what I said in the beginning is the real state of facts. That manganese ore——

Senator SIMMONS. I want you to get down to this point. You are asking protection in the interests of American labor.

Mr. DINKEY. I am holding it to manganese ore. Let us discuss it from that standpoint.

Senator SIMMONS. There are some people in this country that are producing manganese ore that do not own a factory and consume their own ore as you do. They sell it. They employ American labor, just as you employ American labor. If your proposition carries with this committee, will they not be unprotected as against this cheap India labor that you spoke of a little while ago?

Mr. DINKEY. You have got to go back to this. Whether I am telling the truth or not you can very quickly determine.

Senator SIMMONS. I am not doubting that you are telling the truth, but you are not recognizing the principle that you invoke in behalf of your labor.

Mr. DINKEY. A principle can not be applied to a thing that is impracticable. There are no manganese deposits in the United States commensurate with the needs of manganese ore. There are none.

Senator SIMMONS. There are some that are being worked by people who do not own factories.

Mr. DINKEY. Not at all. The ore does not exist. How are you going to apply a principle to a thing of that kind?

Senator SIMMONS. Do you mean to say that there is nobody in the country producing manganese ore that does not himself manufacture that ore?

Mr. DINKEY. No. No one is producing ore except an incidental carload or two. There is no one producing ore and manufacturing manganese in any relation at all to the industry; none.

Senator SIMMONS. I would like very much, then, for you to give me the amount of manganese ore that is produced in this country by persons that do not manufacture that ore into manganese.

Mr. DINKEY. There is practically none.

Senator SIMMONS. You state that there is none?

Mr. DINKEY. Practically none.

Senator SIMMONS. Very well.

Mr. DINKEY. Just a minute. There is a map in the back of the book——

The CHAIRMAN. Are you going to have this book printed?

Mr. DINKEY. Yes, sir; I am going to submit it. Here [indicating] is where the manganese is produced, and there [indicating] is where it is used. There is nobody making ferromanganese. They tried it in Montana, and, of course, they quit it. Their freight rate is \$12 to Pittsburgh.

Senator SIMMONS. I understand you to mean that the steel manufacturers, or rather the big steel manufacturers, have practically bought up all the manganese ore mines in this country?

Mr. DINKEY. There is no big steel manufacturer that owns one of these mines.

Senator SIMMONS. I thought you said you owned one of these mines.

Mr. DINKEY. I am talking about iron ore.

Senator SIMMONS. I am talking about manganese. I thought you said you produced it from your own mines.

Mr. DINKEY. Oh, no. I was talking about iron ore when I spoke about the big Mahoning mine.

Senator WALSH. To what extent has your business depreciated as to importations in recent months? You say it is in very bad shape and its mines are closed up.

Mr. DINKEY. Oh, yes.

Senator WALSH. To what extent?

Mr. DINKEY. There are almost no importations.

Senator WALSH. It is due entirely to world conditions?

Mr. DINKEY. To world conditions; certainly.

Senator WALSH. There is no demand for goods and very limited purchasing power on the part of the people?

Mr. DINKEY. Yes, sir. They are conditions that I can not analyze completely, even to myself.

Senator WALSH. So the present conditions in your trade, at least, could not be traceable to importations of commodities which are produced—

Mr. DINKEY. No, sir. We have before us some threatened importations, but they have nothing to do with the business conditions.

Senator SIMMONS. You do not own your manganese ore, then?

Mr. DINKEY. No, sir. We do not own any manganese ore, and the big steel concern owns any of this manganese ore.

Senator SIMMONS. Does not the United States Steel Corporation own its manganese ore?

Mr. DINKEY. It owns foreign deposits in Brazil.

Senator SIMMONS. But owns none in this country?

Mr. DINKEY. No, sir. They might own some incidentally, but I am sure they are not operating.

The CHAIRMAN. Is there anything else?

Mr. DINKEY. Nothing else.

A copy of the brief referred to by the witness was submitted by him to each member of the committee.)

STATEMENT OF GEORGE H. CROSBY, DISCOVERER AND EXPLORER OF MINERALS, DULUTH, MINN.

The CHAIRMAN. Mr. Crosby, you reside in Duluth, Minn.?

Mr. CROSBY. Yes, sir.

The CHAIRMAN. What is your business?

Mr. CROSBY. I am a discoverer and explorer of minerals.

The CHAIRMAN. What do you desire to address yourself to in connection with this bill?

Mr. CROSBY. Manganese-bearing ore.

The CHAIRMAN. Are you repeating what has already been stated to the committee?

Mr. CROSBY. There has been nobody on manganese-bearing ore. There are two men here on the producing manganese-ore industry—Charles W. Potts and myself.

The CHAIRMAN. You may proceed.

Mr. CROSBY. In order to get myself properly before the committee, I will state that I am a discoverer and explorer of minerals on the Minnesota, Michigan, and Wisconsin ranges and elsewhere. By exploring is meant the proving of tonnages and grades to determine merchantability, by the use of power-driven churn and diamond drills. I have had an experience of over a quarter of a century and I am one of the pioneers of the Mesabi and Cuyuna Ranges. The Mesabi is an iron-ore bearing range; the Cuyuna Range is known as an iron range, but a considerable portion of the ore from this district carries manganese and has been of considerable economic importance on account of its manganese content in steel making.

Since the discovery of the Cuyuna iron and manganese range there has been about 2,800 holes drilled, differing in depth from 60 to 1,000 feet. Of those 2,800 holes I have personally drilled 700. I have drilled something like 20 properties. Eight of those properties have become producers of manganese-bearing ore and helped to furnish the manganese that was used in the steel manufacture during the war period.

During the year 1918 there were 860,000 tons of this material shipped from the Cuyuna Range to the steel industry in this country and used in the manufacture of steel; and, in addition to that, there were 305,000 tons of what we call high-grade manganese ore running 40 per cent or better. This higher grade of manganese came from different localities, more especially from Butte and Phillipsburg, Mont., and from Virginia and Arkansas. The balance of the tonnage was distributed over a large area, and about 30 States were represented.

It has been stated by witnesses here—and I simply am amazed at the statements they have made—that there are no reserve tonnages of manganese ore in this country. As a matter of fact, we will prove to you in a brief that will be presented by Mr. Charles W. Potts, based upon Government reports and reports of producers of this material, who have made explorations of their deposits and measured the tonnages and the grades, etc., that there are 36,000,000 tons of ferruginous manganese ore in reserve; that there are over 20,000,000 tons of high-grade manganese ore that runs over 40 per cent ready to be mined and shipped to the steel manufacturers.

I do not believe it is necessary for me to dwell upon where the manganese that has been used up to 1914 came from, because you are all familiar with that. But I will state that most of it came from Brazil, the Caucasus, and India. It is true that this ore has been the chief source of supply that steel makers have used generally in the manufacture of steel. It comes, perhaps, in larger deposits. However, the grade is no higher than our best domestic ores.

The domestic-ore producers rose to the emergency during the war and filled a demand that would have been quite impossible to have filled otherwise.

I personally spent, in trying to produce for war purposes, \$1,450,000 in the development of mines in Minnesota, and I wish to state that this money will be almost a total loss to me unless the producers of manganese ore in this country are protected.

I have read the report of the Tariff Commission on the subject of manganese-ore reserves and know the tonnages of manganese-bearing ores and the grades that have been accredited to this range by the United States Geological Survey, series 121. Based on the knowledge I have of the Cuyuna Range, gained through years of experience, these estimates do not fully represent either the actual tonnages or the proper classification of grades of this district.

According to the reports issued by the Geological Survey, there are only 13,628,000 tons of manganese-bearing ore, containing 5 to 10 per cent manganese, in the district. No figures are given for an additional reserve in prospect. This report seriously minimizes the importance of manganese-bearing ores of the Cuyuna Range, for the following reasons:

That the actual tonnage is greater than claimed. There were 12 mines on the Cuyuna Range that were producing or preparing to produce manganese-bearing ore in 1918. I can name two out of the group that contain more ore than the Geological Survey says exist in the whole district. The Sagamore contains 11,000,000 tons, and Ida May, 4,000,000. The proved tonnage of Cuyuna Range is 36,000,000 tons. This constitutes the actual tonnage of manganese-bearing ores included in the classification of ferruginous manganese

and manganiiferous iron ores containing 5 to 35 per cent manganese, of which the balance of the mineral constituent is iron ore. A fact generally overlooked by the Geological Survey and the Bureau of Mines, that is to say, they take it into consideration, but when they present their totals of reserves they do not mention it, that 5 per cent manganese ore, if it were contained with rock, would be of little avail as a mineral, but is quite valuable if it is combined with iron ore. For instance, where manganese ore in the Cuyuna Range has 5 per cent manganese it has a constituent mineral which contains 50 to 55 per cent iron ore. Therefore, it becomes commercial in that way, and it is used in making high manganese pig. The Government report minimizes the importance of the ores of the Cuyuna Range by ignoring the probable ore. There is an additional tonnage of probable ore not capable of definite calculation, of certain existence, which would undoubtedly increase the reserve tonnages to approximately 50,000,000 tons.

The Government report minimizes the importance of the Cuyuna Range, in that it does not take cognizance of the vast area of partly developed ore bodies contiguous to proven deposits.

In addition to the 50,000,000 actual and probable tons of manganese ores, there are a great many properties on which diamond drilling has been done and on which merchantable grades of manganese-bearing ore have been found, but owing to the lack of demand for these ores at this time exploration has not been continued to the extent where tonnages could be measured. The 50,000,000 tons above considered represent only those properties that have been quite thoroughly drilled in the heart of the Cuyuna Range, which is confined within a rectangle seven miles wide and eight miles long. There is an area many times as great as the area described above which is all within the proven manganese formation and which has not been drilled because of the fact that it is away from the railroads and because there has not been sufficient demand to warrant thorough development. However, this has been proven by the discovery of the ore at different points throughout the area described above. The Cuyuna Range, in my opinion, has great possibilities for the discovery of additional large tonnages of manganese-bearing ore. If it were thoroughly drilled it would undoubtedly add greatly to the reserve ore bodies actually proven. Upwards of \$7,000,000 have been spent in development on this range, and at the present time there are only two mines operating against the demand during 1918 under war demand. Unless manganese ore has a protective tariff, the domestic mine owners and operators will be obliged to abandon their properties, as they can not compete with cheap mining costs of ores from Brazil, India, and Russia because of the difference in labor costs.

It has been pointed out that the ores of the Cuyuna Range, containing comparatively small percentage of manganese—about 10 per cent, and the balance of the metal content, approximately 40 per cent iron—are not to be classed as low-grade manganese ores in the same sense that an ore containing 10 per cent manganese without the presence of iron ore would be so classified.

It has been proven by a great many examples that the manganese content of these ores is capable of utilization in the manufacture of

steel. This practice has been followed under two different methods the first one comprises the manufacture of a manganese alloy known as spiegeleisen, which normally contains about 20 per cent manganese and 75 per cent iron and 5 per cent carbon. This alloy is used in the Bessemer process of steel making and can be made out of manganese ore where the total metallic content of the manganese is 12 per cent or better. Approximately 25 per cent of the 36,000,000 tons or 9,000,000 tons of the manganese bearing ore of the Cuyuna Range contains manganese 12 per cent or better.

The other 75 per cent of the manganese-bearing ores of the Cuyuna Range, 27,000,000 tons, contains approximately 7 per cent manganese. This is all capable of utilization in making high manganese pig iron. High manganese pig iron has also been used in steel making, thus eliminating the use of additional manganese to the steel bath at the time of the pouring in as large amounts as is now used where all the manganese is added in the form of 80 per cent ferromanganese.

This practice has been followed in European steel making; it has been followed by the Colorado Fuel & Iron Co. for a number of years and I am reliably informed this practice was successfully employed by a number of steel companies during the war period. There are numerous publications tending to prove that this practice was entirely satisfactory and a steel of a better grade was produced than has been produced by the other practices.

This, then, proves that the manganese-bearing ores of the Cuyuna Range are a valuable source of a supply of domestic manganese and should be taken into account by the Government in estimating domestic reserves.

The average content of manganese in the 36,000,000 tons of manganese-bearing ores of the Cuyuna Range district of Minnesota is about 9 per cent. Thirty-six million tons of 9 per cent manganese bearing ores is equivalent to approximately 5,000,000 tons of high grade manganese ore containing 45 per cent manganese.

It is my opinion that a tariff on manganese ore would stimulate the exploration of manganese-bearing minerals that as yet are but slightly developed. And when this development has reached the proportions which would naturally be expected, America will learn that she has ample supplies of manganese ore to last as long as our vast supplies of iron ore, which, if the lower grades are utilized at the same ratio that the late Andrew Carnegie estimated, we will have both iron and manganese sufficient to last this country for 20 years.

There are 23 mines on the range that produce manganese ore and out of that 23 mines of the Cuyuna Range there is not one running and producing ore to-day. Every one of them are closed down and out of 39 mines on the range that produced manganese and iron ore, there are only 2 mines running. The condition is appalling.

I say this with all candor: I believe that if this industry were protected so that there would be a sale for the ore that this country is capable of producing 75 per cent of the manganese that is consumed in the steel-making trade of this country and would be able to do so for a great many years. There is no question in my mind about it. For instance, in Minnesota alone there has been explored up to this time only one-eighth of the actual proven formation, and

covers an area of 36 miles square. At different points throughout a manganese-ore bearing district, which covers about eight times that area, there have been holes put down and manganese of a merchantable quality been discovered.

Senator McCUMBER. Mr. Crosby, may I ask a question just to get clear information? You get both the pig iron and the manganese from what we call iron ore, do you not?

Mr. CROSBY. No, sir; we get high manganese pig iron from ferrous manganese ore, not iron ore.

Senator McCUMBER. And a certain percentage of it will be pig iron and a certain percentage manganese?

Mr. CROSBY. You mean in the high manganese pig iron?

Senator McCUMBER. Yes.

Mr. CROSBY. Yes, sir.

Senator McCUMBER. Take the ore: Now, what per cent of it will be pig iron and what per cent of it, on the average, would be manganese?

Mr. CROSBY. It would not be separated; that would be called high manganese pig iron. It would be a homogeneous mass; it would be pig iron containing a percentage of manganese.

Senator McCUMBER. Very well, sir. That helps me. To harden the iron, to make steel of it, what per cent of the manganese is used?

Mr. CROSBY. When they are using 80 per cent ferromanganese they use about 15 pounds to the long ton in the bath, and it is put in lump form while the steel is in molten state.

Senator McCUMBER. What I am trying to get at is, whether when you extract the manganese from the ore, say a ton of ore, you get enough manganese out of that ton of ore to harden the pig iron that is in that ton of ore; whether it takes less or whether it takes more?

Mr. CROSBY. There would be a certain amount of manganese contained in the pig iron.

Senator SMOOT. I think the Senator wanted to know what the percentage of the bath in this 15 pounds that is put in is to the whole amount in the bath.

Mr. CROSBY. That would be the amount that would be added where no manganese was put in the original pig; that would be the total amount put in.

Senator McCUMBER. I do not know anything about the percentage in the 15, unless I would know how many pounds were in the bath.

Mr. CROSBY. It is a very small percentage, about three-fourths of 1 per cent of the whole.

Senator McCUMBER. If there is enough manganese in a ton of ore for all the hardening properties you will need in converting the ore into the ton of pig iron, and it is manganese pig iron, why is it necessary, if you have the protection upon the pig iron, to have any other protection on some of the contents of that same pig iron separate from the pig iron itself?

Mr. CROSBY. I would like to give you a little illustration in answer to that.

Senator McCUMBER. I would like to have it.

Mr. CROSBY. Standard grades of iron ore contain almost no manganese. The prevailing furnace practice consists in adding the

manganese at the time of pouring the steel. It is not added for hardening properties but for its purifying effect. If the prevailing practice utilized the manganese-bearing iron ore, we would have no tariff to protect it, but the steel manufacturer prefers to use the manganese ore coming from its foreign mines instead of our domestic supply. The protection of pig iron of \$1.25 per ton does not protect manganese ore or the makers of manganese alloy. That tariff protects only the manufacturer of pig iron. Personally, I see no excuse for a tariff on pig iron except to benefit the steel people and for revenue. As a manganese-ore producer I am not concerned with the duty on pig iron, only in the duty on manganese ore and its manganese alloys.

The ore producer has no railroads, no boats, no blast furnaces, and no steel mills, so that the chance he has of making profit is on the sale of the ore; while many of the steel makers own their railroads, boats, blast furnaces, and steel manufacturing mills, and they put profit on the manufactured article or on some other phase of their operations.

I would like to file a brief, as these are only notes. There are some things I would like to touch on.

Mr. CROSBY. In regard to the tariff on manganese ore, we would like to have the minimum grade placed at 20 per cent instead of 10 per cent as now in the Fordney tariff bill. If placed at 30 per cent it would permit Spanish ore to come in free as they have large quantities of the same character of ore that we have on the Cuyuna Range. This ore from Spain is mined with cheap labor and transportation and it would affect our industry.

The statements which are made in this brief with reference to the statistics in bulletins issued by the Geological Survey are not made with a desire to criticize any of the functions or personnel of the bureau, but they are simply in justice to our own industry to show the reasons why the statements are not a just basis for judging the manganese industry from the standpoint of possible tariff protection. We do not attempt to assign reasons for the disparity between our statements and those of the survey except with the possible suggestion that with the colossal task the survey has before it, its reports are as adequate and abreast of the times as it is possible with its appropriations at its disposal, and we offer our own statements as being of equal interest to the committee and of equal interest to the survey with the assurance that the survey consider these present-day statements with equal interest with the committee. [Reading:

Three-fourths of the reserves of low-grade ferruginous manganese ores appear to be in the Cuyuna Range, Minn. Although many problems have been encountered in marketing these ores, they must be considered the most valuable source of manganese ore in the country. (Manganese and Manganiferous Ores in 1919, by H. A. C. Jenson, p. 96, issued by the United States Geological Survey.)

The action of the American Iron and Steel Institute in 1918 in urging all its members to reduce the grade of ferromanganese enabled the producers to maintain a relatively large production in 1919. The iron content of the ore and cheap transportation are decided advantages. The principal problems that have been encountered in the marketing of these ores appear to have been solved, and although 1919 was a very unfavorable year, under normal conditions these mines may be able to market large quantities of ore for some time to come. (Manganese and Manganiferous Ores in 1919, by H. A. C. Jenson, p. 113, issued by the United States Geological Survey)

STATEMENT OF CHARLES W. POTTS, DEERWOOD, MINN.¹

The CHAIRMAN. You are a producer of manganese?

Mr. POTTS. Yes, sir.

The CHAIRMAN. Do the gentlemen who have already appeared represent you?

Mr. POTTS. No, sir; not at all or only in part. I represent to a certain extent the manganiferous-ore producers of Minnesota, which subject Mr. Crosby has just covered, and I also represent the producers of high-grade manganese ore in Arkansas and certain men from various States who are interested, who have invested money in the production or in preparing to produce manganese ore during the war. A number of them have been in communication with members of this committee from Indiana, Ohio, and various States.

The CHAIRMAN. What is your business?

Mr. POTTS. My business has been primarily the diamond drilling business, similar to Mr. Crosby's. But during the war time I was induced by Government requests and demands to enter the mining of manganese, and the companies I represent have spent about three-quarters of a million dollars in attempting to produce these manganese ores. Some ores have been produced.

I want to talk principally on the subject of manganese-ore reserves. I sat here yesterday and listened to 10 men talking of the various schedules affecting the steel industry. Most of them said that there were no deposits of manganese ore in this country.

I have spent a considerable amount of my time in the past few years in developing and in the exploration of manganese deposits. I am familiar with various districts in which manganese has been produced, and a few general figures I think will be of interest to you.

There are 30 States in the Union in which manganese ore is known to exist. About half of them have shipped manganese ore in quantities that have been of more or less importance, especially during the war period.

I heard a number of witnesses yesterday state that there were no deposits in this country. I would very much have appreciated if some one would have asked them on what information they made that statement.

Senator WALSH. Did they say there were no deposits or none produced?

Mr. POTTS. They said there were no deposits of any consequence.

Senator WALSH. Is there any produced?

Mr. POTTS. Yes, sir. In 1918 manganese-bearing ores were produced as follows: High-grade manganese ore containing more than 15 per cent manganese, 305,869 tons; manganese ore containing 10 to 35 per cent manganese, 916,163 tons; manganiferous ore, containing 5 to 10 per cent manganese, 470,138 tons. In 1919 there were produced 56,265 tons of high-grade manganese, and in 1920 there were 94,000 tons produced. The average yearly production of high-grade manganese ore in this country for the five-year period previous to 1914 was only 2,612 tons.

Senator SMOOT. There is not any question but what there are manganese ores in the United States in different parts of this country. The question arises as to whether there is enough manganese

¹See reply of Geological Survey to portions of this statement, p. 2096.

in the ore to make it profitable to mine. If we put this price here at 10 cents a pound or \$200 a ton, there is not any question but what we could produce manganese as long as we would want it in this country from American manganese ore. The question is whether that is the proper thing to do. If you have anything to say as to the rates of duty that are imposed in this bill, whether too high or too low, the committee would like to know it, and to have you tell us why. That is what we want to know.

Senator LA FOLLETTE. And I, as one member of the committee, would like to know about these deposits. I do not take the word of the United States Steel Corporation and those who are interested in the Brazil mines that this industry can not be developed here in this country.

Senator SMOOT. It can not be.

Senator LA FOLLETTE. I want to know about it.

Mr. POTTS. May I answer Senator La Follette's question first? It will logically lead to answering yours.

Senator SMOOT. Yes.

Mr. POTTS. I can not criticize the gentlemen who yesterday said there were no deposits of manganese ore in this country if they relied upon the reports of the Tariff Commission and of the Geological Survey.

According to the report of the Tariff Commission, series No. 21, commencing at page 123 and extending to page 149, and the summary in that chapter on manganese, there were in this country in 1918 only 699,750 tons of high-grade manganese ore with an additional tonnage of 1,130,000. This statement I regard as incorrect. It does not state the situation with reference to the manganese reserves correctly. It does not take into consideration the information contained in the reports of the Geological Survey or the reports of the Bureau of Mines, the reports of the geological surveys of various States, nor the reports of engineers and geologists of note who have been writing articles and publishing the same in various magazines and technical journals for several years.

The Tariff Commission's report bases its estimates on the Geological Survey and various other publications, and at the end of the chapter there is a bibliography of documents from which the data are obtained. In this bibliography you will discover that a number of the reports on which the estimates are based are 5 or 6 years old. Those reports which were published five or six years ago are out of date as far as manganese-ore reserves in this country are concerned. There are other reports that bear dates of 1918 and 1919, and you might assume from the fact that those dates are rather recent that perhaps the estimate of ore, as shown in the list of reports, is correct, but if you examine the original reports you will find that the investigations upon which those reports were based were made several years previously. You will also find in that bibliography other reports bearing dates 1918 or 1919. They refer to reports in which investigations were made in those years but if you read those reports you will find that they were reports made during the war period and that the engineers and geologists who made those reports stated and admitted that they were superficial and that they did not observe the degree of accuracy that is ordinarily required by mining companies.

A number of the references in the bibliography on page 149 are publications of the Bureau of Mines and bear the dates 1918 and later. None of these publications, however, deal with ore reserves, and there is but little of their contents incorporated into the reports of the Tariff Commission. These reports contain interesting and valuable information, but in no instance do they give unfavorable data on the ore reserves, and in this respect they are irrelevant to the subject under discussion.

Important developments in the discovery of manganese ore and important adaptations and uses of domestic manganese ore were made in 1918 and later that have not been taken into account in the Tariff Commission's report; and without these contributions to the industry included, any statement or conclusion from such statements are inadequate and unfair to this infant industry.

Constituting a part of the total manganese-ore reserves of the United States is a report of the deposits of manganese ores in Arkansas. I went to see the geologist of the Geological Survey who examined the Arkansas district. The estimates of the manganese ore of the Batesville (Ark.) district was about 250,000 tons. He gave me the figures of his estimates of various properties. One of these was the property which we are operating. According to his estimate of a certain grade of ore there was only 2,000 tons on our property. Last year in a little over 60 days we mined 2,600 tons and got barely started.

We made some investigations by test pitting and sinking holes, and we found more ore on 17 acres of our land than he credited our whole 600 acres. From the data we have on our property I believe we have more ore on it than the report of the Geological Survey credits the whole Batesville district of Arkansas.

I am not criticizing the geologists of the Geological Survey nor questioning their integrity or their ability, but I do say that they did not have the opportunity to make thorough investigations during the hectic war days. They could not attain that degree of accuracy that is required by mining companies in the investigation of properties.

In order that you may realize that it is the custom of the companies that I represent to go into the details so that we understand exactly what we are doing with reference to development and exploration of mines, I have brought some of the maps which show the method we employ in investigating the mineral deposits of the properties in which we are financially interested.

The CHAIRMAN. Are you a mining engineer?

Mr. PORTS. I am not so employed. I do not so designate myself, although I have a university degree and an experience covering a period of 15 years in the mining business. I have done a certain amount of mining engineering in the States of Minnesota and Arkansas, but I have never signed my name as a mining engineer.

Each one of these colored areas on this map represents an area containing manganese ore. I might go through the following 12 pages. They would be similar. The work is accurate; we know what we are doing, and as an operator I know what we are talking about.

Senator SIMMONS. You are making these investigations with a view to investing capital?

Mr. POTTS. Yes. We did invest capital, and if we do not get a tariff we will be "busted."

Senator WALSH. How much money has been invested?

Mr. POTTS. \$750,000.

Senator WALSH. Has that stock all been sold?

Mr. POTTS. That is actual money that has been invested. It is not a stock-jobbing proposition.

Senator WATSON. Where did you invest it?

Mr. POTTS. In Minnesota and Arkansas.

Senator WALSH. What is the percentage of the ore?

Mr. POTTS. Of the ore?

Senator WALSH. Yes.

Mr. POTTS. In Arkansas the average of the high-grade ore from our properties is as follows: Manganese, 49.03; iron, 5.62; phosphorus, 0.165; silica, 4.89.

Senator WALSH. That is very high?

Mr. POTTS. Yes; that is very high. We have another grade that we call low-grade ore that runs 31 per cent in manganese and 15 per cent in iron.

Senator WALSH. That can be used for spiegeleisen.

Mr. POTTS. For spiegeleisen and also in making high manganese pig iron. Before I finish talking of this matter of Government reports I would like to call your attention to a few other things.

Here is World Atlas of Commercial Geography. It was published this year, 1921. The ink is hardly dry. The data on which this report is based was compiled from information available in 1913.

The CHAIRMAN. What department issued that report?

Mr. POTTS. The Geological Survey.

The CHAIRMAN. Is that of great value?

Mr. POTTS. No, sir; except historically.

Senator McLEAN. Just what does that embrace?

Mr. POTTS. A compilation of the mineral resources of the world as known, up to and including 1913. Manganese is one of the minerals covered in this report.

The CHAIRMAN. Does that come from the Geological Survey directly or through the Department of the Interior?

Mr. POTTS. Through the Department of the Interior.

Senator WATSON. Is this the latest they have issued?

Mr. POTTS. I could not tell you that, Senator. They issue a great many.

Here is the last report issued on manganese and manganiferous ore reserves in the United States.

Senator WATSON. What is the date of that?

Mr. POTTS. April 6, 1921.

Senator DILLINGHAM. Is that the one you have been discussing?

Senator LA FOLLETTE. Is it based upon information that is old and out of date?

Mr. POTTS. Yes.

The CHAIRMAN. This last document you had in your hand is an ancient document, is it?

Mr. POTTS. Yes; it is all right; it is a desirable thing to have, but the point I am trying to make is that it is not up to date. There has been such a tremendous development in the manganese mining industry and in the methods of beneficiating manganese ores that any

report based upon information or investigation previous to 1918 is now obsolete and can not be depended upon.

The CHAIRMAN. Are those documents widely read and distributed to the public in search of knowledge on manganese?

Mr. POTTS. Yes; the reports of the Geological Survey are the basis for this report, Series 21, of the Tariff Commission.

The bibliography to which I take exception appears on pages 148 and 149 of this report.

Senator McCUMBER. How old is that?

Mr. POTTS. This, I think, is very new; in fact, the last report of the Tariff Commission on manganese.

Senator McCUMBER. How old is the data?

Mr. POTTS. That is, data I have given you? It is dated from 1915 to 1918, but the more recent data were based on investigations that were made previous to or on superficial investigations, or on subjects collateral to the subject of reserves.

The CHAIRMAN. How do they get rid of these documents if they are worthless?

Mr. POTTS. They are not worthless. They contain original data.

We have heard gentlemen here say that there are no manganese ore deposits in this country. I believe that they think what they say is true, but they are mistaken.

According to the report of the Geological Survey in 1918, the Butte district of Montana contained 2,800 tons of high-grade manganese ore.

Senator LA FOLLETTE. You mean that is what the Geological Survey represented?

Mr. POTTS. That is what the geologists of the Geological Survey stated in their report.

In 1918 investigations were made by geologists of the Geological Survey in order that they might report on domestic reserves of manganese ore. Making up a part of that total of 679,750 tons was an estimate of 2,800 tons in the Butte district of Montana. In 1918 it was printed; in 1919 it was again printed; and in 1920 it was printed again; and on April 6, 1921, it was again printed, stating that there are only 2,800 tons of high-grade manganese ores in the Butte district of Montana. Since that time there has been 166,650 tons shipped from that district. The Government reports still say there are 2,800 tons there.

Senator SIMMONS. One hundred and sixty-six thousand and six hundred and fifty tons?

Mr. POTTS. One hundred and sixty-six thousand six hundred and fifty tons; yes, sir.

Senator LA FOLLETTE. What is your authority for that statement?

Mr. POTTS. Other reports of the Geological Survey.

Senator SMOOT. Was this manganese ore or was it manganiferous ore?

Mr. POTTS. That was manganese, and a considerable portion of it went to the companies represented by the gentlemen who testified yesterday.

Another portion of the Geological Survey reports of 1918, in describing the deposits in the Butte district, said that while no good basis exists for computing the exact tonnages, descriptions given by those who have had opportunity to observe them leave no room

for doubt that the aggregate amount of such bodies is very large. The gentlemen who made those statements in the descriptive part of their report totally ignored these large deposits of manganese when tabulating the total domestic reserves.

I do not want to take the time to read all the evidence I have here with reference to these reserves. I expect to file a brief which will contain a great deal more data than I am able to give you now.

Senator McLEAN. Are these reports equally accurate in respect to oil reserves?

Mr. POTTS. I could not tell you that, Senator.

Senator CURTIS. From what I hear, I think they are.

The CHAIRMAN. I have a theory that 60 or 70 per cent of the Government publications are worthless.

Senator SMOOT. We were told 12 years ago that there was only coal enough in the United States to last 28 years.

The CHAIRMAN. I know that large numbers of these pamphlets are returned to me with letters of indignation by constituents in Pennsylvania.

Senator SIMMONS. Your constituents in Pennsylvania were sticking mighty close to the Government reports, because they were trying to convince the committee that the manganese ores in this country are negligible.

Mr. POTTS. It is fortuitous for those who opposed a tariff on manganese ores that the reports of the Geological Survey are so much to their liking.

There are several things with reference to manganese reserves that I have not touched upon, and I shall not take the time to go into the various details.

Thus far I have discussed only the reserves of high-grade manganese ores. There are other forms of manganese ore used in the steel business besides the high-grade manganese. The reports of the Geological Survey mention these ores, but do not take them into consideration when they compile the totals of reserves nor in the estimate of the length of time the reserves will last the steel industry. They have made estimates of the number of years which they think the available domestic supply will last the steel industry, but these estimates are to my mind, obviously belittled.

Besides the high-grade manganese ore, the supply of which is a great deal larger than the Geological Survey says it is, we have immense tonnages of ferruginous manganese ores. These are ones containing 10 to 35 per cent manganese, and the balance of their metallic content is iron ore. Iron ore and manganese are used in the steel business, and those ores can be used, and have been used, successfully, and there is no reason why they should not be used if it were not for the fact that the people who are opposing the tariff on manganese have their own selfish interests at heart, and their interests naturally mean more to them than our interests do.

It was brought out in yesterday's testimony that they own a large mine in Brazil. They own the largest available sources of manganese ore at the present time.

I am skipping over a great many points that I would like to cover but I have not the time.

Senator SIMMONS. Do you know who the gentlemen were who testified so strongly on yesterday?

Mr. POTTS. Yes.

Senator SIMMONS. Did they represent, as a rule, companies that own foreign manganese ore?

Mr. POTTS. I could not say that any of the men who testified yesterday represent companies that own foreign manganese mines. The men who testified were largely representative of the so-called "independent" steel companies. The independent steel companies, however, are very closely associated with the Steel Corporation.

I heard the Mahoning mine mentioned yesterday by one of the witnesses, and it called to my mind the fact that practically all the big iron mines in the Minnesota iron-ore districts are owned jointly by the Steel Corporation and the independent companies. If the Steel Corporation does not want a tariff on manganese, it is almost a certainty that the independents will not want a tariff either.

Senator LA FOLLETTE. The United States Steel Corporation has the largest single deposit now available, has it not?

Mr. POTTS. Yes, sir. There may be other large deposits in Russia and India, but they are not now available.

It has been stated by those who oppose the tariff on manganese ore that the reserves are small, and that they will not last more than two or three years under normal requirements. It has been proved by investigations of various reserves—and by various reserves I mean high-grade manganese ore, ferruginous manganese ores and the manganiferous ores, and other grades of ore as they occur in mixtures of silica and in mixture with clay, that can be easily separated by washing processes—that our probable ore reserves will extend the period which the reserves will last the steel industry a great many years.

It has been proved, I think, by reports that have been issued, and I think I can submit a brief which will substantiate those facts.

Senator SIMMONS. With your knowledge, what do you think are the actual deposits of workable—commercially workable—manganese ore in this country?

Mr. POTTS. I think we have—I can not state this as an engineering fact, for obvious reasons, which I will explain—reserves amounting to 10,000,000 tons of high-grade manganese ore. We have approximately 20,000,000 tons of ferruginous manganese ore, containing from 10 to 35 per cent manganese; and we have approximately 36,000,000 tons of manganiferous iron ores. If those ores are all utilized in the steel business, as I think they can be, and as those ores have been used successfully in the past, our manganese reserves in this country will last as long as the iron ore reserves will last.

Senator LA FOLLETTE. When you say 10,000,000 tons, what grade do you mean?

Mr. POTTS. Approximately 42.5 per cent.

Senator LA FOLLETTE. That is high grade?

Mr. POTTS. That is considered high grade.

There is another point I want to cover, and that is the statement that has been frequently made of late, to the effect that our domestic high-grade manganese ores are so much inferior to foreign manganese ores.

Since 1918 most of the foreign ores have been coming in from Brazil. Eighty per cent of the ores from Brazil comes from the Morro da Mina mine owned by the Steel Corporation; and accord-

ing to the reports of the Geological Survey the Morro da Mina mine was so intensively worked in 1918 that the former grades, which were from 48 to 50 per cent, have fallen down to a point where now anything over 40 per cent is acceptable.

Senator SMOOT. Do you know the price of 1 pound of metallic manganese on the market?

Mr. POTTS. The last quotation I recall is 22 cents a unit.

Senator SMOOT. That would be 22 cents for 20 pounds?

Mr. POTTS. To be exact, 22 cents for 22.4 pounds; that is, 1 per cent of a long ton containing 2,240 pounds.

In reply to the question you asked in the earlier part of my testimony with reference to what I consider a reasonable duty on manganese ore, I desire to say that the schedule in the Fordney bill as approved by the House meets with my approval as being the correct duty to be imposed. This duty of 1 per cent per pound on the metallic content of manganese ore will enable the better class of properties to operate with only a reasonable amount of profit. Any reduction in this rate of duty would lessen the tonnage of ore that could be produced, since it would eliminate all but a very few of the 405 mines that were producing ore in 1918. If this duty of 1 per cent per pound on the metallic content is retained in the bill, the domestic mines will be able to supply from 50 to 75 per cent of the annual requirements during the first few years and eventually the domestic mines would be able to supply the entire yearly requirements. I believe it is a mistake, however, to put all ore containing less than 30 per cent manganese on the free list. All ore containing 15 per cent or more of manganese should be included in this schedule. Unless the manganese-bearing ores containing manganese down to 15 per cent are dutiable, it would enable the importers, by manipulation and mixing, to bring in vast quantities of foreign manganese and thus evade the law. It is also important that the manganese alloys be protected, otherwise foreign manganese alloys would flood our markets; our independent ferromanganese furnace men could not be able to operate, neither would our mines be able to sell their ore.

Senator SMOOT. That is all I wanted to know.

Senator LA FOLLETTE. Have you any special or particular statement that you can make briefly?

Mr. POTTS. I would like to make a statement with reference to the development of our manganese industry as a source of protection in case of military emergency, but if you would rather, I can put that in my brief. I have a great deal to say on that subject, and it is very important.

The CHAIRMAN. That argument is brought up with everything that comes along.

Mr. POTTS. It is particularly important in the case of manganese. I know of no industry in which the domestic reserves are as important as in the case of manganese.

Senator SIMMONS. I think from what the witness says that whatever brief he files will be likely to receive the careful consideration of the committee.

Mr. POTTS. I have a brief, but after hearing some of the witnesses on yesterday I want to make some changes.

The CHAIRMAN. Very well.

**OF CHAS. W. POTTS, DEERWOOD, MINN., A PRODUCER OF MANGANESE ORE
IN MINNESOTA AND ARKANSAS.**

Manganese is a metal used in steel manufacturing, and is, next to iron and carbon, the most essential element. There are no known substitutes. It is primarily used as a refining reagent. About 15 pounds per long ton of steel is required.

Previous to the World War period America was the only great steel-producing country that did not produce its own ferromanganese alloys. Ninety-nine per cent of the ore used in this country came from foreign lands, was produced by cheap labor and transported at less cost per ton than domestic ore could be produced.

Deposits of manganese were known to exist in various States, but production was negligible until war conditions cut off foreign supplies. Americans were then urged by governmental departments to develop American deposits. Appeals were made on patriotic grounds. Stimulation was sought through price control and threats of impending legislation) to confiscate the properties of the operators if the maximum production was not speedily attained. Phenomenal results were obtained. Producers of manganese ores made sacrifices unexcelled in any other industry. Foreign ores and foreign alloys are now supplying our domestic requirements. Our mines are depleted.

There are two classes of people primarily interested in this manganese schedule: (1) the producers of the ore, who desire the tariff; (2) the steel manufacturers, the owners of foreign mines, and the brokers of foreign ore and alloys, who are against it.

The public, pledged to protective tariff principles in the last election, is listening to the pleadings of the two sides. The producers have shown their potential resources and plead for the application of that principle "Live and let live" for the manganese industry. Many of those opposing the schedule represent industries once small but, under fostering protection of a tariff, the pride of the Nation.

Those interests opposing a duty on manganese advance many arguments. These arguments are largely based on an assumption that there are no adequate reserves of ore in the United States. Part I of this paper is a discussion of the Tariff Commission's report on the subject "Manganese," which substantiates the charge against this erroneous assumption. Part II contains a general affirmative statement with reference to our domestic reserves, a discussion of manganese and military emergency, and other phases of the question, including a summary of reasons why manganese should be protected.

PART I.—TARIFF INFORMATION.

Answering the question, Does the report of the Tariff Commission in Tariff Information No. 21, 1920, state fully and correctly the facts relating to the grades, reserves, and economic importance of the domestic sources of manganese ore?

GENERAL STATEMENT.

The purpose of any report is to achieve a result of conservative accuracy. In the chapter "Manganese," series No. 21 of the report of the United States Tariff Commission for 1921, an obvious injustice has been done. The undersigned respectfully submits the proposition:

That there are so many inaccuracies in the statements, and the method of presenting data is so irregular in the above-named report, that it is unsafe for anyone seeking information relative to the manganese industry to accept the statements and reports therein contained as final and conclusive.

These inaccuracies and irregularities, if unchallenged or uncorrected, would undoubtedly lead to the erroneous assumption that there are not enough manganese-ore reserves in the United States to warrant a protective tariff.

It is the purpose of this brief to prove there are material and vital errors in the statements and conclusions in the chapter "Manganese" in the Tariff Commission's report No. 21 which should disqualify it as an authoritative source of information, support of which attention is called to the following disclosures:

1. A portion of the data on which that report is based, and to which references are made, is from reports published before 1918 and is now obsolete in many respects. (P. 3.)

2. A portion of the data on reserves on which that report is based is from publications dated in 1918 or later, but the information contained in some of those reports is compiled from investigations made several years previous and before the extensive development of manganese mining in 1918. (P. 4.)

3. A portion of the data from which the information is drawn was obtained by superficial investigations hurriedly made during the war period, and does not reflect that degree of accuracy required by operating mining companies. (Pp. 5 to 8.)

4. Some of the references in the bibliography bear the dates of 1918 or later. These publications are irrelevant to the subject of ore reserves or the utilization of domestic ores for steel making. (P. 8.)

Important developments in the discovery of manganese ore and important adaptations and uses of domestic manganese ore were made in 1918 and later that have not been taken into account in the Tariff Commission's report; and without these contributions to the industry included, any statement or conclusions from such statements are inadequate and unfair to this infant industry.

5. The body of the report on the manganese situation is not fair to that industry for the reason that it is not accurate in the quotation of the authorities it cites and the method employed in presenting data. The inaccuracies are interwoven with reliable data in such a manner that close scrutiny is required by anyone not intimate with the subject to differentiate between sound and unsound conclusions, the effect of which is primordially inimical to the manganese industry of the United States. (Pp. 20-21)

OBSOLETE REPORTS.

A portion of the data on which the Tariff Commission's report is based and to which references are made is from reports published before 1918 and is now obsolete in material respects.

There are four references in the bibliography on pages 148 and 149 to publications dealing with domestic manganese-ore reserves which are identified as to point of time by the dates indicated. These publications are now five years old. They are as follows:

McCarty, E. P., Manganiferous iron ores of the Cuyuna Range, Eng. & Min. Journal, vol. 100, 1915.

Thomas, Kirby, Southern manganese mining not satisfactory, Mining & Eng. World, p. 853, 1915.

Hewett, D. F., Some manganese mines in Virginia and Maryland, U. S. Geo. Survey Bull., 640, 1916.

Eng. & Min. Journal, vol. 100, p. 543, 1915.

On the Cuyuna Range in 1915 there were only seven mines producing or preparing to produce manganiferous ore; in 1918 there were 23 mines producing or preparing to produce manganiferous ore and many other developments contemplated. In 1915 there was mined and shipped of manganiferous ore 42,973 tons; in 1918, 860,695 tons.

There were substantial discoveries of manganiferous ores in new fields and increased tonnages discovered in known deposits through diamond drilling. Much favorable information was also learned in regard to increased tonnage and improved grades through the development of the opened mines, and considerable information was gained relative to methods of beneficiating the ores by washing.

There is in addition to the 13,638,000 tons of manganiferous ore reported to the tax commission of Minnesota, on which taxes are paid, a large number of tracts of land on which manganiferous ore of merchantable grade has been discovered. Because on account of insufficient market for these ores exploration has not been extended so as to determine the tonnage.

Southern manganese mining might not have been satisfactory in 1915 when 11,701 tons were mined, but there was much improvement in 1918 when 63,651 tons were mined. (All grades included in both years quoted.) In 1918 the State of Arkansas alone produced of all grades 16,904 tons from hand mining and hand washing, while 11 washing plants were being erected. Much was learned during this time in regard to grades and tonnages and methods of beneficiating the ores. Any report of 1915 for this district is now obsolete.

The comparison of the conditions that existed in 1915 and 1918 above discussed is still further illustrated in the mining development in Montana where in 1915 no ore was produced, whereas in 1918, 199,932 tons were produced. It is absurd to take the obsolete reports of the manganese industry of 1915 as a criterion of the industry in 1921.

OBSOLETE DATA QUOTED IN RECENT REPORTS.

A portion of the data on manganese-ore reserves on which that report is based is from publications dated in 1918 or later, but much of the information contained in some of those reports is compiled from investigations made years previous and does not take into account the extensive development of manganese mining in 1918.

There are two reports cited in the bibliography dealing with domestic manganese-ore reserves that bear the date of 1918 or later, viz:

Mineral Resources, U. S. Geological Survey Annual (1919?).

The Mineral Industry, G. A. Roush Annual (1919?).

the data used in Mineral Resources, 1919, are to a considerable extent taken from investigations previous to 1918, as the following list of authorities cited on pages 94-95 in Mineral Resources 1919, Part I, discloses:

-) Arkansas, western, June, 1916.
-) Alabama, certain districts, 1917.
-) Colorado, Leadville district, August, 1917.
-) Colorado, other districts, July, 1917.
-) Minnesota, Cuyuna Range, 1917.
-) Montana, Butte district, August, 1917.
-) Virginia, east side of valley, September, 1917.
-) Oklahoma, 1917.
-) Montana, other districts, August, 1917.

The data on ore reserves cited in Mineral Industry by G. A. Roush are largely a re-tulation of the same data used in Mineral Resources. It is a noteworthy fact, however, that the author of the manganese chapter of Mineral Industry in several places takes exceptions to the estimates of the geologists of the United States Geological Survey in such expressions as "too conservative;" "could be doubled and conservative."

The great activity of manganese development was in the latter part of 1918. The Government's active stimulation of the industry did not take effect generally until then. The spectacular development largely followed in the succeeding five months. In many instances the status of ore deposits and development in 1917 was obsolete in October, 1918.

SUPERFICIAL INVESTIGATIONS HURRIEDLY MADE DURING THE WAR PERIOD.

A portion of the data from which the information is drawn was obtained by superficial investigations hurriedly made during the war period and does not reflect that degree of accuracy required by operating mining companies. This statement might appear severe were not its curse somewhat abated through admissions by those persons who prepared the reports complained of, which are in part as follows:

H. C. Harder and D. F. Hewett, outstanding figures as geologists of the United States Geological Survey, have issued numerous able reports for that department on the manganese situation. Prominent among the reports on this subject is a paper presented at the September, 1919, meeting of the American Institute of Mining and Metallurgical Engineers and published in the transactions of that institute by permission of the Director of the United States Geological Survey.

In this report the Government geologists, on page 41, recite the difficulties encountered in collecting reliable data in the time available and admit that the accuracy is as is required by operating mining companies.

The following is a very fair admission of the inadequacy of the estimates on reserves, since it refers to investigations of this Geological Survey by the investigators themselves, it is important that it be quoted verbatim:

"Among the purposes of the field investigations of manganese deposits by the United States Geological Survey during the past three years, the attempt to estimate reserves has been fundamental. This part of the work was approached with a certain apprehension, for it was recognized that for most districts neither the extent of exploration nor time available for the work would permit the order of accuracy that operating mining companies require as guides in operating. * * *

"Early in the investigations it was recognized that important geologic features of several types of deposits were obscure and that the estimates of quantity and grades might only indicate the order of magnitude. * * *

"Since a number of geologists have aided in the work and many types of deposits have been examined, complete uniformity of method and the same degree of accuracy in the estimates have not been attainable throughout. * * * In only a few deposits * * * have data necessary to calculate 'ore developed' * * * been obtainable.

"In several States * * * the estimates represent little more than the order of magnitude of minimum recoverable quantities."

Those who are so ardently opposing a tariff on manganese would make us believe that there was a unanimity of approval on the part of disinterested mining engineers and geologists in the estimates of domestic manganese deposits. This is not the case. For example, Marshall Haney, the author of the chapter Manganese in the 1919 Annual of Mineral Industry, edited by G. A. Roush, of Lehigh University, says in a discussion of the manganese-ore reserves (p. 499) of Georgia, by the United States Geological Survey, "all estimates being very conservative." Again in a discussion of the Tennessee estimates (p. 456), he says: "This estimate was made by the United

States Geological Survey and is very conservative, in the opinion of the writer, conservative for the 120 promising deposits examined."

At another place (p. 452), in discussing the estimates of manganese in the mountain region of Virginia, he says: "The estimates could be doubled and still be conservative."

It is an outstanding fact that the Mineral Industry is a highly accredited publication and is accepted as entirely trustworthy by the mining profession. It is singular that the Tariff Commission's report should cite this authority as a reference, yet not take into account the context of the report.

In further support of the allegation that some of the data on ore reserves collected in 1918 were not accurate, reference is made to testimony before the Ways and Means Committee on February 14, 1921, which is in part as follows:

"Mr. POTTS. In our operations in Arkansas within the past year we have produced more manganese ore in the Batesville-Cushman district than any other mining company in that district. On one particular tract of land comprising about 600 acres we believe we have more high-grade ore than is credited to the whole district. * * *

"The Government report embodies an estimate of low-grade ore on a particular property which we are operating. This estimate is 2,000 tons. In a little over 60 days we took out 2,600 tons. * * *

"Mr. GARNER. And the estimate they made was 2,000 tons?"

"Mr. POTTS. Two thousand tons. And, gentlemen, we have just barely commenced. I believe there are a quarter of a million tons of low-grade ore on that particular property. * * *

"I should think that our actual operation should take precedence over the theoretical view and opinion of what the tonnage would be. Our own operations prove we have taken out more ore in 60 days than the Government engineers estimated on the whole property, and we barely got started."

Many other examples of a similar nature could be submitted, some showing even a ludicrous disparity between the tonnage estimated, by following certain restricted rules of calculations, and the tonnage developed by practical mining methods.

The deposits of domestic manganese ore at the time of these investigations by the United States Geological Survey did not lend themselves to easy estimate. The geologists in charge did not have the facilities or the time to make thorough investigations in those hectic war-period days, and, as has been admitted, there was not the degree of accuracy attained that is required by mining companies.

Lest it be said that too much emphasis is being placed on the fact that reported reserves are based in some instances on only a year or even a few months previous to the date of signing of the armistice, let us refer to the fact that in 1910 manganese had been reported in only 96 localities of the United States, whereas, by the end of 1918, manganese had been reported from 427 localities in the United States, and production had increased as follows:

Domestic production of manganese-bearing ore.

[From Manganese and Manganiferous Ores in 1918, Hewett, p. 62A.]

Year.	35 per cent manganese ore.	10 to 35 per cent ferruginous manganese ore.	5 to 10 per cent manganese iron ore.
	Tons.	Tons.	Tons.
1910.....	2,258	41,200	1,100
1911.....	2,457	37,584	1,100
1912.....	1,664	40,863	1,100
1913.....	4,048	51,512	1,100
1914.....	2,635	91,066	1,100
1915.....	9,613	190,951	1,100
1916.....	31,474	453,853	1,100
1917.....	129,405	730,759	1,100
1918.....	305,869	916,163	350,000

REPORTS IRRELEVANT TO SUBJECT, MANGANESE RESERVES.

Some of the references in the bibliography bear the dates of 1918 or later, but the publications are irrelevant to the subject of ore reserves or the utilization of domestic ores for steel making.

A number of the references in the bibliography on page 149 are to publications of the Bureau of Mines and bear the dates 1918 and later. None of these publications

ever, deal with ore reserves, and there is but little of their contents incorporated in the reports of the Tariff Commission. These reports contain interesting and valuable information, but in no instance do they give unfavorable data on the ore reserves, in this respect they are irrelevant to the subject under discussion.

The reports dealing with the cost of producing ferro-grade manganese ore are now obsolete, for conditions regarding labor have been changed. The bulletin describing electric smelting of manganese ores is a valuable contribution to the subject, and the exposition on the subject offers valuable suggestions for the reduction of our domestic ores at points of production.

The object of this discussion is to point out the fact that while some of the references to the manganese industry are to publications that are not obsolete, they do not deal with the subject of domestic reserves in any way opposed to the contentions of proponents of a tariff on manganese.

MINIMUM AND MAXIMUM ESTIMATES CONFUSED.

In the statements of the geologists of the United States Geological Survey, 1918, in the discussion of the estimates of reserve tonnages of domestic high-grade manganese ore, the authors, D. F. Hewett and E. C. Harder, say:

"The estimates represent little more than the order of magnitude of minimum recoverable quantities."

The Tariff Commission's report, Series No. 21, on page 141, under the caption "Reserves," states: "The amount of high-grade ore * * * in sight has been estimated at only 699,750 tons with 1,130,000 tons more in prospect."

There is a wide difference between describing the estimated tonnage as the least (minimum) that can be expected or the maximum (all, or only) to be expected. This quotation of the authority cited is inaccurate and without close scrutiny leads to the unsound conclusion that the only ore that can be expected is the minimum tonnage quoted.

ADMISSIONS OF LARGE DOMESTIC RESERVES OBSCURED.

On page 141, the opening sentence under the paragraph "Reserves" says: "Domestic reserves of manganese ore, exclusive of those of Butte, are sufficient for only a few years."

Farther down the page the report does admit that "there are large reserves in the Butte district, but to date there are no reliable figures as to the exact tonnage available. These deposits together with the Phillipsburg ores are the only ones in the United States which could serve as the basis for a permanent industry."

Then there is more ore than "only" the estimate quoted. The tonnages of these other ores, not included in the estimates, are admittedly of such larger quantities that they "are the only ones in the United States which could serve as a basis for a permanent industry."

Some favorable data are given on the Montana deposits but they are so interwoven with antithetical statements that the closest scrutiny is required to avoid the unsound conclusion that the United States has only a small tonnage of manganese ore.

COMPARISON OF FOREIGN AND DOMESTIC ORES.

Much comment has been made on the inferiority of the domestic high-grade ore as compared with the foreign high-grade ore in the Tariff Commission's report; yet these conclusions seem to be drawn with a total disregard to other statements relative to Brazilian ores, which comprise approximately 80 per cent of the total imported tonnage. Attention is called to page 133 of the Tariff Commission's report, to wit:

"The manganese resources of Brazil are said to be rapidly diminishing. * * * During the war the great Morro da Mina mine, Minas Geraes, was intensively worked, and the grade of ore has fallen off (from the old standard of 48 to 50 per cent) until nothing over 40 per cent is acceptable."

Manganese and Manganiferous Ores in 1919, by H. A. C. Jenison, of the United States Geological Survey, page 96, under the chapter caption "Classification of reserves," discussing domestic high-grade manganese reserves, says:

"The classification in the preceding table¹ indicates as far as possible the use to which the ore may be put (referring to domestic ore containing 35 per cent or more

¹Tables of Domestic Manganese Reserves, *ibid*, pp. 94-95.

of manganese). The average manganese content of this first class of ore is about 40 per cent."

There is not much difference between the Brazilian ores that have fallen below the old standards until anything over 40 per cent is acceptable and our domestic high-grade ores "about 40 per cent," yet such facts are withheld in part or presented in such a manner that the closest scrutiny must be employed lest a perverted conclusion be drawn.

It is a noteworthy fact that considerable prejudice has existed in the minds of some users of manganese against the utilization of domestic ores, on account of failure under prewar conditions of producers to fill orders of grades or tonnages sold by miners who were "farmers or greenhorns."² This prejudice is disappearing and will eventually be obliterated, for many of the men who invested part of the \$15,000,000 in developing the manganese-ore industry under Government stimulation in war times are not "greenhorns," and they are making the fight of their lives to reopen the mines and produce the ore waiting now for the return of the idle miner. That the attitude of antipathy to the domestic producer has existed and is abating is disclosed in a statement by E. C. Harder and D. F. Hewett, of the Geological Survey, which is as follows:

"If some consumers have been reluctant to use the available high-grade, as well as low-grade, domestic ores, other consumers, advantageously situated, or with commendable enterprise, have proved conclusively that the problems of utilizing the domestic material are not as insuperable as was at first thought to be the case."

RATIOS OF PRODUCTION QUOTED NOT MOST COMPREHENSIVE AVAILABLE

It is hardly fair to stop at the comparison of war-time domestic production of manganese ore with war-time requirements, and use this ratio in comparing the possible domestic production of the future. The following comparisons are illuminating:

The average yearly production of domestic high-grade manganese ore was for the five years preceding the war period, 2,612 tons. In 1918 it was 305,689. This is an increase of 11,700 per cent. According to the conservative statements of the iron-ore producers, production could have been doubled the following year if the iron-ore mines had been kept out and had the demand continued. It is admitted that the production of domestic ore in 1918 was about 33½ per cent of the domestic requirements.

In 1919 the total tonnage of domestic ore mined was 55,322 tons, the importation 333,344 tons. Our 1918 production was 78 per cent of this amount. In 1920 the total tonnage of domestic ore mined was 94,000 tons, the importation 606,937 tons. Our 1918 production would have been 43 per cent of this amount. The production of domestic manganese ore in 1918 was more than the average combined importation and domestic production of ore previous to the war period.

If the mines operating in 1918 and the mines then being developed had produced the amount they would be capable of producing, our domestic production would be approximately more than half our present annual requirements. If the mining companies felt satisfied that their operations were secure from ruinous foreign competition, practically all our domestic requirements could be met by domestic production within a few years.

INFORMATION FROM RELIABLE SOURCES FAVORABLE TO GREATER TONNAGE OF RESERVES IS CLASSED AS "UNAUTHENTICATED" AND IS RELEGATED TO OBSCURE FOOTNOTES

The following appears as a footnote on the bottom of page 147:

"It is stated by Anaconda Copper Mining Co. (letter May 5, 1919, in auxiliary file) that Butte could with reasonable certainty be counted on for 162,500 tons per year, which, added to 119,000 from Phillipsburg, would give a total of 281,500 tons, equal to average total consumption manganese ores during the five years 1910 to 1914."

While these estimates of production are mentioned they are not given credit in the summary of domestic reserves.

The fact should not be overlooked that Montana is a new field in manganese mining and its deposits hardly touched yet. The annual production from that State at 1916, 6,418 tons; 1917, 61,109 tons; 1918, 199,932 tons. Since 1918 production has decreased, due to the large importation of foreign ores.

Another instance of valuable data being relegated to a footnote as unauthenticated is illustrated in the following (bottom of p. 141):

² The Mineral Industry, Raush, 1919.

³ Recent Studies of Domestic Manganese Deposits by E. C. Harder and D. F. Hewett, Transactions of the American Institute of Mining and Metallurgical Engineers, A. I. M. & M. E., p. 46.

It should be said that in Montana (which State in 1918 produced over 60 per cent of the domestic total) the controlled mining practice of the large companies and the use of the deposits make it possible to mix high-grade Phillipsburg ore with lower-grade Butte ore and maintain a fair uniform grade of material."

The subject of grades in the body of the report closed the discussion on this subject expressing the opinion as a finality that domestic ores are unsatisfactory because they are irregular in grades. No suggestion is made that they might be improved if the industry were permanently established.

The same improvements in grades and uniformity will be worked out in all production fields whenever the industry is established on a stable basis.

FERRUGINOUS MANGANESE ORE, "MOST VALUABLE SOURCE OF MANGANESE ORE IN THE COUNTRY," IS IGNORED.

Failure to recognize modern classifications of manganese-bearing ores, and failure to differentiate between ores carrying a little less than 35 per cent manganese and those carrying only 5 per cent manganese, and failure to give averages, tends to minimize the importance of ferruginous manganese ore. No mention is made in the Tariff Commission's report of this grade of ores, yet they constitute a large portion of the 17,000,000 tons of actual reserves of 5 per cent to 35 per cent manganese.

The importance of these ores to the manganese industry is so great in their reserve-estimate that H. A. C. Jenison, in Mineral Resources of the United States, Part 1, page 96, says:

"Three-fourths of the reserves of low-grade ferruginous manganese ores appear to be in the Cuyuna Range, Minnesota. Although many problems have been encountered in marketing these ores they must be considered the most valuable source of manganese ore in the country."

These ferruginous manganese ores contain manganese from 10 to 35 per cent and iron from 35 to 39 per cent. All the metallic content of the ore goes into the processes of steel making. In spite of their importance, the ferruginous manganese ores are confused with the lower grades and their existence is ignored by the Tariff Commission's report.

LACK OF PROPER EXPLANATION OF THE IRON CONTENT OF CERTAIN ORES RESULTS IN AN INJUSTICE TO THE MANGANESE RESERVES.

The iron content of the manganiferous iron ores and the ferruginous manganese ores is of great economic importance, yet no mention is made of that fact in the Tariff Commission's report.

Ninety-five per cent of the manganese ore used in this country is used in the steel business; that is, it is used with iron ore. Without mention of this fact, anyone who is not intimately acquainted with the subject might assume that the accredited 17,000,000 tons of low-grade ore—down to 5 per cent manganese—is of negligible importance. One might—as some have already done—assume that the Tariff Commission's report had been liberal to the interests of the manganese-ore producers by the inclusion of these low-grade ores in the list of possible sources of supply, but to fail to state the fact that the other constituent of these ores is iron rather than useless rock does an injustice to the subject of reserves and does not achieve the conservative accuracy that one expects in an unbiased report, such as the report of the Tariff Commission is assumed to be.

As a source of manganese to be used in certain practice in the manufacture of steel, an ore containing 5 per cent manganese and 50 per cent iron should not be classed as low-grade manganese ore, in the same sense that an ore in which the total metallic content is 5 per cent manganese, and no other metal, would be considered a low-grade manganese ore.

In the former instance, practically the entire metallic content of the ore is economically recoverable, whereas in the second instance the manganese ore would not be economically recoverable.

Any failure to differentiate this distinction as to so-called low-grade manganese ores amounts to an inaccuracy of a most serious character.

GOVERNMENT CALCULATED ESTIMATES CONTRASTED WITH THE FACTS.

The estimates of tonnage of domestic manganese-ore reserves in the report of the Tariff Commission, Series No. 21, are taken in most respects verbatim from the reports of the United States Geological Survey.

According to these reports the figure 699,750 represents the total tonnage of domestic high-grade manganese-ore reserves actually proved in 1918. This tonnage is still

being considered by the Survey and the Tariff Commission as the only satisfactory estimate.

The reports of the Geological Survey give the estimates of the various districts that go into the lists to make up this total.

Commercial estimates of ore bodies have repeatedly shown a much larger estimate than those of the Government. Apparently the Government geologists have approached the investigation of domestic reserves with pessimism. Reports of geologists in the geological departments of universities have claimed greater reserves than those in the Government reports. It is almost startling to know that the Government reports by their own data prove that their estimates of manganese reserves are inaccurate. One of the most glaring examples has to do with the estimates of reserves and tonnage of high-grade manganese ore in the Butte district of Montana.

For the purpose of making clear the contrast of calculated high-grade manganese ore in the Butte (Mont.) district by the Geological Survey with its own informal admission of greater tonnage, supported by the statements of the owners and the incontrovertible evidence shown by production reports, the data have been set down in columnar arrangement:

GOVERNMENT ESTIMATES OF HIGH-GRADE MANGANESE ORE IN THE BUTTE DISTRICT OF MONTANA.

August, 1917:⁴ Estimate of high-grade manganese ore proved in the Butte district, 2,800 tons. Estimate of additional reserves in prospect, none.

1918: The same estimates published as contained in the report of 1917.

1919: The same estimates published as contained in the report of 1917.

WHAT THE DISTRICT HAS DONE, WHAT THE OWNERS CLAIMED; WHAT THEY CLAIM NOW.

In 1917,⁴ according to a Government report, the size of the bodies of manganese ore in the Butte district are described thus: "Though no good basis exists for computing exact tonnages . . . as descriptions given by those who have had an opportunity to observe them lead to room for doubt that the aggregate amount of such bodies is very large. Such terms as 'abundant,' 'large quantity,' 'quantities,' and one of the constituents of the gangue are commonly used by the authors of reports cited without mentioning this material. From a consideration of the great total . . . * * *, as described, the amount . . . seems practically unlimited."

In a letter July 16, 1919,⁵ former Senator William A. Clark, of Montana, after describing the extent of the manganese ore averaging about 42 per cent in the Travona and the ancient lodes in the Butte district: "It would be very difficult to estimate the enormous quantities of ore these three mines contain. They would run into millions of tons. There are other large bodies of manganese in the Butte mining district, but on this I could not give you any definite information."

Albert J. Seligman, of the Butte Copper & Zinc Co., says: "In 1917 we shipped a few tons; in 1918 we produced and shipped about 71,000 tons; and in 1920 we produced and shipped about 63,000 tons of manganese ore . . . We have large bodies of manganese already developed . . . At the time of the armistice we were shipping about 4 tons a day. . . . We purchased . . ."

⁴ Manganese at Butte, Montana, U. S. Geological Survey Bull. 690.

⁵ Hearings on General Tariff Revision 1921, Part V, pp. 3784, 3795.

⁶ Hearings on general tariff revision, 1921, Part V, pp. 3783, 3794.

mine called the Ophir adjoining us, and with this we can easily maintain a production of a thousand tons per day. * * * The Phillipsburg properties, I understand, were shipping a thousand tons a day just before the armistice was concluded * * *. We are satisfied that given a fair duty we can produce a very large proportion, if not all, the manganese that is required in the United States from the Butte and Phillipsburg districts for a long time to come * * * and in addition we have enormous bodies of lower grades running below 35 per cent which can be concentrated and which have been concentrated.

August, 1917:⁴ Estimate of high-grade manganese ore proved in the Butte district, 2,800 tons.

1920 and 1921: The same estimates published as contained in the report of 1917.

"It is stated⁷ by Anaconda Copper Mining Co. (letter May 5, 1919, in auxiliary file) that Butte could with reasonable certainty be counted on for 162,500 tons per year, which, added to 119,000 from Phillipsburg, would give a total of 281,500 tons, nearly equal to average total consumption manganese ores during the five years 1910 to 1914."

From 1918 to 1920, inclusive, the Butte district has actually produced 166,650 tons of high-grade manganese ore, the yearly production being as follows:

	Tons.
1918.....	⁸ 100,000
1919.....	⁹ 3,650
1920.....	¹⁰ 63,000

Sixty times as much ore has been taken out of the Butte district as the Government geologists conceded existed there, and, according to commercial estimates, there are several million tons of high-grade manganese ore still remaining.

It should be borne in mind that there are 426 other districts in the United States that are capable of producing manganese ore. All of these districts have been investigated and reported by the Geological Survey. There are reputable geologists who claim that there are other districts in the United States containing larger reserves than the Butte district and that they only require the stabilization of the manganese industry by a protective tariff to enable them to become producers of equal magnitude.

Which is to be given the greater credence, a Geological Survey's estimate of 2,800 tons, or the statements of the owners of the property who have already removed 166,650 tons and claim a million or more tons in reserve?

PART II.—WHAT ARE OUR DOMESTIC MANGANESE RESERVES?

It has now been proved that the estimates of the Geological Survey as to the reserve tonnages of manganese ore in the United States are inaccurate and that all of these inaccuracies tend to minimize the tonnage and importance of domestic grades. It has also been proved that the estimate of the period of time which these reserves would last this country is based only upon an estimate of high-grade ore which is belittled and that that estimate does not take into consideration lower grade manganese ores or the manganese ore associated with iron ore; nor does it take into consideration the metallurgical adaptability of all our ores in steel making.

Any attempt to make an estimate of the period of time which our domestic reserves would last the industry without taking into account all classes of reserves that are now available and all satisfactory metallurgical practice is unfair.

⁴ Manganese at Butte, Mont., U. S. Geological Survey Bull. 680.

⁸ Mineral Resources of the U. S., 1918, Part I, pp. 627, 643.

⁹ Special information from U. S. Geological Survey, Aug. 4, 1921.

¹⁰ Hearings on general tariff revision, 1921, Part V, pp. 3784, 3794.

To make an accurate estimate of the period of time which our reserves will last the steel industry contemplates a more thorough investigation of our domestic reserves than has yet been made, but research and collaboration are doing their present to get a more correct estimate of these reserves.

Assuming that the estimates of the high-grade reserves by the Geological Survey have been uniform, and assuming that the disparity in these estimates and the tonnages that have subsequently been proved to exist are indices of the general disparity between the estimated and actual tonnages throughout the country, taking into account the vast tonnages of metallic manganese available in lower grade ores and in ores that are mixed with iron, it is safe to assume that the manganese reserves of the United States will last the steel industry as long as the present known high-grade deposits of iron ore will last the steel industry.

To personally and thoroughly investigate all of the properties in the United States is a colossal task for one individual and would involve a large expenditure of money and a long period of time. There has been collected, however, within the last few months sufficient data to prove that the tonnages of reserve ore is vastly in excess of Government estimates in practically every instance in which a check has been made. The following examples are quoted as indicating the basis for some of the assertions:

(1) A mine in the Batesville district of Arkansas was credited with only 2,000 tons of high-grade manganese ore. Since that estimate was made a considerable amount of exploration work has been done by careful test pitting, and the owners claim they have proved 45,000 tons of high-grade manganese ore containing approximately 50 per cent metallic manganese. The owners also claim 175,000 tons of probable ore and 350,000 tons of possible ore as a result of their investigations. This information is transmitted by sworn statement, accompanied by blue prints.

(2) Another mine comprising 600 acres in the Batesville district of Arkansas was credited with 2,000 tons of ore of a certain grade, besides 10,000 tons of high-grade ore. Since that estimate was made, 2,600 tons of that certain grade of ore have been produced, and an additional tonnage has been disclosed in a continuous body of greater magnitude than was heretofore anticipated. Test pitting on a small area that had been badly worked over proved an additional tonnage of 13,000 tons. Calculations based upon the disclosures now made indicate a total tonnage on this particular property of approximately 2,500,000 tons, of which approximately 125,000 tons is high-grade manganese ore over 46 per cent metallic manganese.

The estimates of the Geological Survey of the deposits in the Batesville district of Arkansas on other properties show similar disparity as to actual tonnages. Several other examples could be given and many more illustrations obtained. The report of the Geological Survey for the entire Batesville district estimates manganese reserves as follows: 100,000 tons of high-grade ore, with an additional reserve prospect of 140,000 tons, and a tonnage of 160,000 tons of ores containing 5 to 35 per cent manganese.

The sworn statement of a mining engineer, who is familiar with and who has operated in this district, claims that there is approximately 5,000,000 tons of ore containing 35 per cent or more of manganese in this district.

(3) The Geological Survey credits the Butte district of Montana with 2,000,000 tons of high-grade manganese ore. There are six properties that have produced this tonnage. A signed statement from the owners of one of these mines gives the tonnage of this property, as determined by the company's engineer, as follows: Developed ore, 198,000 tons; probable ore, 800,000 tons; possible ore, 840,000 tons, making a total of 1,850,000 tons of proven ore and additional ore in prospect, grade 37 per cent to 40 per cent.

(4) There are numerous instances in which the engineers for the War Mineral Relief Commission have admitted greater tonnages on specific properties than the tonnages admitted by the geologists of the Geological Survey for the whole district.

(5) In the case of the Cuyuna Range, in Minnesota, 25 properties are reported in the Geological Survey's report, to have contained 13,628,000 tons of manganese ore in 1917. The manganese content of these ores is not listed in the tables, except that it is more than 5 per cent and less than 35 per cent. According to the estimate of a prominent explorer and developer of this range, a man who has put down approximately 700 drill holes in the district, there are approximately 36,000,000 tons of high-grade ore disclosed in this district, with an additional tonnage of ore in prospect bringing the amount to between fifty and sixty million tons, of which 25 per cent of the tonnage is ore carrying more than 12 per cent metallic manganese.

The writer has personally encountered manganese-bearing ores in drilling operations on 20 different 40-acre tracts, only two of which have been developed to point of production, but apparently there are just as good opportunities on any of the other tracts for the development of mines. It is also known that there are many properties

which manganese ore has been discovered, but, owing to the paucity of drilling, definite tonnage have not been disclosed, and that these properties, together with the 18 above mentioned, are not taken into consideration in the estimates included in the 100,000 tons above referred to.

The above illustrations comprehend only a small amount of data now collected tending to show the greater tonnages of domestic manganese reserves than those admitted in the reports of the Geological Survey.

Investigations are now being made of the various deposits of manganese ore, and calculations are being compiled from all of the reports of the Geological Survey, Bureau

Mines, reports from the geological departments of the various States, technical reports from geologists and mining engineers of high repute, supplemented by the commercial reports of operating mining companies, and other authentic data. From the data already accumulated the evidence points toward a reserve tonnage of domestic manganese ore as follows:

	Tons.
High-grade manganese, 35 per cent and over.....	10,000,000
Erruginous manganese, 10 to 35 per cent.....	20,000,000
Manganiferous iron ore, 5 to 10 per cent manganese.....	45,000,000

THE DEVELOPMENT OF OUR MANGANESE INDUSTRY IS DESIRABLE AS A PROTECTION IN CASE OF MILITARY EMERGENCY.

One important lesson has been learned in the part that the United States played in the conduct of the World War. That lesson was learned at great risk to our national honor. That lesson involves the necessity in time of peace of building up of those industries which supply all the accouterments of war of which this country has potential reserves in raw materials or possibilities of industrial development.

The attention of Congress has been called to a great many products of mine, of farm, of chemical plants, and of manufacturing industries that previous to our entrance into the World War had not been produced on a scale commensurate with our requirements, but which in times of national stress are of the greatest importance.

Chief among those metals which had not been produced in substantial quantities previous to the war period and on which so much depends in the prosecution of the war was manganese.

Early in 1917, before America entered into the war, the note of warning was sounded. We were told that manganese was an actual necessity in steel manufacture, that next to iron and carbon it is the most essential constituent of steel, that there is no known substitute, and that manganese must be had at any cost if we entered the war.

The statement of Dr. C. K. Leith, chairman of the committee on imports and exports of the Shipping Board, still rings in our ears. He earnestly said when describing the plight of the steel industry in its need for manganese, in 1918:

"There will be the greatest difficulty * * * in getting ships for that manganese. It is very doubtful now whether under the most favorable conditions it can be done this summer * * *. The shipping situation is so acute that it is beyond any other one in this country * * *. The Shipping Board, after going over all the figures, can not see ships in sight for the usual requirements of foreign manganese * * *. So far as manganese is concerned, it is not a case of simply following the normal developments of steel practice, but doing anything that is physically possible, regardless of cost."

The Secretary of the Interior, the Bureau of Mines, the Geological Survey, the various war boards, and various quasi Government committees cooperated in the plan to reduce the consumption, as far as steel practice would permit, and increase the supply of this essential metal—manganese. It was noteworthy that manganese was an outstanding requirement for the prosecution of the war.

Previous to the war days it was not supposed that America had reserves of manganese of any commercial importance. Less than 1 per cent of the requirements of the steel trade had been met from domestic sources.

Americans responded to the Government's call, sought out and produced more ore in the single year of 1918 than had previously been considered was in existence. American citizens sought out, located, and commenced mining operations on a vast number of deposits of manganese which had formerly not been known. From less than 100 known deposits previous to 1918, the latter part of that year saw 1,181 deposits. In the short period of a few months the production increased 11,700 per cent. The men who responded to the Government's call for manganese responded in the same spirit of patriotism and with the same sense of duty and obligation that men responded to the notification for registration for the selective draft; that loyal American citizens responded to the appeal of the Government for its citizenry to purchase thrift stamps and Government bonds.

Those who sought out and produced or prepared to produce manganese relied upon the tentative promises of the Government for protection of their investments in the same manner that they relied upon the Government's guaranties when they purchased Liberty bonds.

In no industry was there more remarkable accomplishment attained in the compliance with the Government's request than in the production of manganese. Yet, due to the short period of time that this industry thrived, it did not reach the stage of development where it would be able to compete with the pauper labor of foreign lands or the other disadvantages generally accompanying any other infant industry in normal competitive times. The industry can not survive without protection, and if it does not survive, not only will there be a great economic loss amounting to about \$15,000,000, but the mines will deteriorate, the shafts, the drifts, and the adits will cave in, the timbers will rot, the headframes and other structures will fall into decay, the mine buildings and the miners' homes will dilapidate into worthless and moldy shacks, habitations for bats, and the specter of what might have been a thriving industrial center, creating wealth and supporting a prosperous and contented community.

Those who responded to the Government's request in opening up the manganese mines made no profits. Their investments were not amortized, and without a protective tariff a great many of those who invested will be bankrupt. These men will not again respond to the Government's request for manganese should a military emergency again exist. Others who saw the failure of the Government to protect this industry would not yield to the importunities of the Government lest they also suffer the same fate. To rediscover and redevelop those mines, once they are completely abandoned, is a monumental task. If American citizens would not again take this chance, it would devolve upon the Government to rediscover and redevelop the manganese mines. This would likely prove as big a failure as the Government's attempt to develop the airplane. Millions would likely be expended and no results attained. The experience of the Government in developing an airplane industry is a reasonable criteria of what might be expected should the Government attempt to develop and mine manganese.

It has been stated by those who are opposed to a tariff on manganese ore that our reserves are small; that they would not last more than two or three years under normal domestic requirements; that whatever ore does exist in this country should be reserved for military emergency. But this argument is based upon a false premise. It has been based upon the assumption that we have no reserves. The authorities for that statement are the reports of the Geological Survey and the reports of the Tariff Commission.

It has been proved conclusively that the reports on which those conclusions are based are obsolete. It has been proved that the tonnage of high-grade ore is much greater than the tonnage (699,750 tons) the Geological Survey admits. Up-to-date investigations prove that the reserves of high-grade manganese ore are approximately 10,000,000 tons. Up-to-date investigations prove that the tonnage of ferruginous manganese ores are approximately 20,000,000 tons; that ores of this class contain 10 to 35 per cent manganese and sufficient iron ore to make the ores of this class highly advantageous in steel making. Up-to-date investigations prove that the Cuyuna Range of Minnesota, which it is admitted constitutes the greatest source of domestic manganese, has a vast tonnage of manganiferous iron ore; that all these ores are and have been satisfactorily used in steel manufacture.

Reports of the Geological Survey show that manganese is known to exist in many States and that there are vast quantities of low-grade ore that are capable of reduction or beneficiation. These ores are not contemplated in the above estimates. It is entirely reasonable to presume that if in the short period of time in which the manganese industry in this country thrived such immense tonnages should be disclosed of manganese-bearing minerals, that if the industry is by a protective tariff fostered and encouraged there will be an ample supply and there is no danger of early depletion. All the deductions and conclusions based on the theory of no reserves is based upon a false premise and is erroneous and unsound.

In case the United States should be so unfortunate that it would again be involved in war and supplies of foreign manganese should be again cut off from importation from foreign countries the plight of our country might be more serious than existed in 1918, for the condition that existed in 1918 developed slowly.

If some unfriendly nation should, after secretly and subtly preparing for war, make a sudden attack by sea and cut off our supplies of manganese ore from foreign countries, our steel industry might be in much more serious situation than has ever existed before.

Of what value would our vast resources of manganese ore be if locked in the inaccessible recesses of the earth, their location probably once known but then forgotten; without railroads or other means of transportation from those isolated places, without definite knowledge of the ore bodies required by mining companies, without mining possibilities for their miners, without suitable equipment, and without organizations of men of experience to develop and mine those deposits?

There is no example more appropriate than that of the manganese industry where could be applied that time-proved adage "In time of peace prepare for war." There is no way in which our manganese reserves can be developed than to develop them. The advocacy of any other process is fatuous.

There seems to be but one reasonable course to pursue and that is to develop our resources. Unbiased men who are familiar with the facts acknowledge this principle. Owen Street Payne, in an article entitled and advocating "Free Trade" in the *Annalist* of August 1, 1921, says:

"As long as there is war in the world it is recognized that each independent nation should have for its protection not only armies and navies but those industries which build up and sustain the armies and navies and support the existence of the nation in case it should be cut off from outside supplies. Such essential industries should receive protection until they have reached a stage where they can sustain themselves; this, however, is not because of any inherent weakness in the principle of free trade but because of the backwardness of human civilization."

Floyd W. Parsons, in an article entitled "Everybody's Business" in the *Saturday Evening Post* of April 24, 1920, says:

"The position that all war mineral deposits should lie idle until a time of emergency comes is wholly absurd. One expert, who is an engineer and metallurgist, comments on this thought as follows: 'If we leave these deposits of valuable minerals locked in the recesses of our mountains, we are simply practicing the conservation of inertia. An entirely undeveloped natural resource in a time of national emergency is as useless to a nation as an entirely depleted one.'"

If the American people fully realized that their future safety was now being imperiled by the greed of those who have waxed strong in their accumulated billions during the last war, they would rise in their might and demand that the manganese industry should receive such protection as is necessary to safeguard the future of this country.

"Let us develop the resources of our land; call forth its powers; build up its institutions; promote all its great interests, and see whether or not we in our day and generation may not perform something worthy to be remembered." (Daniel Webster.)

ADAPTABILITY OF UTILIZATION OF MANGANIFEROUS ORES AS A SUBSTITUTE FOR HIGH-GRADE MANGANESE ORE IN OPEN-HEARTH STEEL PRACTICE.

The practice of using high manganese pig iron in the manufacture of steel, instead of using so much ferromanganese or spiegeleisen, has been the custom in continental Europe for many years; this practice has been followed by the Colorado Fuel & Iron Co. for a number of years and was followed by a large number of steel plants during the war period. That it was pronounced a success by many of the operators who have followed this practice is a well-known fact.

In a paper by C. L. Kenney, jr., superintendent of No. 1 open hearth, South Works of the Illinois Steel Co., he discusses this practice. It is reported in the April (1919) Bulletin of the American Institute of Mining and Metallurgical Engineers. The paper is exceedingly technical, but the following quotations indicate his attitude with reference to the utilization of the manganiferous ores in making high manganese pig iron to be used in the open-hearth steel practice in place of high-grade alloys made from manganese ores:

"The steel industry will be confronted, year by year, with an ever-increasing need of meeting more difficult physical specifications * * *. Preeminent among the expedience stands the necessity for thorough deoxidation * * *. Can one logically assume that these demands are met * * * by the almost archaic method of hurriedly adding a few hundred pounds * * * (of ferromanganese) in the ladle and inevitably pouring the steel almost immediately? I am sure the answer is 'No.'"

* * * The alternative lies only in the use of these ores (manganiferous iron ores) by the blast furnace and the production therefrom of irons carrying high percentage of manganese.

"From the viewpoint of an exact scientific investigation * * * the conclusions drawn are substantiated by results attained by many others who have worked on a large scale among identical lines * * *. There will be found not only a material economy in manganese in the high percentage alloy derived from foreign ores, but a reasonable recovery from the domestic ores and the certainty of a more perfect final product."

SUMMARY OF REASONS WHY THERE SHOULD BE A TARIFF ON MANGANESE

All of the arguments of a general nature favoring a protective tariff for any American industry apply to the manganese industry, viz:

First. The general advantages of building up home industries.

Second. The employment of American labor at good wages.

Third. The maintenance of high standards of living for American labor.

Fourth. Good dividends for American capital.

Fifth. The establishment of American industrial independence.

The development of our manganese industry is desirable as a protection in case of military emergency.

The payment of the obligation the Government owes the producers of manganese as a result of its requests, demands, and promises for the development of this industry in the war period is highly important.

The protection of American capital expended in American enterprises is of more importance than American investment in foreign countries.

Stabilizing the industry in such a manner that great fluctuations of cost of raw products do not react so as to establish higher price levels of the finished products can be attained by the placing of a tariff on manganese.

The sum of money which the proposed tariff on manganese will bring into the United States Treasury is estimated to be three million to four million dollars per year.

The tariff on manganese will reopen the manganese mines, frequently found in isolated places, in agricultural communities, where such industries would be of great benefit in furnishing employment for labor and increasing markets for agricultural products.

That the present proposed schedule will add such a small burden to the steel industry that it is not appreciable when it reaches the pocketbook of the consumer.

That the duty of 1 cent per pound on the metallic content of manganese ore will place a burden of only 25 cents per ton on steel products, which amount is insignificant when compared to the duties placed on these same products for the benefit of the steel manufacturer.

That the duties paid on imported ores do not increase the difficulties of exporting products made from those ores, for the reason that such amounts are rebated when the manufactured products are exported.

That the mining and preparation of ore for blast-furnace use is essentially a manufacturing process, and has been so decided by the supreme courts of various States.

That as a manufacturing industry there should be no discrimination in the protection of labor engaged in the manganese industry as against the protection of labor in any other class of manufacturing.

There is no reason why the manganese industry and other industries supplying raw material to the steel industry should all be sacrificed so that the steel industry could make still greater profits. The better policy to follow is one that acknowledges the justice in that principle "Live and let live."

The position of those who advocate protective tariff principles as applied to their own industry and advocate free-trade arguments for those who are engaged in other industries is untenable.

TUNGSTEN ORE.

[Paragraph 302.]

STATEMENT OF NELSON FRANKLIN, RARE METALS ORE CO
DENVER, COLO.

Mr. FRANKLIN. Mr. Chairman and gentlemen of the committee, all the members of the committee who are now present, except Senator Walsh of Massachusetts, are perfectly familiar with this subject of tungsten and will require very little information, because I have appeared and others have appeared before the committee on two different occasions, and the printed records of those hearings are available.

The CHAIRMAN. What is your occupation, Mr. Franklin?

Mr. FRANKLIN. I am vice president of the Rare Metals Ore Co., a producer of tungsten ore in Colorado, and I am here representing not only ourselves, but I am authorized to represent practically all the producers in Colorado, California, Nevada, and Arizona.

The CHAIRMAN. Are you satisfied with the duty the House has put on tungsten?

Mr. FRANKLIN. I would like to have something to say about that, Senator, and I am not going to occupy much of your valuable time about it. I will be the only witness. I am the only one present of a group of producers that appeared before the committee at previous hearings.

The CHAIRMAN. We will be very glad to hear you, Mr. Franklin.

Mr. FRANKLIN. What was known as H. R. 4437 passed the House in August, 1919. That provided for a duty of \$10 per unit of tungstic trioxide, and compensatory duties on the manufactured products of tungsten. We had a hearing before the Senate Finance Committee in November, 1919, and one in January, 1920. Your committee amended the bill and provided for \$9 per unit, with a corresponding reduction in compensatory rates on the manufactured products, and probably reported the bill to the Senate in March, 1920.

In the Fordney bill now under consideration, in paragraph 302, the duty is considerably reduced from that in H. R. 4437, as amended by your committee. The Ways and Means Committee, in order to conform to the method adopted in levying duties on all other minerals, changed the method on tungsten from the unit basis to the pound basis and have provided a duty of 45 cents per pound of metallic content of tungsten in the ore.

As tungsten ore is always sold commercially on the unit (20 pounds) basis and on the tungstic trioxide content, it is necessary to transpose that to the metallic content for comparison in rates, to make plain to the testimony given at previous hearings. The rate of 45 cents per pound of metallic tungsten equals \$7.14 per unit of tungstic trioxide, as 20 pounds of tungstic trioxide equals 15.86 pounds of metallic tungsten.

The duties provided in paragraph 302 on the various intermediary manufactured products of tungsten are compensatory and based on the duty put on tungsten ore. The duties provided in paragraph 305 on tungsten steel and articles containing tungsten are compensatory and based on the duties provided on the various intermediary products of tungsten.

A duty of \$7.14 per unit of tungstic trioxide will not permit a maximum production from our present developed and equipped mines, as it will only permit the lower-cost mines to compete with Chinese ore, on the amount of duty provided, and then only for the reason that our domestic ore of ferberite and scheelite are of higher purity, carrying less deleterious elements than the Chinese ore of ilmenite, are preferred by the trade, and command a little higher price.

A duty of \$7.14 per unit will not stimulate research and new development, and will not encourage in some instances the equipment of present known ore bodies, which were discovered and proven to be large ore bodies at about the time of the armistice.

If the industry is to be maintained at all and to a limited production, the rate provided is the absolute minimum. To mine the maximum production the rate provided in the Fordney bill must be raised to conform to H. R. 4437, as amended by your committee, and be placed at 57 cents per pound metallic tungsten, which equals \$9 per unit of tungstic trioxide.

At the previous hearings a number of manufacturers appeared in opposition to the bill H. R. 4437, but they have long since withdrawn their opposition for significant reasons, which I will now state.

The manufacturers in this country of ferrotungsten and tungsten powder have been able since the war to purchase imported ores on an equal basis with England, but have not been able to compete with England, and as a result all the ferrotungsten and tungsten powder consumed for over a year past in the United States has been imported from England, and the 30 or more plants which during the war manufactured these products are shut down.

The manufacturers in this country of high-speed steel, although being in a position to import ferrotungsten and tungsten powder at prices much below the domestic cost of production, are unable to compete against the Sheffield English manufacturers of high-speed steel and they are all shut down.

Only one appearance has been made before this committee at the hearing in opposition to the tariff on tungsten ore—Dr. Mathews of the Crucible Steel Co., appeared on Thursday and asked that tungsten ore be placed on the free list. At the same time he suggests higher rates of duties than those provided on some of their products, which request I have no objection if the duty provided is not sufficient. He, in fact, objects to a duty on any product which he calls raw material and which duty would increase his cost of production and interfere with export business, which on manufactured products tungsten does not exist and statistics on exports prove it.

Tungsten ore, as it is mined from the ground, carries from one-half per cent of tungsten trioxide to higher percentages, none of which is usable or salable and requires concentration to the extent sometimes that it requires 200 tons of mined ore to make 1 ton of concentrate of 60 per cent (the standard grade) tungstic trioxide content. This operation requires a large and expensive plant of machinery, therefore the product is our finished product. On the contrary, when we buy a carload of raw steel from the Crucible Steel Co. it comes to us as their finished product, but it is entered on our warehouse books as raw steel and becomes a finished usable product for us when we make it into mine drills in our blacksmith and machine shops.

Dr. Mathews also said that another reason for asking that tungsten ore be placed on the free list was because it was an established industry.

I will prove to you gentlemen of the committee that tungsten mining was not an established industry in this country until the war period. I have a chart here furnished by the United States Geological Survey, giving the history of tungsten in the United States from the year 1900, when tungsten was first discovered in Boulder County, Colo. It shows for each year from 1900 to 1920, inclusive, the following: United States production, world production, United States imports, United States exports, United States low price, and United States high price. I will furnish your committee this chart for information.

This chart will prove there was only an indifferent production of tungsten ore in this country prior to the war, and it was shown at previous hearings that the manufacture of the finished products of tungsten in this country was of no volume prior to the war, also that the small quantity of ore we produced was shipped to Germany and

imported from Germany the finished products made from our own. The chart shows that the highest consumption of tungsten in this country prior to the war was in 1913 and amounted to 3,600 tons, of which we produced 1,500 tons and imported 2,100 tons.

During the war new uses for tungsten were developed for other war purposes, and in 1917 we consumed 11,022 tons, of which we produced 6,144 tons and imported 4,878 tons.

The consumption for 1918 can not be accurately arrived at, as at the close of the war there were large carry-over stocks. We, however, for the 10½ months up to the signing of the armistice, produced 5,029 tons and imported during the year 11,600 tons.

Up to 1915 there was not enough tungsten consumed in the world to create a demand and to command a high price, and the domestic production was almost wholly from surface float ore from the erosion veins, and it was only necessary to gather it from the surface of the ground as is now done in China. Up to that time very little mining had been done, but the surface float became exhausted, the demand increased, prices went up, extensive research began, and not until then did tungsten mining become an established industry in this country.

At our last hearing in January, 1920, it was shown that not a pound of tungsten ore had been produced in 1919. That same condition continued through 1920, and not a pound is being produced today in the United States.

The control of the tungsten industry has passed from Germany to England, and with England controlling the port of Hongkong, the absolute control over the United States market for all the manufactured products of tungsten will remain with England until adequate protection is afforded the domestic tungsten industry in all its branches.

The Chinaman is acknowledged to be a shrewd trader; he also is well informed on what our Congress is doing, and if an adequate duty on tungsten ore is not provided to permit the resumption of mining in this country our mines will not only deteriorate beyond redemption, but the Chinaman will raise his price to the American consumer to a point just below our production cost, and no one but the Chinaman will be benefited.

I do not know that I have anything further to say unless some members of the committee desire to question me about this new rate and what it will do. I think you have full information. We went through exhaustive hearings.

The CHAIRMAN. I think the committee is reasonably familiar with the tungsten proposition.

Mr. FRANKLIN. I think it is, Senator Penrose.

The CHAIRMAN. We are all for helping American industry.

Mr. FRANKLIN. I thank you, Senator Penrose, for that expression, and think your final analysis will show that if an adequate duty on tungsten in all its branches is not provided, the tungsten industry will remain in control of England as it is at present.

I want to submit a brief which will set forth the facts in connection with the tungsten industry up to date.

The CHAIRMAN. The committee will receive the brief and print it as part of your remarks.

BRIEF OF NELSON FRANKLIN, DENVER, COLO., REPRESENTING THE TUNGSTEN PRODUCERS OF COLORADO, CALIFORNIA, NEVADA, AND ARIZONA.

We desire to present the following in reference to the production of tungsten and the effect on the industry of the proposed legislation.

In June, 1919, full hearings on tungsten ores were held by the Ways and Means Committee, and a bill (H. R. 4437) was passed August 21, 1919, by the House of Representatives, levying a duty of \$10 per unit on tungsten ores. This bill was referred to the Committee on Finance in the Senate August 22, 1919. Hearings were held by that committee in November, 1919, and January, 1920. On the 23d March, 1920, it was favorably reported to the Senate as follows (S. Rept. No. 44).

"The Committee on Finance, to whom was referred the bill (H. R. 4437) to provide revenue for the Government and to promote the production of tungsten ores and manufactures thereof in the United States, having considered the same, report favorably thereon with the recommendation that the bill do pass with amendments."

"Tungsten is a vitally important war metal. It is equally important in our industrial peace program. Tungsten is the only known element which forms an alloy with steel giving to this steel the property of retaining its temper at extremely high temperatures. This property, together with its great hardness, makes possible the manufacture of tools for drilling, cutting, and finishing steel products. Those tools are operated at such high speed that one machinist and one lathe can do as much as five machinists and five lathes equipped with carbon-steel tools. Quantity production is dependent on high-speed tungsten steel.

"Prior to the war Germany controlled the tungsten-refining industry and very little tungsten was refined in the United States. During the war the tungsten industry was fully established and the United States became the leading nation in the manufacture of tungsten products.

"The mining of tungsten in the United States was greatly stimulated during the war, and the production in 1917 reached 6,144 tons of 60 per cent concentrate. The evidence showed that the normal requirements of this country were between 6,000 and 7,500 tons of 60 per cent concentrate per year. The annual production from the best equipped mines that can be operated under the proposed duty was demonstrated to be from 4,000 to 4,500 tons per year. It is claimed through the stabilization of the market and stimulus of the duty that this production can gradually be increased until the entire domestic requirements will be supplied. During that period of development a substantial revenue would be received from importations of ore.

"The report of the United States Tariff Commission states that 'the United States has a sufficient supply for many years to come.'

"The destructive competition which American producers are helpless to meet comes from the ores of Asia. The costs of domestic production were proved from certain statements to average \$13 per unit. The foreign costs were showed to be from \$4 to \$4.65 per unit, and foreign ores are being sold in New York at from \$6 to \$7.50 per unit. Large quantities, aggregating about 50,000 units per month, are being imported, duty free, and none is being produced now in the United States.

"The difference in costs is not due alone to the discrepancy in high wages paid to American miners (from \$4.65 to \$6.50 per day) and the pittance paid Asiatic miners (from 20 cents to 50 cents per day), but the physical character of the deposits is different. Most foreign ores are recovered from rich surface deposits that require little or no equipment, while American ores are recovered from veins or lodes of hard rock. Expensive mine equipment is required and large costly mills are necessary, as the ore has to be crushed and concentrated to put it into a marketable product.

"It has been shown that the tungsten-mining industry is in a critical position. Unless prompt action is taken it will be destroyed. Every mine in the United States is closed down, and without the duty asked for can not reopen. The industry was proved of such vital importance during the war will fall in decay so it can not be rehabilitated and the country will be left to the mercy of Asiatic production to supply a material as necessary in our industrial peace program as it is essential in war.

"At the present time tungsten-bearing ores of all kinds are on the free list. By the placing of a duty on such ore it is necessary to place a compensatory duty on imports of refined tungsten products and alloy steels, and the rate named in the bill provides that compensation.

"From the showing made it is perfectly evident that this industry should be protected. Without a healthy tungsten industry the United States will be completely at the mercy of hostile nations, which could instantly cut off supplies. The production of war material would be paralyzed.

"Your committee believes a duty should be placed upon tungsten-bearing ores for two reasons: First, the protection it would afford to this country; and, second, the revenue that would be derived from a duty upon such ores as may be imported.

"We therefore recommend the passage of the bill (H. R. 4437) as amended by your committee."

Recent history.—Since the above report was written, imports of ore have continued, and the situation is further complicated by imports for the first time since the war of refined tungsten. These imports aggregated 1,963,463 pounds in 1920. The result has been the complete stoppage of the refining industry and the piling up of imported ores in storage. There has been no market for ores. The price has dropped to \$2 to \$4 per unit, but in the face of these conditions imports of ore continue. With the slump in the steel trade much less refined tungsten is being used and the entire requirement is more than met by imported refined tungsten from England.

The Finance Committee considered that through the stabilizing effect of this legislation and the expected reduction in labor and material prices that these costs would be reduced and therefore amended H. R. 4437 to read \$9 per unit instead of \$10.

The Fordney bill, H. R. 7456, in order to conform to the method of levying duties on all other minerals has changed the method on tungsten ore from the unit (20 pounds) basis of tungstic trioxide to the pound basis of metallic tungsten. The rate provided is 45 cents per pound of metallic tungsten, which equals \$7.14 per unit of tungstic trioxide, as one unit (20 pounds) of tungstic trioxide equals 15.86 pounds of metallic tungsten.

Costs.—At the Finance Committee hearings much additional evidence was presented that conclusively fixed the costs of production in the United States of mines which could operate under the proposed tariff at \$13 per unit. (Part 1 of hearings before the Committee on Finance, pp. 19 and 35 to 40, and by certified statements from the important mines in California, Nevada, and Arizona, pp. 51 to 55.) Foreign production costs were proved to be \$1.25 to \$4 per unit (pp. 41 to 43), wages of foreign labor 20 cents to 65 cents per day. Of our production costs labor represents about 50 per cent. Wages of our labor from \$4.60 to \$5.25 per day.

The equipment of the average mine to work our large low-grade deposits involves an expenditure of approximately \$500,000. Many millions are invested in the industry as a whole.

The operating costs exclusive of depreciation and depletion of producing tungsten per unit in the United States is well illustrated in the following table compiled from the testimony before the Finance Committee (pp. 36 to 40, 51 to 55). Three of the largest best-equipped mines are taken, each as a representative of a type—(1) low-grade quarry deposits, (2) medium-grade lode deposits, (3) high-grade deep-vein deposits.

Class.	Cost per ton of ore mined.	Cost per unit of WO ₃ recovered.	Percentage of WO ₃ .	Name of mine.	Method of working.
1.....	\$3.77	\$12.83	0.294	Tungsten Mines Co.....	Quarry.
2.....	12.80	12.89	1	Pacific Tungsten Co.....	Tunnel; lode.
3.....	21.16	11.13	2.5	Atolia Mining Co.....	Shaft; vein.

¹ Atolia unit cost 1918, \$8.91, but grade of ore 25 per cent less than 1918. Cost of mined ore same, cost per unit increased.

Foreign costs.—At the hearing before the Ways and Means Committee June, 1919, Mr. Frank L. Hess, of the Geological Survey, testified that the published Burma costs were less than \$1.92 per short-ton unit.

Mr. Guy C. Riddell testified "much of the Burmese ore is produced for less than \$2 per unit."

At the hearing before the Committee on Finance Mr. F. W. Horton, corroborated by Mr. Hess, is quoted, "Chinese ore can be mined from \$1.25 to \$2 a short-ton unit and can be laid down in New York for \$5 to \$6 per short-ton unit."

This statement is proved by the fact that Chinese ores were sold in New York during 1919 at prices from \$6 to \$6.50 per short-ton unit, and over 10,000 tons were imported that year at that market price.

In an effort to convince the ore purchasers that \$6.75 per unit was not too high a price in 1919 Mitsui & Co., the largest importers of Chinese ores, circulated the following letter detailing the cost of producing those ores and getting them to market.

MITSUI & Co. (LTD.),
(MITSUI, BASSAN, KAISHA (LTD.)),
New York, June 13, 1914

GENTLEMEN: During the past month or two, we have frequently been keeping you informed as to the wolframite ore market, both in New York and China, at the same time placing before you various offers as cabled by our Hongkong office. However we regret to note these offers have not resulted in any business due to our presumably high quotations.

Generally speaking, we believe it safe to say that the ore market at the present is in a settled state, and we understand business has successfully been closed on a basis of \$6.75 short-ton unit, 65 per cent guaranteed. While this price may appear somewhat too high at the present time, still it is our contention that wolframite purchased at present is cheap, and circumstances permitting, orders should be placed.

As consumers as well as producers, we believe you undoubtedly may be interested in the attached statement conveying the exact cost of producing ore as arranged for our own reference by our Hongkong office. The inclosed statement will furnish you in detail with exact cost of material to our foreign offer, exclusive of other incidental charges, such as interest, transportation, and cable charges. These figures are, however, naturally subject to change in order to take care of any differences in exchange, ocean freight rates, also provisional State taxes which are based on value of ore at time material is forwarded from interior to shipping port.

It may appear peculiar but can be safely guaranteed that the price of wolframite is purely compounded on actual cost of extracting the ore from the mines plus cartage and incidental duties and taxes for which China is distinctively noted, deriving most of its revenue from such sources.

In conclusion, we believe as consumers the inclosed statement will be of interest to you as indicative of \$7.20 per long-ton unit Pacific coast as being about minimum price at which wolframite ore can be produced at the cheapest market, namely, China.

We trust the inclosed information will be of service to you in determining your future operations.

FUMIO TONE, Metal Department.

Tabulation of actual cost of tungsten wolframite ore in China.

Mining charges per picul.....	H\$10.00
Kiansi-Nanyu taxes.....	2.40
Kiansi-Nanyu forwarding charges.....	2.50
Kiansi war expense and Nanyu local taxes.....	1.40
Nanyu-Shoshu freight.....	1.00
Shoshu eastern customs duty.....	.75
Shushu Tarhei customs duty.....	1.00
Hokko Maning bureau duty.....	4.00
Finance bureau expenses.....	4.50
Finance bureau customs duty.....	.75
Rail freight to Canton.....	1.15
Koshu-Canton.....	.10
Canton export duty.....	2.00
Canton-Hongkong freight.....	.30
<hr/>	
Total charges per picul.....	H \$30.40
Per ton, 20 hundredweight.....	H\$511.00
<hr/>	
Exchange at 80.....	G\$408.80
Ocean freight to Pacific.....	20.00
Packing and insurance.....	3.00
<hr/>	
	G\$431.80

On basis 60 per cent at \$7.20 unit long ton, G\$ representing gold dollars, H\$ representing Hongkong dollars.

In using the basis of 60 per cent the cost is shown at \$7.20 per unit, although the letter they refer to a guaranteed 65 per cent content. Chinese ores carry from 65 to 70 per cent tungstic acid.

On a 65 per cent basis the cost would be \$6.67 per unit long ton, or \$5.96 per unit short ton.

An analysis of the \$5.96 cost shows: Mining, \$1.84; local transportation charges, 90 cents; taxes, \$2.88; ocean freight and packing, 34 cents.

Picul=133½ pounds; 22.4 pounds WO₃=1 unit long ton; 20 pounds WO₃=1 unit short ton.

It therefore seems clearly proved from the above data that Chinese ore may continue to be sold in New York at \$6 to \$6.50 per unit, or \$9 less than any domestic ores can be sold.

The mining costs are only \$1.84 per unit, while internal taxes are \$2.88. Those Chinese taxes are variable and are adjusted to meet the competitive conditions as established by the New York market price.

Requirement.—The normal requirement of tungsten ore in the United States is not as yet definitely known and can not be known for some time to come. The use of tungsten steels increased so rapidly during the war that prewar statistics are valueless. There was such a large carry-over of stocks of ore, ferrotungsten, and steel from 1918, and the transition from war to peace time production was so irregular, that no authentic estimates can be made of the amount of steel used in 1918, and therefore the future normal requirements can not be predicated on any 1918 statistical figure.

The maximum definite figures of our war-time domestic consumption was the amount used in 1917. There was very little carry-over from 1916 and none at all from 1917, so it is reasonable to assume the production of ore plus imports of ore less the equivalent of ore in exports would represent the amount used. These figures are: Production, 6,144 tons; imports, 4,878 tons; equals, 11,022 tons; less exports, 2,500 tons, leaves the net amount used at 8,522 tons. As munition plants were the largest users of tungsten steel, it is obvious that the peace-time normal requirement must be much less. That amount has been variously estimated by the United States Geological Survey from 1,000 to 5,000 tons, while the steel makers have guessed 7,500 tons. Six thousand tons, in all probability, more nearly correct, under normal conditions.

The alloy-steel industry is in the same deplorable condition as the common-steel industry, and any estimates made on the normal requirement of tungsten do not apply to the present.

PRODUCTION.

The evidence given at the previous hearings showed a production from present equipped mines which could be operated under the duty provided in H. R. 4437, as amended by Finance Committee to \$9 per unit, of 4,500 tons per year. There are known developed large low-grade deposits as yet unequipped which can increase this output to keep pace with our requirements. An example of such deposits is that of the Tungstonia mine at Ely, Nev., where there was developed a very large tonnage of ore. A mill was purchased for this property in November, 1918, but was not erected on account of signing of the armistice. That machinery is still in Nevada, and the property could be placed under production at the rate of 600 tons per year within four months. If the industry was stabilized by the passage of this bill, capital would be justified in the equipment of such properties.

The fact that our domestic mines produced 6,144 tons in 1917 (with prices ranging from \$17 and an average of \$22) is significant, especially when it is considered that the large contact deposits were not then developed. Our 1918 production (confined to 10½ months) was 5,029 tons, and three of the largest new mills were just starting to work. (See pp. 82 and 83 of Finance Committee hearings.) The mills are those of the Pacific Tungsten and Nevada Humboldt in Nevada and of the Pine Creek Tungsten Co., of California. They will produce 1,800 tons per year. The Tungsten Reefs Co., of Arizona, and Tungstonia Co., of Nevada, will produce when their mills are completed 1,200 tons per year.

The duty as provided in H. R. 7456 is not adequate to guarantee an output sufficient to supply a normal demand, as the production possible under the duty of \$7.14 as provided in the bill must come from the lower cost mines, and the estimate made that we can produce from developed and equipped properties 4,500 tons per year is on the assumption that this committee will protect this industry to the extent that we may be able to supply the demand and increase the rate in the bill to 57 cents per pound metallic tungsten, which equals \$9 per unit of tungstic trioxide.

Tungsten ore being always sold by the unit (20 pounds) of tungstic trioxide all calculations and estimates on requirement, output, prices, and costs are made on that basis.

PREWAR STATISTICS

A study of the chart furnished by the United States Geological Survey will clearly show the change that has taken place in the tungsten industry. Up to 1914 the average price was from \$7 to \$7.50 per unit. The price was regulated by fluctuations in the world's production. In 1914 our rich surface deposits had been exhausted, and only a small production could be maintained at the price of \$7.50 per unit. While it would appear in the years 1912 to 1914 we imported practically the same amount of ore as we produced and that only half of our requirements could be met from domestic pro-

duction, the fact is that no tungsten was refined here but the ore was shipped to Germany, refined there, and imported by us to make high-speed steel.

The increase in world production from 1914 should be noted. Also that in 1918 huge quantities of ore were imported into this country, most of it at the end of the year when England's embargo from her possessions was lifted. This demoralized our market. The continued imports in 1919 added to our accumulated stocks. The situation was still further complicated by imports of refined tungsten in 1920. The result has been the wiping out of our tungsten industry which was developed during the war. Mining ceased, refining ceased, and neither can be resumed unless a duty sufficient to equalize the cost between this country and China is provided.

The difficulty in getting a correct understanding of the tungsten industry in the United States, is that the development during the war period was so rapid that statistics became obsolete often before publication.

This is especially true in the mining of tungsten. The Tariff Commission made an investigation of the mining of tungsten in June, 1918. Between that date and the published report of that investigation the large contact deposits (which were referred to in the report as having been discovered and their highly prospective value was predicted) had not come into production and their effect on tungsten mining could only be guessed at.

With the equipment of these deposits the conditions of tungsten mining changed.

It was stated that the output of the Atolia mine in California constitutes over 75 per cent of the domestic output. While this statement was true of 1916 and perhaps 1917, the output of the mine decreased rapidly in 1918. In the last quarter of that year the ore dropped in grade, with consequent proportionate decrease in tons of concentrate produced while costs of production increased proportionately per unit. When the Tariff Commission reported there were some producers who could market tungsten at \$10 per unit, they referred to the Atolia mine, using their production and cost figures of 1916 and 1917, which were the lowest in the industry.

It was definitely shown in the hearing before the Finance Committee what the Atolia reduction in output was; and also that the operating costs, which averaged \$8.91 per unit in 1918, would in the future be from \$11 to \$12, based on the figures of the last quarter of 1918.

Therefore the statement that any ore can be marketed at \$10 per unit belongs to the past and not to the future.

It was also said the Atolia district was the largest producer of scheelite in the world. But through the erection of three large mills in Nevada in the latter part of 1918 the future production of Nevada will equal that of California, and the Bishop district in California through the addition of the Fine Creek mill will surpass the Atolia in production. Also the development of the vast ore body of the Tungsten Reefs Co. in Arizona at the close of 1918 will insure a production of scheelite from that field as large as the Atolia district.

So conditions relating to the future production of California, Nevada, and Arizona have completely changed due to the developments in the latter part of 1918. The cost of producing tungsten in those three States will be from \$11 to \$14 per unit.

In none of these developments has the refiner or steel maker the remotest interest. No refining or manufacturing of tungsten products is done on the Pacific coast and no properties or mills in California or Nevada are owned by such interests.

So it will be seen that the statement of the Tariff Commission that 75 per cent of the domestic production is created in the hands of four large companies is entirely erroneous as applied to the future. The whole production of Colorado will not amount to 15 per cent of the domestic production. Assuming that the Atolia mine will continue to furnish 15 per cent of the production of the United States, and such an assumption is not warranted by the facts, it would leave 55 per cent of the domestic production scattered through other producers in California, Nevada, and Arizona.

But it was not true that the past production of Colorado centered in three large companies, affiliated with refiners or manufacturers. There were according to the Tariff Commission's own report 10 mills in Colorado. The Tungsten Products Co. referred to as one of the three, produced no ore but purchased ore from leasers, concentrated these ores, and refined the concentrate in their own plant at Boulder.

The Rare Metals Ore Co. has a large mill, and produced ore as well as purchased it. That company had no affiliation with any manufacturers of tungsten products.

The Primos, Vasco, and Wolf Tongue companies each operated large mills, and while all were producers, still the main source of their ore was through purchases of ore from leasers and independent owners. All of those large mills shipped the concentrate under their own names and so were credited with the production irrespective of the source of the ores.

There are over 25 large finely equipped tungsten mills in Colorado, Nevada, California, and Arizona to take care of the production from a large number of mines.

the mills and mines are distinctly separate in ownership without any overlapping interests.

There were 27 refiners of tungsten ores and 32 makers of high-speed steel according to the United States Geological Survey tabulations.

Any suggestion of the possibility of a monopoly in any branch of the tungsten industry is absurd.

FOREIGN TRADE RELATIONS.

Export.—There is no export business in tungsten ores. Our exports of finished tungsten products have been negligible, with the exception that during the war we came to the assistance of the allied powers by shipping them ferrotungsten. With the close of the war all exports ceased. Our export business can never become a factor, as foreign countries control cheaper ores and manufacture at a lower cost. They are and are now underselling us in our home markets.

Imports.—We have been importers. Before the war establishment of our refining industry most of our imports were in the form of refined tungsten from Germany. So we always imported high-speed steel. During the war and since the war we have been large importers of ore. But these ores are imported from countries which are not directly engaged in the war. All of them are creditor nations. In 1919 60 per cent of the ore imports were from Asia and 22 per cent from South America. So far as our trade relations with South America go, they can not be adversely influenced by tungsten. The mines are largely controlled by England, but Ross Zeltnie (consul, La Paz, Bolivia, reports to State Department, July 9, 1919, foreign file No. 4) states: "The average cost of production 1918 was about \$12 gold per unit.

* * * The poorer mines can not operate unless the price goes well above \$12 per unit. * * * No imports of ferrotungsten are listed in official statistics, and the exports, if any, are negligible. * * * No tungsten is used locally."

Such priced ore can not compete with Asiatic ores any more than our ores can. Any ore which Bolivia can sell us now in competition with Asia we can buy as well with a tariff as without a tariff; so how can American tariff legislation injure Bolivia or American interests in Bolivia? It was stated (p. 45 of hearings) that there was from 1,200 to 1,500 tons of Bolivia ore that can compete strictly with China. This statement is borne out by the 1919 imports, which include 2,106 tons of South American ore (p. 83, hearings). The imports of ferrotungsten and high-speed steel are now coming from England. But the duties levied in this bill are in no sense shut-out duties. England always has exported tungsten steel and can continue to export to the United States, but it does not seem good policy to destroy absolutely our vitally important tungsten industry in order to give England the whole of a trade where before the war she was content with about 30 per cent of it. Japan, for the first time, is beginning the manufacture of tungsten products.

If the industry which was developed as a war-time necessity, from the sole standpoint of guaranteeing our national security, is not worth that, we have no reason to ask for the legislation.

Unless the mining of tungsten is put on a stable basis and maintained the other branches of the industry—namely, (1) refining, (2) alloy steel making—can not continue.

Tungsten is a precious metal. It is never found native but always in chemical combination with other substances. Ores containing tungsten can not be used direct but must be refined and put in the form of tungsten powder or ferrotungsten. From these refined products the alloy steels are made, also the metal tungsten. Only negligible amounts of the metal tungsten are produced. The great use of tungsten is in the form of tungsten powder or ferrotungsten, from which tungsten alloy steels are made. Ninety-five per cent of the refined tungsten output of the world is used in making high-speed steel—a tungsten alloy steel containing 18 per cent tungsten.

All substances containing tungsten are costly and are bought and sold on the pound basis. It would be just as misleading to express the value of tungsten in terms of tons as it would to express the value of gold in terms of tons.

In considering the duty imposed by the bill, the significant substance is high-speed steel—the only commercially important product of tungsten—the product which reaches the consumer. Both the ores and refined products are intermediates high in value, of basic importance but of meager tonnage.

Following is an excerpt from an article by Owen Street Payne in *The Annalist*, Monday, August 1, 1921, advocating free trade:

"As long as there is war in the world it is recognized that each independent nation should have for its protection not only armies and navies but those industries which build up and sustain the armies and navies and support the existence of the nation in case it should be cut off from outside supplies. Such essential industries should receive protection until they have reached a stage where they can sustain themselves."

CONCLUSION.

In conclusion I want to emphasize the fact that to-day the tungsten industry in this country is out of existence in all its branches—mining, refining, and steel making—that the British control absolutely the markets of this country on the manufacture of products of tungsten, viz, ferrotungsten, tungsten powder, and high-speed tungsten steel, and will continue the control until protection is afforded the industry in all its branches by levying duties sufficient to equalize the cost as between this country and China on the production of tungsten ore and as between this country and England on the cost of producing the various manufactured products of tungsten.

It then remains for the Finance Committee to determine the question whether it will protect this industry which was established during the war and was very essential and employs tens of thousands of men and in which there is invested many millions of capital.

CRUCIBLE TOOL STEEL.

[Paragraphs 302, 304, 305, 307, 308, 315, and 316.]

STATEMENT OF JOHN A. MATHEWS, PRESIDENT OF THE CRUCIBLE TOOL STEEL CO. OF AMERICA.

Senator SMOOT. Give your name to the stenographer.

Dr. MATHEWS. I am John A. Mathews, president of the Crucible Tool Steel Co. of America, and I also represent about 25 other makers of crucible tool steel. All the gentlemen who have appeared heretofore have been representatives of what we call the tonnage-steel industry. I am representing the small-steel industry, which is engaged in making a relatively small quantity of high-grade materials which go into watches, fine tools, and similar special uses.

Senator LA FOLLETTE. Is your address 17 East Forty-second Street, New York City?

Dr. MATHEWS. Yes. I have a brief referring to one or two changes as we see them, in the bill now before you. In the first place, however, we want to express our appreciation to the Senate Finance Committee for its recognition of the American valuation principle, which is a sound principle and one on which the first tariff bill was drafted. In regard to the crucible or fine steel industry, I wish to say that this industry is engaged in the manufacture of the finest grades of steel. This industry is a stationary and not a growing one.

Senator SMOOT. You do not intend to read all of that brief, do you, Dr. Mathews?

Dr. MATHEWS. No, sir. I have here a number of pages with notes on them. [Reading:]

Comparing the production of open-hearth steel in the last decade of the last century with the production for the second decade of the present century, we find that the production has tripled, while the manufacture of crucible steel had increased by 10 per cent. The inability of the crucible-steel industry to grow anywhere nearly in proportion to the open-hearth industry has been due in a considerable measure to the fact that in previous tariff bills no special recognition has been given to this branch of the industry, in which skilled labor rather than mechanical equipment is the outstanding feature.

The manufacture of crucible tool steel and various fine-steel specialties is carried on in this country in 30 or more plants located in Connecticut, New York, New Jersey, Pennsylvania, Ohio, Illinois, West Virginia, and some other States. Most of these plants are small, but in some cases tool steel and special steels are manufactured in branches or divisions of large steel plants, as, for example, at Midvale and Bethlehem. It is difficult to state the exact capital invested in the industry, but we believe that \$250,000,000 is a very conservative estimate. There are employed from 30,000 to 40,000 men. The industry is quite distinct from the manufacture of tonnage or commercial steels. This difference is indicated by the fact that tool steels are sold by the

and while tonnage steels are sold by the hundredweight or ton. In a tool-steel mill a full shipment of one size is rare. A 1-ton order of a regular quality and size is considered a good order.

The proportion of labor to raw material is many times as great in the manufacture of crucible steel as it is in the manufacture of open-hearth or Bessemer steel. The capital invested in a crucible-steel plant is from five to six times as great per ton of product as required for mills making merchant bars, structural steel, etc. The investment per ton in the former is customarily from \$300 to \$400, while in the latter it may vary from \$25 to \$75 per ton of output. The product of the tool-steel mill averages about 1 ton per man per month. In the manufacture of tonnage steels it is from 15 to 30 tons per man per month. It is in proportion to the increased amount of labor involved that imports of steel increase and exports decrease.

These basic differences in the nature of the crucible-steel industry as compared with the tonnage-steel industry have never been given adequate consideration in the matter of drafting tariff bills, with the result that a very large proportion of all the imports of steel are made to the detriment of this relatively small industry, while the exports of commercial tonnage steels are almost negligible compared with the vast volume of production.

Senator SMOOT. Will you tell me just what you want, so that I can refer to it later? What changes do you want?

Dr. MATHEWS. I am coming to that now. [Reading:]

The 35,000 employees of the crucible-steel industry have not had 25 per cent employment in the last 10 months, and such employment as they have had has been on part-time basis, averaging probably a little better than 50 per cent. The other 75 per cent of the employees of the industry are sitting on the side lines wondering what Congress is going to do to bring about a return of employment and prosperity. It is probable that their ideas on this subject may become fairly well crystallized by election day.

I have stated that there are about 30 mills engaged in the manufacture of crucible tool steel. There are from 40 to 50 importers of grades in direct competition with these mills who have relatively no capital investment, giving employment to no labor, and assuming but a very small proportion of our tax burden.

In paragraph 302 very heavy duties are imposed upon the ores and raw materials which are an essential part in the manufacture of tool and alloy steels. This is a radical departure from the traditional policy of cheap raw materials for manufacturers, coupled with suitable protection on finished articles the manufacture of which involves much labor.

It is difficult to understand why manganese ore and tungsten ore should suddenly require protection in an amount of something over 100 per cent of their prewar values. No great deposits of these ores have been discovered, and this country does not possess in quality or quantity sufficient of either of them to take care of its needs. We shall have to go abroad for our principal sources to the great deposits existing in foreign lands.

Senator CURTIS. You had hard work in getting any during the war, didn't you?

Dr. MATHEWS. We had to go abroad for increasing requirements. [Reading:]

Manganese may be considered as a steel-making necessity, and compared with it all other alloying materials mentioned in paragraph 302 may be termed luxuries. The Bessemer process for steel making had almost proven a failure until it was discovered that the addition of manganese was required to produce sound steel in a Bessemer converter. The proposed duty of 1 cent per pound on metallic manganese in ores "containing in excess of 30 per cent" is in itself an admission of the low quality of our domestic ores. The high-grade ores of Brazil, India, and Russia frequently contain 50 per cent of metallic manganese. This material should be restored to the free list, or possibly protected to the extent of 10 per cent as a revenue measure.

The proposed rate of duty on tungsten ores and concentrates is about 250 per cent of the present selling price, or 125 per cent of the average prewar selling price. Our company is a very large buyer of tungsten ores. In the years before the war over one-half of this material was of domestic origin. During the war period, when the prices were so high and the difficulties of obtaining foreign shipments were so great, we had to rely more and more upon foreign sources, and for the past three years we have bought no domestic ores. The demand for tungsten ores during the war was so great that many were induced to work tungsten properties which were of little value, and

it is poor economics to continue the operation of such properties by reason of an orbitant rate of duty, particularly since they can not under any circumstances take care of the country's normal needs. The rates for both tungsten and manganese are to be predicated upon the extremely high costs during the war period rather than upon the basis of operation in normal times.

In the case of molybdenum ore we have a little different situation. Of all alloying materials used in the steel industry molybdenum seems to be the only one of which we possess an adequate domestic supply. The use of this metal is a development in steel metallurgy, and the production of molybdenum is an infant industry which we believe is entitled to some protection. We feel that the rate proposed of 75 cents per pound is too high and should be changed to not over \$10 per ton.

The rates proposed on the ferro-alloys made from these ores are in the nature of compensatory duties made necessary by the extremely high rates imposed upon the ores themselves. If the rates on the ores are reduced, as they certainly should be, then these rates on the ferro-alloys should be correspondingly reduced. The rates on the other ferro-alloys are needlessly high, and seem to be based upon war-time conditions, and not on any normal basis of costs. If the present rate of duty is retained on tungsten ore and ferrotungsten, it will raise the cost of high-speed tool steel from 20 to 25 cents per pound and the selling price by somewhat greater amount.

In the manufacture of ferro-alloys in electric furnaces American makers are under no disadvantages except in the cost of electricity. Power and raw materials are the big items of expense, and labor is of less importance. Capital investment in plants is very moderate, and an ad valorem duty of not over 10 per cent should be an adequate protection.

Paragraph 304: The fundamental defect in this paragraph, and in several others, is the lack of orderly classification of steel products. The need for more scientific classification has been pointed out by the United States Tariff Commission, and in a brief which the writer submitted to the Ways and Means Committee January 1, 1921, he proposed a classification which Dr. Page, of the Tariff Commission, stated was the best attempt in this line that he had seen. The basis of such classification depends upon grouping iron and steel products somewhat in proportion to their advancement from the raw-steel state to the more highly finished forms, and imposing ascending rates of duty as the proportion of labor to raw materials increases. Paragraph 304 includes ingots, billets, bars, and forgings. These represent great differences with respect to the ratio of raw material to labor. In the fine-steel industry it is made possible by the application of labor to convert 5 cents' worth of raw steel into the ingot into 75 cents worth of needle wire, or \$1.50 worth of safety razor blades, or \$10 worth of hair-spring wire. It is the highly finished forms of steel, representing the expenditure of much labor on a small amount of raw material, that are seriously affected by importations from abroad, where labor is so much lower than it is here. The crucible or fine steel industry is a handcraft industry, and represents in tonnage only about one-half of 1 per cent of the total steel production of the country. This small amount of tonnage, however, represents possibly from 2 to 2½ per cent of the value of the total steel business. Against this small tonnage is directed a very large proportion of the total importations. About 70 per cent of the duties collected on iron and steel products are on products which are imported in competition with the tool-steel industry.

Instead of adopting an ascending rate of duties on products representing an increased amount of labor, this paragraph contains specific duties, the highest rate of protection being given to the tonnage products, which have almost no competition from abroad, and the lowest duty is given to the highest priced steels, which represent in some cases 85 to 90 per cent labor. If you will examine this schedule you will find that a steel valued at 1½ cents is protected to the extent of 33½ per cent, while a steel valued at just under 40 cents is given 15 per cent protection, and all steels over 40 cents are allowed 20 per cent.

On the basis of protecting the American workman and American standards of wages and living, these rates should be reversed, but if the rates in the present bill are maintained for tonnage steels, they are obviously much too low for high-grade steel products. This same condition has existed in many of the previous tariff bills, and the crucible-steel industry has never received the protection to which it is entitled because of the nature of the industry. The tariff act of 1913 did give some recognition to the crucible-steel industry in that it provided for 15 per cent duty on the products of the crucible and electric furnaces and upon alloy steels, while lower rates were given to the tonnage products, but this feature based upon process of manufacture is almost impossible of administration, and I shall later propose a method that can be readily administered.

Paragraph 305: The defect in the rates in paragraph 304, as applied to high-grade steels, can be in large measure corrected without complete revision if in line with

graph 305 you will insert the words "carbon, or" before the word "nickel." 7 would then read: "containing more than six-tenths of 1 per cent of carbon, nickel," etc. It so happens that nearly all of the crucible or fine steels are high products, running well above six-tenths of 1 per cent, while the large tonnage steel is in very large part made up of steels running much below six-tenths of 1 per cent. Therefore, if the carbon should be included along with the alloying metals industry based largely upon the production of high carbon steels would secure additional protection which it deserves and needs.

The last portion of paragraph 305, beginning at the end of line 13, should be amended so that the additional cumulative duty should apply to the entire molybdenum or tungsten content. Having defined in the earlier portions of this paragraph the lower limit of alloy which shall constitute an alloy steel for duty purposes, there is no reason for setting a different rate at which the assessment of additional cumulative duty shall begin in the case of molybdenum and tungsten. The provision as it now stands will permit the entry of a great many steels containing, in fact, less than 1½ per cent of these elements.

Senator McLEAN. I want to ask you one question. I want to call your attention to paragraph 305, which, I think, embraces cold-rolled, forged, stamped, or drawn steel. Mr. Brewster appeared before the committee the other day and wanted that rate reduced from 15 per cent to 12.5 per cent ad valorem, on the ground that you do not make high-speed drill steel. That was with reference to the American product. I think he said that they could not use the American drill steels. What have you to say as to that?

Mr. MATHEWS. We have the capacity and the ability to make anything in this country that is made abroad; in fact, we have more capacity as we need in that respect.

Senator McLEAN. I am speaking of high-speed drill steel.

Mr. MATHEWS. Yes; drill steel. We can take care of the drill steel. I suppose you are talking about mining drill steel.

Senator McLEAN. Yes.

Mr. MATHEWS. There is no difficulty in taking care of that, both in capacity and quality.

Senator McLEAN. Then you do not agree with Mr. Brewster?

Mr. MATHEWS. Probably not, sir. We do not generally agree with a fellow who is trying to sell what we are selling. We do make large quantities of mining drill steel. [Reading:]

The additional cumulative duties proposed under paragraph 305 are, of course, based upon the exorbitant rates of duty proposed on molybdenum and tungsten ores and metals. If these rates are reduced, as they certainly should be, then, of course, the additional cumulative duties should also be reduced; and if not reduced it will seriously injure all the manufacturers of high-speed steel and all of the manufacturers of small tools, such as twist drills, cutters, etc., made from high-speed steel. These rates of duty will necessarily prevent American manufacturers of high-speed steel from exporting any of their product, and they will also prevent the makers of small tools from exporting their product; but these rates will encourage such manufacturers as now have established businesses abroad to buy their high-speed steel in a foreign market and put it into tools for export, upon which they will receive a drawback duty. If this condition is forced upon us, it will injure both the American tool steel manufacturers and the American producers of tungsten ores and alloys, and no one will be benefited but our foreign competitors.

It should be further pointed out that this additional cumulative duty is the same amount as the cumulative duties placed upon molybdenum metal and ferro-molybdenum, tungsten metal, and ferrotungsten. It does not take into consideration at all the fact that there is a loss of some 20 to 25 per cent in the use of these metals in ferro-alloys in the process of conversion into finished steel. The amount of this loss has been confirmed by the investigation of the Tariff Commission. Therefore, we are not only deprived of the additional cumulative duty on the first 1½ per cent of molybdenum or tungsten contained but also upon the entire conversion loss in the use of these metals. If the rates are to be retained as they now appear on the ores and alloys the additional cumulative duty should be increased by 25 per cent,

and it should apply to the entire tungsten or molybdenum content. This will still further injure the American manufacturer of tungsten and molybdenum and, indirectly, the producers of the tungsten and molybdenum ores and metals.

To paragraphs 307 and 308 the same applies as to paragraph 304, namely, that the higher the value of the steel the lower its rate of duty. This defect would be in a measure corrected, in so far as it applies to the manufacture of tool steel, if the amendment I have suggested in paragraph 305, line 7, is adopted.

Paragraphs 315 and 316 cover satisfactorily ordinary commercial rods, wire, and rolled strip. They do not adequately protect the manufacturer of highly turned specialties in this line, as, for instance, polished drill rods, watch-part steel, razor steel, either tempered or untempered, tape-line steel, pen steel, needle and similar products which are turned out by specialty mills and involve a great deal of skilled hand labor in their production. If the amendment proposed in paragraph 305, line 7, is adopted, this would in a measure take care of these highly specialized products, and in general, I believe, this end could be better accomplished by the proposed amendment than by any other method or than by the change of the rates in the paragraphs as they now stand.

FERRO-ALLOYS.

[Paragraphs 302, 385, 386, 389, and 390.]

STATEMENT OF JOHN A. TOPPING, NEW YORK CITY, REPRESENTING THE REPUBLIC IRON & STEEL CO.

Mr. TOPPING. Mr. Chairman, I have reduced what I want to say to the committee to the form of a written statement, because I thought by so doing I might perhaps present more specifically and clearly my general views on the bill as a whole, but if it is the wish of the committee, for the purpose of discussing any paragraph which I either approve or disapprove, to have me read it, I will do so; if not, what I have already prepared in the form of a written statement covers my general views on the Fordney bill.

The CHAIRMAN. Mr. Topping, I suggest that you have the written statement printed, and then if you desire to call the committee's attention to any high spots in the statement or any matters having particular bearing on the question, we would be glad to hear you.

Mr. TOPPING. In following your suggestion, Mr. Chairman, I restate that the high spots that I shall particularly address myself to, and which other speakers who will follow me will address themselves to, is the fact that the iron and steel rates in the Fordney bill are too low. We regard this bill as a revenue tariff from our viewpoint, and while we are disposed to accept the schedule, with slight changes here and there, it is only with the recommendation that it is tied in with the protective clauses, such as the American valuation, the anti-dumping, and the bounty clauses, and all other features of the Fordney bill that provide for what we term unfair competition.

We also in making our recommendations have in mind the adoption of what we consider to be a time-honored policy of the Republican Party; that is, protection for finished products and free raw materials. We can not live under this bill as framed unless we have the same protection in the way of cheap raw materials that we formerly had under the Payne-Aldrich bill. The proposed increase in taxes on our raw materials under this measure will add to the steel cost in this country enormously, for such items as ferrosilicon, fluorspar, manganese ore, magnesite, pig tin, and zinc. These items alone will add \$23,805,000 per annum increased cost to steel.

We can not view with equanimity an increased cost of \$24,000,000 annum in steel when we have to-day, due to the expanded growth production, stimulated by war necessity, a present output of about 100 per cent excess of our home demand. We feel that the wise thing to do under the circumstances is to accept a low duty with free raw materials, and thus stimulate lower costs, so that we can export part of our surplus in order to more nearly employ 100 per cent of home labor.

In brief, these are the high spots, and the general arguments supporting that position are set up fully in the brief that I submit.

I also desire to submit a supplemental statement for your general information which covers some statistical data of general interest. This statement is, I think, as accurate as possible, respecting the comparative labor costs in the principal competing countries of Belgium, England, Germany, and the United States; freight differences, present selling price, and, in fact, all general data, suggestive of the reasons for adopting the recommendations that we make.

Senator CURTIS. This information has been collected by you and is reliable? Or is it information obtained through the newspapers?

Mr. TOPPING. I will give you the character of it. My authority is given in the statement. It is very difficult, I might add, Senator, to obtain exact statistical information from foreign countries; in fact the data on cost is changing from time to time.

Senator CURTIS. That is why I asked the question.

Mr. TOPPING. That is due to the fact that over there conditions are not as they are here, in more or less of a state of flux. But here is something that I think may be regarded as official and is suggestive. The German Institute of World Economics recently published in their publication, "The Weltwirtschaftliche Nachrichten," returns from 20 different cities of Germany on the cost of living. The information contains the comparative wages paid there to-day as compared with what were in effect in 1913 and 1914. To illustrate by a specific case, a machinist in 1914 earned \$1.49 gold per day. To-day that same machinist, on the basis of the Institute's report of current wages measured in gold, earns 41 cents a day. This rate per day does not take into account, however, the difference between the international gold exchange value of the mark and the local purchasing power of the mark, due to governmental regulation of prices, which has given an increased buying power to the mark in excess of its international exchange value. Some authorities have put that as high as three to one, and in some cases as high as four to one. If you adopt the mean, say, two to one, that machinist's wages to-day would be \$1.23 as compared to \$1.49 in 1914. So you can see that Germany has passed through the transition period, or has readjusted herself and liquidated her labor to more than the prewar basis.

Data published by this German institute show also that while the cost of living has increased, yet the purchasing power of a German factory laborer, under existing conditions of price control, is about the same as it was during the prewar period. With us that is not true. Our wage rates are about 52 per cent higher than they were in 1914, and yet the steel industry as a whole has probably more thoroughly liquidated labor than any other group of large employers. We are also probably the largest employers in the country. The steel

industry, it is estimated, employs easily a million and a half men when operating in full.

Senator SMOOT. As I understand it, Mr. Topping, you are interested in the raw material of manganese, tin, zinc ore, and iron in blocks and pigs.

Mr. TOPPING. And the entire ferro-alloy schedule.

Senator SMOOT. And your idea is that the rates provided in this bill on those items are too high, if the rates on the steel products remain as they are in the bill?

Mr. TOPPING. That is absolutely correct, Senator Smoot.

Senator SMOOT. So I judge from what you say. Does your bill show a comparison between the steel products and the raw materials?

Mr. TOPPING. My supplemental statement will show that in a general way. For instance, take the raw material schedule in the bill we are discussing.

Senator SMOOT. I did not particularly care to go into that because I do not think it is necessary if your report shows it.

Mr. TOPPING. I think it does, by comparing the ad valorem equivalents, in rates of duty.

Senator SMOOT. The committee will have to spend considerable time on that, anyway.

Mr. TOPPING. I was trying, at the suggestion of the chairman, to give you in a general way the "high spots" and point out the objectionable features, and to also tell you what features of the bill we fully approve. For instance, we think the reciprocity feature of the Fordney bill is desirable, because we think cooperation between the Government and business will be more necessary than in the past, if we are to maintain our export trade.

Senator McCUMBER. Are you satisfied with those rates, provided the steel is given a sufficiently high rate to compensate the manufacturers of steel?

Mr. TOPPING. I will answer that question, Senator McCumber, by saying that this schedule in the Fordney bill is lower than the schedule in the Payne-Aldrich bill, and it is proposed, notwithstanding we have less protection than under the Payne-Aldrich bill, to tax our raw material costs over \$24,000,000 per annum. Give us the same raw-material cost as you did in the Payne-Aldrich bill, and we will accept the Fordney bill as it stands.

Senator LA FOLLETTE. But with American valuation?

Mr. TOPPING. Yes; with American valuation.

Senator LA FOLLETTE. But whether it applied or not, do you mean to say that the rates fixed in this bill will be lower than those in the Payne-Aldrich bill?

Mr. TOPPING. I do.

Senator McCUMBER. I did not get to finish my question, Mr. Topping. If we retain the rates on these alloys that are used at the present rate and then give you a corresponding increase in the steel rates will that affect your export of steel products?

Mr. TOPPING. Very seriously.

Senator McCUMBER. Then, as a matter of fact, you are not entirely satisfied with the rates that are given on the raw materials that you use in the alloys. Would you rather it be low so that you can export? Is that true?

Mr. TOPPING. That is correct. We will accept a very low schedule for our own finished products in order to obtain all of the compensating advantages we can in the way of a low cost, so as to broaden our markets and thus employ more of our labor. Otherwise, we cannot hope to employ the labor we have heretofore employed, particularly with the exchange rates of the world upset, or at a discount on the pound sterling of from 23 to 25 per cent, with 60 per cent on the mark, the lire below this, so you can readily see that our chances of export under those conditions are very small unless low costs can be obtained.

Senator McCUMBER. Do you export steel products to those countries?

Mr. TOPPING. No; but they are leading us in a competitive way in South Africa, Australia, and in Canada. England, as you may know, accorded preferential treatment in all her colonial possessions.

Senator McCUMBER. Your main markets are Canada and South America?

Mr. TOPPING. Yes; but we ship to Australia, New Zealand, South Africa, and Japan. Japan at times has been quite a large buyer. Our exports represent our surplus, and we export that, whether we lose or make money on it, because in that way we are able to employ more labor and keep our overhead down and produce cheaper at home. I know that this policy is objected to by some, but it is sound business and common sense, as it means by this policy more money in circulation through our pay rolls, and should be considered a good republican doctrine.

Senator LA FOLLETTE. What is your connection with the Republic Iron & Steel Co.?

Mr. TOPPING. I am the chairman of the board of directors, sir.

Senator LA FOLLETTE. Who are the officers of that company?

Mr. TOPPING. I am the chief executive officer and the other active officers of the company are Mr. T. J. Bray, president, and Mr. H. L. Townsend, vice president.

Senator LA FOLLETTE. What commodities does your concern produce?

Mr. TOPPING. We mine ore, coal, and limestone, and produce pig iron, North and South, tubular products, sheet and plates, merchant bars, and a great many agricultural shapes, bolts and nuts—in other words, a diversified product. We produce our products on an integrated basis, viz, from raw materials to the finished product.

Senator LA FOLLETTE. Have you in your brief specified changes in the existing duties upon each of these commodities which you would seek to have made?

Mr. TOPPING. My general brief, Senator, contains general observations on the bill as a whole; my statement is to be followed by statements of others who are associated with me, who represent the independent steel interests of America.

Senator LA FOLLETTE. Where you desire changes made I suppose you will indicate them?

Mr. TOPPING. They will be specifically stated; yes, sir.

Senator LA FOLLETTE. Are they indicated in your brief, or will they be presented by others?

Mr. TOPPING. My brief is a general argument to support the general claim that I made, that in order to sustain the schedules of the Fordney tariff bill it will be necessary to have American valuations and free raw materials, such as were heretofore accorded us under the Payne-Aldrich Bill, and the reasons in detail will be stated by the gentlemen who will address themselves to the individual paragraphs.

Senator LA FOLLETTE. Who are your principal American competitors?

Mr. TOPPING. The United States Steel Corporation, who are our principal competitors, outside of our own group, which represents quite a large list of companies—for instance, the group represented here to-day probably represents close to a billion and a half capital and close to 50 per cent of the steel production of the United States.

Senator LA FOLLETTE. How many are associated together in the group of which you speak?

Mr. TOPPING. None. We are all individual companies.

Senator LA FOLLETTE. I understand that, but you spoke of cooperating here as independents in the presentation of your case. I ask you how many different companies are associated, if you can name them.

Mr. TOPPING. They are here listed in detail and they represent all principal so-called independent manufacturers. There are eight gentlemen here who represent these interests, our thought being that we would save the time of this committee by presenting our views in this way.

Senator LA FOLLETTE. What companies do they represent?

Mr. TOPPING. I am speaking for the Republic Iron & Steel Co., the Bethlehem Steel Co., the Midvale Steel & Ordnance Co., the Youngstown Steel & Tube Co., Jones & Laughlin Steel Co., Brierley Hill Steel Co., Pittsburgh Steel Co., Sharon Steel Hoop Co., Interstate Iron & Steel Co., Lackawanna Steel Co., Gulf States Steel Co., Inland Steel Co., Lukens Steel Co., Wheeling Steel Corporation, and the Steel & Tube Co. of America.

Senator LA FOLLETTE. What per cent of the total output of your production does your principal competitor, the United States Steel Co., turn out?

Mr. TOPPING. That varies somewhat, Senator. In a rough, general way it is about 50 per cent. I think it is between 45 and 50 per cent.

Senator LA FOLLETTE. What is the total capitalization of your concern?

Mr. TOPPING. Our company capital is \$55,000,000.

Senator LA FOLLETTE. State separately the amount of each class of capital stock, bonds, and other indebtedness, surplus and undivided profits.

Mr. TOPPING. Twenty-five million dollars of the preferred stock, \$30,000,000 of the common, and a little over \$12,000,000 of bonds, and an earned surplus accumulated over a period of twenty-odd years of approximately \$38,000,000. We do not know, however, how much of this surplus will be left on the 1st of January, 1922, because we are dissipating that surplus now by shrinkage and operating losses, as current steel prices are about \$5 per ton below the present cost of production.

Senator LA FOLLETTE. I am speaking of what your books would show as to surplus and undivided profits.

Mr. TOPPING. Yes; I did not want you to get away with the idea that we had \$38,000,000 net profit per annum.

Senator LA FOLLETTE. How much has this surplus been reduced? I am not trying to get away with anything; I want only the facts.

Mr. TOPPING. We publish quarterly statements. I am not saying that you are trying to get away with anything, Senator, I meant that I did not want you to go away with a wrong impression.

Senator LA FOLLETTE. You gave the amount of your surplus and divided profits for January 1, did you not?

Mr. TOPPING. For 1920; that is our last annual report.

Senator LA FOLLETTE. You have made quarterly statements since then?

Mr. TOPPING. Yes.

Senator LA FOLLETTE. Give the same figures for each quarterly statement since then.

Mr. TOPPING. I can not remember the exact figures.

Senator LA FOLLETTE. Give them in substance.

Mr. TOPPING. We lost about a million dollars in the first six months of this year. Does that answer your question? That covers the period from January to July.

Senator LA FOLLETTE. I would rather you give me figures of your surplus as shown by each quarterly statement.

Mr. TOPPING. I will file with you, if you desire, a copy of the last annual report.

Senator LA FOLLETTE. That is very much better.

Mr. TOPPING. I brought it along and thought you might like to have it.

Senator LA FOLLETTE. I certainly would like to have it.

Mr. TOPPING. I shall be glad to give it to you. We circulate these reports because we are proud of them, but because we believe in publicity. This is our last annual report, dated December 31, 1920.

Senator LA FOLLETTE. Were quarterly statements made since then?

Mr. TOPPING. The quarterly statements I have not with me.

Senator LA FOLLETTE. You will supply them?

Mr. TOPPING. I shall be very glad to do so and to furnish you with any other information that is proper.

Senator LA FOLLETTE. Yes; I want a little more information and will proceed. How much of your capital represents, first, cash actually paid in?

Mr. TOPPING. I can not answer that question, because I was not in the company at the time of its organization.

Senator LA FOLLETTE. I suppose your books will show?

Mr. TOPPING. I do not think they will, but I have not investigated them.

Senator LA FOLLETTE. Will you make an investigation and answer that question?

Mr. TOPPING. I do not think I could find out, because the original company was organized in 1889, and the original records are not in my possession.

When the question of the excess-profits tax came up for consideration, the revenue department suggested that these early records might be helpful, but we were unable, from the records of the company in our possession, to supply the data that was wanted. Our

company was organized in 1889, and the price paid each one of the companies was not made known but a total cost was known, and the only way we could measure the probable cash value of the property at the time of organization, in 1889, was by what the stock sold for in the market on a cash basis, and our original invested capital was calculated somewhat with these thoughts in mind. Since 1889 we have squeezed out all the water if there ever was water in the Republic Iron & Steel Co., by additions through accumulations of earnings.

Senator LA FOLLETTE. Now, just excuse me. Your books as they stand to-day will show, of course, some figure of cash originally invested in the business.

Mr. TOPPING. No; they will not.

Senator LA FOLLETTE. What do they show with respect to your capital?

Mr. TOPPING. This is what they show [referring to the twenty-first annual report]. It does not show, as you will observe, what you wanted to know, viz, the original property value. It shows what our present total property value is, which is \$97,000,000.

Senator LA FOLLETTE. Yes; I understand that. So you have no means of stating how much cash has actually been invested in the business in your company? That is your answer, is it?

Mr. TOPPING. No, sir; that would not be my answer. I could not answer that yes or no direct. I can only answer your question in an indirect way, which will give you, perhaps, a better reply than a direct answer.

Senator LA FOLLETTE. Fine.

Mr. TOPPING. Our total property account shows in this statement referred to \$97,329,000 of property values of all kinds—mineral lands bought many years ago, coal, iron ore, real estate. This property was never appreciated on the books, but is now carried at the original cost, with additions made since 1899.

Senator LA FOLLETTE. I think if you will just—

Mr. TOPPING. Since 1899 we have spent in actual cash on new construction over \$46,000,000. So that if you go back, to answer your question by deduction, you can readily see that at least \$46,000,000 of this was real new money, and with the preferred stock which was \$25,000,000, leaves you only about twenty-odd million dollars for speculative theory as to the real cash value of the original property. This statement I think gives you a suggestion of original cash value.

Senator LA FOLLETTE. Well, I am following certain forms that have been approved by the Government, and I am going to ask you for answers to the questions based upon those forms. Of course I accept your answers as you make them. I ask you to state with regard to your capital how much of it represents cash actually invested, if you can?

Mr. TOPPING. I can not. If you want a direct answer. I cannot answer in that way.

Senator LA FOLLETTE. How much property was put into the business?

Mr. TOPPING. That I can not answer because I have not the original figures.

Senator LA FOLLETTE. Well, have you any data in the records of your company that will furnish answers to those questions?

Mr. TOPPING. I have not. The only data we have is the total property values turned over by the organizers of the company, and we have no records beyond what we acquired as a consolidated company, Senator.

Senator LA FOLLETTE. How much of your capital represents patents?

Mr. TOPPING. None.

Senator LA FOLLETTE. Trade-marks?

Mr. TOPPING. None.

Senator LA FOLLETTE. Secret processes?

Mr. TOPPING. None.

Senator LA FOLLETTE. Good will?

Mr. TOPPING. None, except as suggested by previous statements.

Senator LA FOLLETTE. I mean secret processes of manufacture, of course.

Mr. TOPPING. I can not answer your question specifically with respect to good will, but it might be said inferentially that the common stock of most companies organized 25 years represented good will.

Senator LA FOLLETTE. How much of your capitalization represents adjustment of values of corporate assets?

Mr. TOPPING. None. We have never made any changes in our books.

Senator LA FOLLETTE. How much of your capital is capitalized surplus or undivided profits?

Mr. TOPPING. None.

Senator LA FOLLETTE. What dividends have you paid in cash?

Mr. TOPPING. We have paid since our organization 7 per cent on the preferred stock, and during the period of the war we paid dividends on the common stock, but never paid any prior thereto and are not paying any dividend on the common stock now.

Senator LA FOLLETTE. Will you please state for the record, and if not able to do so from data before you at this time will you furnish for the record, what dividends you have paid in each of the last ten years, list stock and cash dividends separately, and show the amount and rate of capital stock outstanding?

Mr. TOPPING. I think our statement here shows what it is.

Senator LA FOLLETTE. Perhaps it is covered, then; but that is only for one year, as I understand it.

Mr. TOPPING. No; there is a lot of data in here.

Senator LA FOLLETTE. Does it go back as far as ten years?

Mr. TOPPING. I am not sure. I think it shows the total amount paid out in dividends since we started.

Senator LA FOLLETTE. By yourself, is what I mean.

Mr. TOPPING. Yes; during my administration.

Senator LA FOLLETTE. No; not detailed.

Mr. TOPPING. Do you mean for each year separately?

Senator LA FOLLETTE. Yes.

Mr. TOPPING. The amount of dividends paid?

Senator LA FOLLETTE. Yes.

Mr. TOPPING. I can very readily compile that for you because it would not cover a very wide spread of years, because for a great many years we did not earn anything.

Senator LA FOLLETTE. What amount have you carried to surplus account during each of the last 10 years?

Mr. TOPPING. That would require investigation. I can not answer that question offhand.

Senator LA FOLLETTE. Will you supply that information?

Mr. TOPPING. Yes, sir; if the committee desire it.

Senator LA FOLLETTE. What amount for each year of undivided profits?

Mr. TOPPING. The amount carried to surplus would be undivided profits. That would automatically answer that question.

Senator LA FOLLETTE. State the amount for each of the last five years of the following items, if you are able to, and if not, I will ask you to supply the information: Gross sales——

Mr. TOPPING. We can do that.

Senator LA FOLLETTE. Total expenses, total wages, total salaries, net profits, after payment of interest and taxes. State for each of the past five years the total cost of production per unit, including cost of distribution of each commodity that you produce. Will you supply us with that data?

Mr. TOPPING. I am not prepared to state whether we care to supply that data in the way you want it.

Senator LA FOLLETTE. If you can do it, will you?

Mr. TOPPING. What is that information to be used for?

Senator LA FOLLETTE. It is to be used for the information of the committee in ascertaining what duty you ought to have upon your products.

Mr. TOPPING. May I make this general statement for your information? I doubt very much whether there is any steel company in America that will show on its combined capital and surplus and earning power, on the average, comparable with that of the average trust company or bank of America. I do not believe our concern would show over a period of time since its organization an average of 8 per cent earned. I am giving this as an opinion, which I will be very glad to verify by the facts, because our statements, when filed, will give you this general information.

Senator McCUMBER. You mean 8 per cent per annum?

Mr. TOPPING. I mean 8 per cent per annum, and I doubt whether any of the companies will show that. I am making a general statement which I believe to be well within the facts.

Senator LA FOLLETTE. My next question is: State the percentage of this cost; that is the total cost of production per unit——

Mr. TOPPING. What do you mean by "production per unit"? I do not understand you.

Senator LA FOLLETTE. Did you understand the question?

Mr. TOPPING. I do not understand the term "cost per unit."

Senator LA FOLLETTE. You discussed it; I thought you understood. State the total cost of production per unit.

Mr. TOPPING. I do not understand what you mean by "cost per unit."

Senator LA FOLLETTE. I mean each unit of product that you produce.

Mr. TOPPING. I want to get it clearly.

Senator LA FOLLETTE. I mean if you produce a ton of pig iron want you to state the production cost of that.

Mr. TOPPING. Do you mean the individual item of cost covering each item of product?

Senator LA FOLLETTE. Yes.

Mr. TOPPING. We refer to a unit as a department. I wanted to clarify it.

Senator LA FOLLETTE. Perhaps I am not using just the term you use in your business.

Mr. TOPPING. I want to understand clearly what you want.

Senator LA FOLLETTE. You do understand now, do you?

Mr. TOPPING. I do.

Senator LA FOLLETTE. Then, I ask you based upon that to state a percentage of this cost for each of the five years distributed to each of the following items:

Direct material, direct labor, factory expense, and general expense, separately stated. I do not expect you to be able to furnish that to me right offhand, of course.

Mr. TOPPING. I doubt if we could furnish it to you at any time, much would depend on how our accounts are classified, and, furthermore, it would require considerable time and expense.

Senator LA FOLLETTE. If you are able to do so; you will, I understood you to say?

Mr. TOPPING. I will consider what we can do with reference to giving you such information as you have requested. I do not want to commit myself to giving something that I can not or should not give you, without exposing, unfairly, our business.

Senator LA FOLLETTE. I am going to address a letter to you and ask you these questions, and ask for answers to them. In that way, Chairman, perhaps I can save some time.

Mr. TOPPING. A very large part of what you ask, Senator La Follette, will be found in our annual reports as published.

Senator LA FOLLETTE. I have not much doubt but what you will answer these questions.

Mr. TOPPING. There are some questions that you have asked that I can not answer, and some that I would want to consider whether it would be fair to answer.

Senator LA FOLLETTE. That is your privilege, sir. I have no objection of compelling you to answer. If I had I would pursue this course: I would not permit testimony of a witness as to what he says and the partial information he is willing to give to be accepted by this committee and entered in its minutes unless he answered all the questions; and I would require every witness to respond in the same way, because it would not be fair for one to do so if others do not.

Mr. TOPPING. Perhaps it will not be out of the way to say this—this is partly in response to Senator La Follette's question—that the Payne-Aldrich bill rates of duty on steel, according to my recollection, are about one-half the Dingley bill. Now, this Fordney bill is less than the Payne-Aldrich bill under Schedule 3.

Senator LA FOLLETTE. May I ask a question right there?

Mr. TOPPING. Pardon me; may I finish?

Senator LA FOLLETTE. It is right on that point.

Mr. TOPPING. So I do not think we are asking you for anything that is not fair, in the way of protection.

Senator LA FOLLETTE. I want to test your statement by a question if you will permit me: In making that statement as to what the rates will be under this bill as compared with the Payne-Aldrich bill, which I do not accept as the standard of just rates, by any means, do you take into account the ad valorem rates, whatever they may be, in the schedules which affect your production and the American valuations?

Mr. TOPPING. No; in that statement I did not. But I will say that. That under the present law the American valuation applies, as a court of last resort where values are in dispute. So that in measuring the influence of the American valuation I do not think either you or I could tell specifically just what the difference, between the American valuation and the foreign valuation, would amount to on any one item, because under your present schedule in the Underwood bill when you can not determine values abroad you have to come back to America to find them. We are now asking you to reverse that situation, go to Europe as a last resort.

Senator LA FOLLETTE. Substantially all the values are determined on the foreign valuation.

Mr. TOPPING. I want to follow that up with just one further thought and that is this, the Payne-Aldrich bill, while I do not hold it up as a perfect piece of legislation, yet so far as it applies to metal schedules it is lower by pretty nearly one-half than the Dingley bill; and if the proposed measure stands unchanged as now recommended by the House the iron and steel schedule will be below the Payne-Aldrich bill.

Senator LA FOLLETTE. But —

Mr. TOPPING. Pardon me. Let me finish.

Senator LA FOLLETTE. But you are making comparisons of bills that extend over a period of 20 years. The cost of production at that time has been very much changed.

Mr. TOPPING. You are hardly fair because I have not finished my statement. When the Payne-Aldrich bill was put into effect, the rate of wages paid then by the steel people of America, and all other employers was about 52 per cent lower than it is to-day; and the freight costs for assembling raw materials to-day are 100 per cent more than they were in 1914. Take one item, crude pig iron. We have to-day about \$10.50 in freight charges as against the prewar period of about \$5. When you think of the great increase in the cost of labor and freight the proposed bill gives us less protection than any other Republican bill.

Senator LA FOLLETTE. Are you speaking of the Pittsburgh pig cost?

Mr. TOPPING. I am speaking of our competitive position. Pittsburgh plus, Senator, is nothing more than a mere yardstick in measuring values; a mere convenience to the seller. It has no significance. I have been surprised that it has been made so much of here in Washington.

Senator LA FOLLETTE. It is to be tested out.

Mr. TOPPING. I shall be delighted to see it tested out. You will not find anything dark about it.

Senator McCUMBER. Most of these duties that you are discussing are specific duties, are they not?

Mr. TOPPING. They are specific, but they are based on a certain value of the product under certain classifications; in other words, the Fordney bill provides specific duties for specific values.

The CHAIRMAN. I have been associated with this metal schedule since the Dingley bill, and I have never found anyone yet that did not concede that the duties were more moderate and the requests more moderate than in any other schedule in the bill. I think that it is only due to the steel industry to make that statement, and I challenge any qualification or contradiction of it.

Senator LA FOLLETTE. To make a contradiction of it one finds it necessary to go into some extended debate.

The CHAIRMAN. Yes, sir; and to compare it with the duties in other schedules.

Senator LA FOLLETTE. Yes; there are other schedules, of course.

The CHAIRMAN. I say, without fear of contradiction, that the metal schedule is more modest from the protection point of view than any other schedule in the bill.

Mr. TOPPING. The ad valorem equivalent of the metal schedule would average very little over 15 per cent; and that is very modest when you think of these raw materials suggesting duties of 200 per cent, some of them.

The CHAIRMAN. And I will go further and say that if we were to be exposed to practically a free-trade proposition and should let the industries of the country suffer, the metal schedule probably would stand without destruction when others would be in a chaotic condition. They are established.

Senator LA FOLLETTE. Yes; that is true and they are protected, in part, by freight rates.

The CHAIRMAN. Well, they have advantages of nature or they could not be there.

Mr. TOPPING. Our big markets are on the seacoast, the Atlantic, the Pacific, and the Gulf; and do not forget we are paying about \$3 a ton more rail freights to New York than our European competitors.

Senator LA FOLLETTE. What is the amount of your exports?

Mr. TOPPING. About 10 per cent of our production the last few years.

The CHAIRMAN. Is it not correct that German structural steel entered largely into San Francisco and New York in the erection of new buildings?

Mr. TOPPING. Quite likely. I show here what German prices are and what delivery cost is to various points along the seacoast.

The CHAIRMAN. Cheaper than from Pittsburgh or from any other place now.

Mr. TOPPING. I do not remember the exact differences, but probably \$10 or \$12 a ton less than we can produce and deliver steel to seacoast points.

Senator McCUMBER. A large part of San Francisco was rebuilt from German steel shipped from Germany at a cheaper ocean rate than can be gotten to-day. These facts are well known.

Senator LA FOLLETTE. I do not care to ask the witness any more questions. I will submit my questions in writing.

Mr. TOPPING. I see by reference to my statement the cost of steel laid down in New York on sheet, structural shapes (all rail, which is \$7.60 a ton from Pittsburgh to New York), is \$2.23 a hundred. The German price, freight and insurance, exclusive of duty, is \$1.47. That would make \$15 a ton. I said from \$10 to \$12 a ton; therefore I was well within the facts.

Senator SIMMONS. Do you export any part of your structural steel products?

Mr. TOPPING. Yes. We larger independent companies, in order to pool our expenses for exporting, organized under the Webb Act an export company, known as the Consolidated Steel Co. The purpose of that was to pool our selling expenses. Neither one of us individually having enough capacity to cover the markets of the world with a selling organization, on account of the expense, so we pooled our issues under the Webb Act, and in that way managed to sell about 10 per cent of our capacity.

Senator SIMMONS. What percentage of your structural steel product do you export?

Mr. TOPPING. I can not answer that question offhand, but based on our total production of all kinds of steel we have been exporting about 10 per cent of our total steel products.

Senator SIMMONS. Where do you sell that?

Mr. TOPPING. All over the world.

Senator SIMMONS. What is your chief market?

Mr. TOPPING. Canada is the chief market we have.

Senator SIMMONS. Do you still sell any in Europe?

Mr. TOPPING. None. They produce their own. It goes to the nonproductive points of the world, South Africa, New Zealand, Australia, and Japan; some to China and South America.

Senator SIMMONS. How much do you sell to Canada?

Mr. TOPPING. I can not answer that question exactly from memory but Canada is by far the largest consumer of American steel in the so-called export market.

Senator SIMMONS. I understood Canada to be the only country that you mentioned to which you exported.

Mr. TOPPING. No; I mentioned other countries.

Senator SIMMONS. But you very specifically named Canada.

Senator SMOOT. He named the others before you came in, Senator.

Mr. TOPPING. I specifically named the other countries. Senator Simmons, in answering a previous question.

Senator SIMMONS. What proportion of the total do you think you send to Canada?

Mr. TOPPING. Of our total of 10 per cent?

Senator SIMMONS. Yes.

Mr. TOPPING. I should think possibly one-third.

Senator SIMMONS. You say they do not produce structural steel to any extent in Canada?

Mr. TOPPING. I think not, but they are building up an industry and they have not only a protective duty but a bounty as well. On account of our advantage in quick delivery we have an advantage in the Canadian market, on account of high inland freight from sea-coast points on European steel.

Senator SIMMONS. Has not Canada some seaports as well as the United States?

Mr. TOPPING. Practically none where they consume steel in any quantity. Their consumption is in the interior, at Montreal, and the West.

Senator SIMMONS. Your competitors who ship structural steel here have to pay the same freight to those interior points that you have to pay, do they not?

Mr. TOPPING. We of the United States have rather an advantage over them because we have a straight rail haul where they have an ocean haul plus a rail haul.

Senator SIMMONS. Who are your competitors in the Canadian market?

Mr. TOPPING. The English, the Belgian, and the German producers, and of course other American manufacturers.

Senator SIMMONS. They are the same competitors that you meet here in America?

Mr. TOPPING. Certainly.

Senator SIMMONS. Can you give about the proportion of your exports of structural steel as compared with the other importations to Canada?

Mr. TOPPING. I have not the data before me, and I can not do it from memory.

Senator SIMMONS. You can not do it approximately?

Mr. TOPPING. No, sir; I would not attempt to give you figures of that character without looking up the records.

Senator SIMMONS. But the fact is you do meet your foreign competitors of this country in the Canadian market?

Mr. TOPPING. We do. I see by reference to some data I have here that our group of companies exported last year—that is 1920—about 235,000 tons to Canada.

Senator SIMMONS. What country is that?

Mr. TOPPING. Canada.

Senator SIMMONS. You shipped that much?

Mr. TOPPING. Not our company, but our group of companies. To Japan about 168,000 tons. The next to that was Mexico, 153,000, and all the other countries were in small quantities running from 1,000 to 80,000 tons per annum, scattered over the globe. So you can see that my general recollection with respect to Canada was not far wrong.

Senator SIMMONS. I do not know whether I quite understood you. Did you understand you to say that you shipped so much to Canada and Japan shipped so much to Canada?

Mr. TOPPING. No, sir; I said that the total tonnage that our group of companies shipped out of the United States was less to Japan than it was to Canada, and I gave you the total tonnage sent to each country.

Senator SIMMONS. Well, I misunderstood you.

The CHAIRMAN. Is that all, Mr. Topping?

Mr. TOPPING. I have nothing further to submit myself, Mr. Chairman, unless there are further questions that you want to ask me.

Senator McLEAN. Can you give the committee an idea of the number of men employed in the domestic production of these alloys?

Mr. TOPPING. I can not answer that question. Perhaps some of the other gentlemen here who will follow me may be able to answer that. But the number of men employed in the manufacture of alloys

as compared to the number of men employed in the manufacture of steel is a mere bagatelle. They would be lost in the crowd and forgotten.

Further than that, I would say, as a general proposition, that the invested capital necessary to produce these alloys as compared to the investment capital necessary to produce steel is relatively small, as steel production calls for an integrated company owning raw materials, and in many instances transportation, because we must take care of a large part of our terminal transportation in order to provide the service required. Most of the steel companies also own steel cars to transport their raw materials, in order to insure service. Had it not been for the fact that we owned our own cars during the war we would not have had any coal and would have produced very much less steel for the Government. To-day those cars are practically valueless, as the earning capacity of a car is barely 6 per cent per annum.

Senator McLEAN. These alloys are imported for the manufacture of steel. Is it your idea that the domestic competition in these alloys should be preserved? Or would you prefer to buy all your alloys from abroad?

Mr. TOPPING. We think that the domestic producers of alloys will live under a very much less duty than they are asking for. We think they are immoderately asking for protection. They are asking more protection on their semifinished or raw materials, in other words, than we are asking of this committee on our highly finished products. Whereas we are asking an average of 15 to 20 per cent, they are asking an ad valorem equivalent of from 35 to 215 per cent on some items.

My idea is that anyone that produces anything in this country of a competitive character and employs labor and fairly needs protection in finishing should have reasonable protection; but on raw materials, particularly where the supply is doubtful and where the bulk of such materials must be imported, it is perfectly ridiculous to protect such industries.

Senator McLEAN. If there were no domestic competition, would you not be subjected to foreign prices?

Mr. TOPPING. We would not worry about what we would be subjected to under a low rate of duty on alloys. If the duty is high we may be compelled to produce our own alloys. We may have to do so to protect ourselves, if you put too high a rate on these things. And that is what we will do, undoubtedly, if it is necessary to protect ourselves.

Senator LA FOLLETTE. How much of a factor are these alloys in the production of steel? I mean how much of a factor are they in the cost of steel per ton?

Mr. TOPPING. Take the increased tax on ferrosilicon alone. It amounts to nearly \$2,000,000 per annum. The increased tax on manganese amounts to about \$8,000,000. In stating the high spots I mentioned that the principal items were about \$24,000,000.

Senator LA FOLLETTE. In the production of what types of steel is the alloy used?

Mr. TOPPING. I am talking about what we call our ordinary steel. The higher grade steels use different kinds of alloys, with higher prices.

Senator LA FOLLETTE. Take a given ton of steel and give us the cost of the alloy that enters into the production of it.

Mr. TOPPING. That would vary with the grade of the steel. The manganese cost in a ton of steel is about 55 cents per ton of ingots. To go through that whole list and give you that information would require references. All of my general statements of increased costs can be easily verified. I would hardly come before this committee and make statements that could not be.

Senator LA FOLLETTE. You say in a general way that the manganese cost was about 55 cents per ton.

Mr. TOPPING. Yes; it might run more, it would depend upon the price of the manganese, whether the ferro is \$75 a ton or \$100.

Senator McLEAN. Does the United States Steel Corporation produce any of its alloys?

Mr. TOPPING. It produces all of its own ferromanganese and some of its other alloys, but while that is true, I can say this in their defense, as I have talked with their officials, they have no desire for any legislation that would give them preferential treatment. They reprecate anything of that character, and they are, I think, in accord with our general tariff views—although I am not authorized to speak for them—but as I understand their views, they are quite in accord with our general views as expressed here.

Senator McLEAN. Naturally, they would prefer to buy their alloys abroad if they could purchase them for less price than they could make them for at home.

Mr. TOPPING. They can, I think, make them at home for less price than they could purchase them abroad, as they own their own manganese mines in Brazil. They transport that ore in their own bottoms. It is quite easy for the Steel Corporation to operate two or three blast furnaces on ferromanganese, whereas a firm the size of ours would not consume the output of even one blast furnace. But we might form a cooperative company of two or three concerns and put one or two blast furnaces on ferromanganese for joint use. And that is what we would have to do if this bill goes through without change, because we could not afford to be at the disadvantage that this bill contemplates placing on us, as compared with the cost of manganese per ton of steel made by the Steel Corporation. Should we import our ore and pay the duty you propose in this bill, and manufacture our own ferro, it will be more economical than to buy our ferromanganese in the open market.

Senator LA FOLLETTE. And pay that duty?

Mr. TOPPING. Yes; and save about \$17 a ton on the cost of ferromanganese.

Senator LA FOLLETTE. And pay the duty that is named in the bill on the ore?

Mr. TOPPING. Certainly; as against buying ferromanganese in the metal form. I am talking now about the preferential treatment afforded the blast-furnace operator who is making ferromanganese in that blast furnace instead of making pig iron.

There is no more reason for putting a duty on manganese ore than on the coal which is on the free list. We think it would be an outrageous thing to do.

Senator SIMMONS. My recollection is that when we were making the present tariff there was some evidence to the effect that the

United States Steel Corporation made its own ferromanganese, but would not sell it to other operators. Is that true?

Mr. TOPPING. That is not my understanding. I assume if they do not sell it, it is because they make only what they consume. They prefer to employ their blast furnaces for a needed pig-iron production. One reason we do not make ferro is that we need our own blast furnaces for pig-iron production. If we can buy our ferro we prefer to buy it, but if not we will make it.

Senator LA FOLLETTE. What is the production of those alloys in this country now? Has it had a perceptible effect on the foreign price?

Mr. TOPPING. There are several gentlemen following me who can give you better information on that subject.

The CHAIRMAN. There are several gentlemen who will follow Mr. Topping and who can speak on that subject. We will recall you if necessary, Mr. Topping. We realize that you are an expert.

BRIEF OF JOHN A. TOPPING, CHAIRMAN REPUBLIC IRON & STEEL CO., REPRESENTING THE INDEPENDENT STEEL MANUFACTURERS.

[Representing Republic Iron & Steel Co., Bethlehem Steel Co., Midvale Steel & Ordnance Co., Youngstown Sheet & Tube Co., Jones & Laughlin Steel Co., Brier Hill Steel Co., Pittsburgh Steel Co., Steel Hoop Co., Interstate Iron & Steel Co., Lackawanna Steel Co., Gulf States Steel Co., Inland Steel Co., Lukens Steel Co., Wheeling Steel Corporation, and Steel & Tube Co. of America.]

For your information, I beg to state that in appearing before your committee I do so as the chairman of the board of directors of the Republic Iron & Steel Co., and also as the designated representative of a large group of the independent steel companies.

I shall address myself in discussing H. R. 7456 to Schedule 3, paragraphs 382, 389, and 390; Schedule 1, paragraph 47; Schedule 2, paragraph 207; and also refer to the general provisions of H. R. 7456.

As to the importance of the interests I represent, it is common knowledge that the iron and steel business is the largest single industry in the world. It is also generally believed that the phenomenal growth of the iron and steel production in this country has been due largely to the time-honored policy of the Republican Party, which party has heretofore given the manufacturing interests of this country not only full protection in domestic markets for their finished products, but through its policy of free raw materials has made it possible for us to extend our trade in foreign fields.

The census report of the United States for 1914 credits the steel industry with a capital investment of nearly \$4,300,000,000, with an annual pay roll of \$723,000,000 and a total value of products of \$3,223,000,000. Since 1914, under the stimulus of war demand, the steel-ingot capacity of this country was increased from about 40,000,000 tons to 55,000,000 tons, or an increase of about 37 per cent. Calculated on this increase, the present total number of steel employees under full operations would closely approximate 1,500,000 people, with an annual pay roll of close to \$1,000,000,000, based on the 1914 wage rates. This total pay roll, however, calculated on present wage rates, would bring the total annual wage disbursement approximately \$1,500,000,000 annually and the total value of products to approximately \$3,500,000,000. As a result of this rapid growth in production, which was overstimulated by war requirements, it is commonly agreed that the present productive capacity of the United States is in excess of its normal requirements. Therefore if labor is to receive full employment hereafter it will not only be important for us to maintain a home demand at 100 per cent, but to seek an outlet for part of our surplus production in foreign markets. To make such a program possible it will be necessary to minimize our cost of production in every possible manner, and for this it will require the fullest cooperation not only of capital and labor but of the Government, the railroads, and the shipping interests if we are to hope for any success in foreign fields.

During recent years the average export tonnage sold of iron and steel represented about 10 per cent of our total output. I think it may be safely estimated that if we are to maintain normal operation of our plants in the future it will now be necessary for us to export 20 per cent of our present capacity. These figures, I believe, are conservative and seem to me to emphasize the importance of making every possible effort, governmental and otherwise, for the protection of domestic trade and for the promotion of foreign trade.

The steel manufacturers had in mind the disturbed economic conditions prevailing throughout the world when they discussed informally Schedule 3 with the sub-

Committee of the Ways and Means Committee of the House of Representatives, and while we indicated our willingness to accept both a classification and rates of duty under Schedule 3 which averaged somewhat below the Payne-Aldrich schedule, we clearly stated that in so doing we must have the Payne-Aldrich free list unimpaired in the new tariff schedule and must have as a further measure of protection a reasonable provision against dumping and undervaluation, and also that provision could be made for reciprocity agreements for the encouragement of foreign trade.

The steel manufacturers, Mr. Chairman, in other words, appreciated then, as they now, that the tariff problem is not easy of solution; that to enact a protective tariff which will yield maximum revenue and not antagonize foreign trade is a problem which will require your best efforts, and we hope that in our discussion of the subject we will be able to offer you some practical contribution of a constructive character. We are opposed to a number of paragraphs under several schedules of H. R. 7456, but we are in full accord with many of its general provisions. We are opposed to paragraph 1680 of Schedule 15, and ask that this item be stricken out, and that barbed wire be placed where we think it properly belongs, under Schedule 3, and made dutiable, for the reason that there is no more justification for placing barbed wire on the free list than there would be to put any other finished iron and steel products on the free list.

We are strongly opposed to the provision of Schedule 1, paragraph 47, and Schedule 3, paragraph 207; also paragraphs 302, 386, 389, and 390 of Schedule 3.

Our principal objection to these paragraphs is that increased taxation is proposed on imports of these raw materials which will materially increase our cost of production. While the cost per ton of steel as influenced by the various items required for steel manufacture referred to in the paragraphs mentioned might appear to be insignificant, they bulk large when the cumulative influence of these cost additions are considered as a total. In fact, the total increased cost, if imposed, will seriously weaken our competitive position.

We estimate, in other words, that iron and steel costs, by reason of the proposed tax on our raw materials, will be increased by the sum of approximately \$24,000,000 per annum, estimated as follows:

	Annual requirements.	Proposed tax.	Tax per annum.
	<i>Tons.</i>	<i>Per ton.</i>	
Silicon, 37 per cent.....	80,000	\$37.05	\$2,964,000
Fluorspar.....	300,000	5.00	1,500,000
Manganese ore, 48 per cent.....	750,000	10.75	8,062,500
Graphite.....	150,000	10.00	1,500,000
Antimony.....	161,949,922	1.02	1,238,998
Lead (first two years).....	1426,986,416	1.02	8,339,728
Total.....			23,805,226

¹ Pounds.

² Per pound.

In addition to these items, further cost additions will be made on account of the proposed tax on lead. As to what the tax increase on lead will be I am not able to specifically state, but considering the amount of lead used for roofing plate in the steel industry, the increase will add substantially to our total cost.

Apart from all questions of cost, these proposed taxes are inequitable and can not be supported or justified for the following reasons:

Fluorspar, Schedule 2, paragraph 207, is a mine or quarry product, the domestic supply of which principally comes from southern Illinois and northern Kentucky. Our product is likewise an item of substantial importation, being imported largely by the central western and eastern steel manufacturers. The Illinois and Kentucky product, however, finds a market principally in the Central West and other distant points from the seaboard. On account of the distance of these mines from the seaboard and the protection which they enjoy by way of inland rates of freight, they are in no danger of foreign competition; in fact, the fluorspar interests have prospered heretofore under free trade, and there can be no possible reason for taxing the steel producers of the East at the rate of \$5 per ton or, as an alternative, force eastern manufacturers to go West to obtain their fluorspar supplies at an increased freight cost, which in many cases would exceed the amount of the duty proposed.

Magnesite, Schedule 1, paragraph 47: Magnesite is also a mine product and is prepared for use by calcining or burning, the process of treatment being similar to that in the preparation of cement rock for use. Magnesite is also largely used in the manufacture of magnesite brick, paragraph 201, Schedule 2. As to the fabricated magnesite

or brick, the rate on this product should be relative to the duty allowed on the grades of fire brick. There can be no justification, however, for a duty on magnesite of \$15 per ton, with a compensatory duty on the brick of \$15 per ton, plus 10 per cent ad valorem.

The magnesite industry, like fluorspar, has prospered under free trade. The known deposits of the carbonate of magnesia, which is the rock required for crucibles and which after treatment is called magnesite, are found in the States of Washington and California. A large business during the war was developed by the quarries in these States, and there can be no question as to their ability to meet foreign competition in their natural markets, which would be St. Louis, Chicago, Pueblo, and other western points where steel works are located. It would be practically impossible for imported magnesite to successfully compete with the western producers on account of the excessive cost for rail carriage from the Atlantic seaboard inland. The freight rate from seaboard to Chicago and St. Louis averages approximately \$19 per ton, and to that extent serves as a protective tariff. But all questions aside, we should quarried burnt rock, which carries a minimum of labor cost, require more protection than mined coal when coked, which carries a much higher labor cost in its treatment, or why should the output of a magnesite mine be entitled to any more protection than is accorded the output of an iron-ore mine. In fact, with the same products of all our mines and quarries on the free list, and consistently free of duty heretofore under Republican tariff legislation, we fail to see any reason why these products should now be made dutiable.

We further claim that a duty on magnesite would be an unfair discrimination against the smaller producers of steel in favor of the United States Steel Corporation and other manufacturers at Chicago, because these western steel works would obtain their supplies from western domestic mines, whereas the eastern makers of steel would be compelled to import foreign magnesite or pay the equivalent increased cost in the haul from the Pacific coast to Atlantic seaboard.

The United States Geological Survey published, under date of July 27, 1919, a statement of our domestic reserves of magnesite, the aggregate of which was 3,500,000 tons; at present rate of consumption this reserve will be exhausted in 10 years. One of the principal owners of this reserve is the Northwest Magnesite Co., the proposed duty will practically give them a monopoly of domestic supply of this important refractory.

Manganese, Schedule 3, paragraph 302: Manganese, heretofore on the free list, is even more difficult to justify now as a dutiable product. The only explanation for the change in the schedule on manganese was recently stated on the floor of the House of Representatives, viz, that the proposed duty was for the protection of the miners in Arkansas, Montana, Georgia, and Florida, but it was not stated on the floor of the House why the miners of manganese in these States went out of business when the war ended. The reason was not because of free trade in manganese but because there was no market for domestic lean and high-silicon manganese ores, whereas the richer foreign products of Brazil, India, and Russia were again available.

As a war measure, the steel manufacturers used everything and anything that would make steel suitable for governmental purposes for the prosecution of the war. Our main idea was tonnage and service for war purposes—cost of production was forgotten in the interest of output; but with the advent of peace, economic reasons were reasserted itself and forced the abandonment of domestic manganese ores, even for such uses as had always been our practice, of using these leaner ores for the production of spiegel. We maintain that if the ferromanganese producer in this country is to prosper he also must have free manganese ores; or, in other words, have the same opportunity for obtaining and smelting the richer and cheaper ores found in foreign countries as are available to his foreign competitor. The American producer of ferromanganese, in our opinion, is at no disadvantage with his English, Belgian, and German competitors, because all these manufacturers of ferromanganese depend upon imported ores, principally obtained from India, Russia, and Brazil, and the producers of ferromanganese in this country are at no more disadvantage in meeting competition than is the manufacturer of pig iron, whose industry rests largely upon domestic supplies of ore and largely so at other points of manufacture in other parts of the world.

Ferromanganese, the product of manganese ore, is a blast-furnace product—manganese in the pig form; in other words, it is only entitled to a relative duty on iron, and there can be no justification in placing a duty on ferromanganese, the product, relatively greater than that accorded pig iron. If this is done, based on a difference in cost above the metallic charge, which is about three and a half cents of pig iron, which is rated for duty at \$1.25 per ton, the maximum duty justifiable on ferromanganese would be \$4.25 per ton, whereas it is proposed to tax this product for steel production at the rate of 2½ cents per pound for the maximum content, or at the rate of \$39.42 per ton.

The burden of this extreme tax on ferromanganese would be borne largely by the smaller steel producers of the United States, because our principal competitor, the United States Steel Corporation, owns its own manganese mines in Brazil, and also has transportation facilities by water and partially by land, and they manufacture their own ferromanganese from their own imported ores, because, owing to their large consumption, they can afford not only to operate one but several blast furnaces for their requirements, whereas the smaller producer of steel would not consume enough ferromanganese to absorb the output of even one blast furnace, consequently, the entire tax burden placed on ferromanganese would fall on them, because they must buy, rather than produce, their supplies.

Furthermore, the proposed tax on manganese ores to any steel works importing the same would mean a tax on about $2\frac{1}{2}$ tons of manganese ores—the amount required to produce 1 ton of ferromanganese—or a total duty of approximately \$23.65; whereas a smaller steel works buying the ferromanganese or finished material would pay a total of \$39.42, which, in effect, suggests a tax discrimination of \$15.77 per ton in favor of the United States Steel Corporation and others who produce their own ferromanganese, which discrimination places the smaller steel works at a serious disadvantage.

Aside from all these questions of equity respecting taxes on manganese ore, it is generally conceded that our supplies of manganese ores are of exceedingly meager proportions and lean in character, and if you place a prohibitive duty on manganese ore you may force the consumer to use the domestic product, which will more quickly exhaust our reserves, and therefore, as a matter of conservation or broad governmental policy, all of these minerals, such as manganese ores, fluorspar, and magnesite, should be kept on the free list, for the protection of our country in times of war, when outside sources of supply of these very essential materials required for steel production might be shut off.

As to the balance of the ferro-alloy schedule, others who follow me will discuss these matters more in detail, but I desire to make of record my protest against the adoption of the duties proposed under the ferro-alloy schedule. I particularly desire to emphasize my opposition to the ferrosilicon rate, because this item is one of large importance to the manufacture of soft steel. The other alloys, however, not specially mentioned by me, are of no less importance to the manufacturers of special steels. Do not believe it will be contended by the manufacturers of these alloys that they employ, relatively speaking, either as much capital or labor as is employed by the manufacturers of steel, whose operations are more widely diversified and integrated; therefore, it is difficult for us to understand why these manufacturers of alloys need the protection they ask, or why they need even the ad valorem equivalent asked by the manufacturers of steel, which average less than 20 per cent, whereas the proposed alloy duties range from 45 to 215 per cent.

As to pig tin, paragraph 386; zinc, paragraph 390; and lead, paragraph 389, of Schedule I there can be no justification for increasing our import taxes on these products, from a protective standpoint at least. The smelting of tin ores in this country is an industry which was established on a free-trade basis, and the only plants operating are located on the Atlantic coast and use imported ores. Inasmuch as tin smelters everywhere operate under equal conditions as to raw material supplies, there can be no justification for showing preferential treatment to this domestic industry, which has demonstrated its ability to live and prosper without protection.

What is true of pig tin is likewise true of zinc, lead, or other materials, and any added cost for these materials through increased taxation will be directly reflected in the cost of galvanized fencing, wire, pipe, and sheet-metal products generally, which are largely used on the farms in housing construction and for household wares; therefore, increased taxes mean increased cost of living to the great mass of our people.

Aside from these reasons, any increase in cost would be an added burden, difficult to overcome, in maintaining competition for our exportable surplus, and will bear most heavily on the small steel manufacturers, because here, too, the United States Steel Corporation produces in part its own zinc supplies and imports both its pig tin and zinc in its own bottoms.

Briefly referring to our labor and general cost conditions, I would state that, owing to the upset conditions now existent throughout the world, it is rather difficult to obtain full data, but I have compiled some general information on this subject, which I shall submit if desired.

As a broad general statement it can not be controverted that a day's labor in America will buy more than double the necessities of life which can be obtained with a day's labor anywhere else in the world, and notwithstanding recent reductions in labor costs, which have taken place in the steel trade, our present wage scales in the steel industry are about 52 per cent higher than during the year 1914, whereas our average selling prices are only 33½ per cent higher; furthermore, our cost for assembling raw materials, due to freight rate advances, are up over 100 per cent, so that to-day

the selling price of pig iron at \$20 per ton carries with it freight charges approximately \$10.50 per ton. In fact, to-day, with pig iron selling at \$20, the maker does not realize enough cash to return him the cost of his raw materials and freight bill, being out of pocket as to labor cost and overhead. What is true of pig iron is likewise true of finished products made from pig iron under the iron and steel schedule, all of which are selling at several dollars per ton below cost of production.

In other words, the iron and steel business to-day is suffering from the greatest depression it has ever experienced, and we must have cost relief in every conceivable direction. Not only must our raw materials be cheapened but our transportation costs must be reduced, if we are to get back to normal business conditions. If our raw materials are taxed on the present schedule under H. R. 7456, we will, owing to high costs, have adequate protection, and Schedule 3 rates will have to be raised as an alternative for taxed steel raw materials. In other words, you must give us free raw materials or increase our iron and steel schedule and revise the iron and steel classification.

It may be stated in this connection that the present world tendency is toward protective-tariff measures, with strong preferential features. This is notably true of the British possessions, whose colonial tariffs give England a distinct advantage through imperial preferences, in such important markets as Canada, Australia, and South Africa.

In view of this situation, we strongly indorse the bargaining clause of H. R. 7456 which empowers the President of the United States to negotiate reciprocal treaties for the promotion of foreign trade where sufficient trade advantages can be obtained to justify tariff concessions by us.

We also heartily approve of the bounty clause in H. R. 7456, as a reasonable measure of protection to home industry, against the unfair competition caused by foreign governmental bounties in favor of foreign products.

We strongly approve of the American valuation plan as a prevention against trade discrimination and undervaluation and also because the American valuation plan provides for protection against the unfair competition brought about through a dislocation of rates of exchange, which rates are now from 25 to 95 per cent discount below prewar normal rates.

I would further state that without the protection of the American valuation plan the rates of duty for iron and steel under Schedule 3 of H. R. 7456 are not protective. We do not agree with the opponents of the American valuation plan, who have condemned this feature of H. R. 7456, and who claim the administrative features of the plan are not practical. We, on the other hand, believe the administrative features of this plan can be easily made operative without confusion, because we believe that it will be easier to obtain the necessary data for appraising market prices at home than it will be to obtain market prices in foreign countries.

In this connection may I not remind you that under the present law of 1913 paragraph K requires that all appraisements shall be based on the actual market value, the wholesale price of merchandise at time of exportation in the principal markets of the country from whence products have been imported, and when values can not be satisfactorily ascertained, paragraph L of the law of 1913 provides that our appraisers, after having failed to obtain cost of production at place of exportation, shall appraise such or similar imported merchandise at not less than such or similar prices as are actually sold or freely offered for sale in the usual wholesale quantities in the United States in the open markets, less cost of transportation and insurance, subject to a deduction for commissions or profits not to exceed 6 to 8 per cent.

It would therefore appear that as a practical measure the present law requires the American valuation when other methods of valuation fail, thus emphasizing the claim that American values are more easily ascertained than are values and prices in foreign countries; therefore, why not apply the American valuation as a primary method of determining values rather than as a last resort method, as the law now provides?

The iron and steel industry, both on account of its size and importance as related to many other industries dependent upon it, has always been regarded as the "backbone industry," and therefore, struggling as we are in our efforts to get back to normal conditions, would it not be fatal to future prosperity to reverse our past tariff policy, which has heretofore given us free raw materials and prosperity, by a change so fraught with danger to business success as is now proposed by taxing these raw materials.

SUPPLEMENTAL BRIEF.

Foreign and domestic labor prices are difficult of comparison, owing to the difference in classification, and also difficult to compare for the reason that foreign currency values, on an international exchange basis, differ from the purchasing power of the dollar, English shilling, and franc in their home markets.

as a broad general statement, in comparing rates of wages with our principal competing countries, Germany is lowest; England, perhaps, highest; Belgium and France, averaging less than England.

From general information, German rates, figured on a gold dollar basis, seem to be about 80 cents per day for common labor, although under date of June 21, 1921, Mr. Charles G. Duboise, president of the Western Electric Co., stated, measured in gold dollars, the general average cost for labor in the metal trades of Germany, as near as he could figure it, was about one-sixth of the American wage basis; this would mean a wage rate of about 60 cents per day common labor.

The only detailed wage scale which I have been able to obtain is one submitted under date of July 9, 1921, by Samuel H. Cross, American attaché at Brussels, who reports the following schedule current at that time in the iron and steel industry of Belgium:

The wages per hour in francs paid the laborers in the iron and steel industries are as follows:

BOILER WORKS.

	Francs.
Bridge work:	
Tracers.....	2.90
Fitters.....	2.60
Riveters.....	2.60
Machine tool by operators....	2.55
Laborers.....	2.10
Boiler makers.....	2.50

Chippers.....	2.50
Mechanics.....	2.70
Laborers.....	2.35
Apprentices, according to age 0.50–1.60	

This schedule of wages, on a 10-hour basis, indicates that common labor is paid at a rate of about \$1.50 per day, or approximately one-half of our present minimum wage of \$3 per day.

While the labor cost per ton naturally varies with the various products, yet I think it is conservative to say, as a general statement, that not less than 85 per cent of the total cost of iron and steel products is labor. If maximum continental labor rates are only one-half our rates, it can readily be seen that the cost difference at the Belgian English works for steel products is far below our cost of production.

Aside from our disadvantage in labor cost, we have a further difference against us in the all-rail cost of freight from Pittsburgh of \$7.60 per ton, while ocean rates are from \$4 to \$5 per ton, or a total difference in favor of continental Europe to the Atlantic coast of from \$2.60 to \$3.60 per ton.

The proposed rate of duty on these various products, as you will observe, ranges from \$6 to \$10 per ton, whereas our increased cost, due to higher labor and freight rates, is far in excess of the proposed rates of duty.

This general statement clearly indicates that the difference in freight and cost alone is serious, but if to these disadvantages you take into account the exchange situation, our position, from a competitive standpoint, both at home and abroad, is precarious indeed.

The Kiel Institute of World Economics recently published in their publication "Weltwirtschaftliche Nachrichten" the following:

"Based on the returns from 20 cities, the compilation shows that in the textile industries wages of spinners had risen from 0.43 marks per hour in the first quarter of 1913 to 3.14 in February, 1920, an increase of 630 per cent. For machinists in the steel trade the hourly average wage of 0.63 marks in July, 1914, had risen to 3.60 marks in February, 1920, an increase of 459 per cent. In the building trade the increase had been from 0.65 to 3.60, a rise of 454 per cent.

"In the month of February, 1920, the exchange market value of the German currency was less than one-twentieth of what it had been under the prewar gold standard, and the average of cost of living in the same German cities, as calculated by the same publication, had advanced 523 per cent above the average of July, 1914. This would appear to indicate that in some German industries wages have actually increased more than cost of living, but that in others the increase in wages has been much less than in the living costs. The estimate for January, 1921, is that the average cost of living was then greater by 840 per cent than before the war, but there has also been a corresponding increase in wages during the last year."

The practical analysis I make of this statement is that the German machinist earned in 1914 in gold marks, for 10 hours work, \$1.499 per day. This machinist earned in 1921, 41 cents per day, but if we credit the worker with the difference between the international exchange gold value of the mark, one-twentieth or 95 per cent discount, with its domestic purchasing power, which, through governmental price regulation, increases the mark's value to perhaps three times its gold value, the total machinist wage would be \$1.23 per day, whereas the American low-grade machinist employed by steel makers, earns \$5.35 gold, or over four and one-third times the German rate.

While the general tendency with us is toward lower wages, it is not believed that wage rates will or should sink to the 1914 basis, as they have done in Germany. Our labor costs are less than one-fourth of ours. Our general wage rate, based on 1914, is now 53 per cent above 1914, which advantage is comparable to an advance in living cost of probably 55 per cent.

Wages paid in steel works now generally in effect in the United States, compiled by Republic Iron & Steel Co. (Valley district), Aug. 16, 1921.

NOTE.—Per cent earnings on gross volume of business, 13 per cent.

German steel works' earnings.

[Iron and Coal Trades Review, London, England, Aug. 12, 1921.]

Name of company.	Net profits.		Dividend on ordinary shares.	
	1919-20	1920-21	1919-20	1920-21
Donnersmarck Hutte.....	£144,000	£102,000	Per cent. 15	Per cent. 10
Kaiserslautern Iron Works.....	28,000	94,000	12½	12½
Rattigebber (wagon works).....	87,000	222,000	14	21
L. Wolf Co., Magdeburg.....	155,000	580,000	15	15
Concordia Hutte.....	25,000	96,000	6	10

The annual earnings, figured on the combined capital and surplus of the Republic Iron & Steel Co., average slightly less than the estimated statement given your committee, the actual figures showing 7.9 per cent. The percentage of earnings on the gross volume of sales averages approximately 13 per cent. When it is considered that this average includes the war period, when earnings were abnormal, it will be convincingly evident that the average profits from iron and steel manufacture is less than that realized by banking and other enterprises and less than that realized by German steel manufacturers.

STATEMENT OF C. A. BUCK, VICE PRESIDENT OF THE BETHLEHEM STEEL CO., BETHLEHEM, PA.

Mr. BUCK. I have come to address you, gentlemen, especially on raw materials. Our company is not taking exception to the duties on the finished product; provided the American valuation plan is established in the law, we are perfectly willing to accept the duties on the finished steel products.

Senator SIMMONS. How much do you estimate that the American valuation plan is worth to you in the form of potential protection, under the Fordney bill?

Mr. BUCK. The American valuation plan would probably protect us 30 or 40 per cent.

Senator SIMMONS. By itself?

Mr. BUCK. By itself.

Senator SIMMONS. So that the American valuation plan adds 30 or 40 per cent to the Fordney duties?

Mr. BUCK. Yes, sir.

Senator LA FOLLETTE. What is your relation to the Bethlehem Steel Co.?

Mr. BUCK. I am vice president of the Bethlehem Steel Co.

Senator LA FOLLETTE. What is your post-office address?

Mr. BUCK. Bethlehem, Pa. The alloys in which we are interested—we believe should be on the free list, and we believe in a nominal duty that would protect the manufacturers of these alloys in this country. There is an excellent opportunity for this country to go much more seriously into the manufacture of alloys. Many of them in the past have come from Europe. Geographically this country is as well located as Europe for the making of ferromanganese; prior to the war 50 per cent came into this country from abroad.

We believe that we ought to make our ferromanganese, because the origin of the raw material is Brazil, India, and Turkey; and the only advantage that the European has had—principally the English—has been in taking their ores to home ports as ballast in connection with their merchandising in these countries. It particularly applies to manganese and also to chrome ore.

We do not believe that the high duties on alloys mentioned in the bill are warranted, and we recommend free ores.

A large element in the cost of the manufacture of alloys is, naturally, fuel. It takes large quantities of fuel to reduce these refractory ores—manganese, chromium, tungsten, and silicon. The labor is the smaller element, because it takes but a few men to run a blast or electric furnace. Fifteen or twenty men, for instance, make 200 tons of ferromanganese in a day; a smaller number of men are required on the electric furnace. So that a nominal duty upon these alloys, we believe, is advisable and would permit this country to make the alloys instead of our buying them abroad.

Senator SIMMONS. Does your company produce any of these alloys?

Mr. BUCK. Our company is a manufacturer of ferromanganese. During the war it made its own ferromanganese.

I desire to subscribe to what Mr. Topping stated relative to the differential between the duties on manganese ore and ferromanganese. The duty of 1.2 cents per pound on manganese contained in the ore when converted into ferromanganese imposes a cost of about \$21.50 per ton on the manganese contained in the ferromanganese. The duty of 2.2 cents per pound of manganese in ferromanganese imported into this country imposes a duty of \$39.42 per ton on ferromanganese. These variable duties on manganese in manganese ore as compared with the manganese in ferromanganese gives an advantage to the manufacturer importing manganese ore over the consumer importing ferromanganese of \$39.42 minus \$21.50, or \$17.92 per ton of ferromanganese. So we ask for free manganese ore.

Senator SIMMONS. You say that by making it you have an advantage over the manufacturer who does not make it, but buys it from Europe, of about \$17 a ton?

Mr. BUCK. Yes.

Senator SIMMONS. Does that mean that you can produce it in this country for \$17 a ton less than these other countries?

Mr. BUCK. No, because the other countries do not have any duty on manganese ore.

Senator SIMMONS. I thought you were talking about the advantage at the American producer of steel products had.

Mr. BUCK. Buying from the domestic manufacturer, not the foreign manufacturer. I may have misstated that, Senator.

Senator SIMMONS. I understood you to say that a man who bought from a foreign manufacturer would have to pay for his ferromanganese about \$17 a ton more.

Mr. BUCK. Yes, \$17 a ton more.

Senator SIMMONS. Then the man who made this ferromanganese in this country would have to pay——

Mr. BUCK. The man who made the ferromanganese in this country could manufacture his ferromanganese at \$17 a ton less than the man who had to buy foreign ferromanganese.

Mr. TOPPING. Inasmuch as I made that statement, Mr. Chairman, may I interject this?

The CHAIRMAN. Yes, sir.

Mr. TOPPING. It is the difference, Senator, between the cost of ferromanganese which I buy in this market from either Mr. Buck's company or any other company and the cost of producing it. It is the preferential treatment between the operator of the blast furnace who makes his own manganese and the little consumer, the little steel maker, who has to buy it in the open market in this country. That is what it means. It is preferential treatment in favor of the big man to the exclusion of the little fellow, which is wrong.

Senator SIMMONS. In other words, if you make your ferromanganese it costs you very much less than the ferromanganese would cost the man who has to buy from abroad.

The CHAIRMAN. I would like to ask Mr. Topping while he is on his feet what percentage of the steel industry in the United States is in operation now as compared with the recent maximum activities?

Mr. TOPPING. I think it would be a maximum percentage to say that 25 to 30 per cent of our capacity is employed. In the case of our own companies we are running about 20 per cent.

The CHAIRMAN. In normal times you employ over 1,000,000 men?

Mr. TOPPING. About a million and a half.

The CHAIRMAN. How many are now employed?

Mr. TOPPING. It would be about 300,000 as against a million and a half, a 20 per cent basis.

Senator LA FOLLETTE. Do you mean in normal times or in war time?

Mr. TOPPING. I mean that would be approximately the total number employed in our mines, mills, etc., from the mines to the finished operation.

Senator LA FOLLETTE. In normal times?

Mr. TOPPING. Yes. That is based on the census returns of 1914. And I have allowed, Senator, in making that statement, for the growth during the war, which was about 35 per cent.

The CHAIRMAN. Big concerns like the Bethlehem and the Midvale are down to their minimum of employment, are they?

Mr. TOPPING. Absolutely. They are not doing enough business to pay to keep the organization together. We would be better off, gentlemen, to-day, if we were shut down 100 per cent. We are losing money on every pound of steel that we are producing. There has never been a period in our history—and I have been in the steel business since 1878, and in all that time, during the depression of 1893 and various other depressions from 1908 on, when, owing to the fear of the Underwood bill it reduced us to very severe conditions in this country, as you remember—during that whole period the state of depression was not comparable to the present conditions.

The CHAIRMAN. It would be cheaper for you to shut up entirely but you remain open in order to hold your men together—

Mr. TOPPING. We are doing it, Senator, to keep our organization and keep a good many of them from starving. In some cases, in the Northwest and in our Alabama fields, we are feeding people at our commissaries where they can not perform any work themselves.

The CHAIRMAN. I wanted to present this to the committee because the committee is continually hearing about the great hardships of the agricultural interests and the other interests throughout the country, and I have stated frequently that the industries in the great manufacturing centers are even harder up than the agricultural interests.

Mr. TOPPING. I think they are, beyond any question of a doubt.

The CHAIRMAN. And there is more starvation and misery and lack of employment prevailing.

Mr. TOPPING. With 6,000 men or more that we employ in the Northwestern ranges—in Michigan, Wisconsin, and Minnesota—we have not a mine in operation. They are all shut down tight. We have not a coal mine in Pennsylvania in operation—not one. We have not a coal mine or an ore mine in Alabama in operation.

The CHAIRMAN. And those men are walking the streets unemployed?

Mr. TOPPING. Yes, sir. We have ordinarily 12,000 men employed in Ohio. I do not think that we have to-day 2,000 men employed in the whole State.

The CHAIRMAN. How many men does your concern employ normally?

Mr. TOPPING. About 15,000.

The CHAIRMAN. Have you any objection to stating how many you are employing now?

Mr. TOPPING. I would say about 3,000, all told, as a maximum.

The CHAIRMAN. As against 15,000?

Mr. TOPPING. Yes, sir.

The CHAIRMAN. And I know that that is true with respect to many very large concerns in Pennsylvania.

Mr. TOPPING. Yes, sir.

Senator CALDER. Do you mean that 15,000 was your prewar force?

Mr. TOPPING. I mean that would be our capacity running normally, 90 per cent or 100 per cent operation. We say 95 per cent 100 per cent theoretically. Ninety per cent would be a good normal operation.

The CHAIRMAN. I am glad of the opportunity to bring out this point, in view of all the talk about profits and one thing and another, and abject conditions in the world's great industries that have been existing for many months and are continuing without any hope of improvement.

Senator SIMMONS. I would like to ask a question. You say that because you have no markets for your product?

Mr. TOPPING. I did not say the cause of it, Senator.

Senator SIMMONS. Is that the cause of it?

Mr. TOPPING. I will tell you what I think is the cause of it, if you want me to express an opinion.

Senator SIMMONS. Yes.

Mr. TOPPING. I think it is due to the fact that the cost of fabricating steel, due to the high cost of labor, in transportation, in building trades, and in various other activities, is so high—on a war peak practically—that they can not afford to use steel.

I will illustrate that by making this statement: If you were going to put up a steel building in Washington, an office building, and I gave you free of cost the structural steel necessary to put up that building, you could not afford to build it to-day, because only about 12 per cent of the cost of that building would be steel. The balance is labor, brick, mortar, and freight charges.

Senator SIMMONS. Therefore you have lost your customers?

Mr. TOPPING. Therefore we have lost our customers, because the customers can not afford to use steel, because the cost of fabricating it, or putting it into useful forms, is so great that the public will not buy the fabricated products. You have got to liquidate the costs of this material. We can not afford to pay war freight rates and get down to a good basis. It is selling to-day at 66½ per cent below the prices current in January, 1921. Think of it. And still we are paying 53 per cent more for labor than we did in 1913, with the costs of the steel close to the value in 1913.

Senator SIMMONS. I think you are giving the real reasons for it.

Mr. TOPPING. I think I am. I think I know.

Senator SIMMONS. The question I was asking you was if that was not the result of a loss of customers. You have given the reasons why you have lost your customers. The question I am asking your opinion about is whether you have not lost your customers in the foreign market to the same extent that you have lost your customers in the domestic market.

Mr. TOPPING. The same causes operate all over the world, Senator, naturally.

Senator SIMMONS. Exactly. All I want to present is that it is not the tariff; it is other conditions.

Mr. TOPPING. Those are operating causes, but they are not the whole and sole cause. You can not apply your thought as being the conclusive and sole influence that brings about this depression.

To my mind, the big factor in our home market is that our values have not been stabilized. To-day a farmer can take a bushel of wheat or a bushel of corn and buy as much steel in pounds of nails

as he could in 1913. It is not true that the steel man can buy as much labor as he could for \$1 in 1913, and it is not true that he can buy as much transportation. Our freight costs are double; and with regard to the supplies necessary in steel production our dollar is a 50-cent dollar again. Yet we are selling our product on practically a prewar basis, hoping to stimulate a demand by cheapening our product. The labor cost is the prohibitive factor against the use of steel, plus the cost of freight.

Senator SIMMONS. You have lost your business for the same reason that the cotton farmer has lost his. You have protection; he has none. His cotton does not command the price that it would command in normal times, because he has not the domestic consumers nor the foreign consumers. He has lost a large part of his domestic consumers and a large part of his foreign consumers——

Mr. TOPPING. I do not agree with you.

Senator SIMMONS. Because they are shut down, not operating their mills.

Mr. TOPPING. I do not agree with you, because the cotton farmer of the South has no competition, substantially. This is the sole source of supply of the world's cotton, in a substantial sense, whereas in our business we are only a 60 per cent factor in the world's production of steel.

Senator SIMMONS. You are in the same position as the cotton man, as I understand you, practically.

Mr. TOPPING. We are influenced to a greater extent by the factors I have recited than the cotton man is. His business may be poor here, but good somewhere else.

Senator SIMMONS. The difference is that you can shut down.

Mr. TOPPING. I beg your pardon. We can not shut down.

The CHAIRMAN. He just said he could not shut down.

Senator SIMMONS. I understood you to say that a large number of your employees are out of work?

Mr. TOPPING. That is not a voluntary act on our part, Senator.

Senator SIMMONS. I know it. You are forced to it.

Mr. TOPPING. You say we can shut down. So can the farmer.

Senator SIMMONS. You are not continuing your operation to the same extent that you did before the war.

Mr. TOPPING. We can not shut down. Our expenses would eat us up. When the farmer shuts down he eats up his surplus crop. That is all that happens to him.

Senator SIMMONS. The farmer can not shut down.

Mr. TOPPING. I was born on a farm, Senator, so I know something about it.

Senator SIMMONS. He has to continue operating his farm——

Mr. TOPPING. I grew up on a farm. You can not tell me anything about farming.

Senator SIMMONS. I am glad to hear it. That accounts for your splendid success.

Mr. TOPPING. Part of my family are still farming.

The CHAIRMAN. Now, Mr. Buck, will you resume?

Senator LA FOLLETTE. Mr. Topping, one question: Were you called as a witness before the Lockwood committee?

Mr. TOPPING. No, sir; I was not.

Senator LA FOLLETTE. Was anybody from your company?

Mr. TOPPING. No, sir. We are not interested in that particular branch of the structural combination over there.

The CHAIRMAN. Now, Mr. Buck, will you resume the continuity of your remarks?

Mr. BUCK. We have an iron-ore mine in Pennsylvania, the largest in Pennsylvania. It is shut down completely now for the first time since 1857.

The CHAIRMAN. That is the "Liberty"?

Mr. BUCK. That is the Cornwall mine, near Lebanon. It is shut down now for the first time since 1857. These mines are shut down completely and everybody is out of work except a small organization at there——

The CHAIRMAN. I was there when the Underwood bill was passed, and the wives of the employees assembled to demand a change in law. It was a pitiful sight to see the distress prevailing there.

Senator SIMMONS. They had been pretty well indoctrinated in the schools of protection.

The CHAIRMAN. They were indoctrinated in the truths of starvation.

Senator SIMMONS. They thought that what you were telling them was more or less true, but it turned out that it was not.

Mr. BUCK. Take the duty that is recommended on ferromanganese, about \$39. I can say with assurance—because we contracted in 1895 for ferromanganese from abroad—we bought it for 15 years prior to the war for between \$35 and \$45 a ton. There is no natural advantage that Europe has in the manufacture of ferromanganese that we do not possess, except the labor situation, which is not an important factor, the principal cost being the cost of the ore and the cost of the fuel in all of these alloys. So we would like to see a minimal duty put upon ferromanganese.

The CHAIRMAN. How many men were employed in the Bethlehem Steel Co. in normal times?

Mr. BUCK. I think, Senator, we had about a hundred thousand men employed.

The CHAIRMAN. How many are employed now?

Mr. BUCK. We estimate that about 20 per cent of our plants are in operation.

The CHAIRMAN. The rest of the men are absolutely without employment?

Mr. BUCK. They are idle to-day.

The CHAIRMAN. And without any means of making a living?

Mr. BUCK. That is correct.

Senator McCUMBER. To what extent have wages been reduced in your establishment since the higher prices and during the war period?

Mr. BUCK. We have reduced our wages something less than 40 per cent since the highest peak during the war period.

Senator McCUMBER. Can you give us an idea of what your general wages are that are now paid to your labor?

Mr. BUCK. We paid common labor 42 cents. We have common labor to-day down to 27 cents an hour.

Senator SMOOT. That is, common labor?

Mr. BUCK. That is common labor. Other rates were reduced proportionately.

Senator McCUMBER. What percentage of your labor is that which you denominate common labor, receiving 27 cents?

Mr. BUCK. I should say that is not over 10 per cent of our labor.

Senator LA FOLLETTE. The other labor has been reduced relatively?

Mr. BUCK. Yes, sir.

Senator McCUMBER. I want to get at what you pay the other labor in the different classes.

Mr. BUCK. What are the rates, you say?

Senator McCUMBER. Yes. What are you paying now?

Mr. BUCK. Take the shipyards—about 70 cents.

Senator McCUMBER. An hour?

Mr. BUCK. Seventy cents an hour is the rate there. In the machine shops 50 to 60 cents an hour.

Senator SIMMONS. Is that skilled labor?

Mr. BUCK. Skilled labor, skilled mechanics, of which we have great numbers, they being machine-shop operators.

Senator LA FOLLETTE. Did you say 60 cents for machine-shop operators?

Mr. BUCK. Fifty to sixty cents.

Senator SIMMONS. Is the American production of ferromanganese adequate to the American demand?

Mr. BUCK. It never has been, Senator. Up until 1914 about 5 per cent of it was imported. About half of the ferromanganese was imported.

Senator SIMMONS. What is the fact now?

Mr. BUCK. There are no importations. The banks of the steel companies and the banks of ferromanganese manufacturers are well piled up. They have a year or more supply.

Senator SIMMONS. You are not importing any at all now?

Mr. BUCK. There is practically no importation of ferromanganese to-day; practically none.

Senator LA FOLLETTE. Had you finished?

Mr. BUCK. Yes, Senator.

Senator LA FOLLETTE. You stated not long ago to Senator Pennington, the chairman, that normally you employed about a hundred thousand men?

Mr. BUCK. Yes, sir.

Senator LA FOLLETTE. And that you now employ about 20,000?

Mr. BUCK. About 20 per cent of them are employed.

Senator LA FOLLETTE. Of the 20,000 men now employed what number are paid 27 cents per hour?

Mr. BUCK. I think about 10 per cent of them, the common labor. I am taking that purely from memory, Senator. I think that is true.

Senator CALDER. Has your labor been reduced?

Mr. BUCK. Yes, sir; from a high rate of 42 cents until it is down now to 27 cents.

Senator LA FOLLETTE. How many hours a day do the men work?

Mr. BUCK. The men work 10 hours a day. In the machine shops they work 8 hours a day.

Senator SIMMONS. What were you paying common labor before the war?

Mr. BUCK. Forty-two cents.

Senator SIMMONS. Before the war?

Mr. BUCK. Oh, before the war I think we were paying about 18 cents, in 1914. I think it was about 18 cents.

Senator SMOOT. Is most of the labor foreign?

Mr. BUCK. Practically all the labor is foreign. It is Hungarian, Slovak and Magyar, Italian, Portuguese, and Mexican.

Senator SIMMONS. Are the bulk of them naturalized?

Mr. BUCK. No. Not a large percentage of them are naturalized. Of course as we curtail our labor we keep our American citizens, and the foreigner is out of work to-day. It was always a small percentage, but the American in our district is the mechanic. During the war you could not get American labor. It was foreign labor that you got, and a good deal of it was Mexican and Portuguese.

Senator SIMMONS. Taking the whole steel industry, could you give the committee an idea of what per cent of common labor is foreign or?

Mr. BUCK. No, sir; I do not believe I could answer that. I do not know now that I have seen any statistics.

Mr. TOPPING. It runs about 70 per cent, Senator. That is based on a poll taken during the war which I happened to be interested in. That is approximately a correct statement for the whole industry.

Senator LA FOLLETTE. And for normal times?

Mr. TOPPING. The same condition. It is practically unchanged.

Senator LA FOLLETTE. How was it before the war?

Mr. TOPPING. I do not know. We had no poll at that time. We took a poll during the war for a purpose. I do not think there has been any change since the war to any material extent. I think that would be an approximately correct statement to-day.

Mr. BUCK. I have in my plea made a request for no duty on fluorspar. We have always had as our source of material the by-product from the lead mines of Great Britain. It is a by-product and we have used it for years.

Senator SIMMONS. We had a gentleman here the other day urging very strenuously a pretty good duty on fluorspar.

Mr. BUCK. The only reason I have to offer for that, Senator, is that we are geographically not well located to the sources of fluorspar which exist in Kentucky and Illinois, and we have a higher transportation charge and have always had a high transportation charge to the Atlantic coast. It does not interfere with the general fluorspar business——

Senator SIMMONS. He was an American and a producer, and he wanted protection. You are an American and a consumer of that product, and you think it ought not to be protected.

Mr. BUCK. We are not objecting to a nominal protection.

Senator SIMMONS. I thought you said you thought it ought not to be protected.

Mr. BUCK. We are rather objecting, Senator, to anything that will add to the cost of our steel. We are trying to get back, as we think the country is, to "normalcy." This is one of the increments that is interfering with our business. Anything that adds to the cost of steel——

Senator SIMMONS. Why should you think that you are more entitled to protection than the man who came here last week, a producer, and asked protection on what he was interested in? That is unfinished product.

Mr. BUCK. Only because we do not think there ought to be a geographical penalty put upon the consumer resulting in the prevention of the use of the commodity.

Senator SIMMONS. I thought the whole argument was, with the geographical location of the mines in the United States or the industry in the United States, there was no reason why one man should be given protection in one section of the country and another man producing the same thing should not have any protection in another section of the country.

Mr. BUCK. Irrespective of where the source of the material might be?

Senator SIMMONS. Yes.

Mr. TOPPING. May I interject something else at this point?

The CHAIRMAN. Yes.

Senator SIMMONS. It seems to me this witness ought to take care of himself.

The CHAIRMAN. They are all together, as I understand it.

Senator LA FOLLETTE. There is no question about that.

Mr. TOPPING. Inasmuch as I appeared before the committee on August 5 and filed a protest against fluorspar as well as magnesite and being interested as a group, the reply comes to my mind that answers your question rather more clearly, I thought, than Mr. Buck's statement, and I would like to make it if the committee will indulge me.

Senator SIMMONS. I have no objection.

Mr. TOPPING. He is not asking for free trade on fluorspar. He is asking for the same treatment as to fluorspar that you accord him under the present law, or under the proposed law, on limestone and all other fluxes that he mines himself.

Senator SIMMONS. If he is not asking for it I am badly mistaken.

Mr. TOPPING. We are asking because we have free trade on coal. Coal is on the free list, and we have had limestone on the free list. Fluorspar is nothing more than a limestone in another form. Why should you protect fluorspar and not protect limestone? We do not want it. We want free raw materials. We want free raw materials that we produce ourselves, our iron ore and coal and limestone.

Senator SIMMONS. The point of my inquiry was, why should not the man who produces free raw material not have protection against his foreign competitor just to the same extent as you have?

Mr. TOPPING. We object to your giving preferential treatment to the fluorspar man when you do not give us preferential treatment on limestone.

Senator SIMMONS. Suppose we give protection to all of the producers of raw materials. Do you object to that?

Mr. TOPPING. Those crude products do not need protection.

Senator SIMMONS. That is the point. You say they do not need protection, but they say they do. These fluorspar men have been here and these graphite men have been here. They make the same argument. You come here and say they ought not to have protection.

The CHAIRMAN. Now, Mr. Buck, if you will conclude.

Mr. BUCK. I would like to add magnesite to the list of raw materials that should be permitted to come into the country free. There is a duty of \$15 a ton proposed in this bill on magnesite.

Magnesite, prior to 1914, was produced and shipped into this country at \$15 a ton. We have magnesite in the State of Washington. The cost of transportation of Washington magnesite to the western steel industry is practically \$15 a ton. We believe that we could not be forced to double the cost of this refractory which is used for the bottoms and for the linings of furnaces, because it will drive the steel maker to using an inferior product in the east, that is, dolomite, which does not satisfactorily serve this purpose and is not economical.

That is all that I have to submit to the committee.

Senator LA FOLLETTE. I would like to ask a question or two. Mr. Buck, you stated that you were reduced to about 20 per cent of your normal employment of labor?

Mr. BUCK. Yes, sir.

Senator LA FOLLETTE. To what do you attribute that reduction in labor and, consequently, in the production of steel?

Mr. BUCK. We naturally do not have a market for our products. We think that transportation is an important element that has added to the cost of these products. I do not know of any better way to tell you about the influence of transportation on plants located as we are, in the East, than to tell you that the cost of assembling the raw materials to make a ton of pig iron is as great as the cost of the pig iron was in 1914—\$12 to \$14 a ton is the cost of assembling our ores, coal, and limestone to make a ton of pig iron. That naturally has increased the cost of the basic elements that go into steel making very greatly. Another element which is important is the one which Mr. Topping referred to, and that is the erectors, the contractors who were consumers of this steel, have not brought down their wages. It is not at all unusual to see a dollar an hour being paid to the steel erector.

Senator LA FOLLETTE. Has your company refused to sell to some of these fabricators where they employ union labor?

Mr. BUCK. I do not think so, Senator.

Senator LA FOLLETTE. Did not your Mr. Grace so testify before the Lockwood committee in New York City?

Mr. BUCK. I do not know just what Mr. Grace testified to. I was not present. I do not know what his speech was. I do not think we refused to sell to anybody. That is the knowledge that I have.

Senator LA FOLLETTE. I had some recollection of having seen such report of his testimony.

Mr. BUCK. There is a great deal of gossip in the papers always, and always exaggerations of that character made.

Senator LA FOLLETTE. It attracted a good deal of attention at the time, as I remember it.

Mr. BUCK. I do not think we could afford not to sell steel generally. We are too much interested in disposing of our steel.

The CHAIRMAN. Is there anything further?

Senator LA FOLLETTE. The 42-cent rate for common labor which you were paying was for what year or what years?

Mr. BUCK. I should say, 1919 and 1920, up until the beginning of this year. It may have been two or three years, Senator.

Senator LA FOLLETTE. What was the price paid per hour for that labor, say, back in 1910 and 1911 and 1912, and along there?

Mr. BUCK. I think, in 1912, about 18 cents.

Senator LA FOLLETTE. It ran along about the same rate for a good many years?

Mr. BUCK. Yes, sir; 15 to 16 cents was the rate of labor for a number of years.

Senator LA FOLLETTE. That is all, I think.

**BRIEF OF C. A. BUCK, VICE PRESIDENT OF THE BETHLEHEM STEEL CO.
BETHLEHEM, PA.**

We believe the proposed duties on finished steel products in the metal schedule to be fair and equitable to the steel industry in general provided the American valuation plan is accepted. It is only certain raw materials and certain alloys that are practically raw materials that we wish to call to your attention. We believe these products should be on the free list:

Ferro-alloys: These are alloys of iron and certain other elements. They are used in the manufacture of certain high-grade steel to give qualities of hardness, toughness, etc. Some of the more important ones are ferromanganese (discussed separately under manganese ore), ferrochromium, ferrotungsten, ferrovanadium, ferrosilicon, etc. Nickel and nickel alloys (par. 385) can be added to the list as their uses are the same.

We would recommend that only nominal duties be put on these materials and that the ores from which these materials are made be put on the free list. Our reasons for these requests are:

1. Ferro-alloys are essentially raw materials, being the first product resulting from the smelting of the various ores, this generally being done in the electric furnace.

2. The ores of most of the metals in this group do not exist in the United States in commercial quantities. As to this feature reference may be made to some of the elements in detail.

Chromium: Only low-grade chromium ores exist in the United States. There are some in California, and their use in the steel industry is practically prohibitive on account of their leanness and their cost when the freight on waste matter in the ores is considered. No rich chrome ores were developed during the exceedingly high prices. The deposits in California are too low grade to be of importance in peacetime but would form a valuable emergency reserve in time of war.

Tungsten: The case of tungsten is much like that of chromium. In using up our tungsten reserves we are consuming a relatively low-grade reserve of very moderate tonnage in competition with rich ores of very large tonnage that occur in Peru, China, the Malay States, etc.

Nickel: No nickel deposits exist in the United States, and a high duty on the crude forms of nickel (metallic nickel and nickel alloys) is a hardship on the steel industry.

Manganese ore and ferromanganese (par. 302): Manganese is absolutely essential in the steel industry, and about 17 pounds of manganese are used for every ton of steel produced. This importance makes the subject worthy of special mention. We are not in favor of a duty on manganese ores, but do not object to a duty on ferromanganese for the following reasons:

1. Experience has shown that even under the inducements of very high prices the United States is entirely unable to supply its needs of manganese ore. Our deposits are of low grade and are so scattered as to be of little importance to the American steel industry. These facts have been brought out in so many investigations that they do not need repetition here. About all that can be said as to American deposits is that they would form a small emergency reserve in case foreign supplies should be shut off by a future war.

2. Putting manganese ore on the free list and imposing a nominal duty on ferromanganese would tend to increase the importation of the crude ore and would allow any steel company to buy its ores abroad and make its ferromanganese in the United States.

3. Foreign manganese ores exist in great abundance in Brazil, Turkey, and India. A duty on manganese ore will certainly tend to make Germany, and more especially England, the principal ferromanganese producing countries. They did enjoy a large business before the war and a great part of our ferromanganese was bought from England. Thus, in the years 1908-1914, inclusive, we imported more ferromanganese than we made—640,000 tons imported as against 610,000 made in the United States.

4. The exports of manganese ore from the countries mentioned above form an important part of their commerce. This is especially true of Brazil, which could

the most natural source of manganese ore for the United States. It would seem entirely possible that in case manganese ore is made to pay a high duty some of the preferential agreements which the United States now enjoys may be abrogated by countries interested. This would certainly be to the disadvantage of our foreign trade.

Geographically the United States is as well located for ferromanganese manufacture as any country in the world. Ferromanganese is not made in any of the countries producing large quantities of manganese ore. Like iron ore, manganese ore invariably goes to a location possessing good coking coal where it is smelted into ferromanganese. Inducements should be made in this tariff for the manufacture of ferromanganese in this country. This can be done by admitting the ores free of duty and by putting a nominal duty on ferromanganese. In this way we will offset the advantage Europe has in the matter of ocean transport on ores from India, Turkey, and Brazil to European points.

England in normal times enjoys a distinct advantage in ferromanganese production over the United States. The reasons for this are summarized in Tariff Information Surveys on the ferro-alloy industries (U. S. Tariff Commission, 1921, p. 69). A tariff on manganese ore will increase this advantage.

Fluorspar (par. 207): Fluorspar is an essential material in the steel industry, being the only satisfactory flux for open-hearth furnaces. For many years a considerable part of our requirements has been imported, mostly from England.

The tariff on fluorspar will be a distinct hardship on eastern steel manufacturers on account of the high freight rates applying from Kentucky and Illinois. We believe the reserves in those States to be ample, but also believe that steel plants located in the East will be at a distinct disadvantage as compared with Chicago and Pittsburgh. The freight rates at present are as follows: From Kentucky-Illinois, field to Chicago, \$6.00; from Kentucky-Illinois, field to Pittsburgh, \$5.60; and from Kentucky-Illinois, field to Bethlehem, \$8.

It is to be noted that the American fluorspar industry will apparently flourish without tariff protection. So many new uses are being developed for high-grade spar that the industry has greatly expanded in recent years. Thus, while the price of spar in 1920 was four times that of 1890, production was about 18 times the production for 1890. This development occurred while fluorspar was on the free list or while it had only a nominal duty of \$1.50 per ton.

Magnesite (par. 47) and magnesite brick (par. 201): Magnesite is an important refractory used extensively in the steel industry for lining open-hearth and other furnaces. It is subjected to a dead-burning process before use and is then called dead-burned grain magnesite. A large amount is used in this form and a large amount also used in the form of brick made from this material.

The only substitute is a very pure dolomite, which while cheaper, is not as satisfactory as magnesite.

The best magnesite for refractory purposes occurs in Austria and the magnesite industry of the United States has practically been built up on importations from that country. As indicating this development the imports of dead-burned magnesite were 30,000 tons in 1904 and increased to 150,000 tons in 1914.

Development of domestic magnesite has been recent and only one property located in Washington is known that can supply an important tonnage. California also is a producer, but the quality of the product is such that it is not well adapted to refractory use. In 1920 California produced 82,000 tons and Washington 222,000 tons.

We are not in favor of the imposition of a duty on magnesite for the following reasons:

1. An important magnesite brick industry has been built up in the East, depending entirely on Austrian magnesite. This industry comprises many brick plants located in Pennsylvania and Maryland and well adapted to serve the steel industry.

2. Geographically, the Washington deposit is such that it will always furnish a product delivered to Eastern steel plants at prohibitive prices. This is due to the high freight costs which will necessarily be charged.

3. The Washington producer does not need protection to insure prosperity. The fact that the Washington production increased from 715 tons in 1916 to 222,000 tons in 1920 with magnesite on the free list is sufficient proof of the above statement.

4. A heavy duty on magnesite will certainly tend to force steel makers to use dolomite as a refractory and the use of magnesite will tend to decrease.

Ferrosilicon: Ferrosilicon is mentioned especially as showing the very high duties imposed on some of the ferro-alloys. At present the price of a domestic 50 per cent ferrosilicon is \$60 per gross ton at Ohio points. A 50 per cent ferrosilicon means that

it contains 50 per cent of silicon, therefore, a gross ton contains 1,120 pounds. The duty proposed in the bill is 2½ cents per pound of silicon or for this grade, a duty of \$28 per ton is proposed. This is nearly 50 per cent of the present selling price.

The materials entering into ferrosilicon are iron and silica which are both abundant in all parts of the world. While a moderate duty might be advisable, we believe that approximates 50 per cent of the selling price is excessive.

HIGH-SPEED STEEL.

[Paragraphs 304 and 305.]

STATEMENT OF ARTHUR BALFOUR, MANAGING DIRECTOR ARTHUR BALFOUR & CO. (LTD.), SHEFFIELD, ENGLAND.

Senator McCUMBER. Will you kindly state your name in full, your residence, what interest you represent, and to what you desire to direct your remarks?

Mr. BALFOUR. My name is Arthur Balfour; I am of Sheffield, England. I am deputy president of the Association of British Chambers of Commerce. I am ex-president of the Sheffield Chamber of Commerce; ex-master cutler of Sheffield, and managing director of Arthur Balfour & Co. (Ltd.), of Sheffield.

I am desirous of drawing your attention to the question of high speed steels and other steels which have been imported from Sheffield for a great many years.

Before doing so I would like to thank you, Mr. Chairman and Senators, for having so very kindly received us on such short notice which we very much appreciate, and our people in Sheffield will very much appreciate it when we tell them about it.

I am sure you will understand that we feel that we are in a rather delicate situation. We do not for one moment desire to appear to suggest in any way what you should do in your own country; but owing to the very long time that Sheffield has been associated with America we ventured to come here and put a few considerations before you.

The industrial and commercial conditions in Sheffield created by the war, and in England in general, are very disastrous. We have about 2,000,000 people out of employment. We have another two or three million working only two days a week and a further million working only three days a week, and we are right up against the economic law, owing to conditions created by the war.

Senator SMOOT. You are in about the same condition as we are in in this country.

Mr. BALFOUR. I gather that we are both in the same position.

Senator McCUMBER. I judge that your position is a little worse than ours.

Mr. BALFOUR. A little worse than yours. There is practically nobody working full time.

Of course, we expected this, but it has come upon us even later than we anticipated.

I would just like to say that my colleagues have asked me to speak for them so as to take up as little of the time of the committee as possible.

Mr. Sidney Robinson, who is with me, represents the firm William Jessop & Sons (Ltd.). They have been doing business since 1828.

Mr. Macgregor represents the firm of Sanderson Bros. & Newbould (d.). They have been doing business since before 1829. Mr. Cecil Ward, of Edgar Allen & Co. (Ltd.), and my own concern have been trading here since 1876. We have been in the closest operation with the steel makers in this country. During this period we have worked out inventions together and sent workers over here, and in most of your steel firms you will find old Sheffield steel makers to-day, or their descendants. We are very anxious that these beneficial conditions shall not be disturbed.

Mosmet steel, manganese steel, stainless steel, and other varieties, of which are produced here at the present time, were invented in Sheffield. The Taylor-White process of treating tool steel, which has been a very great factor in the trades which we represent, was invented in your country, but as regards the making of high-speed steel, it was perfected in Sheffield.

The population of Sheffield to-day is over half a million, of which a hundred thousand workmen are largely skilled. We also represent Messrs. Sir W. G. Armstrong, Witnouth & Co. (Ltd.), of Manchester, who make the same class of steel, but it is made in Manchester and not in Sheffield. Taking into consideration their employees, which amount to probably 25,000, we represent about 125,000 workers.

We have also had long personal connections with this country, which has induced us to venture to come to see you. I molded car wheels in Buffalo for four years, from 1892 to 1896. I have been here many times. Mr. Robinson has been here 43 times, and my other colleagues over 20 times. We are all of us local taxpayers, through means in which we are interested, and all of us employ labor in this country.

We should have liked, if it were possible, to have no change in the tariff at all. We recognize that that is not possible, and we are prepared to accept the data and proposals made by Mr. Smiley (speaking for the committee of fine steel importers) recently. These gentlemen distribute our products in this country.

Senator SMOOT. Mr. Boker, I think, also.

Mr. BALFOUR. I was speaking not of cutlery just for the moment, Senator. He represented cutlery, but he also spoke, perhaps, of steel.

Senator SMOOT. Yes, he did. Will you let me know just what I want? Take the steel valued above 40 cents per pound. The tariff as it passed the House provided 20 per cent ad valorem. That is where the high-speed steel falls. As I remember it, Mr. Smiley voted 10 per cent instead of 20 per cent.

Mr. BALFOUR. Yes, sir. Taking paragraph 305—

Senator SMOOT. No; that is the first of paragraph 304. Three hundred and five is the paragraph providing 72 cents per pound on steel containing tungsten content in excess of $1\frac{1}{2}$ per cent, "and 72 cents per pound on the tungsten content in excess of $1\frac{1}{2}$ per cent shall be levied, collected, and paid on any articles containing molybdenum and tungsten."

Now, for high-speed steel, you have got to take paragraphs 304 and 305.

Mr. BALFOUR. In conjunction.

Senator SMOOT. It has been suggested, although not by Mr. Smiley, that the 72 cents be cut to 50 cents. Others have suggested

that in their testimony. In other words, they were content with making paragraph 304 10 per cent instead of 20 per cent, and cutting 72 cents to 50 cents per pound on the tungsten contained in the steel.

Mr. BALFOUR. We suggest that the tungsten should be cut 22 cents from 72 cents.

Senator SMOOT. That is what I wanted to find out. You want 10 per cent?

Mr. BALFOUR. Thirty-five instead of 72.

Senator SMOOT. And 10 per cent instead of 20 per cent?

Mr. BALFOUR. Ten per cent instead of 20 per cent; yes, sir.

At the present time, as you have all heard, the fine-steel importation is only 2 per cent of the whole; and we feel that that is a very small percentage and, at the same time, a very useful percentage, as it makes an incentive to the manufacturers here and a great incentive to us to give the best value we can as regards quality and price.

We are satisfied that if the tariff went through as it is at present written it would put us out of business. There is no question about that. I understand that it is not your desire to put anybody out of business entirely; but we could not possibly send you steel under that tariff.

Senator McCUMBER. What you mean is that it would be prohibitive so far as the American trade is concerned?

Mr. BALFOUR. It would be absolutely prohibitive, sir, because the duty would come to about 200 pounds per ton, in pounds sterling, and as we have to keep stocks in this country from 50 to 100 tons, we will always have to lock up 20,000 pounds sterling in duty on our high-speed steel before we could trade at all.

There is another view which bears very strongly on the amount of the tariff. That is the valuation question. We have got along very well under the present valuation. We are in very close touch with the representatives of your Treasury Department in London. They come to Sheffield to see us and we give them every possible facility for looking into matters, and we have always been able to satisfy them exactly as to what we have been doing.

We desire to go on doing that. We are very anxious that the valuation should be fixed in some way so that we can quote a price to our customers in this country; else it is almost impossible to receive that your buyers here will give us an open order on a price which is indefinite.

If the valuation is put on the basis it has been suggested, it will be almost impossible for us to say on any given day what duty we have to pay and what price we can guarantee to our customer.

Senator SMOOT. You must take into consideration that you have an advantage in the exchange value that you have never had before, and this committee has to take that into consideration in fixing the rates.

Mr. BALFOUR. I agree; I quite appreciate that. We have the same exchange difficulties that you have, somewhat intensified with the competition which we have so close to us in Germany.

Senator SMOOT. You know something about that.

Mr. BALFOUR. We know all about the exchange difficulties, but we do put before you for consideration the difficulty of trading in an open indefinite situation of the kind which this new valuation will create. We also have contracts here with some of your big firms.

makers for steel, which are running contracts for two or three hundred tons. They want to fix a price that is definite in order to be able to fix their costs of production. Under this system it will be most impossible for either of us to do that.

Senator SMOOT. I can not agree with you there, because it seems to me that your price under the existing tariff law is fixed upon the day of the exportation. If changes in price should occur in England during that time, of course the rate of duty imposed to-day will be different. The American valuation does not fluctuate any more than the valuations in a foreign country fluctuate.

Senator McCUMBER. They are probably more stable now, because the currency is more stable.

Mr. BALFOUR. I quite agree with you that upon tonnage steel it is a fixed thing. It is a fixed market question. But take high-speed steel and these fine steels, and it is not fixed. They have a different composition, a different analysis, and each concern makes a separate quality. They are not standard.

Senator SMOOT. But that same difficulty, if you call it a difficulty, exists to-day with the foreign valuation.

Mr. BALFOUR. To some little extent, but nothing like to the same extent, because we can to-day make the price and fix the price in cents.

Senator SMOOT. We have a fixed price in America, too.

Mr. BALFOUR. I only ask you to consider these points and see what you can do with reference to these difficulties.

Senator McLEAN. On the tungsten content the rate is specific.

Mr. BALFOUR. The rate is specific on the tungsten content, but there is also an ad valorem percentage on the price.

Senator SMOOT. All that the question of American valuation affects is the ad valorem duty of the steel above 40 cents.

Mr. BALFOUR. We are all in agreement on that. High-speed steel is our important product which we have to send to this country. We are also interested in carbon steel.

Senator McLEAN. Do you manufacture high-speed steel in this country?

Mr. BALFOUR. No; none of us. We only manufacture it in England.

Senator McLEAN. You said you had branch interests here.

Mr. BALFOUR. Jessops have a company at Washington, Pa., where they roll sheets. The others of us have branches in different parts of the country—Chicago, Boston, and New York.

Senator McLEAN. Will you give the committee your capital invested in this country?

Mr. BALFOUR. I could not, offhand, without consulting my colleagues. I should say, altogether, that we employ perhaps 100 or 500 people in this country, probably no more than that.

Senator WALSH. I suppose your ownership is associated with Americans?

Mr. BALFOUR. Yes, sir. They are practically retailing companies, with the exception of Jessops.

We, of course, are very much interested in the export of finished tools from this country which are made from our steel. We buy large numbers in England and great numbers are sold to the colonies.

We feel that this tariff will certainly put a difficulty in the way of the export of those tools, as it will further depress the exchange and

further accentuate the exchange difficulty, and also make the cost of the high-speed steel to the makers here very much higher, particularly in view of the duty on tungsten.

And if you will allow me to say a word on tungsten, I would like to say that we had during the war great difficulties with tungsten, just as you had; but, fortunately, we had the tungsten in the British Empire, as you had it in your country, and the fact that we had a supply in the British Empire saved us a great deal during the war and enabled us to produce munitions, and we are anxious, from our side, to retain a certain amount of tungsten in the British Empire and not work it all out. Fortunately we are helped in this by cheap supplies from other countries which are available at this moment.

Senator WATSON. What are your imports to this country of high-speed steel, as you class it?

Mr. BALFOUR. They have varied enormously. Recently it has been perhaps 500 to 700 tons per annum, something under 1,000 tons.

Senator McCUMBER. What was the value?

Mr. BALFOUR. About £250,000 sterling or something of that kind, roughly.

I just want to state to you, broadly, that we are suffering from very, very hard conditions in England. We are paying taxes of £23 sterling per head.

Senator WATSON. Is your industrial condition in Sheffield characteristic of the general condition in England?

Mr. BALFOUR. Yes, sir. It is worse in some places. It is bad everywhere. Sheffield has probably the worst conditions. We are paying £23 sterling per head of tax in our country this year. The nearest to us in the world is about £5 6s. sterling. That is putting a very great burden upon us, and we are struggling to overcome the enormous strain put upon us due to the war.

All that we ask you to do is to let us live and work and pay you back what we owe you. We owe you a vast amount of money, which is a great anxiety to us, and we feel that unless we can trade with you our difficulties are going to be enormous. You have got something like fifty thousand million dollars in gold. We can not send you any more gold. We have not got it, even if it were advisable for you to receive it, which I do not think it is. So that the only thing we can do is to trade in goods for goods with you, and that we are very anxious to do.

Senator WALSH. What is the unemployment in England? Some figures which have been given us show that it is about 5 or 6 per cent.

Mr. BALFOUR. We have 2,000,000 unemployed; we have another million employed two days and several other millions employed three days. Our population is about 45,000,000.

Senator WALSH. It is about the same.

Mr. BALFOUR. There is very little difference in the figures.

Senator WATSON. For the entire year of 1920, under the classification of steel by whatever process made, containing alloys, such as nickel, cobalt, vanadium, chromium, tungsten, or wolfram, molybdenum, titanium, iridium, uranium, tantalum, boron, and similar alloys, we imported 883,740 pounds, valued at somewhere between three and four million dollars.

Mr. BALFOUR. That would be about right. There are about 250,000 of high speed, and the rest would be made up of other steels.

Senator WATSON. About \$250,000 of that is high speed?

Mr. BALFOUR. Practically.

Senator WATSON. How much of that comes from Sheffield?

Mr. BALFOUR. It practically all comes from Sheffield. A little comes from Manchester. Sweden sends practically no crucible steel and no high-speed steel to this country.

Senator SMOOT. I suppose half of that amount would be imported to the United States even though the rates were higher than they are here?

Mr. BALFOUR. Unless the selling price is too high. I do not think you can say that we have ever ruined the price in competition with the American makers. We have always obtained for our steel at least as good a price, or a little higher, on account of special quality.

Senator SMOOT. Yes; it has special quality.

Senator WATSON. I did not hear your question, Senator.

Senator SMOOT. I did not ask a question. I simply stated that no matter if the rates are higher than they are in the Fordney bill there is no doubt that at least half of that amount that was imported in the past would be imported in the future.

Mr. BALFOUR. I misunderstood your statement, Senator. I understood the Senator asked if we always obtained a higher price.

Senator SMOOT. No; I did not ask that question.

Mr. BALFOUR. I am sorry that I can not quite agree with that. If the proposed duty is put on I do not think we shall be able to import high speed at all.

Senator SMOOT. From the information we receive there are certain industries in this country that would use it no matter whether it cost more than it does now or not.

Mr. BALFOUR. Yes; even more, but the amount proposed I am afraid would make it impossible to do any export trade.

Senator WATSON. What wages do you pay in the making of high speed steel as compared with the wages paid in this country in the same line?

Mr. BALFOUR. Our wages have gone up very much since the war. I do not think our wages are very much different from yours at the present time. On the other hand, our fuel, which is a very big factor, is very much higher than yours.

Senator SMOOT. What are you paying common labor?

Mr. BALFOUR. The ordinary common labor, that is, a man wheeling a barrow, gets 3 pounds 10 shillings.

Senator WALSH. How long do they work per day?

Mr. BALFOUR. Eight hours a day.

Senator WALSH. What is your cost of living as compared with that in America?

Mr. BALFOUR. I should say your living is a little higher.

Senator WATSON. Do you think your cost of living of the working people is cheaper than in America?

Mr. BALFOUR. They live on a different standard, sir. Our people do not live perhaps on as high a standard as they do in this country.

Senator McCUMBER. You can not compare wages without knowing the cost of living.

Mr. BALFOUR. No; it is impossible. Our cost of living is possibly 100 per cent higher than it was in 1912.

Senator McCUMBER. You pay wages that are about commensurate with American wages?

Mr. BALFOUR. Very close, sir; not very much different.

Senator SMOOT. They are based on the pound of \$3.60 instead of \$4.87. You would not pay the same amount——

Mr. BALFOUR. Not on \$4.87; I quite agree. We have not paid the same wages for a great number of years.

Senator SMOOT. No; you never have.

Senator McCUMBER. But you think it is a fact that your wages have gone up very largely?

Mr. BALFOUR. Four hundred per cent since 1912.

Senator McCUMBER. While ours have perhaps doubled.

Mr. BALFOUR. I ought to say, in fairness, that ours are now coming down quite rapidly.

Senator McCUMBER. Is not your great trouble to-day, and many being out of work, due entirely to a labor wage that is away above the ability of purchasers to buy?

Mr. BALFOUR. Absolutely so. We are not making anything in England to-day which we can sell, when we have made it, at what it has cost us to make.

Senator McCUMBER. And your remedy lies more in getting your labor down to a reasonable basis so that you can sell the products to the world?

Mr. BALFOUR. And our fuel, which is the same thing.

Mr. McCUMBER. But your labor increase makes the cost of your fuel to a great extent.

Mr. BALFOUR. Quite right, sir. I must say this for our labor. They are recognizing the situation. They are fully recognizing it, and the better class of labor leaders at least see that this system which has been pressed very hard during the war, that a man should not produce more than a certain quantity, that they should restrict output, and so on, is an impossible economic situation. That is to-day being altered in our country, I am glad to say.

I just want to touch on one question as lightly as I can.

We do not believe in retaliation in our country. I believe that whatever you do to us we would never permit that. We think it would create a feeling of mistrust between us, and I believe we shall always give you a free entry into our market for your goods. All we ask of you is to give us the best and squarest deal you can under the circumstances.

Senator SMOOT. You have no objections whatever to our imposing a duty equal to the difference in the wage and to equalize the exchange value?

Mr. BALFOUR. Sir, we have no objection to your imposing a duty. It is for you to decide what it is to be and how it is to be done. We understand all that; but we do ask you, after the pleasant connections we have had together, not to put us out of business.

Senator SMOOT. Do you think that the proposition would be a fair one that all that we would impose by way of duty would be the difference in the labor cost and to equalize the difference in exchange?

Mr. BALFOUR. Yes; provided you made the condition that it should not become a permanent thing; that when conditions altered you would be prepared to reconsider the matter and not, when we have the other conditions right, leave us with a high tariff.

Senator SMOOT. Of course, you must know that no tariff that will be passed is going to remain on the statute books as they have done in normal times in the past.

Mr. BALFOUR. We certainly hope not. But we do not believe in retaliation. Whatever happens, we shall give a free entry to your goods as far as it is possible. That I am perfectly convinced of.

Senator McCUMBER. Let me ask you a question in a little different form from that asked you by Senator Smoot.

Would you be satisfied if we put a tariff on that would measure the actual difference between the cost of production, including everything, in your country and in this country?

Mr. BALFOUR. Yes, sir; we would, because the cost of production of high-speed steel is less in this country than it is with us. That would suit us entirely.

Senator McCUMBER. Then, according to that view, there would be no tariff in your mind?

Mr. BALFOUR. I started my remarks by saying that we should be very glad if everything could remain as it was.

Senator SMOOT. Remain as it was?

Senator WATSON. Have you prepared production costs to show that it costs less to make high-speed steel in this country?

Mr. BALFOUR. We have great difficulty in giving you production costs of your own people. We know what our costs are. We are constantly giving them to your representative in London.

Senator WALSH. What percentage do your companies ship to America?

Mr. BALFOUR. I should say a little less than 20 per cent—probably 15 per cent.

Senator WALSH. Assuming that this tariff amounted to an embargo, your reduction would be only 18 to 20 per cent?

Mr. BALFOUR. But it does not quite work like that. It is not distributed evenly over the trade. We have some gentlemen whom I am representing who do their whole trade with America. I can put my hand on two or three firms that would go clean out of business. Other firms will be hit more or less hard according to the percentage that affects their own trade.

Senator SMOOT. You spoke of having this on the free list.

Mr. BALFOUR. No, sir. Under the same conditions as exist at present, 15 per cent ad valorem. I said no change in the tariff as it is at present.

Senator WALSH. Do you mind giving us the names of firms or tell us the product produced that would be put out of business?

Mr. BALFOUR. I can give you that at once. The firm of S. C. Wardlaw, who manufacture cutlery steel, would be practically put out of business.

Senator WALSH. Can you give us any others?

Mr. BALFOUR. I can give them to you afterwards.

Senator WALSH. Do they also make cutlery?

Mr. BALFOUR. There are also other firms who make cutlery and high-speed steel.

Senator SMOOT. The average price of high-speed steel in Britain to-day is about \$200 a ton?

Mr. BALFOUR. Three and nine pence. It is about £420 sterling per ton.

Senator SMOOT. A ton of 2,240 pounds?

Mr. BALFOUR. Yes, sir.

Senator SMOOT. What I wanted to get at was the price to-day the average price of that steel, so that I can figure the 15 per cent—

Mr. BALFOUR. Will one of my colleagues, while I am speaking, just work that out?

Senator SMOOT. I can work it out if you give me the information.

Mr. BALFOUR. Four hundred and twenty pounds a ton is the price of 18 per cent high-speed steel to-day f. o. b. England.

Senator SMOOT. Thank you; that is all I care for.

Mr. BALFOUR. I do not think it is necessary to further take up your time. We appreciate, not only on the part of ourselves but on the part of Sheffield, the very kind way in which you have received us and the opportunity which you have given us of putting our views before you. We have very, very strong feelings that the peace of the world depends entirely upon you and upon us, and we want to do nothing from our side to disturb the harmony and the excellent way in which we have worked together.

Senator McCUMBER. Does Mr. S. J. Robinson desire to be heard?

Mr. BALFOUR. I do not think the other gentlemen wish to give any evidence at all. They asked that I should speak for the whole of them.

Senator McCUMBER. If there is any brief that you would like to file, that may be done and it will be printed as a part of your testimony.

Mr. BALFOUR. Thank you. We will consider that; but I think that with the help of the Senators who have questioned me we have brought out the evidence very clearly.

We are very much obliged to you, gentlemen.

STATEMENT OF C. F. SCHWEP, REPRESENTING THE INGERSOLL RAND CO.

Mr. SCHWEP. We have six plants in this country, employing approximately 6,000 men. We are interested in paragraph 304 only in so far as it pertains to hollow mining drill steel. We import this commodity from Sweden because this country has not yet produced a quality of steel for that particular purpose that equals in quality the Swedish steel.

We import approximately 2,000 tons a year, on which the Government derives a revenue, under the present tariff act, of about \$37,000.

Under the proposed Fordney Act the revenue would approximate \$90,000, representing a difference of about \$53,000, which would have to be borne by the mining industry in this country, provided they continue the use of this better quality of steel. If not, they would be deprived of the efficiency of the drills manufactured and used in conjunction with that steel. Therefore we ask that the present tariff of 8 per cent be continued.

Senator WATSON. Have you ever sold any drills made from American steel?

Mr. SCHWEP. We have.

Senator WATSON. Do they not give satisfaction?

Mr. SCHWEP. They do. The point is this: That the old type of percussion drilling differs widely in principle from the hammer drill. The hammer drill uses a hollow steel, and instead of lifting the steel

the chuck up and down the drill is tapped on the end. The steel gives blows at the rate of 2,000 per minute, and the steel has to withstand shock and vibration, and we have found that there is something inherent in the Swedish steel which is not revealed by analysis and which makes that particular steel very much better adapted for that kind of work than the American steel.

Senator SMOOT. Is that all you desire to say?

Mr. SCHWEP. I may say that this Swedish steel is the only product that we import that enters into the manufacture of our product. Otherwise we use all American products. The only exception is this variety of steel.

Senator WATSON. How much do you import per year?

Mr. SCHWEP. About 2,000 tons a year.

CRUCIBLE, ELECTRIC, AND ALLOY STEELS.

[Paragraphs 304, 305, and 316.]

STATEMENT OF JOHN H. BREWSTER, NEW YORK CITY.

Senator SMOOT. Mr. Brewster, give your full name and address to the stenographer, please.

Mr. BREWSTER. John H. Brewster, 56 West Forty-fifth Street, New York City.

I desire to address myself to paragraphs 304 and 305. I have nothing to say to the committee further than what I have tried to say in my brief. May I file that brief?

Senator SMOOT. You may file your brief. Is there any other statement you desire to make?

Mr. BREWSTER. I think I have covered the whole subject as well as I could. I have here a schedule as a supplement to my brief. It is a part of the evidence.

Senator SMOOT. Very well; that may be filed.

BRIEF OF JOHN H. BREWSTER, NEW YORK CITY.

1. The House of Representatives, by adopting in paragraph 304 the approximate provisions of the Payne-Aldrich bill, overlooked the tariff differential established in paragraph 110 of the present tariff, which provides for a duty of 15 per cent on crucible and electric steels and 8 per cent on open-hearth and Bessemer. This distinction should be maintained.

2. When the Payne-Aldrich tariff was written crucible tool steels comprised a major part of our imports, consequently all bars and other shapes were given the same tariff classification.

3. From 1909 to 1913 great progress was made in the development of electric and alloy steels, and these fine steels were given greater protection under the present tariff than Bessemer and open-hearth steels, whose costs were so low that foreign competition was negligible.

4. This distinction should be continued in the new tariff, because the imports of crucible, electric, and alloy steels are principally tool steel, which is a finished product and used as such, whereas the imports of open-hearth and Bessemer steels are principally semifinished raw materials used by American manufacturers, who expend large labor costs in turning these steels into finished products. Among the buyers of Swedish steels for special purposes are large steel makers, such as the United States Steel Corporation, the Wickwire Spencer Steel Corporation, and the Washburn Wire Co.

5. Most of the imported crucible or electric tool steels are merely sharpened, heat treated, and then used in machine tools for cutting and shaping other metals.

6. Imported open-hearth and Bessemer semifinished shapes are used for blades in pocket and other cutlery, twist drills, taps, carpenters' chisels, black-

smith tools, scythes, ball bearings, and other finished products on which the labor cost is the most important item.

7. Imported tool steels are marketed in small quantities, with sales averaging less than \$100, at a wide margin of profit.

8. Imported open-hearth and Bessemer is sold at very close prices as semi-finished products to American manufacturers and dealers in tonnage quantities averaging much over \$1,000.

9. The open-hearth and Bessemer steels of Sweden, by reason of their superior excellence, are higher in price than American open-hearth and Bessemer and lower in price than crucible and electric steels.

10. This enables important manufacturers to use these Swedish steels when a special quality is required, in case this increase in their raw-material cost does not make too large an increase in the cost of their finished product.

11. Under these circumstances Sweden has always been forced to sell its Bessemer and open-hearth steels at very close prices; consequently the 300 per cent increase over the present tariff rate would cause many manufacturers to discontinue purchases.

12. As the open-hearth and Bessemer steel manufacturers did not appear before the Committee on Ways and Means, and as Dr. Mathews, the representative of the crucible and electric steel interests, stated to that committee: "The decline of duty (i. e., the 8 per cent in paragraph 110 of the present tariff, possibly justified in the case of products not involving excessive investments and labor costs," it may be taken for granted that producers of steels made by the Bessemer or open-hearth process in the United States do not desire an increased duty, as they need no protection, and unnecessary advances over the present tariff rates might react unfavorably on their large exports by the enactment of countervailing duties.

13. United States customs reports available for the years 1912 to 1916 inclusive, show a yearly average of 12,350 tons of open-hearth and Bessemer steels imported from Sweden, or one-thirtieth of 1 per cent of the average total production of American mills for the same period, so that these imports are inconsiderable in comparison with our output of domestic steels.

14. The money values of our purchases of Swedish steel and iron is less than \$5,000,000 a year and our annual exports to Sweden average more than \$100,000,000 annually.

15. Comparative increases of production costs in 1920 as compared with 1910 are: Ore cost in United States 1.4 times, in Sweden 3.5 times; fuel cost in United States 2 times, in Sweden, 3 times; labor cost in United States 1.4 times, in Sweden 2.5 times; transportation cost in United States, 1.7 times, in Sweden 3 times.

16. Therefore since the increase in Swedish costs is proportionately higher than the increase in the American costs, it follows that Sweden is much less able to pay a higher duty on its steels, particularly as these higher costs have thrown the Swedish semifinished products into a much higher classification under paragraph 304 than was paid under the Payne-Aldrich tariff. In 1910 the average production costs of Swedish steels at the mills were less than 5 cents, where as in 1921 the production costs of the same steels averaged more than 5 cents, so increasing the Payne-Aldrich duty of seven-tenths to a percentage duty under paragraph 304 of 1½ cents per pound.

17. With Swedish open-hearth and Bessemer costs so much higher than similar American steels, the former can only be used in limited quantities for purposes where special results are desired, and the increase of 1 cent per pound under paragraph 304 will in many cases become prohibitive.

18. Therefore your committee is requested to add to paragraph 304 the following provision:

"*Provided*, That steel ingots, copper ingots, blooms, slabs, bars, sheets, plates, and steel not specially provided for, made by the Bessemer, Siemens-Martin, open-hearth or similar processes in the manufacture of which wood or charcoal is used, all the foregoing valued at not over 4 cents per pound, shall be subject to a duty of three-tenths of 1 cent per pound; valued over 4 cents per pound, six-tenths of 1 cent per pound."

19. This follows the distinction made in the present tariff and the amount of suggested duty is the same as that given to semifinished wire rods in paragraph 315. Such a rate of duty on Bessemer and open-hearth steels would increase the revenue now realized, whereas the rate proposed in paragraph 304 would diminish it.

20. If this provision be confined to steels in the manufacture of which wood or charcoal is used, this not only insures the maintenance of high quality for

American manufacturer but also insures a steel of such high cost and limited output as to prevent any serious competition with the American steel industries.

1. With reference to paragraph 305, our request for modification is that chrome be removed from its classification with tungsten and molybdenum and added with manganese and silicon, because the effect of a small percentage of chrome in carbon steel is to intensify the hardening quality of the carbon and under modern heat-treatment practice occupies a place in steel making similar to manganese and silicon rather than the other alloys mentioned in this paragraph.
2. The present limitation of chrome contents in paragraph 305 to six-tenths of 1 per cent would probably prohibit the import of two or three thousand tons of this character of steel purchased by manufacturers of ball bearings who would not pay 15 per cent in addition to the duty imposed under paragraph 304, this would make the total duty equivalent to 35 per cent on a raw material.
3. Also, spring steels made of silicon and manganese in percentages running from 1 to 1½ per cent are largely made in American open-hearth furnaces and sold at a few cents per pound, but there is a demand from American spring steel manufacturers for a small tonnage of the better quality Swedish spring steel of similar analysis, although such manufacturers will not pay 15 per cent in addition to the rates in paragraph 304 on account of the addition of two or three tenths of 1 per cent of manganese or silicon to the 1 per cent now permitted.
4. Therefore, it is requested that paragraph 305 be changed by eliminating the word "chromium" from the sixth line of this paragraph and inserting the word "manganese" in the ninth line to read: "*Provided*, That chromium, manganese, and silicon shall not be considered as alloying material unless present in the steel in excess of 1½ per cent."

FACTS IN SUPPORT OF ABOVE STATEMENTS.

Paragraph 1: Published copy present tariff Schedule 3, paragraph 110.

Paragraphs 2 and 3: Special Statistical Bulletin Iron and Steel Institute, No. 21, showing no manufacture of electric steel before 1909 which increased to 1,180 tons in 1913 and 502,152 tons in 1920.

Crucible steel production was 107,355 tons in 1909 and 121,226 tons in 1913 and this decreased as electric steel was substituted to 72,265 tons in 1920.

Paragraph 4: Re Crucible steel. In Mr. John A. Mathews's hearing before the Ways and Means Committee, he stated that crucible steel making was a handicraft industry and added "In crucible steel the principal item is represented by labor rather than material," and in Mr. Mathews's brief he states, "The proportion of labor to raw materials in the manufacture of crucible steel is many times as great as it is in the manufacture of Bessemer or open-hearth steels."

Re electric steel. The booklet of the Halcomb Steel Co., which is Mr. Mathews's personal division of the Crucible Steel Co., states on page 48, "The material we charge into our electric furnace is just as good open hearth as can be made but it is not good enough, so we put on the finishing touches in the electric furnace. These are the things that make quality." So supporting our statement that crucible and electric should be considered separately from open-hearth and Bessemer.

The Hess Steel Co., makers of electric steel, state in brief before the Ways and Means Committee, "European makers compete injuriously with our labor in this handicraft industry," so coupling electric with crucible and further support our request for a differential by stating in the same brief "the higher the import value, the higher should be the rate of duty."

Paragraphs 5 and 7: Can be confirmed from buyers of tool steels.

Paragraphs 6 and 8: Names taken from a list of buyers from Fagersta Bruks, Fagersta, Sweden, is an example of the tonnage bought, the increase in price, and the purpose of use.

These names selected are representative of the business firms buying Swedish materials.

Paragraph 9: For comparison as to difference in domestic cost between open-hearth bars and crucible or electric tool steel bars, see printed list of maximum prices agreed to in 1918 between the United States Government and the steel makers for open-hearth steel bars of more than 0.50 carbon. The base price was \$3.15 per 100 pounds (see page 49), while for tool steel bars containing over 0.50

carbon the price ranged from \$16 to \$36 per 100 pounds, while the price of steels containing substantial percentages of tungsten, molybdenum, or other alloys ranged from \$0.65 to \$2 per pound. (See pp. 146 and 147.)

Paragraphs 10 and 11: Buyers mentioned above and prices paid by them confirm the statements in these paragraphs.

Paragraph 12: A copy of the Ways and Means hearings on Schedule 3 confirm this statement.

Paragraphs 13 and 14: The customs reports, as far as completed to date, confirm this statement as well as Swedish export figures.

The reports of the Department of Commerce will verify these figures.

Paragraph 15: Increases in Swedish costs prepared by Dr. Wahlberg, of the Swedish Government, and increases in American costs prepared by Carney Lindemuth.

Paragraph 16: An examination of the customs entries at the port of New York will verify this statement.

Paragraph 17: Letters from many American manufacturers stating that prices are too high can be furnished the committee.

Paragraph 18: Embodies our request.

Paragraph 19: The tariffs are before you.

Paragraph 20: The letters offered in proof of paragraph 17 would prove.

Paragraph 21: Compare the price of Michigan charcoal pig iron with other iron.

Paragraph 22: Oberg in 1918, page 286, says, "The effect of chromium is similar to carbon."

Harbord, in his Metallurgy of Steel, page 397, states that "chromium in the absence of carbon does not produce any greater hardness than silicon."

Sir Robert Hadfield, in a paper before the British Iron and Steel Institute, see volume 2, stated on page 80: "In high carbon steels, chromium enables the carbon to act more energetically in combining and hardening the iron. In low carbon iron its action is but little greater than silicon."

He also states, on page 143, that "chromium does not act per se, but has a strong influence in causing a more intimate combination between iron and carbon."

L. Guillet, British Iron and Steel Institute, 1906, volume 2, page 8, states: "The tensile strength and elastic limit do not differ greatly from the normal values obtained with the same percentages of carbon, quenching acts upon chromium steels the same as carbon steels, but with greater intensity increasing hardness."

Howe, in Iron, Steel, and other Alloys, page 323, states chrome steel containing up to 2 per cent chrome and 0.80 to 2 per cent carbon owes its value to its combining, when hardened, intense hardness with a high elastic limit.

Paragraph 23: By reference to the official prices issued by the American Iron and Steel Institute open-hearth spring steels carried a 25-cent extra addition to the bar price of \$2.90, making a price of \$3.15 per 100 pounds, and to-day quotations on silicon, manganese spring steel of \$4.50 per 100 pounds show that such steel can not carry 15 per cent in addition to those in paragraph 304. Silicon and manganese have never been considered as alloying elements.

STATEMENT OF JOHN B. SMILEY, NEW YORK, N. Y., REPRESENTING AMERICAN IMPORTERS OF FINE STEELS.

Senator SMOOT. Give your name and address and whom you represent.

Mr. SMILEY. John B. Smiley, 115 Broadway, New York, representing American importers of fine steels.

Mr. Chairman, I want to thank you, first of all, for the opportunity to be heard. I am not a lawyer nor an orator, and I want to get to the point and be as brief as possible and give you the facts, and I am in position to submit a brief.

Senator SMOOT. Do you desire to file a brief as part of your remarks?

Mr. SMILEY. Yes; if you please. I have a detailed brief which I would like to file.

Senator SMOOT. What are you requesting under paragraph 304?

Mr. SMILEY. I am not appearing under paragraph 301. That is typographical error. I appear in reference to paragraphs 304, 305, and 316.

Senator SMOOT. You begin with steel ingots?

Mr. SMILEY. Yes, sir; in section 304.

Senator SMOOT. Will you tell me what you want with reference paragraph 304?

Mr. SMILEY. I have a modification here which I can submit for the record as to our request.

Senator SMOOT. Put it into the record at that point.

Mr. SMILEY. In connection with the paper that I have handed in, Mr. Chairman, I want to call attention to the fact that with reference to importations of fine steels not in excess of 20,000 to 30,000 tons per annum have been imported from abroad, and that this quantity is constantly decreasing. This is true under the present Underwood tariff.

There is produced in this country, in ingot capacity, 1,252,000 tons per annum. We are allowing one-third to come down to the unfinished bar as waste; and in these figures which I am also prepared to submit we show 834,984 gross tons per annum in the finished bar.

Senator SMOOT. Will you briefly state what changes you desire paragraph 305?

Mr. SMILEY. Under paragraph 305, based on the American valuation plan, the elimination of the additional 15 per cent duty on alloy steels; but failing in this, its reduction to 12½ per cent and the duties contemplated by paragraph 304 in application to paragraph 305 waived.

Senator SMOOT. You mean in relation to vanadium or manganese or silicon?

Mr. SMILEY. No, sir. I mean in connection with the present duty under the Underwood tariff, which is 15 per cent. I have asked above, under paragraph 304, that the duty be cut in half; that is, under the recommended new American valuation at 20 per cent we ask that you reduce it to 10.

Then, under paragraph 305—I have all of this for record purposes. I rather imagine that it is more or less technical, and I do not want to bother you with it—I do want to say a few words in connection with the whole situation if I may. It will not take more than five minutes.

Senator SMOOT. Do you want to read it? Just hand it to us and it will save you that much time.

Mr. SMILEY. There are certain reasons that I desire to discuss for possibly maintaining our business or remaining in business. Mr. Schwep, of Ingersoll-Rand Co., is here, and he imports about 2,000 tons of steel per year from Sweden. He imports it because of its quality, not claiming in any way that the American steel is inferior, but because, after years of experimenting, he has found that the only steel that will actually fit in for their requirements is this particular steel. It may be that it is due to the raw materials employed, the skill of the process of manufacture, or it may be the charcoal fuel. We do not know. But, nevertheless, the quality is the

Senator McLEAN. What do they use this steel for?

Mr. SMILEY. Rock drills. Of course, if they are required to pay higher duty it will naturally be reflected back to the public. There is no question about that.

Senator SMOOT. Will you tell me what changes you desire in paragraph 305?

Mr. SMILEY. They are all mentioned here.

Senator SMOOT. I mean, briefly.

Mr. SMILEY. Based on the American valuation plan, the elimination of the additional 15 per cent duty on alloy steels.

Senator SMOOT. You want 15 per cent eliminated?

Mr. SMILEY. Yes, sir.

Senator McLEAN. Do you use these drills for blasting?

Mr. SMILEY. Preparatory to blasting.

Senator McLEAN. How much will the increased cost of the drills add to the cost of the rock?

Mr. SMILEY. If I may, I would like to call on Mr. Schwep to answer that question, because that is more in line with his business.

Senator SMOOT. Paragraph 316. What change do you want to make in that paragraph?

Mr. SMILEY. I ask that, based on American valuation plan, a straight ad valorem duty of 10 cents be imposed.

Senator SMOOT. Instead of 20?

Mr. SMILEY. Yes, sir. May I say this to you, that for many years the import of fine steels has been decreasing. That would indicate that under the Underwood tariff we had about reached the limit under which we could import steel. If we go much beyond that limit it is going to shut us out, because there is a price that people will pay for quality, but beyond that they will not go. The fact that we are to-day importing only 2 per cent of the 100 per cent of consumption and that 98 per cent is manufactured in this country would indicate it was just a fleabite; but still, it is our business, and we want to be permitted to remain in that business. The revenue derived by the Government is \$500,000.

Senator WATSON. Can you not buy American steel?

Mr. SMILEY. Oh, yes, sir.

Senator WATSON. Is it not as good as the other?

Mr. SMILEY. I say that we have no complaint to make about the quality of American steel. There is no question but what fine steel is made in this country; but for particular requirements, either due to the process of manufacture or the raw materials employed, it has been found by actual experience over years that the foreign steel gives better life and is more what we want.

We simply ask that we be permitted to continue to import, say 20,000 tons of steel per annum, which is badly needed in the country because of that quality.

Senator SMOOT. I think we understand your position.

BRIEF OF JOHN B. SMILEY, NEW YORK CITY, REPRESENTING AMERICAN IMPORTERS OF FINE STEELS.

Paragraph 304: Based on American valuation plan, a straight ad valorem duty of 10 per cent on all crucible steels. On Bessemer, Siemens-Martin, open-hearth, and similar process, the following to be added to paragraph 304: "Provided, That ingots, clogged ingots, blooms, billets, slabs, sheets, plates and steel not specially provided for, made by the Bessemer, Siemens-Martin, open-hearth, in the manufacture of which wood or charcoal is used as fuel, or similar special processes, all the foreign

ed at not over 4 cents per pound shall be subject to a duty of three-tenths of 1 cent per pound; valued over 4 cents per pound, six-tenths of 1 cent per pound."

Paragraph 305: Based on American valuation plan, the elimination of the additional per cent duty on alloy steels; but failing in this its reduction to 12½ per cent and duties contemplated by paragraph 304 in application to paragraph 305 waived. That the additional cumulative duties on molybdenum and tungsten content should be reduced from the proposed \$1.25 per pound on molybdenum content to 62½ cents per pound on molybdenum content in excess of 1½ per cent, and the proposed 72 cents per pound on the tungsten content to 36 cents per pound on the tungsten content in excess of 1½ per cent.

Paragraph 316: Based on American valuation plan, a straight ad valorem duty of 1 per cent.

NOTE.—We once again point out that under the Underwood tariff the American steel industry has prospered, and importations have decreased. The above proposition covering recommended modifications in the proposed Fordney tariff measure, metal schedule, No. 3, if accepted, will still further burden the importation of the steels by imposing higher duties than now obtain.

POINTS FOR CONSIDERATION.

The following points we desire to emphasize:

1. The importation of fine steels into this country is not in excess of from 20,000 to 25,000 tons per annum, which represents approximately 2 per cent of the total consumption of fine steels in this country. Surely an industry which manufactures 3 per cent of the domestic consumption can hardly complain of competition from abroad when this competition does not exceed 2 per cent, and particularly so when it is emphasized that foreign fine steels do not compete on a price basis with the American industry but on the contrary command higher prices. This can be borne out by Mr. Schwep, of Ingersoll-Rand Co., who imports large quantities of hollow drill steel from Sweden, not because it is their desire or wish to do so but because after years of experimenting, they have found no steel produced in America which will answer their purposes.

We do not claim that American steels are inferior, but rather that due to the raw materials employed and the process or skill the foreign manufactures produce the quality which is so essential to certain manufacturers who purchase semifinished material from abroad.

2. If the duties in the proposed Fordney tariff bill remain unchanged a revenue to our Government estimated at approximately \$500,000 per annum will be cut off, as the duties mentioned would absolutely prohibit at least 80 per cent of the present imports, and the remaining 20 per cent which might be imported because of some peculiar characteristic would have to be paid for by the American public as this additional duty would of necessity be added to the selling price.

We, as American citizens, are all anxious to recover from our inflated condition and again approach normalcy, but in this point we are certain that with the proposed high tariffs on fine steels people who are forced to use steels from abroad will have to pay a large increase which will not produce the result which this administration is endeavoring to bring about.

3. Large sums of money have been invested by American citizens who import fine steels into this country and the business of these citizens if the high tariffs in the proposed Fordney bill are passed, will be ruined.

4. Up to the beginning of the war it was necessary for foreign countries to purchase from this country certain raw materials.

During the period, however, from 1914-1919 conditions abroad were radically changed and it was found necessary to utilize substitutes for our exports.

These foreign countries can, if needs be, resort to the use of said substitutes, thereby retaliating should we absolutely prohibit their exports to us. We are exporting from this country many times the amount of steel that we import as reference to statistics of the Department of Commerce will show, and we know that foreign Governments will resent the excluding of the small percentage of fine steels manufactured in these countries which they are at the present time permitted under the existing tariff law to send us.

5. The excess productive capacity of our industries require an outlet for their surplus, and by leaving open possible channels of trade with other countries it will give facilities to our own much neglected export business. International trade relations have been and are necessary to the well-being of this country's development, and we

respectfully submit that the proposed provisions in paragraph 304 and paragraph 305 will tend to sever commercial connections spreading over the past 100 years.

6. We maintain that duties under the proposed Fordney tariff bill will place the consumers of fine steels in America practically in the hands of a monopoly, which inevitably means that ultimately higher prices will be demanded and resultant increased cost to the buying public on the commodities dependent on such material. Furthermore, in addition to the above, the revenue produced under normal conditions of over \$500,000 per annum will be cut off.

COMPARISON OF FINE STEEL PRODUCTION IN AMERICA WITH THE AMOUNTS IMPORTED FROM ABROAD.

From the best figures available we estimate the total American fine-steel industry has an ingot capacity of 1,252,476 gross tons per annum. Allowing a loss of one-third of this tonnage from the ingot into the finished bar, which is the form that fine steel is imported, reduces the aforesaid 1,252,476 tons to 834,984 gross tons per annum in the finished bar.

Taking the minimum figure of 16,000 tons of imported fine steels per annum (the same figure used in arriving at revenue derived) the result shows approximately 2 per cent of the American capacity imported from abroad.

Following is a calculation of revenue derived by the United States Government under the existing tariff law on fine steels.

TWENTY THOUSAND TO TWENTY-FIVE THOUSAND TONS OF FINE STEELS IMPORTED PER ANNUM FROM ABROAD.

In the following calculations we have taken the minimum of 20,000 tons and further reduced this amount by 20 per cent to 16,000 tons, dividing same as follows:

12,500 tons Swedish, at 10 cents per pound	\$2, 500, 000
3,000 tons crucible, at 25 cents per pound.....	1, 500, 000
500 tons high speed, at 80 cents per pound.....	800, 000
Total.....	4, 800, 000
8 per cent on Swedish.....	202, 000
15 per cent on crucible.....	225, 000
15 per cent on high speed.....	120, 000
Revenue per annum.....	547, 000

NOTE.—The above rates of duty obtain under the Underwood bill. In our calculations we have throughout used the figure of \$500,000 as being the amount of revenue derived by our Government each year from the importation of fine steels. It can be readily seen from the foregoing that we have been most conservative in this estimate and that the amount in actual revenue derived is probably many thousand dollars in excess of this figure.

DEFINITION OF STEELS.

- Steels must broadly be divided into three classes:
1. *Fine steels.*—Fine or high-grade steels made for special purposes and produced in relatively small quantities from pure base or refined raw materials. Such fine steels may be approximately grouped as straight carbon or may contain alloys, and the workmanship thereon is a highly developed art. Generally manufactured by the crucible, electric, or similar processes and melted in small furnaces from very pure raw materials.
 2. *Intermediate steels.*—The output quantity production from large furnaces using less refined raw materials and fabricated mostly by mechanical equipment and used for automobile parts, axles, etc.
 3. *Tonnage steels.*—Totally massed production of steel from ordinary raw materials fabricated by machinery with the whole idea and principle of tonnage output and at cheap prices for constructional, railway, shipbuilding, and heavy machinery purposes.

PARAGRAPH 304.

DISTINCTION IN STEELS UNDER DIFFERENT METHODS OF MANUFACTURE.

The proposed paragraph 304 overlooks the differential made in paragraph 110 of the Underwood tariff which provides for different rates of duty. For steels made by the crucible, electric, and similar processes (present duty, 15 per cent ad valorem on the foreign market value) and the open hearth and Bessemer steels (present duty partly

the free list and partly 8 per cent ad valorem on the foreign market value). We maintain this present distinction is proper and should be continued as the imports of crucible, electric, and steel made by similar processes are principally tool steels, whereas the imports of open hearth and Bessemer steels are principally semifinished materials used by American manufacturers, as such.

CRUCIBLE STEEL.

History of the industry.—Crucible steel was invented and manufactured at Sheffield, England, in 1740, and has been exported to the United States for about 100 years. Crucible steel has been made in the United States for approximately 80 years, and has developed in proportion to the demand.

The larger proportion of crucible steel imported into this country comes from England. Small quantities are imported from Sweden and Austria and one or two other European countries. These crucible steels are sold strictly on quality and the imported material has never been sold on price and does not compete with the American product except on a quality basis. The price at which the foreign crucible steel is sold is always much higher than the market price of the American production for steels of similar classification; this differential varies from 20 to 50 per cent at the present time.

For many years past, the tonnage of imported crucible steels has been either stationary or decreasing, and it can not therefore be argued that the foreign crucible steels are a menace to the American producer.

We would state that in the past many important American industries have built up their business and their reputation resulting from the use of the high quality of imported crucible steels. Since that time, however, the American crucible steel manufacturer has in many cases succeeded in producing a steel which has been found satisfactory, and the American consumers now largely buy the domestic product. This partly accounts for the decrease in the tonnage of imported crucible steels.

There still remains, however, a demand from a number of American manufacturers for a superior crucible cast steel required for the manufacture of special tools. Contrary to any statements which may have been made, we assert that the highest grades of crucible carbon tool steel are not produced in the United States. We do not suggest that this superior grade of crucible carbon tool steel can not be made in this country, but would point out that the raw material used and the process of manufacture adopted are different.

The apparent reason that this superior quality of crucible steel is not manufactured by the American producer is that the tonnage involved is so negligible that it has not justified any special efforts being made to obtain the business. It is, however, worthy of note that the same raw material (Swedish iron) and also the process of manufacture are open to the American crucible steel maker, should he choose to adopt them.

Owing to the enormous advance in the price of raw materials and the large increase in the cost of labor in Europe during the last few years, it has been found increasingly difficult for importers of foreign crucible carbon tool steels to sell their goods in America.

As previously stated in this brief, the differential for steels of similar classification is from 20 to 50 per cent higher than the American price. Any increase in the duties will most seriously affect the position of the importers of crucible carbon tool steels.

American manufacturers who now find it advisable to purchase imported crucible carbon tool steels on account of superior quality, will be unable to continue said purchasing. If they are unable to buy the imported crucible steels, they will be forced to purchase an inferior steel, which will result in decreased efficiency in production. It will, therefore, be seen that in any event the American manufacturer will be faced with increasing costs which will be reflected in the selling price of the particular tools or articles produced or be forced to offer an inferior product.

This situation is one which would be extremely detrimental to the American engineering industry as a whole and should be avoided.

Conclusion.—(a) The imports of crucible carbon tool steels are decreasing.

(b) They form only a negligible proportion of the crucible or fine steel trade of this country (less than 2 per cent).

(c) They never compete on price and are sold only on quality at much higher rates than American crucible steels of similar classification.

(d) Any increase in the present tariff rates will greatly reduce the small tonnage of crucible carbon tool steel entering this country, resulting in loss of revenue and increased costs to those American manufacturers who will still be obliged to buy imported crucible steel.

We therefore urge that in so far as crucible carbon tool steel is concerned that the present rate of 15 per cent ad valorem be allowed to stand and request that paragraph 304, Schedule 3, of the Fordney bill (H. R. 7456) be amended accordingly.

ELECTRIC FURNACE STEEL.

Electric furnace steel, which approaches crucible carbon steel in quality, is largely used in the making of tools. For this purpose its use is constantly increasing. It is, however, very little of this grade of steel imported from abroad.

OPEN HEARTH AND BESSEMER STEELS.

History of industry.—Imported steel manufactured by the open-hearth and Bessemer processes have been purchased in the United States for the past 50 years but has shown no recent increase in tonnage.

The sale of such steels imported from Europe is extremely precarious because the metals cost much more than similarly made American metals and are sold only because of their superior adaptability for some process in American manufacture.

It has always been proven that when the tonnage of any metal imported from Europe becomes of sufficient importance to cause the American metallurgists to develop a substitute, European steels—as in the case of bicycle and other bearing tubing—have been driven from this market.

The margin of higher price which the European metals must secure over the price asked for American metals made by similar processes is closely limited by how much the American manufacturer feels that he can increase the cost of his finished product. The closer the competition in the selling price of articles made by American manufacturers who have purchased European steels manufactured by open hearth and Bessemer processes, the smaller the volume of sales to this country because of the desire of these manufacturers to lower their production costs. This results in the constant development of new specialties by European metallurgists which, when recognized, are then adopted by American steel makers thereby excluding the European product.

Conclusion.—The open-hearth and Bessemer steels imported into this country never compete in price with domestic steels made by similar process, and are only sold in this country on account of high quality.

The increase in the present proposed duty compared with the Underwood rate now prevailing is excessive and means prohibition of import of these steels, which in turn reflects less revenue and considerably increases costs to the American manufacturer, who may for quality sake still be required to use these imported steels. This increase will be paid for by the American public. We therefore urge the following modifications to be added to paragraph 304:

“Provided, That steel ingots, cogged ingots, blooms, billets, slabs, bars, sheets, plates, and steel not specially provided for made by the Bessemer, Siemens-Martin, open hearth or similar processes in the manufacture of which wood or charcoal is used as fuel, all the foregoing valued at not over 4 cents per pound shall be subject to a duty of three-tenths of 1 cent per pound; valued over 4 cents per pound, six-tenths of 1 cent per pound.”

NOTE.—In paragraph 305 remove the word “chromium” from its association with tungsten and molybdenum and classify it with silicon and manganese as chromium in combination with carbon steels to the extent of 1 to 1½ per cent is only used to intensify and deepen the hardening property of the carbon content and is never considered as a tool steel nor as giving special qualities such as shown in the use of large percentages of nickel, tungsten, molybdenum, etc. The permitted contents—silicon, chrome, or manganese—should be increased to 1½ per cent, and should be confined to open hearth and Bessemer steels.

LETTER BY THE INGERSOLL-RAND CO.

AUGUST 6, 1921.

Hon. BOIES PENROSE,

Chairman Senate Committee on Finance.

DEAR SIR: We manufacture rock drills, air compressors, and general mining machinery and are the largest industry of its kind in the world.

We control and operate six plants located in the United States and one plant in Canada, employing normally 6,000 hands. Besides the branches located in the important cities in this country we have branches or agencies established in every important country on the face of the globe.

One of the principal products of our manufacture is rock drills used in the extraction of ore, minerals and stone, in mining, tunneling, and quarrying operations.

In the early days, drilling of hard substances was carried on by means of hand drills and the process was slow and expensive. An ordinary grade of tool steel was used and

wered the purpose very well. About 40 years ago the percussive type of rock drill was developed and revolutionized the art of drilling. This called for a better grade of steel since the service expected of it was more severe. The striking force or power of the rock drill machine was increased and demanded a grade of steel that was better able to resist shock and still maintain its cutting edge.

It might here be stated that there is no machine in use to-day, with the possible exception of the steam hammer, that is required to withstand so much abuse as a rock drill. In fact, it is questionable whether any machine, after taking into consideration the skill of the operator, receives as little care and attention as the rock drill.

When drill steel was produced that could withstand the increased work placed on it by the harder striking machines, efforts were then directed toward developing an even more powerful machine. The history of the conflict between armor plate and the projectile has a parallel, in a measure, to the war that was waged between the rock drill machine and the steel. In one case the drill steel would withstand, just like the armor plate, the impact of the blow it received, but with the later strides made in the improvement of rock drills, just like the perfecting of the projectile, the drill steel was no longer able to withstand the abuse, and the demand was again created for a grade of steel that would not yield to the added punishment. This conflict is still going on, and the supremacy of the one over the other lies in the ability of the steel manufacturer and the designer of the rock drill to outdo the other. The best experience of the steel makers and scientific knowledge of metallurgists have been directed toward producing steel of such character as to withstand the extraordinary severe service required of it, which some authorities are ready to admit approaches very nearly the physical possibilities of the metal, so far as the art of steel making goes to-day.

In testing and putting into service every known brand of drill steel produced in this country over a period of many years, whether produced by the crucible, electric furnace, open-hearth, Siemens-Martin, or Bessemer process, we were forced to reach the conclusion that we had to turn to foreign-made steel if we hoped to get a better quality for this particular purpose. This is not a reflection on the manufacturers of steel in this country, as we firmly believe they have made the best of their raw products. It can not be disputed that the art of steel making in this country has progressed at least as far as with any steel manufacturer in the world, but for certain purposes, such as rock drill steel, this country does not possess basic ores that equal some of the ones that are mined in Sweden. Our entire product, with the exception of drill steel, is manufactured from materials, either in the raw or finished state, that are produced in this country, but in the case of drill steel, where so much is expected on account of the abuse it receives and the peculiar service it performs, we can not, in justice to ourselves and our trade, put out an article that is not equal to that produced abroad. Our policy always has been, and always will be, to use American-made materials in the production of our products, and we only go outside our domains when we can not get a commodity produced at home that is as good as that from abroad.

The evolution of the rock drill has given us the hammer type of drill, which, while performing the same function as the percussive drill, differs widely in principle. The hammer type of drill is much lighter in weight, operates more rapidly, and instead of lifting the steel in the hole with each stroke it strikes the steel a blow on the end while it is comparatively stationary. The work imposed upon steel used in this machine is even more severe than in the other type of drill, because, while the blows struck are lighter, they are much more frequent, so the molecules of metal in the steel are in a constant state of agitation, whereas with the old types of drills there was a period of rest which was not so injurious to the steel from the standpoint of crystallization. The drill steel used with these machines is invariably hollow, i. e., it is made with a hole through the center. The hole is intended to carry a mixture of air and water to the cutting bit, which allays the dust, cools the point of the steel, and cleans the hole. In many mines it is required to use the water type of drill, and they are now universally used in practically every mine in the world.

The manufacture of hollow steel presented many difficult problems, but the processes now employed have been perfected to such an extent that we are able to get a satisfactory article, but there is still room for improvement. When the necessity arose for producing hollow steel the earlier practice was to drill a solid bar of steel from either end. The length of the bar was limited by the depth a twist drill could bore a hole. The method was slow and expensive and not satisfactory. As the demands for hollow steel increased and provisions had to be made for producing it on a commercial basis in larger quantities and longer lengths, one of our steel mills in this country about 25 years ago conceived the idea of rolling the steel from the

billet with a pierced hole in it in which had been placed a soft iron bar. The theory was that as the outside diameter of the billet was reduced the hole would likewise diminish in diameter and the iron bar could be drawn out after the bar of steel had cooled on account of its ductility.

Only a small quantity of hollow steel was produced in this manner as the process was not practical and far from commercial.

About this time a process for making hollow bars was patented in England and known as the "sand core" process. The patent really applies to the method of extracting the core from the hole after the bar is rolled. The process consisted of drilling a hole in the billet and plugging the hole up with sand and then sealing the ends of the billets with boiler punchings. The billets were drilled cold and after they had been prepared in the manner designated were heated in the furnace and rolled. The bars were then allowed to cool and the sand core was removed by a jet of air introduced by means of a small piece of tubing inserted in the hole. There are a number of concerns in Sheffield making steel by this process and also a number of concerns in Sweden who use the same method, some mills modifying it to the extent of removing the sand core by means of a jet of water instead of air. There are a number of steel makers in this country who make hollow steel by the sand-core process and a modification thereof, and one of these, the Crucible Steel Co. of America, is supposed to be working under a license of the patentee and claim to have exclusive rights for this country. There is another process employed for making hollow steel by one of the mills in Sweden, generally known as the Mandrel process.

Hollow steel made in this manner is rolled from a billet that is pierced hot and the billet then rolled in a tube mill similar to that employed and generally known as the Mannesman process. None of the hollow steel made in this country is produced by this latter process. We procure our hollow steel in Sweden, and it is made by the only mill that we know of that employs the Mandrel process, and consider it superior not only because of the quality of the metal but on account of the way it is manufactured.

Our experience, extending over a period of 25 years with hollow steel made in this country, convinces us that the American manufacturer has not yet produced a quality that is equal to that made in Sweden and we are firmly of the opinion that an equal quality never will be produced until the same base materials are used and it is manufactured by the same process.

We are perhaps the largest importers of hollow steel in this country and attribute our success not alone to the machine that we manufacture but to the superior cutting and enduring qualities of the steel that is used in conjunction with the machine.

Our importation of hollow steel approximates 2,000 tons per annum, on which we pay under the present tariff act a duty of about \$36,000. Under the proposed Fordney tariff bill this duty would amount to \$90,000 approximately on the same steel. The added cost would have to be borne by the mining industries in this country. On account of the higher price charged for the steel the mines should decline to continue the use of Swedish steel we would be penalized for having placed on the market a quality of steel that will accomplish more in actual drilling performance than any steel produced in this country.

We, therefore, request that paragraph 304 of the proposed tariff bill be so amended as to permit of Swedish hollow steel being admitted to this country without any increase over the present tariff.

Yours, very truly,

GEORGE DOUBLEDAY,
President

PARAGRAPH 305.

ALLOY STEELS IN GENERAL.

This applies to all steels containing more than six-tenths of 1 per cent of the following alloys: Nickel, cobalt, vanadium, chromium, tungsten, and molybdenum, or any other metallic element used in alloying steels. The fact that these steels contain alloys does not increase the manufacturer's cost in proportion to the 15 per cent ad valorem assessed under paragraph 305. The quantities of the imports of these steels are practically negligible compared with the tonnage produced in this country and the fact remains that the duty of 15 per cent under the Underwood tariff has been sufficiently high to prevent imported steels from competing with domestic manufacturers on a price basis.

Example 1.—A magnet steel, which is alloyed with about 1 per cent tungsten, 2 per cent chrome, and made in the electric furnace, sells in the American market 1.34 cents per pound delivered. It would carry under the proposed tariff the following duty:

assuming this steel costs 10½ cents per pound at port Gothenburg, Sweden, and is assessed on foreign invoice value:

Paragraph 304, specific.....	cents per pound..	2. 00
Paragraph 305, 15 per cent ad valorem.....	do.....	1. 57
Total duty.....	do.....	3. 57

Equal to 35 per cent on foreign invoice value.

Example 2.—A chrome steel, Siemens-Martin quality, for ball bearings and steel balls containing about 1 per cent carbon, 1½ per cent chromium, is valued, at Liverpool, at 12½ cents per pound. On the foreign invoice value this steel would pay the following duties:

Paragraph 304, specific.....	cents per pound..	2. 50
Paragraph 305, 15 per cent ad valorem.....	do.....	1. 91
Total duty.....	do.....	4. 41

Equal to 34 per cent on the foreign invoice value.

Similar chrome ball-bearing steel made by the electric process in the United States sells from 10 to 13 cents per pound. The lower price on the hot melt, the higher price on the cold melt. It will therefore be seen that the price at Liverpool is already higher than the American selling price, and we again revert to our original contention that all these "fine steels," be they alloy or otherwise, do not need any duty at all.

Example 3.—Hot-rolled tungsten alloy sheets for hacksaws containing about 1.25 per cent tungsten, 1 per cent carbon, cost, at Liverpool, 20 cents per pound. The selling price of the American mills for this steel is 25 to 27 cents per pound. The duty on foreign invoice value would be as follows:

Paragraph 304, specific.....	cents per pound..	3. 50
Paragraph 305, 15 per cent ad valorem.....	do.....	3. 00
Total duty.....	do.....	6. 50

(Calculation based on present method of assessing duty. American valuation base disregarded.)

This is 32½ per cent duty on the foreign invoice value, to which freight, insurance, and landing charges and selling expenses have to be added. It therefore will again be seen that the foreign steel is absolutely not competitive on a price basis.

Furthermore, the innumerable varieties of alloy steels for automobile construction absolutely can not be imported into the United States from abroad, as the American mills by far exceed in technique, promptness of delivery, laboratory facilities, and immediate expert advice as to the treatment of such steel; therefore, the importer is not seriously considered by the American automobile manufacturer. These foreign automobile alloy steels are not only higher in their original cost, but even if they were from 25 to 50 per cent cheaper than American steels, they could not possibly be considered as a competitor of American steels because of the distant source of supply.

Conclusion.—(a) These figures prove that even without duty on foreign "alloy steels" they could not be sold on a competing price basis.

(b) The present Underwood tariff duty of 15 per cent ad valorem on foreign invoice value has already brought imports of fine steels to a minimum.

(c) A straight 20 per cent ad valorem duty on foreign invoice value without the 5 per cent cumulative duty of paragraph 305 would not increase these imports, but tend to restrict them still further.

(d) The 15 per cent ad valorem on an alloy steel under paragraph 305 is altogether unnecessary for the protection of the American industry and is drastically prohibitive to a source of revenue.

(e) The 15 per cent additional duty assessed under paragraph 305 is absolutely inconsistent and no reason can be found for same, in as much as it costs no more and creates no additional waste to put such alloys into the steel and finish into bars. In fact, the additional chromium in steel makes the resulting ingot much easier to be turned into finished bars. It can not be said that the cost of the alloys in the steel demand this additional 15 per cent, because these costs for alloys are already taken care of in the present American selling prices, the same as they are taken care of in the foreign selling prices, consequently the 15 per cent additional for alloys used in the steel is inconsistent and unfair. The greater amount of labor involved in a ton of production, with the equivalent less tonnage output per man, the higher the selling price for the size, section, or quality of steel produced. The same conditions obtain abroad, and America is favored because here we produce our alloy "fine steel"

specialties with greater percentage of machine production per ton, as compared with hand labor per ton, than any other producing country, and certainly manufacture these specialties as cheaply as the foreigner.

The total production in the different American steel products, and the proportion of amount of labor and capital investment involved, are all equitably reflected in the differences established in the selling prices for these various steel commodities, with no reference or relation to the tariff or any foreign competition whatsoever. There were about 22 manufacturing plants in the "fine-steel" business in America before the war. There are now about 45. The Crucible Steel Co. of America operates about 10 of these plants. The producing capacity of the American "fine steel" has increased between three and four times to what it was before the war. There must be an opportunity for the present small percentage of foreign "fine steels" to enter America because the American buying public demands them, and to protect this public from being absolutely at the mercy of the American manufacturers. Then, too, the question of possible tariff retaliation at the rate of which the power is 50 to 1 should be considered.

(f) The American importers of "fine alloy steels," recognizing the Congress of the United States as the supreme bulwark of the rights of the American people, earnestly pray that your committee will make a searching inquiry into this war subject, and without fear or favor act for the protection of the good name of America and the interests of the American people.

ALLOY TOOL STEEL—HIGH-SPEED TUNGSTEN STEEL.

History of the industry.—High-speed steel was invented in 1901 and in the beginning chiefly made in and imported from England, but with the passage of time the American mills perfected the making of this steel and cheapened its production to such an extent that during 1920 approximately 30,000,000 pounds were produced in the United States and only about 3 per cent was imported, with a duty revenue to our Government of approximately \$150,000.

The new methods employed and the large tonnage consumed make it now possible to produce this steel cheaper in the United States than in England.

The requirements of the American users of fine steel demand deliveries from the American and the European mills being distantly located (requiring four to six months delivery), necessitate large stocks in America, and the importer, by reason of the foreign situation, is subject to heavier selling expense than the American mills. A low estimate of the selling expense on high-speed steel is 25 cents per pound.

The American mills are not handicapped to the foregoing extent with respect to their selling expense as are the importers. This advantage, combined with the lower cost of production, as aforesaid, gives the American producer a double benefit. It will therefore be seen that an increase of duty, as in the proposed Fordney schedule, only aggravates the situation still further and will actually result in destroying the businesses of American citizens, inasmuch as an experience covering 30 or 40 years has demonstrated that the foreign mills are unable to sell their product in the United States except through an American agent, importer, or middleman.

Prices.—The English 18 per cent tungsten standard high-speed steel sold in 1914 at or about 72 cents per pound in Liverpool. The reduction up to date, in line with reduced cost of raw material, fuel, and labor, and with overhead based on increased mill output, is probably 20 per cent, and foreign high-speed steel may now be purchased in Liverpool at 58 cents per pound at the exchange rate of \$3.60 per pound sterling. To this price must be added 5 per cent for cases, freight, insurance, landing charges, and cartage to deliver the steel to the warehouse floor (plus of course duty).

Before the war metallic tungsten sold for 50 cents per pound, which is also its present cost (see Iron Trade Review, July 28, 1921, p. 254); and the standard high-speed steel of 18 per cent tungsten, to-day's price, 45 to 50 cents per pound; 1 per cent vanadium, to-day's price, \$5 to \$6 per pound; 3 to 4 per cent chromium, to-day's price, 12 to 14½ cents per pound; 78 per cent iron, to-day's price, 5 cents per pound. It cost the American makers before the war about 30 cents per pound in a finished condition on the mill floor.

This same quality of standard high-speed steel cost before the war (at the then prevailing rate of exchange of \$4.86 per pound sterling) 42 cents per pound in Liverpool.

At the beginning of the war the American high-speed steel sold from \$2.50 per pound up to as high as \$3 per pound, while the British Government embargoed all exports. Later American high-speed steel sold during the war, under Government ruling, at \$1.90 per pound.

at the time of the armistice prices receded to \$1.50 per pound and the present prices are: Nominal retail price, \$1 per pound; moderate consumer, 90 to 95 cents per pound; large consumer, 80 cents per pound.

We also hear of prices from 65 to 70 cents per pound for as small lots as even 1,000 pounds at a time. It therefore appears that foreign high speed steel, even under the present duty of 15 per cent ad valorem on foreign invoice value, can not be deemed a competitor of the American product when sold on a price basis.

Proposed duty under the Fordney bill on tungsten alloy steels (such as high-speed steel) being valued above 40 cents per pound: Paragraph 304, 20 per cent; paragraph 305, cumulative for the fact that an alloy is in the steel, 15 per cent; paragraph 305, cumulative, specific duty for the 18 per cent tungsten contents, 12 cents per pound. On an American valuation of, say, 80 cents per pound (which already includes the selling price and profit) this means: 20 per cent, 16 cents per pound; 15 per cent, 12 cents per pound; for 18 per cent tungsten, 12 cents per pound; total, 40 cents per pound.

This on a price of 58 cents per pound in Liverpool, plus 5 per cent expenses, is equal to 61 cents per pound; proposed new duty, 40 cents per pound; on the warehouse floor the importer, \$1.01 per pound.

Assuming that the duty would be assessed on the foreign invoice value of, say, 20 per cent ad valorem, this would result in the following: Liverpool price, 58 cents per pound; 5 per cent expenses, 2.9 cents per pound; 20 per cent of 58 cents, 11.6 cents per pound; total, 72.5 cents per pound.

To these two calculations must be added the 25 cents per pound selling expenses, that the importer is required to obtain at least: On American valuation, \$1.26 per pound; on foreign valuation, 97½ cents per pound before a profit is derived from his investment, whereas the American mills' selling price to-day is from 65 cents to \$1 per pound, which includes selling expenses and profits.

Conclusion.—(a) The foregoing figures prove that even without the duty the imported steels could not really be sold competitively on a price basis.

(b) The present Underwood tariff of 15 per cent ad valorem on foreign invoice value is already brought the imports to a minimum.

(c) Even a straight 20 per cent ad valorem duty on foreign invoice values without the two cumulative duties of paragraph 305 would not increase these imports but would absolutely restrict them.

(d) The 15 per cent ad valorem for being an alloy steel under paragraph 305 is altogether unnecessary for the American industry.

(e) The 15 per cent additional duty of paragraph 305 taxes the labor, raw material (except as to tungsten) selling expenses and profits twice, as it is already taxed 20 per cent ad valorem under paragraph 304.

(f) The specific additional tungsten duty of paragraph 305 is by far too high, as it can not be assumed that the tungsten metal duty under paragraph 302 will advance the price or cost of tungsten to the American steel maker to the extent of the tungsten duty under paragraph 302. Paragraph 302 taxes pure metallic tungsten 72 cents per pound plus 15 per cent ad valorem. The present price of tungsten, as per daily reports in the Iron Trade Review, is from 45 to 50 cents per pound. The present Underwood tariff assesses tungsten metal under paragraph 101 with 15 per cent ad valorem, and the Fordney bill maintains this 15 per cent ad valorem under paragraph 302. Therefore, the 15 per cent under the proposed Fordney bill will leave the tungsten situation as to that tax in exactly the same condition as it has been for the last eight years. Consequently only the 72 cents per pound specific duty on tungsten metal of paragraph 302 may be taken into consideration in this calculation.

We believe that it can not be assumed that the price of tungsten will increase from 50 cents per pound to \$1.22 per pound because the American tungsten mine will sell in competition with the other American mines and supply and demand will govern the price. It is not the duty which will govern the price, but the duty will only be a contributing factor.

(g) The second paragraph of paragraph 305 assumes that this 72 cents per pound of the tungsten duty of paragraph 302 will carry itself along equally balanced into the steel, viz: Paragraph 305 provides a specific tungsten duty of 72 cents per pound on all tungsten contents above 1½ per cent. This is for 18 per cent tungsten steel 16½ per cent, which is 12 cents per pound of the tungsten in the finished bar.

We claim that due regard should be given to the extent to which the additional duty of paragraph 302 on tungsten metal, in comparison with the Underwood bill, will carry itself forward to the finished bar steel in the last paragraph of 305; and the alloy steels should not be taxed to the full value of this increase of duty of paragraph 302, but should be taxed correspondingly much lower than now specified and should

be according to the prevailing opinion as to how far this advance in tungsten metal of 72 cents per pound will be felt by the American steel maker in the ingot cast.

We consider that alloy steels belong in paragraph 304 and by reason thereof be immune from the additional 15 per cent duty of paragraph 305, for which there is no just reason or explanation possible.

We further consider that a more equitable compensation should be found for the duty of paragraph 302 as to the alloys in the steels than by assuming that the full advances of the duties of the alloys of paragraph 302 will take effect to its full extent in the finished steel to the American maker, and we further believe that one-half of this 72 cents would be amply protecting the American steel maker.

We qualify this by the information, which we have on good authority, that there is at present in this country enough tungsten and tungsten concentrates to be sufficient for a normal demand by the steel makers for at least two years—probably 10,000 tons—and under the present curtailed demand this supply will last much longer—probably four to five years. Consequently it is not to be expected that a demand for the importation of tungsten or tungsten concentrates or metallic tungsten will arise in probably three to four years, and therefore the tungsten price will again be governed not by the duty under paragraph 302 but solely by the supply and demand. For this reason we deem it fair and equitable that this fact should have a strong bearing on the last part of paragraph 305, in view of the fact that such a specific duty as under paragraph 305 would have an immediate effect on the importer of the steel.

PARAGRAPH 316.

WIRE AND COLD-ROLLED STRIPS.

This paragraph provides a duty of 20 per cent on the United States domestic market values on all wire valued above 6 cents per pound and on all cold-rolled strips not thicker than one-fourth of an inch and not exceeding 16 inches in width.

History of the industry.—Soft cold-rolled steel for stamping and drawing purposes, used in the manufacture of the typewriter, adding machine, sewing machine, automobile parts, etc., is so cheaply produced in the United States that it is impossible to import. The American mills produce this soft cold-rolled steel so efficiently and in such large tonnage that it sells in the United States for 4½ cents to 6 cents per pound, which is below the European cost of production.

Cold-rolled strip steel of the better grades suitable for hardening and tempering and tempered cold-rolled strips imported from Europe are confined to a few highly specialized grades, purchased on account of superior quality and individual preference, for which the consumers feel inclined to pay a premium above the market price for similar grades produced in America.

The importation of these specialties from Europe has not increased, but rather steadily decreased, during the past 10 years on account of the improvements made by the American manufacturers of similar grades, making it more difficult for the European products to compete. Therefore only a small tonnage of these European grades are sold in America, and this only to the consumer who does not want to sacrifice the quality by buying the grades manufactured here at the cheaper price.

Price.—The European manufacturers have to contend with constantly higher cost of production, especially in Sweden, where the charcoal fuel is becoming more expensive every year. Sweden practically produces no bituminous or anthracite coal nor coke, all such fuel for the manufacture of steel having to be imported from other countries.

The process of cold rolling strip steel and drawing wire in tonnage quantities has been so perfected in the United States that it is practically an automatic machine process in which the American mills surpass the European.

Imports.—The imports of cold-rolled strip steel and wire have been insignificant under the present duty of 15 per cent ad valorem on foreign invoice values, and what little quantities have been imported have been on account of quality only.

The importer is subject to heavy selling and warehousing expense and this affords the American manufacturer additional protection.

Duty.—Should the duty be raised higher than the present 15 per cent ad valorem on foreign invoice values, this will mean an additional burden on the American consumer as cold-drawn wire and cold-rolled strip steel imported from abroad are not finished, which the domestic buyers manufacture into finished products and sell to the ultimate consumer or the public. If, however, an increase of duty should take place, still smaller quantities will be imported with consequently less revenue.

COMPARISON OF PRICES OF IMPORTED COLD-ROLLED STRIP STEEL AND DRAWN WIRE.

Example 1: Cold-rolled shoe-shank steel sells at the present rate of English exchange, 2½ to 5 inches wide by 0.025 to 0.042 inch thick in 50-ton lots:

	Cents.
Price per pound at Liverpool.....	6.5
Freight, insurance, landing charges, packing, 5 per cent.....	.325
15 per cent duty on 6.5 cents.....	.975

On warehouse floor of importer, per pound..... 7.8

An equal grade of American-made steel sold in 1920, delivered customer's plant, at 8 cents per pound, and it is well known that American production cost of raw material, labor, and fuel has gone down considerably since, therefore the present American selling price is now less.

Example 2: A medium grade of Siemens-Martin cold-rolled strip steel suitable to draw and temper, 0.9 to 1 per cent carbon in a standard size of 3½ inches wide by .08 inch thick, in straight strips of 6 feet sells:

	Cents.
Price per pound at Liverpool, in 500-pound lots.....	15.5
Expenses for freight, cases, insurance, landing charges, 5 per cent.....	.77
15 per cent duty on 15.5 cents.....	2.32

On warehouse floor of importer, per pound..... 18.59

A similar grade of American cold-rolled steel was quoted in July, 1921, at 8.05 cents per pound f. o. b. Pittsburgh, in equal quantities.

Example 3: Cold-rolled pen steel in standard sizes such as are used for pen making, 0.95 per cent carbon, in 50-ton lots sells:

	Cents.
Gothenburg, Sweden, per pound.....	26.03
Freight, insurance, landing charges, tin-lined cases, 8 per cent.....	2.08
15 per cent duty on 26.03 cents.....	3.90

On warehouse floor of importer, per pound..... 32.01

The present price of cold-rolled pen steel, as sold by the domestic manufacturer, is between 20 to 24 cents per pound at American mill.

Example 4: Cold-rolled hardened and tempered spring steel for mainsprings in watches in phonographs and talking machines, such sizes as 1 inch wide and 0.027 inch thick, sells now in 100-ton lots:

	Cents.
Gothenburg, Sweden, per pound.....	55.00
Freight, tin-lined cases, landing charges, insurance, 8 per cent.....	4.4
15 per cent duty, 15 per cent ad valorem of 55 cents.....	8.25

On warehouse floor of importer, per pound..... 67.65

Similar grades of spring steel manufactured in United States are freely selling at 30 to 40 cents per pound, and in certain instances at a still lower figure.

Example 5: Music wire for use in pianos. A trial shipment was made of sufficient quantity of assorted sizes to string 1,000 pianos, and the price is:

	Cents.
Gothenburg, Sweden, average price for all sizes, per pound.....	36.00
Freight, tin-lined cases, insurance, landing charges, 8 per cent.....	2.88
15 per cent duty, 15 per cent ad valorem on 36 cents.....	5.4

On warehouse floor of importer, per pound..... 44.28

The average price of such piano wire of sizes used in pianos, made by the American wire manufacturers, range between 30 to 35 cents per pound at American mill.

The facts above mentioned will prove that imported cold-rolled strip steel and wire from abroad does not bring any competition to the American manufacturers in corresponding qualities, as far as prices are concerned, and that the general conclusion can only be that the foreign invoice values are already, without duty and expenses, higher than the selling prices of the American mills. The present duty of 15 per cent ad valorem—already a most serious check on importations—has brought them to a practically negligible figure.

The American user of these semifinished products has so far shown a willingness to pay a slight premium for what he considers in individual cases a more adapted and superior article, but if these differences should become too great he will have to forego

his preference and quality, abandoning the use of the imported article or obtaining a higher price for his finished product.

Any advance in duty would aggravate the situation still more and consequently reduce the now existing revenue on these imports.

Conclusion.—We do not believe it to be the intention of Congress to impose a tariff prior to the importation of fine steels to the extent that such importation will be limited and consumers of fine steels in this country left to the mercy of domestic manufacturers and a monopoly thereby created.

As American citizens we protest vigorously against the destruction of our industry particularly in view of the fact that our Government will not benefit from the point of revenue but indeed will lose the substantial revenue now obtaining.

The small quantity of fine steels now imported into this country (2 per cent of the total consumption here) can not be considered competitive, as the imported fine steels do not undersell similar grades of American steels because the imported products command higher prices due to their quality, therefore it can not be claimed that the American industry is threatened; hence the proposed increased duty will only result in the creation of a monopoly which will have the American purchaser at its mercy.

The proposed duty in addition to causing loss of revenue and creating a monopoly will invite retaliation from foreign Governments whose citizens export fine steels into this market. This power of retaliation is far more serious than ever before, inasmuch as the war has taught foreign countries to use substitutes for our products; these substitutes they will undoubtedly resort to if the necessity occasions.

Surely an industry where 98 per cent of the consumption is manufactured domestically and which has been developed in this country for more than 40 years can not be seriously interfered with by foreign imports to the extent of 2 per cent.

A monopoly that the proposed duty confers upon the American manufacturer will force the consumer to pay higher prices and thereby disappoint a public who looks to the present administration to restore "normalcy."

We urge upon you that we have overproduction in almost every line of manufacture that an outlet must be found for our surplus and that the few things which we can export go only a small way toward paying for our exports; that the unemployment, doubt, distress, and anxiety which are present in America are surpassed by those of the world. This condition is reflected by our fast disappearing foreign trade which automatically drags down with it our internal commerce, leaving in its wake idleness and discontent in our body politic.

WHAT IS THE PURPOSE OF A TARIFF LAW?

INTRODUCTION.

The purpose of this pamphlet is to present brief but businesslike reasons why sections 304-316 of the proposed Fordney tariff bill, imposing an import duty as there stated upon "fine steels," should be rejected. The effort has been made to handle the argument so as to avoid a statistical and technical discussion, thereby making it the same readable.

The introduction to this pamphlet has indicated that a consideration of the subject must necessarily be general as distinguished from a scientific and statistical one.

But it must not be assumed therefrom that we have sacrificed accuracy or otherwise surrendered to expediency.

We are constrained to approach the matter in this way, realizing that our Senators and Representatives are endeavoring to enact a tariff measure which will be in the best interest of their country.

These gentlemen come from the regular walks in life. Few, if any, have any technical knowledge or are sufficiently acquainted with the manufacture of steel to distinguish the difference between "fine steels" and "tonnage steels." Not more than a dozen Members of Congress could analyze understandingly the tariff on fine steels as obtaining in the objectionable sections 304-316 of the proposed Fordney measure.

Nor need the gentlemen at Washington acquaint themselves with this technical knowledge in order to perform their duty, because our Congressmen are well enough acquainted that they need apply a simple test only to determine if an item should or should not bear an import duty, and how much.

This test is: (a) Does the industry producing the material need protection; if so, to what extent?

(b) Will the proposed duty on a material yield revenue to the Government?

The foregoing test is the basis of our objection to the duty levied in the proposed Fordney measure on fine steels, and our arguments in respect thereto are:

I.

he fine-steel industry needs no protection, and certainly not to the extent proposed for in sections 304-316 of the proposed Fordney bill.

he fine-steel industry in the United States was developed over a period of years a process of evolution hand in hand with the cotton gin, harvesting apparatus, machine tools, sewing machine, breech-loading weapons, typewriter, bicycle, linoe, automobile, airplane, and other machines where American mechanical industry leads the world. These intricate machines contain many parts, which, by ue of the friction and burden imposed thereon, are required to possess a fineness quality that yield strength, toughness, and durability while operating at high ed.

he majority of parts of these machines were made interchangeable. In due rse an immense business was created in the production of fine steel, from which ny of these parts are manufactured and numerous other uses were developed for steels.

n 1920 there were about 45 plants engaged in the production of fine steels within United States. The growth of the industry was extensive and the profits thereon great, which caused the inevitable result that the business suffered through rproduction.

But to say that the situation may be remedied by a tariff is too ridiculous to admit argument when one pauses to consider that of the fine steel marketed in the United tes each year only about one-fiftieth (2 per cent) thereof comes from abroad. How all a competitor of the domestic manufacturer is the foreign importation of fine el is self-evident and makes obvious that the sections 304-316 of the proposed asure will encircle the American market with a Chinese wall, thereby creating a monopoly fattened by favor.

If Congress, with full knowledge of the situation, permits this condition to come out, then so let it be, as the responsibility will rest on that august body.

If, however, the fine-steel industry is entitled to have its economic condition relieved congressional legislation with respect to the tariff—especially when the question tariff in no way contributed to said condition—then the same privilege should be rded to all other lines of industry. If this were done, we would have the American blic at the supreme mercy of the shoe manufacturers by placing a prohibitive rff on hides; the public at the supreme mercy of the sugar producers by a prohibitive rff on sugar; and the public at the mercy of the oil producer by a prohibitive tariff the importation of oil, and so on, ad infinitum.

Those favoring the enactment of sections 304-316 of the proposed Fordney measure ay indulge in all the specious argument that the English language affords to justify id sections, but when subjected to the cold analysis of logic the fact can not be enied that the development of the fine-steel industry in the United States has been progress for 50 years or more last past, and the business to-day is in the hands of out 45 plants of greater or lesser magnitude producing annually more than 1,000,000 ns. The present import duties on fine steels from abroad has enabled the American anufacturers to dispose of their product at a handsome price, thereby yielding most bstantial profit. The importation of fine steel from abroad—20,000 to 25,000 tons annually—has in no way interfered with the development of the American industry with the marketing of its product, inasmuch as the great percentage of the foreign portation has been of an exceptional quality necessarily required to be manu-ctured abroad by reason of the peculiar characteristics of the raw materials employed, and the imported product makes no attempt to undersell the American product, but a rule procures a higher price because of this quality.

The argument that the fine-steel industry in the United States needs protection y an absolute prohibitive tariff, contained in sections 304-316 of the proposed Fordney measure, is both improper and incorrect and is inspired solely by the desire to eliminate very vestige of possible competition and thereby compel American consumers to ay an outrageous and unthinkable price for fine steel.

II.

WILL THE PROPOSED DUTY ON A MATERIAL YIELD REVENUE TO THE GOVERNMENT?

The duty on fine steel under sections 304-316 of the proposed Fordney measure ill yield no revenue to the Government, but on the contrary will destroy a substantial evenue at present derived from the tariff now obtaining.

The foregoing assertion is not conjectural or speculative. Indeed, it is a positive tatement of fact, which an examination of the existing tariff and the proposed tariff ill verify.

Under the tariff at present obtaining, the revenue to the Government derived from the importation of fine steel approximates \$500,000 each year.

Sections 304-316 of the proposed Fordney measure by levying a tariff which is so great as to preclude the importation of fine steel except in negligible quantities, can not be had in the United States, and must, therefore, be purchased abroad necessarily destroy entirely the revenues heretofore derived from foreign imports.

It can not be argued that the higher rates in the proposed Fordney measure will compensate for the loss of quantity importation, because the reduction in quantity importation will in no way be offset by the revenue from the suggested increase in rates.

Furthermore, an examination of sections 304-316 of the proposed Fordney measure discloses that the Government will be required to maintain an army of expert chemists and analytical laboratories at tremendous expense, which will greatly lessen the revenues that may be derived from the new rates.

We make no effort to submit a table of comparisons contrasting the imports now levied by the tariff at present obtaining and those fixed in the proposed Fordney measure because to do so would require burdensome and intricate statistics, which we have purposely endeavored to avoid in this pamphlet. We are prepared, however, to submit such tables upon request by any Congressman or committee. The enormous expense entailed in the maintenance of chemists and analytical laboratories is obvious.

Conclusion.—We, as citizens of the United States, who import fine steels from abroad, are not unmindful of the fact that our country is required to have a tariff measure for the protection of home industries where protection is necessary and for purposes of revenue. At the same time we submit most earnestly with respect to the fine-steel industry that by no stretch of the imagination may it be argued that the industry in the United States needs additional protection, and we further emphasize that sections 304-316 of the proposed Fordney measure will defeat its own purpose with respect to deriving revenue.

We further argue in all sincerity that no objection may be taken to a fair and reasonable tariff which will afford a moderation of protection to home industries without destroying competition and which will also yield revenue to our Government.

We do object, however, to the erection of a tariff barrier which will destroy competition and revenue and competition, leaving the fine-steel purchasers of the United States absolutely in the hands of a monopoly.

Trade balance between the United States and foreign countries from which fine steels are exported into this market.

[Figures obtained from reports of the Department of Commerce, Miscellaneous Series No. 12]

	1918	1919
Imports from—		
England.....	\$118,513,817.00	\$95,624,000.00
Sweden.....	5,935,490.00	13,722,000.00
Austria-Hungary.....		2,417,000.00
Exports from the United States to—		
England.....	1,952,870,099.00	2,125,157,000.00
Sweden.....	15,674,108.00	13,722,000.00
Austria-Hungary.....		4,217,000.00

It will be observed from the above figures that England and Sweden import into this country approximately ten times the amount of commodities which are imported by these countries into the United States, and in the case of Austria-Hungary the trade balance is 20 to 1 in favor of the United States.

STRUCTURAL STEEL.

[Paragraphs 304, 307, and 312.]

STATEMENT OF W. L. KING, VICE PRESIDENT OF THE JONES & LAUGHLIN STEEL CO., PITTSBURGH, PA.

Senator LA FOLLETTE. What is your address?

Mr. KING. Pittsburgh.

Senator LA FOLLETTE. Is that all the address I need in order to communicate with you?

Mr. KING. Yes, sir; just Pittsburgh.

Senator WALSH. Steel men are better known than you think, Senator.

Senator LA FOLLETTE. I suppose so.

Mr. KING. In order to conserve the time of the committee, Mr. Chairman, I have prepared a small, concise statement which I think I had better read at this time. [Reading:]

The Jones & Laughlin Steel Co., for whom I address you, are large manufacturers of steel products in many forms, the more important of which are steel bars, structural shapes, plates, wire products, pipe, tubes, and tin plate, and are, therefore, vitally interested in securing adequate protection in the proposed new tariff not only for the steel industry and its workmen but for all other American products which can be produced in Europe and elsewhere more cheaply.

In the main, we agree with the general statement of Mr. John A. Topping on both finished and raw materials. On a comparative basis of labor and other costs here and abroad, the duties on common steel products fixed in House bill 7456 are inadequate, but we appreciate that changes must occur as the world progresses towards normalcy, and that the tariff should anticipate these changes. Knowing the difficulty in securing accurate information as to foreign labor costs, efficiency and other conditions, and the uncertainty of the future, we are not able, even if disposed, to dispute your prognosis for the future as it may appear in this bill.

The chief elements of cost to the American manufacturer is the increased charge for transportation. Generally speaking, it has more than doubled since the tariff of 1890; but you will, perhaps, better understand the effect on our costs by the specific statement that the cost of assembling the raw material per ton of steel in Pittsburgh, and shipping the steel to New York, where we must meet foreign competition, is 50 per ton more than before the war. This is a cost which we can not control but are, of course, hopeful of relief, and it can not come too soon for the general good.

Our appearance here is not to criticize, but to call attention to the classification of 10, or perhaps three, of the finished steel products which has been handed down in previous tariffs, and which we believe can be greatly improved with but slight increase in the duties.

In fixing the duty on steel bars in the House bill under discussion, paragraph 304, their importance and probability of importation have not been recognized, largely, I think, because they are classed with about 17 other articles or products having no relation in cost or importance, ranging from steel ingots, die blocks, and gun-barrel molds to certain alloys. This same classification appears in previous tariff bills, but it covers too much to cover it well. The lower-priced brackets are too low for bars, but possibly entirely adequate for the other articles, and the higher-priced brackets are entirely unnecessary for bars. As to the importance of steel bars, the tonnage is greater than any other single steel product, and the selling price is lower than any other steel product. They are likely to be imported, not only because of their general use, but because they are not usually subject to chemical or physical specifications; can be easily transported in vessels, and more readily sold because of their wide market. Certainly they are important enough to have a separate paragraph in the tariff bill and I hope this suggestion will appeal to you.

If the American-valuation plan is retained, it is not likely that any steel bars will be imported under the first or lowest bracket in paragraph 304, namely, when valued at not over 1 cent per pound, two-tenths of a cent per pound duty; but in the second bracket, reading "valued above 1 cent per pound and not above 1½ cents per pound, three-tenths of a cent per pound," imports are entirely possible, and would result in the reduction of American labor to a point below the accepted standard of living conditions and comfort, which we earnestly hope will never become necessary. I would therefore recommend for your consideration a change in the classification, and slight increase in the duty on common merchant steel bars to read as follows:

"Valued not over 1 cent per pound, three-tenths of a cent per pound duty. Valued over 1 cent and not over 1½ cents per pound, four-tenths of a cent per pound duty. Valued over 1½ cent per pound to 2½ cents per pound, five-tenths of a cent per pound duty."

Beams, channels, angles, etc., commonly known as structural material, in paragraph 312 of House bill 7456, are made dutiable at a flat rate of seven-twentieths of a cent per pound. Structural material is a large and important tonnage but not as likely to be imported as bars, because of the rigid specifications as to quality, lengths, etc., necessary for large buildings, but based on competitive costs here and abroad, both present and prospective, the duty of seven-twentieths of a cent per pound flat is not adequate. In some previous tariffs structural materials carried a sliding scale based on the price, and there is not logical reason now why they should not carry a sliding scale such as I have suggested for steel bars, but if your committee decides in

favor of a flat duty I suggest that it be increased one-twentieth of a cent per pound in paragraph 312, making the duty four-tenths of a cent per pound.

I do not know whether anyone has been designated to speak to you on steel plate but the duties specified in paragraph 307 is, in our opinion, fairly adequate. The sliding scale of seven-twentieths, four-tenths, and five-tenths of a cent per pound. The sliding scale protects manufacturers from foreign competition on a low market but gives the Government higher revenue on a strong market and would seem to be a principle fair alike to the American industries and the Government. Any increases I have asked or suggested are based on the adoption of the American-valuation plan in the new tariff bill.

Would you allow me, Mr. Chairman, to speak a word on the raw materials?

The CHAIRMAN. Go ahead.

Mr. KING. It was not assigned to me, but I thought I ought to say something about it.

In closing, I beg your indulgence for a few words regarding raw materials as specified in the House bill under discussion.

The rates on raw material are beyond reason, and, beside adding materially to the cost of domestic consumers, will have a most serious effect on our foreign trade. The framers of this bill on raw materials doubtless had in mind the desirability of increased revenue for the Government; but, in my opinion, it would be poor business policy for the Government to exact a few hundred thousand dollars at the customs in exchange for many millions of dollars of foreign trade, on which the Government would receive taxes on its manufacture and transportation. The encouragement of steel exports is hardly less important than home protection under present and prospective conditions. The excess war-made tonnage can not be disposed of at home, and the duties fixed in the House bill will undoubtedly prevent the free flow of exports. We are informed that foreign Governments, especially Germany, are fully alive to the importance of their export trade, and are making concessions in freight and taxes to their manufacturers, and it is our hope that, in the tariff under discussion, no handicap will be placed upon us.

Thanking you for this opportunity, and assuring you of my desire to give any further information possible, I submit this paper for your consideration.

The CHAIRMAN. Mr. King, how many men does the Jones & Laughlin Co. employ in normal times?

Mr. KING. Normally about 25,000 to 26,000.

The CHAIRMAN. Is there any objection to stating how many you are employing now?

Mr. KING. Not at all. We are running about 25 per cent. I would say we have between five and six thousand men.

Senator WALSH. That condition is due to the general depression throughout the world in business, is it not?

Mr. KING. Oh, yes.

Senator WALSH. It is not due to the market being flooded with imports?

Mr. KING. Not at all; no. I do not believe that very much foreign steel has come in; not a material quantity.

The CHAIRMAN. Are there any other questions to be addressed to Mr. King?

Senator LA FOLLETTE. I am going to address you by mail requesting some information, Mr. King.

Mr. KING. I shall be very glad to give you anything I can.

IRON AND STEEL SHEETS.

[Paragraphs 307, 308, and 309.]

STATEMENT OF W. H. ABBOTT, VICE PRESIDENT WHEELING STEEL CORPORATION, REPRESENTING INDEPENDENT SHEET STEEL MANUFACTURERS, WHEELING, W. VA.

Senator Smoot. What particular paragraph do you wish to speak on?

Mr. ABBOTT. Paragraphs 307, 308, and 309.

Mr. Chairman, I appear before your committee as vice president of the Wheeling Steel Corporation, and also as a designated representative of the following independent manufacturers of sheet steel:

Alan Wood Iron & Steel Co., Philadelphia, Pa.; Allegheny Steel Co., Pittsburgh, Pa.; American Rolling Mill Co., Middletown, Ohio; Apollo Steel Co., Apollo, Pa.; Ashland Iron & Mining Co., Ashland, Ky.; Bethlehem Steel Co., Bethlehem, Pa.; Erie Hill Steel Co., Youngstown, Ohio; Canonsburg Steel Co., Canonsburg, Pa.; Canton Sheet Steel Co., Canton, Ohio; Carnahan Tin Plate & Sheet Co., Canton, Ohio; Chapman Price Steel Co., Indianapolis, Ind.; Eastern Rolling Mill Co., Baltimore, Md.; Falcon Steel Co., Niles, Ohio; Follansbee Bros. Co., Follansbee, W. Va.; La Belle Iron Works, Steubenville, Ohio; Mahoning Valley Steel Works, Niles, Ohio; Mansfield Sheet & Tin Plate Co., Mansfield, Ohio; Massillon Rolling Mill Co., Massillon, Ohio; National Enameling & Stamping Co., Granite City, Ill.; Newport Rolling Mill Co., Newport, Ky.; Newton Steel Co., Newton Falls, Ohio; Parkersburg Iron & Steel Co., Parkersburg, W. Va.; Reeves Manufacturing Co., Dover, Ohio; Republic Iron & Steel Co., Youngstown, Ohio; Seneca Iron & Steel Co., Buffalo, N. Y.; Sharon Steel Co., Sharon, Pa.; Superior Sheet Steel Co., Canton, Ohio; Trumbull Steel Co., Warren, Ohio; United Alloy Co., Stark Division, Canton, Ohio; West Penn Steel Co., Brackenridge, Pa.; Whitaker Glessner Co., Wheeling, W. Va.; Youngstown Sheet & Tube Co., Youngstown, Ohio; Wheeling Steel Corporation, Wheeling, W. Va.

My statement is restricted to those steel products that are made on jobbing mills or sheet mills only, and to a proposed tariff on imports of similar materials covered by H. R. 7456, Schedule 3, paragraphs 307, 308, and 309.

The sheet-steel industry consists of 598 sheet mills and 43 jobbing mills scattered from the Atlantic seaboard to Wisconsin, the principal production, however, being in the Pittsburgh-Wheeling, Youngstown-Mahoning Valley, and the Cincinnati-southern Ohio districts. Other large districts of production are Chicago-Milwaukee, St. Louis, Baltimore-Philadelphia-Bethlehem, and Buffalo districts.

The combined production of jobbing and sheet-mill products was, 1919, 2,335,000 net tons; 1920, 3,300,000 net tons, of which production approximately one-third was galvanized, using in 1920 approximately 88,000 tons of spelter for that purpose.

The industry represents a large investment, and in 1920 produced 3,300,000 net tons of sheets, employing approximately 42,000 people in the conversion of sheet bars into finished black and galvanized sheets. The wages paid for this conversion—mill labor only—amounted to \$80,260,000.

Comparative tables of statistics of the growth of the industry in recent years are omitted from this statement, because of the abnormal conditions prevailing in 1915 to 1920, inclusive, during which period an unusually large percentage of the capacity of the industry was engaged in making sheets for foreign consumption, as, during this.

period, the principal foreign competitors were not in position to supply their accustomed percentage of the world's consumption.

Any consideration of a protective tariff as an efficient, practical measure at this time must take into consideration the general subnormal conditions that exist and that, presumably, may be expected to exist for several years in foreign countries; also, the effect of low ocean rates from foreign countries against all-rail or rail-and-water rates in this country from our principal producing districts to our seaports.

Directly and indirectly, not less than 80 per cent of the total cost of steel sheets in this country is the item of labor.

Senator LA FOLLETTE. What is the direct labor cost?

Mr. ABBOTT. I will state that in a moment, Senator.

Senator LA FOLLETTE. Go ahead.

Mr. ABBOTT (continuing). But analyzing from the conversion of the sheet bar into the finished common black sheet—not galvanized or specially finished—the direct cost of labor of producing and of repair labor ranges from 27 per cent to 31 per cent of the total cost of the product.

Senator SMOOT. But with the galvanized—

Mr. ABBOTT (interposing). The cost of labor and production and maintenance of galvanized sheets would, based on the total cost of the product (No. 24 gauge galvanized steel sheets), be equal to from 27 per cent to 33 per cent of the excess cost of producing galvanized over black sheets. The increase in cost per ton between 1912 and the first quarter of 1921 for black sheets is as follows:

	Produc- ing labor.	Labor, repairs, and main- tenance.	T.
Actual average cost of labor producing common black and blue annealed steel sheets, per net ton:			
Year 1912.....	\$13.28	\$0.43	\$13.71
First quarter 1921.....	22.86	1.20	24.06

A difference of \$10.35—equaling an increase in labor cost over 1912 of 72 per cent.

No comparative figures as to similar labor producing costs per ton of product produced as paid in mills of foreign countries are available at this time, but a general contrast can be made with Germany—the figures being reduced to United States currency at the now existing rate of exchange, and both figures being as of July 1, 1921:

Germany: Unskilled workers, \$0.88 per day; skilled workers, \$1.25 per day.

United States: Unskilled workers, \$3 per day; skilled workers, \$9.95 per day.

Senator LA FOLLETTE. Will you please state where you obtained those figures?

Mr. ABBOTT. Yes, sir. They were taken partly from papers and corroborated by figures furnished by the Consolidated Steel Corporation of New York City, of which corporation we are member companies, and who do our export business. I have several sources of information. Mr. Topping furnished information of this kind the

orning, and these figures are corroborative. It is a little difficult to get at exactly, because of the difference in exchange. On the 1st of July the rate of exchange was a little higher than it is to-day, but these figures are approximately correct, and I think are correct enough for this purpose, because if they vary a little it will only be pennies.

I would mention that our skilled workers only work five and a third days per week and the unskilled six days per week.

Senator LA FOLLETTE. When you speak of unskilled labor in your business, is it what is called common labor?

Mr. ABBOTT. It is what is called common labor; yes, sir.

Senator LA FOLLETTE. Then you are paying 30 cents per hour?

Mr. ABBOTT. We are paying 30 cents per hour, were on the 1st of July, and we are to-day.

Senator LA FOLLETTE. As against 25 cents an hour being paid by the Midvale?

Mr. ABBOTT. The rates in the East have been a little lower than they are in the district in which the majority of these mills are located.

Senator LA FOLLETTE. There are average figures for the whole territory?

Mr. ABBOTT. Yes, sir; I think these are average figures for the Wheeling-Pittsburgh and Youngstown districts.

Senator LA FOLLETTE. I think those figures in that respect agree with Mr. Campbell. I think he stated they were paying 30 cents an hour.

Mr. CAMPBELL. About 30 cents an hour in the Youngstown district.

Mr. ABBOTT. Both English and Belgian rates for similar work are higher than the rates paid in Germany, but are very substantially less than the rates paid in the United States.

Senator LA FOLLETTE. Can you give those?

Mr. ABBOTT. I can not. I can not say whether Mr. Topping has those rates in the data he collected, but in making up my statement, partly on account of limited time, I could not obtain them. They are obtainable, however.

In connection with the comparison of the wages paid in the United States as of July 1, it is pointed out that the rates effective at that time were materially less than the average of those existing in 1920. The rate in 1920 for unskilled labor was \$5.06½ for a 10-hour day. The skilled labor rates show a corresponding reduction.

Mr. TOPPING (interposing). In the statement I file will be found the schedule of the Belgian rates, which are the next lowest to Germany, covering the entire steel schedule.

Senator LA FOLLETTE. Do you also give the British rates?

Mr. TOPPING. The British rates we could not obtain. They are in a state of greatest flurry and have not gotten down to an established rate. Their rates are somewhat higher.

Senator LA FOLLETTE. Their rates are higher than ours?

Mr. TOPPING. Ours are about double the English rate. They vary somewhat in different industries, but the schedule of Belgian rates is fairly comparable as to respective applications of the rates I filed of the Youngstown steel district as a whole on that basis of 30 cents an hour, and it covers pretty widely the steel-producing section.

Senator LA FOLLETTE. You obtained figures of the Belgian rates through the consulate?

Mr. TOPPING. The specific figures.

Mr. ABBOTT. I wanted to emphasize labor, because the making of sheet steel is so essentially a labor matter.

I will now refer to transportation costs. The following comparison is made between the rates from Pittsburgh and the comparative ocean rates from the principal shipping ports in England, Germany and Belgium, all per net ton of 2,000 pounds.

[Foreign currency rates reduced to United States currency at now existing rates of exchange.]

To—	From Pittsburgh.		From England.	From Belgium.	From Germany.
	All rail.	Rail and water.			
New York.....	\$7.60	\$5.40	\$4.50	\$4.00
New Orleans.....	10.20	\$11.20	5.80	4.60	4.00
San Francisco.....	33.30	20.17	5.80	5.00	4.00
Seattle.....	33.30	20.17	10.80	6.00	4.00

The following comparison shows the difference between lowest foreign and lowest Pittsburgh rate, per net ton, in favor of foreign manufacturers:

To—	Pittsburgh rate.	Foreign rate.	Difference.
New York.....	\$7.60	\$4.50	\$3.10
New Orleans.....	10.20	4.60	5.60
San Francisco.....	20.17	5.00	15.17
Seattle.....	20.17	6.00	14.17

The following comparison shows increase in foreign and domestic transportation rates, per net ton, between 1912 and 1921:

	1912	1921	Increase.
Liverpool to—			
New York.....	\$2.00	\$5.40	\$3.40
New Orleans.....	2.20	5.80	3.60
San Francisco.....	5.00	8.80	3.80
Seattle.....	7.00	10.80	3.80
Pittsburgh to (all rail)—			
New York.....	3.20	7.60	4.40
New Orleans.....	5.14	10.20	5.06
San Francisco.....	19.90	33.30	13.40
Seattle.....	19.90	33.30	13.40

Senator WALSH. Are those rates about double the prewar rates?

Mr. ABBOTT. Yes; the rate, for instance, from Liverpool to New Orleans in 1912, which is the only comparative year I have, was \$2.20, and it is now \$5.80, which is more than double; and the rate from Pittsburgh to New Orleans was \$5.14, and it is now \$10.20, a difference of \$5.06, or, as you suggest, about double, Senator.

The Pittsburgh rate to San Francisco is \$20.17, foreign rate \$5.00, difference, \$15.17.

From Pittsburgh to Seattle the rate is \$20.17, foreign rate \$6.00, or a difference of \$14.17.

brought those differences out because I thought perhaps you would like to compare them with the tariff for protection that is given. Senator SMOOT. You are quoting rates there now with the 3 per cent tax added, are you not?

Mr. ABBOTT. I am not; it would make our rates that much higher.

Senator LA FOLLETTE. Did you omit that?

Mr. ABBOTT. I took the actual tariff rate as it stands. Perhaps I might not to answer positively—I am not sure; the figures were prepared by our traffic manager, and it may be that they have been misled.

Senator SMOOT. In that case it is 3 per cent more.

Senator LA FOLLETTE. Would you ascertain and note it in revising your statement, so that we will know exactly?

Mr. ABBOTT. I will do that. [Since: The rates stated do not include the war tax on freight of 3 per cent.]

The Pittsburgh rail-and-water combination rates existing in 1912 are not available at the time figures were compared.

It is apparent that the difference in transportation costs alone would prohibit a buyer on the southern seaboard, and particularly the Pacific coast markets, from purchasing at home, even though the advantage of quicker service or lowered investments in merchandise stocks would otherwise govern his preference. This difference in transportation costs has existed in the past, but not to the marked extent of to-day.

The tariff rates on iron and steel sheets as proposed in H. R. 7456, Schedule 3, paragraphs 307, 308, and 309, provide adequate protection to the industry, except to the seaboard territory, where transportation costs are so decidedly favorable to foreign manufacturers. This condition may be remedied to a substantial extent by the American valuation plan, which is strongly indorsed by the industry.

In conclusion, I have omitted from my statement statistical information concerning the past, which, apparently, will not be either useful or helpful unless and until foreign countries obtain a more normal condition—at least financially.

I mention that the capacity of the sheet-steel industry of this country is sufficient to supply the requirements of the United States, as evidenced by any previous year's consumption, and, in addition, to produce a surplus equal to at least 25 per cent of its capacity; so that in the period from 1912 to 1921 the number of mills increased 38 per cent and producing capacity 45 per cent.

METAL SHEETS AND PLATES.

[Paragraphs 309 and 385.]

STATEMENT OF J. R. BOKER, REPRESENTING H. BOKER & CO. (INC.), NEW YORK CITY.

Senator DILLINGHAM. What paragraph do you appear on?

Mr. BOKER. I appear on paragraphs 309, 385, and 305. I want to speak first on paragraph 309 and then I want to say a few words afterwards about 305.

Senator LA FOLLETTE. What is your residence?

Mr. BOKER. I am from New York, 101 Duane Street. I am the president of H. Boker & Co. (Inc.).

Senator SMOOT. Importers?

Mr. BOKER. We are very large American manufacturers. We operate the Valley Forge cutlery factory and have a large plant in Hilton, and we are large importers.

Senator SMOOT. You are an importer and a manufacturer?

Mr. BOKER. Yes. Our manufacturing interests are financially larger than the importing interests, because we have just built some very large plants here.

Senator SMOOT. What particular item under paragraph 305 are you interested in?

Mr. BOKER. I would like to speak on 309 first. In paragraph 309 we are interested in the lines 18 to 21, which state that "sheets and plates composed of iron, steel, copper, nickel, or other metal with layers of other metal or metals imposed thereon by forging, hammering, rolling or welding, 28 per cent ad valorem."

This material, gentlemen, is also made in wire and in bars and rods. The words "Wire, bars, and rods," should be inserted after the words "sheets and plates," and that would really cover the industry.

Senator SMOOT. I think that will come under the wire schedule.

Mr. BOKER. It is a very peculiar article, very unique in its manufacture, and it is really all in a class by itself.

Senator SMOOT. Would not that fall under wire rods in paragraph 315?

Mr. BOKER. It is such a totally different article, I will visualize it to you and show what it is.

Senator SMOOT. Go on and make your statement, and then I will see whether that applies there or not.

Mr. BOKER. This class of metal divides itself into two different groups. One is the iron and steel group, which is the base metal, and the other is the copper, nickel, and other metal group, which I might call the rare-metal group.

The iron and steel group we have been trying to find a market for where zinc is being used now and for the making of linings of fireless cookers, but there has been no market created as yet. We have been trying for the last 20 or 30 years, and there is hardly any market in this country. In Europe this material is used for cooking pots for which the American market is not receptive. We have tried and others have been trying to get it established, and the American market does not take it. Therefore, the demand for this material has not been more than 25 or 30 tons a year, and I want to say, so far as I know, it is not made in this country, because the making of it is only profitable by having a very large and expensive plant, and as there is no demand it could not maintain such a plant. Consequently, we have had a very small demand for it, and, as I said, with our best efforts we have not been able to increase it. It is classified under 28 per cent ad valorem, and I would like to see it classified as 15 per cent ad valorem, or, in fact, it would be better to make a specific duty of $3\frac{1}{2}$ cents a pound. The material costs 15 to 20 cents a pound, and it can not compete with pure brass and copper.

Senator McCUMBER. What is it chiefly used for, do you say, fireless cookers, and what else?

Mr. BOKER. Fireless cookers. We have found use for it for candy pans, because the candy pans are now made of copper, nickel-plated,

the verdigris of the copper is very apt to act injuriously on the body, because the surface is very permanent and more durable than nickel or electroplated copper. That is one of the very few uses we have found for the metal. It is stamped up into little forms, as this [exhibiting samples to the committee] for forming candy, and the metal itself is used in Europe for such parts as this [indicating], which is the beginning of a pot for making a coffee pot, and this is the other coffee pot.

Senator McCUMBER. To what extent would the tariff provided in the bill add to the ad valorem cost of those articles?

Mr. BOKER. We have had a 15 per cent ad valorem duty on it, and we have not increased the sale. The material itself inherently is too expensive to compete with anything in the line such as electroplated steel.

Senator SMOOT. Where has that been classified heretofore—in the basket clause?

Mr. BOKER. No; it has been specially classified for years.

Senator SMOOT. I did not know but what it had been classified in the basket clause.

Senator McCUMBER. May we know what the revenue is from that particular metal?

Senator SMOOT. No; we could not do it.

Mr. BOKER. Twenty-five to thirty tons would be a liberal estimate. The present duty is 15 per cent, and the revenue is very small, and with the 15 per cent which I suggest now it ought to be $3\frac{1}{2}$ cents a pound—it will just about remain as small as it is now. But if the duty is put very much higher the trade will not use it.

Senator McCUMBER. Because of limited use, would it not easily offset short the tariff that is placed on it by the bill?

Mr. BOKER. Then we would get into a very high price, and we are now competing with electroplated steel, and it would then be too high and the trade would not buy it at all. That is the way we feel about it.

Senator McCUMBER. You think the tariff provided in the bill would have that result?

Mr. BOKER. I think so; yes; and with $3\frac{1}{2}$ per cent duty net on it, valued at 20 cents a pound, I believe it is a little higher than what is now being paid on it, and I think the imports could be maintained. It is one of the articles that is not made in this country; so I do not know how we would arrive at the American valuation.

Senator SMOOT. It would not affect it at all.

Mr. BOKER. The wire should also be included in that.

Senator SMOOT. You have never had any trouble, have you, about the wire falling under the wire paragraph?

Mr. BOKER. We have not imported any wire for a very long time.

Senator SMOOT. Because I think that under the Underwood bill and also under the Payne-Aldrich Act it has always come in under the wire paragraph.

Mr. BOKER. Yes; we had 15 per cent duty on the wire.

Senator SMOOT. And I was wondering if you had had any trouble, and as long as it is not made it seemed rather inconsistent to put wire in with the sheet.

Mr. BOKER. The other class in this paragraph is the rare-metal group, which is copper, nickel, and other metals.

The iron and steel plated sheets are not made in this country, but the copper, nickel, and other metals, I think, are made in this country.

At least I hear that some of this material is made by the brazing process. We are not importing any of it except little sample lots. So we do not speak very much about it, but if the duties on sheet copper and sheet nickel and sheet brass should be taken as averaged, we think that a duty of about 20 per cent on this would be fair and equitable because the duties on copper sheet is $2\frac{1}{2}$ cents per pound, and I think brass sheets 3 or 4 cents a pound, and what the duty is on nickel I am not sure, but I think it is 10 to 15 cents a pound. So I think when averaging it up we could say that 20 per cent ad valorem would be equitable, or 10 cents per pound specific duty.

Senator SMOOT. That is if the change is made specific on sheet nickel, I think there ought to be a difference made here.

Mr. BOKER. Yes; $3\frac{1}{2}$ cents per pound specific for the iron and steel plated sheets and 10 cents per pound for the copper, nickel, and other metal sheets.

If I may now speak about paragraph 385? Paragraph 385, lines 13, 14, and 15, is what we are interested in, which states "bars, rods, plates, sheets, strips, strands, anodes, or electrodes, 30 per cent ad valorem."

I think that the words "wire and tubes" ought to be added in there because the cost of manufacturing sheets is, from what I can learn, identical with the cost of manufacturing wire, and as the making of wire and tubes is part of the industry it ought to be thrown into this paragraph; this paragraph provides 30 per cent ad valorem.

Senator SMOOT: Are you interested in this? Because this only applies to nickel, with oxide, where they are the component material of chief value.

Mr. BOKER. The article which I am speaking of now is called pure nickel; it is nickel with a small percentage of manganese, which makes it ductible and malleable.

Senator SMOOT. Coming in tubes?

Mr. BOKER. Coming in tubes, wires, bars, rods, sheets, and strips. Therefore, as it contains only $1\frac{1}{2}$ to 2 per cent manganese, it is thrown into the pure-nickel group, as I call it, and hence it falls under paragraph 385, and as the wire and tubes are made of this material I feel they ought to have a place there.

Senator SMOOT. Where have they been classified before?

Mr. BOKER. They have been classified before in the same group and have apparently been left out. I know they were classified under the Payne-Aldrich tariff, and they were so classified. I have been importing them for the last 20 years, and they have always been classified with the nickel group.

I believe that 30 per cent ad valorem is too high, for the reason that nickel is what I might call an international metal. We have exported from the United States in quite considerable quantities to Germany and then brought it back again in the refined form. So I suggest to classify the bars and rods with a 10 per cent ad valorem, which is the present Underwood tariff, and to classify the strips, wire, tubes, and strands with 15 per cent ad valorem; the cast anodes with 10 per cent ad valorem; the rolled anodes with 15 per cent ad valorem; and the electrodes with 15 per cent ad valorem.

Senator SMOOT. In the Payne-Aldrich bill it was divided this way. That pigs and ingots, bars, rods, and plates were 6 cents a pound.

Mr. BOKER. Yes, sir.

Senator SMOOT. And the sizes in strips were 35 per cent ad valorem.

Mr. BOKER. That was the Payne-Aldrich bill?

Senator SMOOT. That was the Payne-Aldrich bill.

Mr. BOKER. But was anything said about wire?

Senator SMOOT. Nothing at all.

Mr. BOKER. I do not know why they were left out.

Senator SMOOT. They may have been classified under the basket use.

Mr. BOKER. Maybe that was true; but if you bring the wires and sheets into the basket clause, which is 35 per cent, you will bring it out of line, because it does not cost any more to make wire than it does sheets.

Senator SMOOT. Have you any objections to the same classifications that we had in the Payne-Aldrich bill?

Mr. BOKER. I think it would be very much easier all the way round the words "wire and tubes" would be added in there.

Senator SMOOT. I mean with that addition, using "wire and tubes," the classification as provided for in the Payne-Aldrich law. The classification was, first, pigs, ingots, bars, rods, or plates, that was 25 cents per pound; and then sheets or strips, 35 per cent ad valorem. Now, if we add wire and tubes to that classification, would that be satisfactory to you?

Mr. BOKER. Yes; that would be satisfactory, with the proviso, of course, under the American valuation that its duties be reduced on this metal to 15 per cent ad valorem.

Senator SMOOT. We have that.

Mr. BOKER. I have written a brief on this which I would like to read. The basic reason is the absolute equality of the cost on nickel in Europe to the cost of nickel in this country. Germany and England do not produce any nickel; they import it; and, consequently, the European countries are under no advantage in that respect.

May I refer now to paragraph 305? The reason I am speaking about paragraph 305 is that we have been importing for the last 34 years steel from Sheffield, England, and we have created a fair market for it, which, however, is constantly reducing itself. The particular steel of which I will give an example is "high-speed" steel.

Senator SMOOT. It has a tungsten content?

Mr. BOKER. It is a tungsten steel. Paragraph 305, in connection with paragraph 304, puts a duty on high-speed steel under the American valuation of 50 per cent ad valorem, which is equal to 40 cents per pound. The steel now sells in the United States at about 80 cents per pound. Paragraph 304 provides 20 per cent ad valorem on this; paragraph 305 provides, by virtue of its being an alloy steel, 15 per cent ad valorem; and the last part of paragraph 305 provides a specific duty of 72 cents per pound on the tungsten contained therein in excess of $1\frac{1}{2}$ per cent, which is equal to 12 cents per pound. Consequently, the duty is 50 per cent ad valorem, equal to 40 cents per pound.

The American manufacturer has already his selling expenses and profit included in the 80 cents. Consequently, if 25 cents per pound is added to \$1.01 a selling price of \$1.26 is necessary for the importer, which does not yet give him a profit.

The English high-speed steel now sells at 58 cents per pound at Liverpool. If we add to this 58 cents per pound 3 cents for expenses

in bringing it over and 40 cents per pound for putting it on the warehouse floor, we get \$1.01 per pound. We all, whether importer or manufacturer, have an overhead. I have been in this business for 25 or 30 years, and have kept very accurate accounts of my expenses, and I know that our expense on high-speed steel is 25 cents per pound to bring it into the hands of the consumer.

The American manufacturer has already his selling expense and profit included in the 80 cents. Consequently, if 25 cents is added to the \$1.01 a selling price of \$1.26 per pound is necessary, which does not yet give him profit; and, therefore, I feel that these duties are absolutely prohibitive and will end the importations of this steel.

Senator SMOOT. You are not manufacturing any high-speed steel.

Mr. BOKER. No; we are buying fairly considerable amounts here in fact, we are dealing very largely in American steels as well. But I know positively that with these proposed duties, these steels could not be brought into this country any more. I really think that we need some international competition on steels in general and high-speed steels in particular, because there exists no danger to the American mills, as, under the Underwood tariff of 15 per cent the imports of these steels have not been more than 3 or 4 per cent, and they are constantly decreasing.

The reason why the imports are so small is because the English manufacturing costs are very high, and the English mill sells its products always at a profit. It will never do any dumping; they make high-grade goods and charge a high price for them, and we have always been selling their steel at a higher price; from 5 to 10 cents per pound higher. We can not sell to the large consumers of high-speed steel.

We personally have imported about 1 per cent of this material.

I suggest to take the alloy steels out of paragraph 304 and to make the duty in paragraph 305 12½ per cent ad valorem, which at the selling price of 80 cents per pound will give 10 cents per pound duty against a present duty of 8.07 upon the English cost.

And then, as to the specific duty of 72 cents per pound, in paragraph 305, not to carry 98½ per cent into the steel but only 50 per cent. My reason for that is as follows: There is a tungsten duty in paragraph 302 of 72 cents per pound of tungsten contained therein and it has been assumed that this duty under paragraph 302 carries itself equally along into the latter part of the paragraph 305. I do not believe it can be expected, as tungsten sells now at 40 to 45 cents per pound, that with a duty of 72 cents per pound the selling price of tungsten will advance to \$1.17 per pound just because there is a duty of 72 cents per pound on it.

It is assumed that this 72 cents per pound duty is to be paid by the steel manufacturer, and in consequence of which he will have to get his compensation for it in the duty on the bar steel, but I do not believe it will work out in practice that way, because the steel manufacturer will not have to pay 72 cents per pound more for the tungsten, because the tungsten price in this country and all over the world is governed by the supply and demand. It is one mine selling against another mine, and it is the scarcity or the abundance of tungsten which governs the price. The duty of 72 cents a pound is a contributing factor, but is not an absolute factor in the matter; and if the American tungsten refiner does not advance his price 72 cents per

and the steel manufacturer ought not to be protected to that extent in the steel.

As to the competition of other countries, Sweden does not produce crucible cast steel nor does it produce any high-speed steel;

Germany never made any high-speed steel that amounted to anything in quality. I do think that English steels ought not to be put out altogether. They have never been dangerous. The English have been very fair in competition, and they have never done dumping in this country.

To sum up, I would suggest making the duty under paragraph 304, under the American valuation, half what it is now proposed, which makes the duty on tool steels 10 per cent ad valorem instead of 20 per cent ad valorem. The chief reason is that English manufacturing costs are extraordinarily high and will not be any lower for a long time. I have figures on costs of coal and on the labor situation.

Senator LA FOLLETTE. Have you incorporated those figures in your brief?

Mr. BOKER. I have no brief on that.

Senator CURTIS. You can add to your brief, if you know it.

Mr. BOKER. Yes, sir.

BRIEF OF J. R. BOKER, REPRESENTING H. BOKER & CO. (INC.), NEW YORK CITY.

METAL SHEETS AND PLATES.

Paragraph 309 reads:

"Sheets or plates, composed of iron, steel, copper, nickel, or other metal, with layers of other metal or metals imposed thereon by forging, hammering, rolling, or welding, 28 per cent ad valorem."

This paragraph divides itself into two distinctly different groups: Group A, iron and steel sheets, plates, wire, or bars, plated with other metals; group B, copper, nickel, or other metal sheets plated with other metals.

Regarding group A, iron and steel sheets, wire or bars, plated with other metals: Under the present Underwood tariff these sheets pay a 15 per cent ad valorem duty. Plated iron and steel sheets and wire have been imported into this country for a great number of years in very small quantities and hardly ever in excess of from 25 to 50 tons annually. There is no industry in this country producing similar sheets as far as we know, owing to the fact that it requires a very large and expensive plant to produce them and it would not pay a domestic manufacturer to install the equipment that would produce this item, when the demand is so small.

Plated sheets of iron and steel are used in Europe for the manufacture of cooking utensils, tableware, coffee pots, service trays, etc., for which the American market is not receptive.

American manufacturers of similar household articles prefer these utensils of aluminum or of nickel-electroplated brass, copper, or German silver.

Repeated efforts have been made in past years to import from Europe the finished tableware made of these iron and steel sheets plated with nickel, but without success, because the American public is educated to the use of kitchen utensils, cooking and tableware made of the rare metal of solid brass or German silver electroplated, in consequence of which the importations of these sheets have remained so very small.

The price of these iron and steel sheets plated with other metals varies according to thickness, between \$300 to \$400 per ton, or 15 to 20 cents per pound, and a duty of 28 per cent ad valorem would prohibit the importation, because it would bring the cost considerably above the cost of pure brass and copper electroplated articles; especially so, as there is generally one-third waste in manufacturing, which waste is of no value (except as common iron scrap) in the iron and steel sheets, whereas the recoverable waste in brass and copper sheets is two-thirds of its value.

Regarding group B, copper, nickel, or other metal sheets plated with other metals: The process of welding other metals on pure copper and nickel sheets is so expensive that the European manufacturing cost is considerably above the cost of producing nickel and copper sheets electroplated with other metals. Consequently we think that an ad valorem duty of 20 per cent would be a sufficient protection.

We suggest that special provision be made under the new tariff to read regarding group A, wire, bars, sheets, or plates composed of iron and steel, with layers of other

metal or metals imposed thereon by forging, hammering, rolling, or welding. 15 per cent ad valorem (or a specific duty not exceeding 3½ cents per pound).

Regarding group B, sheets or plates composed of copper, nickel, or other metals with layers of metal or metals imposed thereon by forging, hammering, rolling, or welding. 20 per cent ad valorem (or a specific duty of 10 cents per pound).

Thermostatic metal is composed of a layer of brass welded on a layer of nickel steel in equal proportions of thickness and rolled into sheets.

Owing to the fact that this is composed in equal thickness of half nickel steel and half brass, we suggest to establish its identity that the words "thermostatic metal" be specially mentioned and to fall under group B with 20 per cent ad valorem (or a specific duty of 10 cents per pound).

NICKEL IN BARS, RODS, PLATES, SHEETS, STRIPS, STRANDS, ANODES, AND ELECTRODES.

History of the industry: Except as to anodes or electrodes, this part of paragraph 385 refers to nickel which has been made malleable and ductile by the addition of manganese. This malleable and ductile nickel was first made in Germany and the process was covered by patents, which have long since expired. Germany does not produce any nickel and has to import it.

The American nickel manufacturers and converters have achieved such a degree of perfection and uniformity in producing this malleable nickel that the very small imported quantities are used solely by a few consumers who are willing to pay a higher price for the imported nickel, because in their opinion the imported nickel may in isolated instances be preferable in quality over the domestic material which they are willing to pay a small premium.

Duties on pure malleable nickel.

	Underwood tariff.	Foreign tariff.
	Per cent.	Per cent.
Bars.....	10	
Rods.....	10	
Sheets.....	20	
Strips.....	20	
Strands.....	20	
Anodes.....	20	
Electrodes.....		

PURE MALLEABLE NICKEL IN WIRE AND TUBES.

Small imports of such wire and tubes have been made, and in view of the fact that wire and tubes are of the same alloy mixture as bars, rods, plates, etc., we would suggest to add the words "wire and tubes" to the word "strips" on line 14 of paragraph 385.

Pure nickel bars, size nine-sixteenths inch, are sold by the American manufacturers at 63 cents per pound.

The European nine-sixteenths inch pure nickel bar sold at the time when the exchange rate was 1.5 cents per 1 mark (as an illustration) at European port, per pound..... 61
5 per cent for freight, insurance, expenses, cases, landing charges..... 3
30 per cent duty on 63 cents..... 18

At warehouse floor of the importer, per pound..... 82

With the rise and fall of the exchange the European mark price changes accordingly, so that the 61 cents per pound cost at European port remains substantially the same.

The selling expenses of the importer are at least 25 per cent on the 82 cents before he can make a profit on his investment.

Sheets 0.040 inch thick and wire 0.040 inch diameter are sold by the American manufacturers, at per pound, 90 cents.

The European nickel sheets of 0.040 inch thickness and wire of 0.040 inch diameter sold at the time when the exchange was 1.5 cents per mark at European port, per pound..... 61
5 per cent for freight, insurance, expenses, cases, landing charges..... 3
30 per cent duty on 90 cents..... 27

At warehouse floor of importer, per pound..... 91

These sheets and wire are retailed out in small quantities by the importer, who has to carry a stock and in order to cover his overhead charges and selling expenses, and so that he can make a profit on his investment, he has at least 25 per cent expenses on his cost. 5.25 cents equal 24 cents per pound, so that we have to obtain at least \$1.19 per pound before making any profit.

With the rise and fall of the exchange the European mark price changes accordingly, but the figure of 65 cents per pound cost at European port remains substantially the same.

The above figures show that the price of pure nickel sheets and pure nickel wire in both cases is identical and therefore substantiate our contention as mentioned on the first page in paragraph 4 that the word "wire" should be specifically mentioned and added to line 14 of paragraph 385.

We have no comparative figures to give, because we do not know of any pure nickel tubes being made in the United States, and have not imported any since the war, but unless the word "tube" is added to line 14, paragraph 385, they would fall under articles not specially provided for, and as the process of drawing tubes is not materially different from the process of drawing wire our opinion is that the word "tubes" should be specially mentioned.

Conclusion.—(a) It should be borne in mind that the American selling prices mentioned above include the American manufacturer's selling expenses, overhead charges, and profits, and that the importer, who has to retail this material out from his stock, has at least selling expenses of 25 per cent on his cost at the warehouse floor.

(b) We ask that the words "tubes and wire" be added to line 14, paragraph 385.

(c) The proposed duty of 30 per cent on the American valuation is on pure nickel at 18.9 cents per pound, which makes the cost to the importer at his warehouse floor 24.75 cents per pound, which is 30 per cent higher than the selling price of the American material. Therefore a duty of 30 per cent is unnecessary and it is obvious, that even 10 per cent duty would compel the importer to get a very much higher price than the American selling price.

(d) Pure nickel sheets and pure nickel wire, with a duty of 30 per cent of the American selling price of 90 cents per pound is 27 cents per pound. If the duty were 15 per cent it would make the cost of this material for the importer on his warehouse floor 22.5 cents per pound, and in order to cover nothing else but the selling expenses of 25 per cent, he would have to sell this material at \$1.02 per pound, before he can make any profit, whereas the American manufacturer sells the material at 90 cents per pound. Owing to the duties being assessed on American selling prices we ask for the following: Pure nickel or alloys of which nickel is the component material of chief value in rods and rods, straight or in coils, 10 per cent; wire, tubes, sheets, strips, strands, 15 per cent ad valorem; anodes, cast, 10 per cent; anodes, rolled, 15 per cent; electrodes 15 per cent.

WELDED METALS.

[Paragraph 309.]

STATEMENT OF GEORGE F. HURD, REPRESENTING H. A. WILSON CO., NEWARK, N. J.

Mr. HURD. Mr. Chairman, this is an application by the H. A. Wilson Co., of Newark, N. J., for a separate classification in section 09 of the proposed bill for thermostatic metal. I will tell the committee in just a moment what thermostatic metal is. We also ask for a specific duty upon that metal sufficient to offset the difference in exchange between the dollar and the mark and the difference between the German costs and American costs.

Before the war Germany was the sole source of supply of this metal and, so far as we know, is the only source of supply to-day other than the American producer.

Senator WATSON. That is not specifically mentioned in this bill, is it?

Mr. HURD. No; that is included in the class of welded metals.

Thermostatic metal is a metal composed of two separate metals welded throughout their entire contact surfaces, the one metal having a very widely different coefficient of expansion from the other. I mean by that that one metal has the property of expanding largely

under heat and the other metal has the property of expanding only in a very small degree or not at all.

As an example, this piece is made of invar steel, which is a combination of steel and nickel, and its coefficient of expansion is practically zero.

This other piece is brass, which expands and contracts largely with varying temperatures.

The action of the two metals welded together as temperatures are changed, results in curling or distortion of the metal, and that curling or distortion is used to set in motion a number of mechanical operations.

If you will permit me to light a match, I can show you what I mean. This [indicating] is an oven indicator. Here is the coil of thermostatic metal—that is, this composite welded metal of which I have been speaking. When I light this match underneath the metal you will see what happens with the change of temperature.

Now, taking this piece, I will show you what happens to it. The action is not as marked in this case, but I want to show you the effect that is produced. This instrument is used in connection with an electric baking oven. When the temperature reaches a certain point the current is automatically shut off. The thermostatic metal here consists of a strip, and the mechanical action follows upon the curling of the strip, which operates on a small rivet attached to a disk which moves the hands on this instrument. When these hands [indicating] are in contact the circuit is closed, and the current going into the electric oven is automatically cut off. While the action in this case is not as marked as in the other, yet it is quite clear.

Is the action noticeable?

Senator DILLINGHAM. Yes.

Senator WATSON. Did I understand you to say that the thermostatic metal is a welded metal?

Mr. HURD. Yes, sir.

Senator WATSON. What metals are welded together to make it?

Mr. HURD. That piece [indicating] is made of invar steel on one side, which expands practically not at all, and on the other side of brass, which expands greatly, causing the distortion of the metal. That distortion is used to set in motion various mechanical operations which automatically act as a means of controlling and regulating the device.

We find ourselves in section 309, in a class with other welded metals which are really rough products, and are not called upon to perform scientific functions.

This metal is a scientific instrument and it goes into finished products which are scientific instruments. The metal must be carefully selected so as to be of uniform consistency; it must be of uniform thickness; and the welding must be uniform throughout the entire surfaces in contact. If not, this metal which comes in a sheet approximately six feet long and several inches wide, will not be suitable for the purposes for which it is intended. From it are made, for example, several hundred of these little parts there [indicating] and they must all operate exactly alike under the same temperature conditions.

Some very fine and delicate instruments are made from this metal, and a variation in distortion of one-sixty-fourth of an inch will result in a difference in temperature of an oven of fifty degrees. It must be made with extreme exactness. As I have said, we find ourselves in a classification with rough products, such as copper and cast steel, when ours is really a scientific instrument.

Neither in the method of manufacture nor in the materials used nor in the function of the product, is our product in any way similar to those metals described in section 309.

Before the war Germany was the sole source of supply of this metal. When the German importations were cut off there was a great deal of inconvenience caused the American producers of the device in which this metal is used.

It is used as an oven control, to control both gas and electric ovens. It is so constructed that it automatically cuts off the flow of gas or electricity when a given temperature has been reached.

It is used in motor cars to control the flow of water from the radiator and around the jacket and to control the temperature of the air in the carburetor, as well as the temperature of mixed air and gasoline taken into the cylinders. It will be so used—it is so used—to accomplish great economies in fuel consumption.

It is also used in aviation motors. In fact, it has a thousand and one uses which are increasing very rapidly.

The Wilson Co. began its experiments some years ago, but it was not until the first part of 1919 that they began to manufacture in commercial quantities. At the present time the German importations have begun to come in, and within a very short time those importations will doubtless be sufficient in amount to take care of the American market.

The American producers at the present time have capacity ample and sufficient to take care of our own market, but the American cost of manufacture is greatly in excess of the German cost; in fact, there is a very wide margin of difference.

In 1920—and I take that year because it is the year in which the Wilson Co.'s production reached its maximum and its costs their best relative figure—the Wilson Co.'s cost was \$3.58 per pound. At this metal is placed in section 309 with other metals that cost from 15 cents to 40 cents a pound.

What the German cost is to-day is difficult to say. We do not know. We do know what it sold for in Germany before the war. We know the cost of transportation. We know what a normal profit ought to be. Considering these things, I think it is fair to say that the cost of the German metal laid down in New York, after bringing into consideration the duty of 28 per cent computed upon the American selling price of the article, would be \$1.40, a difference of nearly 56 per cent in favor of the German manufacturer. Of course, the great element of—

Senator SMOOT (interposing). The Wilson cost was what?

Mr. HURD. \$3.58. I say that I think it is a safe statement to say that the German product can be laid down here to-day with the present rate of exchange, including a duty of 28 per cent on the American selling price for the article, at \$1.40. Of course, the great factor in that differential is the difference in the exchange rate, the mark being worth about one-twentieth of what it was before the war.

There is also a great difference in the labor costs and probably in the material costs.

The cost in this country has been high, partly due to the fact that the industry is in a state of development, both as to manufacturing processes and the uses to which the metal can be put.

To-day the Wilson Co. has educated in this country a number of customers who understand the use of the metal and who do not have to be educated as to its uses. But as to the new business that they are figuring on—and it is only in the new business that the industry can be developed—they have to go through the educational process with the consumer of the metal; and that requires, of course, the employment of high salaried men and considerable expense.

In the manufacturing operations there are several factors which go to make the metal costly. In the first place, in order to get a uniform product, a great deal of care must be exercised in the selection of metal going into the thermostatic metal, and particularly in the process of manufacture, in order to obtain this absolutely uniform welding throughout the sheet or strip which comes out at the end of the welding operation.

In spite of the utmost care in the factory, a great many times the operation is not successful, and of the 100 per cent of raw material—that is, invar steel if that is used, or brass if that is used—which goes into the operation, only about 50 per cent comes out in satisfactory finished goods. There is about 50 per cent waste, or 50 per cent scrap, as the result of the manufacturing operation. The large percentage of scrap is not due to carelessness in production or to improper or inappropriate methods of manufacture. It is due to the fact that an absolutely perfect product must be manufactured. Processes such as must be employed to produce thermostatic metal we believe can not be relied on to result in any substantial greater percentage of perfect product than that now employed by the Wilson Co. The causes of waste are inherent in these processes.

Senator McCUMBER. That is due to the fact that you have not perfected your methods, is it?

Mr. HURD. It may be, Senator, and it may be that it is not humanly possible to make the product so that the results of the welding operation will be absolutely uniform.

Senator SMOOT. What rate do you ask for?

Mr. HURD. A specific rate of \$2.50 per pound.

Senator SMOOT. A straight and specific duty?

Mr. HURD. Yes, sir.

Our cost in 1920 was \$3.58 per pound, as I said a moment ago. The cost of the German product, with the proposed duty, as nearly as we can estimate it—and I think our statement is conservative, reliable and just to the German manufacturers—is \$1.40 laid down in New York. With the duty on which we have requested the same cost would be \$2.97. The difference between this figure and the Wilson Co.'s costs during the most favorable year of the company's experience is 82 cents. Out of this 82 cents would have to come the importer's profit, and the balance would be a differential in favor of the German manufacturer. Even under a specific duty of \$2.50 per pound the German manufacturer can lay down the metal in New York cheaper than the Wilson Co. can produce it, but the margin of differ-

is relatively small, and with the reduced margin the Wilson Co. is willing to, and we believe can, compete.

Senator WATSON. Is the Wilson Co. the only manufacturer of this product in the United States?

Mr. HURD. At this time. The General Electric Co. was in this business, but I think they have given it up.

Senator WATSON. You ask for a duty of \$2.50—a specific duty?

Mr. HURD. Yes.

Senator WATSON. Would not that shut out all other manufacturers altogether?

Mr. HURD. It would enable them to lay down the goods in New York at \$2.97.

Senator WATSON. But when the rate of exchange returns to normal, then what?

Mr. HURD. That would operate to increase the tariff burden.

Senator WATSON. It would operate as an embargo, would it not?

Mr. HURD. Hardly.

Senator WATSON. That would leave a monopoly?

Mr. HURD. It would not leave a monopoly. This is not an industry covered by patents. It is entirely possible for anybody to come in if he is willing to spend the time and the money.

Senator SMOOT. And can find a market for it?

Mr. HURD. And can find a market for it; yes. That is true.

You see the condition we are facing is this: With this enormous differential in favor of the German product there is no possibility of competing with it considering the exchange factor as it is now. As I say, there is no monopoly about it. The General Electric Co. has manufactured this product in rather large quantities, but they have given it up.

Senator WATSON. What ad valorem rate would that be under the American valuation?

Mr. HURD. About 75 per cent.

Senator SMOOT. Seventy-five per cent is what he wants.

Mr. HURD. But the specific duty would be more satisfactory because it would give us a certain basis on which to work. Prices will change from time to time. In order to develop this business you have to meet the market on costs. We have always sold at a loss. There has been no period of the company's business, even including the year 1920, when they did manufacture in commercial quantities, when they did not sell at a loss. Our purpose has been to develop the industry, and we hope after some years to have a ready and profitable business.

I would like, with the permission of the committee, to file a printed brief in which I shall show you in detail the cost to the H. A. Wilson Co. of materials, labor, overhead, etc., as well as exactly what business we have done and exactly what prices we have received for the metal.

Senator McCUMBER. That will be printed as a part of your remarks.

Mr. HURD. All we ask for is a different classification from these other metals with which this thermostatic metal can not be properly assessed, and protection against this German metal.

TIN PLATE.

[Paragraph 310.]

STATEMENT OF E. R. CRAWFORD, REPRESENTING THE ASSOCIATION OF TIN PLATE MANUFACTURERS.

Senator LA FOLLETTE. Please give your full name and address.

Mr. CRAWFORD. E. R. Crawford, McKeesport, Pa.

Senator LA FOLLETTE. You are connected with what company?

Mr. CRAWFORD. With the McKeesport Tin Plate Co.

Senator LA FOLLETTE. Are you an official of the company?

Mr. CRAWFORD. I am president of that company.

Senator DILLINGHAM. To what paragraph are you going to address yourself?

Mr. CRAWFORD. Paragraph 310. The Association of Tin Plate Manufacturers represents all the independent makers in the country outside of the United States Steel Corporation. We represent from 55 to 60 per cent of the total production of the country.

Senator SMOOT. Have you a brief?

Mr. CRAWFORD. Yes; I have reduced my thoughts in this matter to a comparatively few pages, which I can read to you in not more than three or four minutes. [Reading:]

On August 8, 1921, we addressed a letter to Hon. Boies Penrose, chairman of the Finance Committee of the United States Senate, briefly stating our views in relation to the situation with the tin-plate manufacturers of the United States and their attitude toward the revision of the tariff and the proposed changes of duty on tin plate as well as certain rates of duty proposed on raw materials which are used in the manufacture of tin plate.

When the tariff bill was under consideration in the House, we requested the Ways and Means Committee to fix the rate of duty on tin plate at 1.2 cents per pound, which was the rate provided in the Payne-Aldrich bill and which was a substantial reduction on the rate provided in the Dingley bill.

The Underwood tariff bill now in force provides a duty of 15 per cent ad valorem, which is entirely inadequate, and under the present unsettled conditions, taking into consideration the abnormal low rates of wages prevailing in Germany, Belgium, and England, as well as the unsettled exchange situation, and exposes this important industry to ruinous competition in all of our seaboard markets, where the great bulk of the tin plate manufactured in this country is consumed. The Atlantic and Pacific seaboard are easily accessible to foreign manufacturers, at low ocean freight rates.

Tin plates are all manufactured in the interior of this country and bear a very heavy freight rate from point of manufacture to seaboard markets. Under the circumstances we feel that we are entitled to restoration of the Payne-Aldrich rate of 1.2 cents per pound on tin plate, terneplate, and taggers plate.

Senator WALSH. What does that represent ad valorem?

Mr. CRAWFORD. You mean 1.2 cents per pound?

Senator WALSH. Yes.

Mr. CRAWFORD. In ad valorem, at the time the bill was filed, it would represent 15 per cent, but since that time there has been a considerable reduction in the price of tin plate, and to-day that would represent, in round figures, 20 per cent ad valorem.

Senator WALSH. At the time you asked for this ad valorem rate before the House committee you did not know the American plan of valuation was going to be adopted, did you?

Mr. CRAWFORD. Senator, we did not ask for an ad valorem rate before the House committee. We asked for a specific duty. We

ght as strenuously as we knew how the ad valorem rate of the Underwood bill. [Reading:]

After due and careful consideration, the tin-plate manufacturers have reached the conclusion that with economies in manufacture which they hope to accomplish as conditions approach a more normal level they will be able to get along with the proposed rate of 1.1 cent per pound and maintain their position in the home market against foreign competition, despite the fact that the Fordney bill has placed a duty of 2 cents per pound on pig tin, as provided in paragraph 386.

Senator LA FOLLETTE. May I inquire what our consumption of tin plate is in this country?

Mr. CRAWFORD. Our normal consumption of tin plate in this country will reach pretty close to 35,000,000 boxes.

Senator LA FOLLETTE. Put that in pounds.

Mr. CRAWFORD. In pounds, that would be 175,000,000.

Senator WALSH. These steel men are not only good lawyers but good mathematicians.

Senator LA FOLLETTE. What were the imports last year?

Mr. CRAWFORD. They were practically nothing.

Senator LA FOLLETTE. What were they this year?

Mr. CRAWFORD. Practically nothing, on account of the unsettled conditions abroad.

Senator LA FOLLETTE. What were the imports immediately following the passage of the Underwood tariff bill?

Mr. CRAWFORD. They were very sluggish, for the reason that the war soon occurred, and conditions became so abnormal that there was not a sufficient supply after 1914.

Senator LA FOLLETTE. War did not occur until something like 18 months after the Underwood tariff went into effect. Imports did not increase particularly under the Underwood tariff, did they?

Mr. CRAWFORD. No, sir.

Senator LA FOLLETTE. They were negligible, were they not?

Senator CALDER. What were the imports under the operation of the Payne-Aldrich tariff? Do you recall that?

Mr. CRAWFORD. That was in 1909, was it not?

Senator CALDER. In 1909 and through 1913.

Mr. CRAWFORD. I do not know just what the imports were, but there was some being imported right along, particularly on the Pacific coast; but I do not recall the amount.

Senator SMOOT. The importations for the 12 months ended June 30, 1920, were 10,330,572 pounds. The exportations during that same year were 399,395,705 pounds.

Mr. CRAWFORD. Yes. There was a shortage in the whole world's supply.

Senator SMOOT. Is there a shortage now?

Mr. CRAWFORD. There is a surplus to-day. I am sorry to say there is a surplus. There is a large surplus.

Senator SMOOT. Of course, under the Underwood bill tin is free?

Mr. CRAWFORD. Yes.

Senator SMOOT. I suppose you are complaining now of the 2 cents that is imposed on pig tin imported into this country under this bill?

Mr. CRAWFORD. Not particularly complaining; but we want to call the attention of the committee to the fact that there is no tin ore produced in the United States.

Senator SMOOT. We know that.

Mr. CRAWFORD. When there is a duty placed on a noncompetitive article, it simply advances the price that much, because the market is controlled in London.

Senator SMOOT. Let me get down to what you want. Are you willing to allow the 2 cents on tin as a revenue measure and accept the House provision of 1.1 cents per pound on tin plate?

Mr. CRAWFORD. Yes. If the committee feels that there is a need of 2 cents a pound as a revenue measure, to meet the present financial condition of the Government, we are not going to complain; but we would like to call attention to this fact, that it will in no way, we think, encourage any industry in this country, for the reason that there are no tin ores.

Senator SMOOT. The committee will decide that. Under the Underwood bill you had free tin and 1.2 cents a pound on tin plate.

Mr. CRAWFORD. Fifteen per cent ad valorem.

Senator SMOOT. I should have said under the Payne-Aldrich Act

Mr. CRAWFORD. Yes.

Senator SMOOT. And you will be satisfied if you have 2 cents on tin and 1.1 on tin plate?

Mr. CRAWFORD. Yes; we will be satisfied with 1.1 per cent.

Senator SMOOT. That is what I understood you to say. Now I understand your position.

Mr. CRAWFORD (reading):

There is very considerable opposition to this proposed duty, for the reason that there are no commercial tin-bearing ore deposits in this country—

I refer now to the 2 cents per pound on pig tin—

and the two tin smelters situated on the Atlantic seaboard produce pig tin from imported tin ores. They sell their product on a parity with the landed cost of imported tin, and there is no prospect of compensating advantages by reason of expected competition from domestic sources, which would eventually reduce the price of this commodity to a basis which would be competitive with imported tin.

Senator WALSH. You are willing, as I understand it, for the sake of revenue, to accept 2 cents duty on pig tin, but from the standpoint of the consumer and from the standpoint of developing the export trade it would be better, you think, if we could take off the 2 cents duty?

Mr. CRAWFORD. Very much, sir.

Senator SUTHERLAND. To what paragraph have you been addressing yourself?

Mr. CRAWFORD. Paragraph 310. [Reading:]

The tin-plate industry is the largest consumer of pig tin in this country, but tin-plate manufacturers realize that the proposed duty may be considered a revenue measure, and for this reason they are not disposed to enter strenuous objection to the proposed duty of 2 cents per pound on pig tin, but leave it to the committee to satisfy itself that the smelting companies in this country are entitled to this protection and that your committee is justified in leaving this duty as a purely revenue measure.

The tin-plate industry in this country consumes 2,500,000 tons of steel per annum and employs, in direct labor in its own plants approximately 40,000 workmen, who obtain the highest rate of wages of any workmen employed in the steel industry in the country.

Senator SMOOT. What do you pay your common labor?

Mr. CRAWFORD. We pay our common labor 30 cents.

Senator SMOOT. How many hours do they work?

Mr. CRAWFORD. Ten hours. [Reading:]

As large consumers of steel, which we purchase from the steel manufacturers, we are indirectly, but very deeply, interested in the schedule of duty proposed on steel.

products which constitute our raw material. The rates proposed in the general metal schedule are extremely moderate, and, in our opinion, may be considered to be drawn on a revenue basis rather than on a basis of protection. The rates on practically all items in the steel schedule are lower than those of the Payne-Aldrich bill, and are an average of about 50 per cent of the rates in the Dingley bill. We have noted, however, that the Fordney bill proposes extremely high rates of duty on raw materials such as magnesite, flourspar, manganese ore, ferromanganese and ferroalloys, which are essential and necessary in the manufacture of steel. These proposed rates of duty will unnecessarily increase the cost of our raw materials and will be an increased burden on manufacturers of tin plate and other similar commodities, who are using large quantities of semifinished steel.

We wish to call the attention of the committee to this situation most particularly because we feel that the proposed rates of duty on these raw materials should be taken out or modified to a strictly revenue basis, as in most cases they are not competitive, and hence the tariff becomes a tax without any compensating advantage. We wish to go on record also with your committee that the independent tin plate manufacturers of the United States are unanimously in favor of the proposed American valuation plan, and we would deplore any modification of that plan which would fix the assessment of duty on valuation prevailing in foreign countries, whose depreciated currencies are subject to violent fluctuation in exchange value as compared with the standard value of the United States gold dollar.

HOOP STEEL.

[Paragraphs 313 and 314.]

STATEMENT OF S. P. KER, REPRESENTING THE SHARON STEEL HOOP CO., SHARON, PA.

The CHAIRMAN. You reside in Sharon?

Mr. KER. Yes, sir.

The CHAIRMAN. And represent the Sharon Steel Hoop Co.?

Mr. KER. Yes, sir.

The CHAIRMAN. Will you state to the committee your views?

Mr. KER. I wish, Mr. Chairman, to address the committee particularly in reference to paragraphs 313 and 314 of House bill 7456.

We are one of the small manufacturers of steel and make principally pig-iron billets, blooms, sheet bars, sheets, plates, hoops, bands, and strips.

The paragraphs that I wish to speak of particularly affect hoops, bands, and strips, and cotton ties, which are a product of hoop mills, and of which we have in past years made a great many.

I think it would be economy of time for me to read a very short statement that I have prepared in connection with the subject.

I would call your attention to the inconsistencies of paragraph 313 and of its inadequacy as a protective measure.

Hoops, bands, and strips are rolled from billets and slabs and are commonly rolled, in this country, up to 16 inches in width as a result of developments in the last few years of wide strip mills. There are several mills that roll up to 18 inches in width. I think, therefore, that hoops, bands, and strips should be described to be steel in coils, scrolls, or cut to lengths 16 inches in width and narrower. Before the advent of these wide-strip mills 8 inches probably covered fairly well the production of this class of steel in this country, but, with the development of the automotive industry a much wider strip was required and the industry has met that requirement by the expenditure of large sums of money in permanent investments in highly specialized mills capable of rolling, as above

stated, up to 18 inches in width. Our own company rolls regularly up to 15 inches in width and down to three-eighths inch wide. We roll in the narrower widths as thin as 23 gauge or 0.025 of 1 inch thick. In the wide widths we roll: Up to 8 inches, down to 15 gauge or 0.065 of 1 inch thick; over 8 to 12 inches, down to 14 gauge or 0.083 of 1 inch thick; over 12 to 15 inches, down to 13 gauge or 0.109 of 1 inch thick.

The rates of duty on this class of material, as written in the bill, are less than that accorded other products not nearly so far advanced in the process of manufacture and in which the labor cost is not so high. (See par. 304, covering, among other things, ingot-blooms, slabs, and billets out of which hoops, bands, and strips are rolled.)

The whole of Schedule 3, as it relates to iron and steel in its various forms, names rates of duty that are not only very low, but the classification is very broad in some paragraphs and not fully descriptive of the product in other paragraphs, notably paragraph 313. The commodities under this paragraph should have a rate of duty at least equal to the extremely low rates provided for commodities not so far advanced in process of manufacture and in which the labor cost is not so great. I do not believe anyone that believes in the theory of protection will argue that the rates in paragraph 304, or, indeed any of the other paragraphs covering iron and steel, are high. The protection afforded by tariff acts on iron and steel commodities in all bills since the McKinley bill, have been subject to material reductions until the act of 1913, which practically affords no protection against foreign competition to this great industry, which was saved from a continuation of the depression which set in during the latter part of 1913 and early part of 1914 only because of the World War. During the first half of 1914 mill order books shrank to a point which necessitated the curtailment of operations and resulted in decreased employment, and only began to fill up during the latter part of 1914 to a point that justified full employment as a result of the European war, and full employment in this country was only continued until the effects of that conflict had passed. It has been in recent months at the lowest rate as to percentage of operation and employment, I think, in the history of this country, and we can only look for improvement as the general conditions of business improve, and then, in my judgment, only if our home market is protected for the benefit of our home labor and investments.

I think it is necessary to rewrite the description of hoops, bands, and strips of iron or steel to meet the actual facts of to-day's production by dropping the limit of 8 inches and by extending the limit to 15 inches in width, and then to give this branch of the industry a rate that will be consistent with the rest of the schedule, which, as already stated, is extremely moderate and will result in only reasonable protection against foreign competition. I would respectfully suggest therefore, that paragraph 313 be corrected to read as follows:

Hoop, strip, band, and scroll iron or steel, hot-rolled, not especially provided for: 16 inches or less in width, three-eighth inch or less in thickness, valued at 1 cent and not over 1½ cents per pound, twenty-five one-hundredths of 1 cent per pound; valued at over 1½ cents and not over 2 cents per pound, forty one-hundredths of 1 cent per pound; valued at over 2 cents and not over 3 cents per pound, fifty-five one-hundredths of 1 cent per pound; valued at over 3 cents per pound, 20 per cent ad valorem. Pro-

ded. That all strip, band, and scroll iron or steel wider than 16 inches shall be considered sheet iron or steel: *And provided further*, That barrel hoops of iron or steel, and hoop or band iron or hoop or band steel flared, splayed, or punched, with or without buckles or fasteners, shall pay no more duty than that imposed on the hoop-band iron or steel from which they are made. Bands and strips of iron or steel, whether in long or short lengths, not especially provided for, 20 per cent ad valorem.

Paragraph 314, covering cotton ties and baling ties, is entirely adequate as a protective measure. Why hoops of iron or steel, fifteen-sixteenths inch wide by 0.035 inch thick, cut to specified lengths of 11 feet 6 inches, put up in counted bundles, inclosing a buckle for each strip in the bundle, and coated or painted, should take duty of less than that imposed upon similar strips or hoops of iron or steel not so put up I can not understand. These bundles are put up in standard weight of 45 pounds each, and are to-day selling at \$1.30 per bundle at makers' mills, Pittsburgh. The rate provided in paragraph 314 of one-fourth cent per pound is, therefore, less than 10 per cent ad valorem. The per ton value of cotton ties at to-day's market at makers' mills, Pittsburgh, is \$57.77 per net ton, which makes the one-fourth cent protection \$5 per net ton. I think that paragraph should have the rate of duty changed from one-fourth cent per pound to 20 per cent ad valorem if it is to protect the American producer of the commodity. In years past, before the rail rates of freight were as high as they are to-day, cotton ties could be delivered from English or German ports to any South Atlantic or Gulf port for a very much less rate of freight than from the mill of any American producer—except as to the mills located at Atlanta, Ga., and Helena, Ala., within the radius of a very short rail haul. There would be no adequate protection to the industry in the rate as written.

Senator CALDER. Please tell the committee what 20 per cent ad valorem would amount to on the pound basis.

Mr. KER. They are selling to-day at a fraction less than 3 cents per pound at makers' mills. Twenty per cent would be \$12 per net ton, or almost that. They are selling for about \$2.97 or \$2.98. They are always sold, however, as a flat bundle of 45 pounds, regardless of their weight.

Senator CALDER. What is the duty now?

Mr. KER. They are on the free list. The duty proposed by this bill is one-fourth of a cent per pound. They were put on the free list in the Underwood bill.

Senator SIMMONS. Where are your competitors?

Mr. KER. Our competitors are numerous and are scattered pretty broadly throughout the country.

Senator SIMMONS. I mean, your foreign competitors.

Mr. KER. Germany, England, and Belgium; principally Germany and England.

Senator CALDER. What was the duty under the Payne-Aldrich Act?

Mr. KER. I do not believe I can tell you that, sir. It was a low rate of duty. I have not the comparison here.

Senator SIMMONS. The duty you propose would be about \$12 a ton?

Mr. KER. No, sir; 20 per cent ad valorem. It is three-tenths under the Payne-Aldrich bill. Cotton ties normally sell for 65 cents a bundle at makers' mills, so 20 per cent ad valorem would be 13 cents a bundle on the normal market. They are not yet down to the prewar basis. It is an expensive article to produce on account of the weight per foot.

Cotton ties in the past have frequently been carried from German or English ports to South Atlantic and Gulf ports practically as ballast or at exceedingly low rates of freight, by ships coming to the ports for cotton or other products for the return cargoes, and this practice will undoubtedly prevail again as the business of the world begins to assume normal relations. With our present excessive rail rates the cost of delivery from American mills to consumers would be so high that it is doubtful if the rate as written in the bill will afford any protection to the American producers of this commodity and while rail rates must be materially reduced, if business is to go forward, it is not easy to believe that they will for a long time be reduced to a rate equivalent to that in effect prior to 1914.

The above rates are suggested as a very modest protection, provided the American valuation clause is retained in the bill, which clause the industry heartily approves and supports.

Senator SIMMONS. Will you pardon just one question?

Mr. KER. Certainly.

Senator SIMMONS. How much potential protection will the American valuation clause give you?

Mr. KER. That depends upon a great many conditions. To-day according to the best information I have, as of July 1, hoops were selling in Germany at 1.248 cents per pound, which is \$24.96 per net ton. They are selling in this country to-day at about 2.30. The average advance on hoops I would express at about \$3 per ton. So they are selling for about 2½ cents per pound here.

The price in Germany, however, I have reduced to the American equivalent. It is not the German mark price.

There has been in the past importation of hoops, and immediately before the war there were importations to both the Atlantic and the Pacific coasts because of the lack of protection at that time. The largest production is in hoops and strips, not in cotton ties. Cotton ties are only an incidental item in hoop mill practice. Cotton ties selling at a normal price of about 65 cents, are used by many mills. I think most of the makers, except the United States Steel Corporation, use them as a filler during the dull period of the business, in the summer time.

Senator SIMMONS. You suggest that the specific rate of the Fordney bill be changed to an ad valorem rate?

Mr. KER. Yes, sir.

Senator SIMMONS. And then you announced your advocacy of the American valuation and said that your approval of the rates was based on the American valuation. What I want to know is how much will the American valuation plan add to the potential protection that you would get upon a 20 per cent ad valorem rate.

Mr. KER. In my opinion, Senator, that question is not susceptible of an answer, because it is dependent upon the fluctuating values in the two countries. To-day a certain amount might be right—probably 40 per cent, as expressed by some of the gentlemen. Tomorrow it might be another figure. It is constantly fluctuating.

Senator SIMMONS. That is true of everything, especially in these times. But take the markets of to-day.

Mr. KER. I have not figured it, and therefore I can not answer the question, because I do not consider the markets of to-day as a very vital or important matter.

Senator SIMMONS. When you said your advocacy of the 20 per cent was predicated upon the American valuation I supposed you had given some consideration to it and could give the committee some idea of how much benefit the American valuation would be to you over the foreign valuation in the application of the 20 per cent ad valorem rate.

Mr. KER. I have predicated it upon that theory. I think I can answer the question, but not in dollars or cents or any per cent of protection. I believe that the American valuation will prevent a foreign nation from dumping its surplus products in the best market in the world at a time when it is profitable to do so, because then that nation will have to meet American valuation and will not be able to dump its products into this market to the disadvantage of our own producers. I think that is the big value of American valuation.

Senator SIMMONS. Have you not considered what would be the increase in your real protection?

Mr. KER. No, sir; because I think that increase in real protection is such a fluctuating thing that an opinion expressed to-day would not be valuable to-morrow, and for that reason I did not even figure it and do not know how to figure it.

Senator LA FOLLETTE. Are you the president of the Sharon Steel Hoop Co.?

Mr. KER. Yes, sir.

STEEL PIPE, TUBING, AND WIRE PRODUCTS.

[Paragraphs 315, 316, 317, 328, and 331.]

STATEMENT OF J. A. CAMPBELL, PRESIDENT OF THE YOUNGSTOWN SHEET & TUBE CO., YOUNGSTOWN, OHIO.

Senator SMOOT. You may proceed.

Mr. CAMPBELL. Gentlemen, they have assigned me the subject of pipe and wire products, and I have a very short statement that I had better make to you first, and if you want to ask me questions in reference to it, you can then do so.

Senator LA FOLLETTE. What company or companies are you connected with?

Mr. CAMPBELL. I am president of the Youngstown Sheet & Tube Co.

For your information, I beg to state that in appearing before your committee I do so as the president of the Youngstown Sheet & Tube Co., and also as the representative of other independent steel companies; especially those making steel pipe, tubing, and wire products.

In discussing this bill, my remarks will refer to Schedule 3, and more particularly to paragraphs 328, 331, 315, 316, and 317.

With reference to Schedule 3, paragraph 328, pertaining to butt-welded and lapwelded pipe, I beg to say that the duty proposed of three-fourths of 1 cent per pound is greater than is necessary to protect this interest; and, therefore, I would recommend that the duty on butt-welded and lapwelded iron and steel tubes, in sizes from 1 to 6 inch, inclusive, be made six-tenths of 1 cent per pound instead of three-fourths of 1 cent; and that sizes of butt-welded pipe

from three-eighths to three-fourths inch, inclusive, and also lap-welded pipe larger than 6 inch, carry a duty of three-fourths of 1 cent per pound, as proposed. I suggest this change to your committee for the reason that the smaller sizes of butt-welded pipe and the larger sizes of lap-welded pipe carry a greater labor cost than what we call the "base sizes" from 1 to 6 inch, inclusive. These sizes on which I propose a lower duty are the common sizes of pipe, and the tonnage is considerably greater than the smaller sizes and larger sizes mentioned. I think the proposed duty on sizes smaller than three-eighths is justified, on account of the small production per man and high labor cost.

With reference to coated conduit for electrical conductors, referred to in this paragraph, I would say that we are large manufacturers of this product, and that 25 per cent ad valorem is ample protection.

With reference to paragraph 315, pertaining to wire rods, the duty proposed in the bill of three-tenths of 1 cent per pound, or \$6.72 per gross ton, is sufficient, and I do not think it should be increased or decreased.

In discussing paragraph 316, pertaining to black and galvanized iron and steel wire, I am also obliged to discuss paragraph 317, pertaining to galvanized wire used for fence, galvanized wire fencing, and wire for baling purposes.

In paragraph 317 you propose a duty of one-half of 1 cent per pound on galvanized wire used for fencing purposes and for making into wire fencing and wire used for baling purposes, while in paragraph 316 you propose a duty on this same wire when used for other purposes of three-fourths of 1 cent per pound.

It seems to me that the committee in framing this paragraph has overlooked the fact that it penalizes one class of users of this material for the benefit of others who use it for fencing and baling purposes only, and that this is "class legislation"; and I am quite sure you could be justly criticised for making this distinction. Therefore, I recommend that you reduce the duty proposed in paragraph 316 from three-fourths of 1 cent per pound to six-tenths of 1 cent per pound, with the addition you now propose of two-tenths of 1 cent per pound for coated wire for all purposes, and that paragraph 317 be stricken out. There certainly can be no good reason offered by anybody why any class of users should be given preference over any other class; and while the duty I propose is smaller, perhaps, than it should be, it will safeguard to a certain extent the users of wire covered in paragraph 317 against unduly high prices, and will still afford sufficient protection to the interest affected by paragraph 316.

I am trying to offer some suggestion here that will make this more harmonious and more scientific.

Referring to paragraph 331, pertaining to nails and spikes made from iron and steel wire, I beg to call your attention to the fact that this proposes four-tenths of 1 cent per pound on nails, which carry a labor cost of \$12 per ton higher than wire; and as it is my understanding that you wish to protect the labor employed in producing these nails to the same extent that you would protect labor producing the wire from which they are made, it naturally occurs to me that the committee framing this bill did not have sufficient information on the subject, and therefore have not provided sufficient duty to protect the labor engaged in the manufacture of nails. If this is the principle by

which your committee is to be guided, then wire nails should carry a higher duty than plain wire, for the simple reason that the labor cost producing this product is considerably higher, as above stated.

With this fact in mind, therefore, I would recommend and strongly urge that paragraph 331 should be changed so as to provide a duty of three-fourths of 1 cent per pound instead of four-tenths of 1 cent per pound on the common sizes of nails and spikes, and other sizes in proportion.

I wish to call your attention to another wire product, viz, barbed wire, both plain and galvanized, which is on the free list, Schedule 15, paragraph 1680. I can not understand the purpose of the Ways and Means Committee in proposing that barbed wire be put on the free list. The cost of wire that enters into the manufacture of barbed wire is fully as great as that of wire for fencing or other purposes; labor in making this wire and in making it into the finished product, barbed wire, is certainly entitled to the same protection as the labor employed in making wire for other purposes, and it would be rank discrimination to treat it other than on the same basis. If the manufacturer of barbed wire is compelled to meet foreign competition without any protection, he will be forced to reduce labor that enters into the manufacture of this wire to the very minimum, and may be put out of business entirely. I do not believe that this is the idea of the Ways and Means Committee or the Senate Finance Committee, and, if it is, I certainly hope that it is not the idea of Congress as a whole, and that this item of barbed wire will be put on the dutiable list and treated the same as other wire products.

Senator LA FOLLETTE. What do you think it should be, or are you going to proceed to state?

Mr. CAMPBELL. It ought to be at least as much as other wire, and I have recommended a reduction on that in order to harmonize it with nails, in order to try to meet the ideas of the Ways and Means Committee that framed the bill and not get it too high.

Senator SMOOT. You want six-tenths of 1 cent?

Mr. CAMPBELL. Six-tenths of 1 cent at least. It ought to be the same as nails, but we will be satisfied if we can get six-tenths of 1 cent.

It is my impression that in framing this tariff bill it was the intention of the House Ways and Means Committee to protect all American interests—the farmer, invested capital, and especially the laboring people.

I appreciate the difficulty that confronted the Ways and Means Committee in framing a bill that will do exact justice to all the interests concerned. All interests are selfish, especially those that ask you to do things that would be an injustice to others. For that reason you should secure the facts and do what is best for the people as a whole, rather than give undue protection to any one interest at the expense of many.

Many producers in different lines may have high costs, due to antiquated factories and methods, or to disadvantage in their geographical location; but if there are such their interests should not be considered to the detriment of the country generally.

While I am not supposed to discuss duties other than those on pipe and wire, I desire to emphasize, if possible, what Mr. Topping has said with reference to duties on raw materials.

The proposed duties on fluorspar, manganese ore, ferromanganese, magnesite, pig tin, zinc, and alloys will put considerable tax on the steel industry, which the consumer must pay. We will pay it first and then we will pass it on to the consumer; we are obliged to do that. Mr. Topping has explained that American producers do not require this abnormal protection, and if there are any cases where they do the interests are so small and can produce such a small percentage of the material required that their needs should not be permitted to impose this tax on all steel consumers.

Mr. Dinkey explained to you about ferromanganese, that there are not any large deposits of manganese ore in this country; and because some man in North Carolina or some man in Colorado may have a little pocket of manganese ore is no reason why the 100,000,000 people in this country should be taxed to protect these two people, and that is about all there are that have deposits, and they are very limited, and we are very glad that we found them during the war to help us out.

The duties proposed on these articles are all too great, in my opinion, especially those on fluorspar, manganese ore, ferromanganese and magnesite, and I trust they will be greatly reduced by your committee.

The duty you are talking about putting on ferromanganese is outrageous. We can not get ferromanganese in this country. The deposits are not here. They are bound to bring it from abroad, and it is only taxing the industry and the consumers of steel to put \$39 a ton or something like that on that material, ferromanganese that I have bought for many years at \$35 per ton.

It should be understood that in recommending lower duties on some tubular and wire products than those proposed in this bill I do so believing that the entire bill will finally provide for a moderate duty on all classes of merchandise. If this bill, as a whole, is so framed that the result of its passage would be to increase the cost of living and labor, in that event we need higher duties than those I have suggested.

We have given you what we believe is the very lowest duty that we can get along with, and we do not want the clothing and the boots and shoes and everything else that enters into the cost of living to be put on a higher basis, because if we do we are at a great disadvantage. I have recommended that these duties be reduced, because if we can get along with a lower duty—some of them are too low—I have tried to get them on a relative basis regarding the cost. I have figured the cost on every product that we manufacture, from the ore mine and the coal mine and the limestone quarry, including transportation, to the finished product. I can give you the items. You take for instance, barbed wire, which is one of the things that is on the free list. Galvanized barbed wire carries a labor cost from mine to the finished product alone of \$39.33, which is the highest labor cost with one exception, of any product that we manufacture, and we manufacture a large line. We have the capacity of producing 1,000,000 tons of steel a year, all kinds of wire products, bars, sheet, both black and galvanized, plates, pipe. We have the capacity of manufacturing 50,000 tons a month of pipe in all sizes from one-eighth inch to 20 inches.

Senator LA FOLLETTE. While you are right on your barbed wire, Campbell, will you be so kind as to take a ton of barbed wire and put it with the ore and give me the labor cost in producing the ore, then the labor cost in producing the ore necessary for a ton of barbed wire, and follow it right through in its different changes?

Mr. CAMPBELL. I will be glad to send you that. I have it at home, here. I just have the totals.

As Mr. Topping states, we will be obliged to export 20 per cent of steel if we are to keep our mines and mills in operation and give continuous employment to our workmen, and anything that adds to costs will make this more difficult, and also increase the selling price to our domestic consumers.

In this connection I would like to make a few observations on the tariff generally in the hope that practical ideas and experience may be of service to your committee.

Conditions are abnormal throughout the world and the quicker adjustments are effected the better for everybody; so it seems to me that your tariff bill, when completed, should be based on what we may think are normal conditions, and values, rather than on conditions that obtain at present. If it has the effect of speeding adjustments to lower values on a more stable basis, it will be of great benefit.

Wages and materials in other countries must increase or wages and materials in the United States must decrease before values are stabilized. Both will happen; wages and materials will be lower in the United States and higher abroad. A reasonable tariff will bring this about quickly; a tariff too high will prolong this readjustment and in the meantime the country will suffer.

I believe in the American standard of living, and I desire to see it maintained, but I am not so much concerned about the rate of wages paid as about what the wage earner has left after paying the cost of living by this standard. Duties that are too high will raise values, increase the cost of living, stop exports, cause unemployment, and finally cause industrial depression. You are expected to frame a tariff bill that will maintain the American standard of living and yet permit us to export our products to the markets of the world. This can not be accomplished by a tariff bill that will materially increase the cost of production.

Senator LA FOLLETTE. I would like to ask the witness a few questions.

Mr. CAMPBELL. All right.

Senator LA FOLLETTE. How many different products do you produce?

Mr. CAMPBELL. It would be difficult to say.

Senator LA FOLLETTE. Quite a long line of them, is there?

Mr. CAMPBELL. We produce quite a large line of all kinds of conduit, both rigid and flexible, and all classes of wire products and wire fence, galvanized wire, barbed wire, wire hoops and nails. We make bars, we make plates, we make sheets, we make sheet bar and billets and coke and steel; and we produce our own ore and our own coal, and are large producers of pipe.

Senator LA FOLLETTE. Yes; I know you are. You have already prepared as a part of your system of checking up costs of production

all of the items of the cost of production of the different articles you produce. Will you be kind enough to send them to the committee, that they may be incorporated in your testimony?

Mr. CAMPBELL. If you will have the chairman write me. I will send him any information that you want specifically—if he will write specifically what he does want.

Senator LA FOLLETTE. I am giving you now specifically what I would be glad to have you furnish to the committee, and you may address it to the committee. But I would like to have you give at least I will designate a few of the more important things that you produce and limit it to them, so as not to burden the record with too much of it. Take the matter of barbed wire. I will ask you to send the chairman of the committee here, to be made a part of the record of your testimony—

Mr. CAMPBELL. The items of labor cost?

Senator LA FOLLETTE. No; all the items of cost that enter into the production of barbed wire—labor as well as other items of cost that enter into it, from the ore clear through to the finished product.

Mr. CAMPBELL. We do not make our costs there in that way. We make our costs by taking the ore at so much per ton and the coal at so much per ton and the limestone at so much per ton.

Senator LA FOLLETTE. So you start with your raw material?

Mr. CAMPBELL. Yes. But I have the figures of labor both as to the ore mine and the coal mine and the transportation plant, and as to the converting from ore to coal into the finished product.

Senator LA FOLLETTE. Then, suppose you start with the coal, the limestone, etc., as your raw material, and give us the items of cost for a ton of barbed wire, indicating that in the gross, but from that point on, so that we will have the relative labor cost with the other costs.

Mr. CAMPBELL. I can give it to you both ways. We have it.

Senator LA FOLLETTE. And will you do the same for nails? Does it make any difference whether you differentiate as to nails, spikes, etc.; if you state it as nails, will that cover the subject?

Mr. CAMPBELL. Well, hardly, because we make a great many small nails—roofing nails—and they go in as a general proposition with the general cost; we do not separate them, although we make special costs on them, and can separate them and give you the base size.

Senator LA FOLLETTE. Then, just do that, if you please, for nails as well as for barbed wire. Do you produce nails as well as barbed wire and tubes in the Youngstown plant?

Mr. CAMPBELL. Yes, sir.

Senator LA FOLLETTE. I mean the Youngstown Sheet & Tube Co.

Mr. CAMPBELL. We have a capacity of 50,000 kegs of nails a month and 50,000 tons of pipe.

Senator LA FOLLETTE. What is the total cost of a ton of barbed wire such as you produce? You have the figures?

Mr. CAMPBELL. I have not the figures; only the labor.

Senator LA FOLLETTE. Can you state from memory about what it is?

Mr. CAMPBELL. I can not. I could for some other products, but that is a minor item with us, and I do not carry that in my head.

Senator LA FOLLETTE. What is the total capitalization of the Youngstown Sheet & Tube Co.?

Mr. CAMPBELL. Our capital is \$20,000,000 of common and \$10,000,000 of preferred. But we have about \$45,000,000 of earnings.

plus over the last 20 years, which is invested in the business, and a total net assets over liabilities about \$75,000,000 to \$80,000,000. We employ about 15,000 men in our coal mines, ore mines, quarries, and plants.

Senator LA FOLLETTE. You own your own coal mines and quarries?

Mr. CAMPBELL. We are interested in a large number of ore mines, about 15. We produce about enough ore to take care of ourselves. We use about 1,800,000 tons a year under normal activity. We are mining in 300,000 tons of ore this year. We are operating at less than 20 per cent for the last three months, and we have lost over \$100,000 a month for the last three months.

Senator LA FOLLETTE. You are paying what wages to common labor?

Mr. CAMPBELL. We are paying common labor 30 cents an hour, which is 5 cents higher than Mr. Dinkey. The highest wages we have paid is 46 cents an hour. We reduced wages about 20 per cent, to 37 cents an hour, and we made a further reduction of about 19 per cent, to 30 cents an hour.

Senator LA FOLLETTE. Do you remember what you were paying common labor per hour in 1913?

Mr. CAMPBELL. \$1.70 a day, or 17 cents an hour.

Senator LA FOLLETTE. That runs 10 hours a day right through?

Mr. CAMPBELL. Well, we work some men only 8 hours and some 10 hours.

Senator LA FOLLETTE. But on the common labor?

Mr. CAMPBELL. Yes; 10 hours.

Senator LA FOLLETTE. So, when you say \$1.70 you mean 17 cents an hour?

Mr. CAMPBELL. Yes, sir.

Senator LA FOLLETTE. Do you recollect what you were paying in 1910?

Mr. CAMPBELL. \$1.70, or 17 cents per hour.

Senator LA FOLLETTE. And what was the rate in the period before that for a few years?

Mr. CAMPBELL. I think the rate has been since about 1902, about \$1.70, but I really do not remember. Before that, during the latter part of 1900, 1897, 1898, and 1899, we were paying all kinds of wages from a dollar a day to \$1.25 and \$1.50.

Senator SMOOT. Is your common labor mostly foreign labor?

Mr. CAMPBELL. Our labor before the war and during the war was about 60 per cent foreign labor, but we had some trouble after our strike, and we tried to decrease that. The trouble was with the foreign labor, and it is about 50 per cent now and 50 per cent American.

Senator LA FOLLETTE. What dividends has your company paid the last five years, Mr. Campbell?

Mr. CAMPBELL. Well, they have paid—you mean on the capital and surplus invested?

Senator LA FOLLETTE. On the capital.

Mr. CAMPBELL. Why not the surplus, too; that is capital invested.

Senator LA FOLLETTE. Well, if you have capitalized the surplus—

Mr. CAMPBELL (interposing). What difference does it make whether you capitalize it or not?

Senator LA FOLLETTE. I think it makes a good deal of difference to the consumers.

Mr. CAMPBELL. Not a bit. You have the money in the business. We have it invested in our ore mines, coal mines, blast furnaces, and mills.

Senator LA FOLLETTE. Yes; and you have charged prices which enabled you to accumulate surplus capital, and then turn around and capitalize the surplus, and so in that way make the public furnish a part of your capital?

Mr. CAMPBELL. The public did not furnish it.

Senator LA FOLLETTE. But that aside, just suppose you give your dividends on your capital and surplus.

Mr. CAMPBELL. Our dividends will average less than 5 per cent on capital and surplus.

Senator LA FOLLETTE. Each year for the last five years?

Mr. CAMPBELL. For the last 10 or 15 years; and we built the latest perhaps, and most modern plant in the United States, because this is one of the latest plants built. We have some advantages, I think early in our history, because it was a new plant with some labor-saving devices, and improvements, and our profits perhaps then on the investment were greater considerably than they are now. You know when you invest in ore mines, coal mines, and limestone quarries and all those things for a future backlog to your business. After you put in \$40,000,000 or \$50,000,000 into a plant account, you must back them up by investing in raw materials. We have over \$10,000,000 in coal that will last us 50 years. We did not dare go without it. We have the same thing in limestone and ore and dolomite, and the profit is very small.

Senator LA FOLLETTE. Yes; because you include that reserve on your present capital for years ahead, and make the business pay its turn on that.

Mr. CAMPBELL. No man can put \$50,000,000 in a plant without putting something behind it and be sure he is going to be able to operate it.

Senator LA FOLLETTE. Will you state what your gross sales were for the Youngstown plant last year?

Mr. CAMPBELL. About \$75,000,000.

Senator LA FOLLETTE. And what was your total expense?

Mr. CAMPBELL. I do not know; I do not carry those figures in my head.

Senator LA FOLLETTE. What is the total wages you paid?

Mr. CAMPBELL. \$25,000,000 at the Youngstown plant, not including mines and quarries.

Senator LA FOLLETTE. What were your total salaries?

Mr. CAMPBELL. I do not know.

Senator LA FOLLETTE. What is your salary?

Mr. CAMPBELL. They pay me all kinds of salaries at times. When we have a good year they pay me one thing and sometimes when we have a poor year they pay me very much less.

Senator LA FOLLETTE. What was it in 1920?

Mr. CAMPBELL. My salary this year is less than half what it was year before last, and about half what it was last year.

Senator LA FOLLETTE. What was it year before last?

Mr. CAMPBELL. I do not think that that is necessary, and unless --

Senator LA FOLLETTE (interposing). Do you decline to answer?

Mr. CAMPBELL. I decline to answer, unless the chairman rules that I should answer. I am not ashamed of it.

Senator LA FOLLETTE. I suppose you are so proud of it you do not want to tell us what it is.

Mr. CAMPBELL. No; I am not proud of it. I think they have always paid me less than I have earned. If you had to do my job I would want more than I get.

Senator LA FOLLETTE. I certainly would; and I would not want to be it at that.

Mr. CAMPBELL. We have 10,000 men idle, walking the streets, and trying to find work for them to meet the conditions as they are today, and have to reduce their wages in the face of the fact that living has not been reduced, or rents have not been reduced—of course, living has gone down some, food products especially, but it is no snap running a steel plant with the large number of men one has to look after.

Senator LA FOLLETTE (interposing). Do you know what the cost of living is to-day, compared with 1914?

Mr. CAMPBELL. Yes.

Senator LA FOLLETTE. What is it?

Mr. CAMPBELL. It is about 60 per cent higher than it was in 1914.

Senator LA FOLLETTE. How does the cost of living at the present time compare with the cost of living in—

Mr. CAMPBELL (interposing). You can get all that from the National Conference report. They are very accurate in their statements, and I do not have it all in my head.

Senator LA FOLLETTE. What is that?

Mr. CAMPBELL. The National Conference Board makes a business of getting these statistics together, and they will be glad to furnish them.

Senator LA FOLLETTE. What is the National Conference Board?

Mr. CAMPBELL. They have headquarters in New York, and their business is making up statistics of all kinds, and they are very correct. They use Government statistics in some cases, where they know they are correct; and where they know they are not correct they do not use them.

Senator LA FOLLETTE. You mean the report of the Department of Labor here?

Mr. CAMPBELL. Is that under the present Department of Labor?

Senator LA FOLLETTE. It is under the Department of Labor. The table I have before me gives the index to the average family expenditure on food in the United States from 1900, by years, down to 1920. Taking 1900 as the index of 100—

Mr. CAMPBELL (interposing). Shows it is a good deal lower than it was a year ago?

Senator LA FOLLETTE (continuing). In 1920 it had advanced to 66. You did say that the wages in 1920 were 46 cents an hour.

Mr. CAMPBELL. We did pay in addition to that time and one-half cent over eight hours, which has been abandoned.

Senator LA FOLLETTE. What is your profit on a ton of barbed wire?

Mr. CAMPBELL. I think we lose about \$5 a ton on the present basis. We are losing on every product we make except one.

Senator LA FOLLETTE. What does a ton of barbed wire cost?

Mr. CAMPBELL. I can not tell you definitely now.

Senator LA FOLLETTE. Can you tell me about what it costs?

Mr. CAMPBELL. No; I could not. I would not want to guess because I might not be within \$10 per ton; I can give you the information and tell you what it costs.

Senator LA FOLLETTE. I will be glad to have you give me information.

Mr. CAMPBELL. You see, we make a hundred different products and while we have a cost sheet for every different product every month showing the labor cost and the taxes and the insurance and the salaries and all those things, I can not carry all those things on my head. I know about the heavier products and the high-tonnage products.

Senator LA FOLLETTE. You prepared yourself to give the labor cost in a ton of barbed wire?

Mr. CAMPBELL. I had it made up because I thought that the bill was not a very scientific bill, and seeing barbed wire on the free list and some other things out of harmony, for that reason I had our controller make up a labor cost; and we got the exact cost of the iron mined and we got from our accountants what the labor cost to put it on the boats and what the labor in water freight was, and we took 60 per cent of railroad transportation charges as the basis for labor on the railroads, and then took our own costs of conversion and made it out just as you would a cost sheet. So that I am sure it is accurate within a very small percentage.

Senator LA FOLLETTE. What part of your product do you export?

Mr. CAMPBELL. About 10 per cent last year. We shipped about 100,000 tons abroad last year.

Senator LA FOLLETTE. What was your principal foreign market?

Mr. CAMPBELL. Canada is our principal foreign market. Mr. Topping explained that this morning. We are in that same arrangement with him. We are a member company of the Consolidated Steel Corporation of New York, which 11 of the large steel companies are in, and we have a selling organization there that sells all of our products for export. We have quite a business ourselves in Cuba and Porto Rico, and, of course, ship some materials to Japan, Australia, and elsewhere.

Senator McLEAN. When you ship to Japan, for instance, do you have to pay a duty there?

Mr. CAMPBELL. I do not think so; I do not know. I am not familiar with the export business. We used to do our own exporting before the Webb Act was passed, and since then we took advantage of the Webb Act and 11 concerns went together, and we turn over our selling company 10 per cent of our products.

Mr. TOPPING. There are revenue duties in Japan.

Senator LA FOLLETTE. How about the duties in Canada? do you carry those in your mind at all?

Mr. CAMPBELL. They have a duty which they can change overnight. They have a law that is good, in my opinion, because they can keep us out of there if they want to, and we have to buy our materials at fully as high a price as is prevailing in this country.

Senator LA FOLLETTE. You sell there on about the same level as sell here?

Mr. CAMPBELL. We are obliged to sell on the same level. They not permit us to sell for any less, while the Germans can come here and sell \$10 a ton under their prices at home. That is the reason we are in favor of this American valuation plan.

Senator WALSH. There are a few general questions I would like to ask the witness, because he is a representative business man, of a large group, and I think it may help us in our work here.

To what extent do you think, as a business man, this committee ought to exercise the greatest possible care in fixing its rates so as to prevent imports into this country? What would be the consequence to a big business like yours if these rates here are fixed so as to shut out imports to this country?

Mr. CAMPBELL. It would ruin the country, in my opinion. If you build a tariff wall around this country, you are going to keep up a fictitious and artificial value on everything that you put that high tariff on. You are going to do the same thing on labor, and the result would be that the industrial depression would mean the breaking down of the whole industrial situation.

Senator WALSH. Is that opinion shared by your group and other business?

Mr. CAMPBELL. I do not know; I am only speaking for myself.

Senator WALSH. I have heard it expressed by others.

Mr. CAMPBELL. I am in favor of a protective tariff, but I want just a little—

Senator WALSH (interposing). I want to know about the Congress putting the duty so high as to exclude the imports.

Mr. CAMPBELL. I believe all the things the Lord put into the trees and the mines, when put into lumber and steel, ought to be distributed throughout the world with the least obstruction, where they ought to be distributed, with the lowest possible freight rates. I think it would be a splendid thing if we could bring our ore from Cuba for the eastern mills and save our resources in Minnesota and Michigan for the western mills. I think we ought to bring that in without any obstruction. But we have no business to bring lumber from Washington to Maine when we can bring it across from Canada. We ought not pay a high duty on that. There is no reason why we should ship coal from the Virginias up into northern Maine when we can bring it over from Canada or from Newfoundland at a low price.

Senator SMOOT. Certainly; and lumber from Canada.

Mr. CAMPBELL. Yes; they ought all to be free. And so manganese ore ought to be free, and all other things that the Lord has put here for the use of the people.

Senator WALSH. One other single inquiry, and I am through. Is the theory you have described the reason why, perhaps for the first time in American history, the representatives of great big business are here asking for the lowering of rates and the representatives of small business and men who produce but a small amount of the consumption are asking for excessively high rates?

Mr. CAMPBELL. I am asking for protection first to maintain the American standard of living. I want to do that, but I want the cost

just as low as possible. Some labor in this country is too high has been unduly protected. Some men are making \$25 and \$30 a day who ought to be working at \$10. But we must keep our wages as low as possible, because we are now a world nation, whether we will or not, and we want to export and must export some of our products to keep our people employed.

Senator WALSH. You are fearful, then, that those concerns will produce a small proportion only of the consumption may require such high rates that it will amount to an embargo, and that that will be to everybody who uses that raw material will be so enormous that it will destroy business.

Mr. CAMPBELL. I do not say it will destroy business. But it is a tax on the consumer.

Senator WALSH. You can not export if your raw material is increased by heavy rates of duty?

Mr. CAMPBELL. No.

Senator WALSH. And we must do an export business?

Mr. CAMPBELL. We should do an export business, and we will when the other nations get up on the same level we are. We are not doing an export business now, and I do not think we can in a year or two.

Senator McLEAN. I want to ask you just one question: You say you believed in a protective tariff. Just what do you mean by that? What should it represent?

Mr. CAMPBELL. I mean that if a man in Germany, for instance, or Belgium, or France gets \$2 a day, and a man needs \$2.50 in this country to live on a little higher basis—on the basis our people live on in this country—there ought to be protection enough that we would be able to pay him that other 50 cents a day; that is, in other words, the difference between the cost of labor on a normal basis and not on the present basis—because everything is abnormal now. And I have cautioned you people about framing a tariff bill based on present conditions, because we are going to seek a lower level—we have got to seek a lower level or else we have to get the farmer up with us, and you gentlemen could not do a better thing than to wipe out the transportation act and the Adamson law, and let the freight rates go down so that the farmer will come up and at the same time reduce our cost and put us down. And then when we are on the same level there ought to be an easy flow of exchange of products. Your transportation act has not worked out; it is a failure. There is a constant contention between the labor board, that knows no more about labor than I know about running a bank, fixing the price of labor in Alabama and in New York City and other places—the same one place as another the country over, and it is holding the business of this country up by the throat right now. And if you do that, in 90 days we would have lower freight rates, men would be re-employed, the farmer's buying power would be restored, and they would buy from us, and our factories and mills would start. We in turn, would give transportation to the railroads and the sprag would be taken out of the wheel and business would go on.

BALL BEARINGS AND SPROCKET CHAINS.

[Paragraphs 321 and 329.]

STATEMENT OF ADOLPH E. BRION, REPRESENTING PETER A. FRASSE & CO., NEW YORK CITY.

Senator McCUMBER. You may state your name and place of residence.

Mr. BRION. My name is Adolph E. Brion, president of Peter A. Frasse & Co., New York City. I will not take your time very long.

Senator SMOOT. What paragraph are you interested in?

Mr. BRION. I am interested in paragraph 321. I would like to see it divided.

Senator SMOOT. Antifriction balls and rollers?

Mr. BRION. Yes, sir.

Senator LA FOLLETTE. What relation do you bear to the maker?

Mr. BRION. President of Peter A. Frasse & Co. In this particular line we are importers. We import about 10 per cent of the goods we handle.

Senator McCUMBER. You want to divide paragraph 321?

Mr. BRION. Yes, sir. It covers not only the balls and rollers but the finished product.

Senator McCUMBER. Exactly how do you want it divided?

Mr. BRION. Just the balls and rollers, for ball bearing, and a separate clause for the other. I do not think the ball-bearing manufacturers would try to keep the tariff so high, because they are buyers of these balls.

Senator SMOOT. What do you want? Just the antifriction balls and rollers and ball bearings——

Mr. BRION. In a separate clause.

Senator SMOOT. What rate are you asking?

Mr. BRION. We are not asking for any rate.

Senator SMOOT. You want a differential between the finished product and the balls and rollers?

Mr. BRION. Yes, sir. Let the American manufacturer fix the rates. The American independent manufacturers of ball bearings have to ask for a high price, because they want it on the finished product. They probably would not ask such a high price otherwise. There is only one real manufacturer in this country.

Senator SMOOT. Does the brief show that fact?

Mr. BRION. The brief shows something else.

In 1917 there were three large manufacturers of steel balls, two of which have been taken over by ball-bearing manufacturers, so there is really only one large plant to-day. In 1917, for instance, a one-eighth-inch ball of a very high quality sold for 67 cents a thousand; to-day they are selling at from \$1.80 to \$4.20 per thousand. I think it is because there is so little competition.

Senator LA FOLLETTE. What is the name of the one company in which they have all been merged?

Mr. BRION. They have not been merged. The ball-bearing manufacturers took over the ball-making concerns to be sure of their supply of balls. The Atlas Ball Co. was taken over by the S. K. F. ball group of ball-bearing manufacturers, and the Standard Ball Bearing

Co., also makers of balls, was taken over by the Rockwell ball-bearing manufacturers. So that leaves it that the independent bearing manufacturer and others who need steel balls are required to buy them from this one remaining large manufacturer, who has the entire field to-day, the only competitors being a few small manufacturers. They have the entire field to-day. For that reason we believe if this clause is separated the American manufacturer or user of ball bearings will not ask so high a tariff as they need to protect the finished product. The question of the tariff we leave to you and the American manufacturer. If there ceases to be a profit in importing, we will stop importing.

In my brief I have tried to show two phases of the American valuation plan, both of which stand to bring in less revenue to the Government, because manufactured articles of iron and steel, if taxed on the suggested rate subject to American valuation, will be shut out entirely.

Senator SIMMONS. You say a tariff on the steel products of the country, using the American valuation together with the rates in the Fordney bill, would amount to a practical embargo?

Mr. BRION. A practical embargo on some of the items.

Senator SIMMONS. I would be glad if you would specify some of them.

Mr. BRION. Steel balls, for instance. I am not clear as to how the fixing of the American valuation is going to take place, whether a commission is going to be appointed or not. For instance, of steel balls there are five different grades. The methods of testing are the endurance test, accuracy, crushing strain, and so on, in the testing of those five grades. When you are importing the comparison will have to be made. As far as I can see, there will have to be a laboratory in every customhouse in the country.

Senator SMOOT. You do what, now, to find out the value?

Mr. BRION. The invoice shows the grade and value of same.

Senator SMOOT. That is it.

Mr. BRION. You probably would not take our word for it.

Senator SMOOT. No; and would not the American manufacturer?

Mr. BRION. It means a lot of detail if you are going to take the American valuation.

Another item in that is the very high-class chains we are importing for power transmission. They will run from 100 to 200 per cent higher in Europe than here. Of course, we assume they will also come under the American valuation. If they do, of course, the tariff will be very much reduced.

Senator SIMMONS. Why is that?

Mr. BRION. This grade is a very superior grade and is sold on its reputation, and in some of the grades they are 100 to 200 per cent higher in Europe, exclusive of importation costs, than here. Take any motor-cycle racing man. Very few will trust themselves on an American chain. Of course, notwithstanding the fact that you have raised the rate from 25 to 30 per cent, we will be getting them in cheaper under the American valuation plan.

Senator SIMMONS. Where an article is higher in Europe than in this country, how are you going to apply the principle on the difference in cost of production?

Mr. BRION. I assume you will get your American valuation—

Senator SIMMONS (interposing). I am not talking about the valuation; I am talking about the principle of protection. The article you are proposing to protect is selling in this country for very much less than it is selling in Europe?

Mr. BRION. Very much higher.

Senator SIMMONS. Do you mean higher in this country?

Mr. BRION. Very much higher in Europe than in this country.

Senator SIMMONS. Therefore, the American importing that article from Europe would have to pay more for it than he would have to pay for it if it was produced in America?

Mr. BRION. My understanding of the American valuation plan

Senator SIMMONS (interposing). I am not talking about the valuation plan; I am talking about the question of a tariff.

Mr. BRION. Yes, sir.

Senator SIMMONS. A tariff without any reference to any valuation plan whatever. I understand the theory of protection is that you ought to measure the difference between the cost of producing a given article abroad and here, and you say that the price of the European article imported to this country is higher than that of the American article?

Mr. BRION. Very much higher.

Senator LA FOLLETTE. Is that the same article?

Senator SMOOT. It is not the same article.

Mr. BRION. It is the same article, but of better quality.

Senator SIMMONS. It has no competition in this country?

Mr. BRION. It has no competition anywhere in the world.

Senator SIMMONS. Then why should a tax be imposed except for revenue purposes?

Mr. BRION. I will leave that to you.

Senator SIMMONS. If it sells higher abroad than it does here, why should a tax be imposed for tariff purposes?

Mr. BRION. I will leave that to you.

Senator SIMMONS. That is perfectly plain, is it not?

Mr. BRION. Yes. I would say we are in favor of a tariff, of course, as we are good Republicans.

Senator SIMMONS. Are you in favor of a tariff where there is no competition?

Mr. BRION. The trouble would be to fix a tariff that would take in all grades. There are low-grade chains imported from Germany to-day. Of course, if you fix the tariff two ways, one on the valuation and the other on the article, it would be accomplished in that way. But the tariff we had before of 25 per cent is high enough. We are satisfied with whatever you make it.

Senator LA FOLLETTE. I would like to understand a little better about these chains. Are they for motor cycles?

Mr. BRION. Motor cycles, bicycles, automobiles.

Senator LA FOLLETTE. Are those chains comparable in everything except the quality of the material and workmanship? Are they comparable in form and use?

Mr. BRION. Exactly.

Senator LA FOLLETTE. Substantially in weight and in size?

Mr. BRION. Exactly.

Senator LA FOLLETTE. And the high grade of the foreign article is due solely to superior workmanship?

Mr. BRION. Yes, sir; and reputation.

Senator LA FOLLETTE. And the better quality of material used in making the article; is that true?

Mr. BRION. Yes. Hans Reynolds, of Manchester, England, was the first maker of these chains. He made the bicycle possible. It has carried that reputation and quality through all these years. They are the best chain made in the world regardless of price.

Senator SMOOT. Everybody is willing to pay for it?

Mr. BRION. Customers buy them who are willing to pay a higher price for higher articles, but the business is not large.

Senator LA FOLLETTE. Under the American valuation those two chains would have to be compared with each other and the duty fixed on the American value, which is less than the foreign valuation.

Mr. BRION. Yes, sir.

Senator LA FOLLETTE. And therefore the duty in that case would be reduced under the American valuation?

Mr. BRION. Where you have raised the duty from 25 to 30 per cent, we would probably be only paying 18 or 20 per cent.

Senator SMOOT. Under the House provision?

Mr. BRION. Yes, sir.

Senator SMOOT. Not under the proposed provision here?

Mr. BRION. I don't know, sir. I would like to point out to you the question of valuation. I don't know how it is going to work. It is quite a puzzle to me. Take cutlery. There are 3,000 or 4,000 different shapes and qualities of knives, and of the files we import there are 1,300 shapes, sizes, and finishes.

Senator SMOOT. Each one to-day would not be any less under American valuation, nor any more.

Mr. BRION. There are so many of those different shapes and qualities that it is going to be very difficult. It is going to delay importations until you give us the figures. No importer can import them without he has that information. It is absolutely necessary to have those figures.

Senator SMOOT. They will be ready before this bill passes.

Mr. BRION. I have my doubts about that.

BRIEF OF ADOLPH E. BRION, REPRESENTING PETER A. FRASSE & CO., NEW YORK CITY.

BALL BEARINGS.

This company believes that the proposed rate of duty of 10 cents per pound and 5 per cent ad valorem on antifriction balls and rollers is ample protection to the American industry.

It is our desire to protest most strongly, however, upon the application of this duty on an American valuation basis, because—

(1) Many bureaus of enormous proportions will be necessary and operated at the Government's expense, to enable importers to calculate their business properly. Such bureaus will incidentally prove a very ready means of ascertaining costs of all material whatsoever and individuals or corporations can consequently gather such data on the pretext of importing. Also the bureaus must be maintained even if imports are negligible.

(2) The instability of such a cost basis makes it impossible to import material to fulfill a contract specification.

(3) There are about 28 domestic manufacturers of finished bearings and 5 of them make their own balls for their finished product. There are 7 manufacturers of balls and one of them practically monopolizes the entire market, as the production of the remainder is either inadequate or not of the extreme accuracy and high quality essential to the application of antifriction bearings.

(4) It will be practically impossible to secure an actual cost, and even more so for the Government to maintain costs as there is no control unless the Government establishes investigating bureaus for this purpose, with the resultant increase in expense.

(5) Owing to the small number of steel ball manufacturers (see par. 3) an invisible combine seems certain and costs arranged accordingly. Add to such a fugitive cost the proposed duty of 10 cents per pound and 35 per cent ad valorem, the importing of steel balls is quite impossible. Consequently a decrease in revenue results and incidentally a substantial loss to the importers who have extensively advertised and stocked their particular product.

(6) Such a combine is indicated inasmuch as all domestic price lists are identical and furthermore the present list was adopted quite recently.

(7) At the recent hearings before the Committee on Ways and Means the steel ball manufacturers petitioned a selling expense of "not less than 25 per cent and a profit of not less than 10 per cent." On investigation it is our belief that the intention was to reverse these figures, making them to read a selling expense of "not less than 10 per cent" and a profit of "not less than 25 per cent." We believe that this is quite exorbitant and proves our contention that increased prices to the users are inevitable on such a valuation basis, such increases continuing indefinitely.

(8) Importing steel balls under the existing laws at a duty of 35 per cent is accomplished by figuring a fair average profit over sizes one-sixteenth inch to 1 inch diameter as some steel ball sizes cost more than the selling prices of domestic manufacturers. Furthermore fluctuations in foreign exchange is the importers' risk, as slight differences in foreign exchange alter the conditions materially. Any perceptible increase in exchange will make the sale of imported steel balls exceptionally difficult, and the greater the increase the more difficult the sale, as better quality is applicable only up to a certain limit. Where the foreign exchange decreases in value, the manufacturing costs increase, resulting in increased prices to the importer. This, of course, is due to the decreased purchasing value of the declining currency.

SPROCKET CHAINS.

This company believes that the proposed rate of duty of 30 per cent ad valorem on sprocket and machine chains of iron or steel and parts thereof is excessive, and that the duty of 25 per cent on chain and 20 per cent on parts at present in force is ample protection to the American industry, because—

(1) The chains we import have a higher cost in the country of origin than domestic selling price.

(2) Examples:

$\frac{1}{2}$ -inch pitch by $\frac{3}{4}$ -inch wide, roller chain; foreign cost, \$0.65 per foot.

$\frac{1}{2}$ -inch pitch by $\frac{3}{4}$ -inch wide, roller chain; domestic sale, \$0.55 per foot.

1-inch pitch by $\frac{1}{2}$ -inch wide, block chain; foreign cost, \$0.36 per foot.

1-inch pitch by $\frac{3}{4}$ -inch wide, block chain; domestic sale, \$0.23 per foot.

$\frac{1}{2}$ -inch pitch by 1-inch wide, silent chain; foreign cost, \$2.10 per foot.

$\frac{1}{2}$ -inch pitch by 1-inch wide, silent chain; domestic sale, \$1 per foot.

(3) Cost can not be based on American valuation, as there are no domestic chains made nor will domestic manufacturers make a chain of comparable accuracy and quality.

(4) If valuation is made on American basis, the Government will lose in revenue accordingly.

(5) In view of the much higher cost of machine sprocket chains and parts imported, any increase in tariff is unwarranted and will curtail the importation of these quality chains, thereby reducing the Government revenue and depriving the country of a crying need for quality chains for various transmission purposes.

BALL BEARINGS, ROLLER BEARINGS, AND STEEL BALLS.

[Paragraph 321.]

BRIEF OF R. C. McCULLOCH, REPRESENTING THE BALL BEARING, ROLLER BEARING, AND STEEL BALL MANUFACTURERS.

The undersigned manufacturers of ball bearings, roller bearings, and steel balls respectfully call the attention of the committee to paragraph 321, page 51, of H. R. 7456 (tariff bill as passed by the House), now pending before your committee, which is as follows:

"PAR. 321. Antifriction balls and rollers, metal balls and rollers commonly used in ball or roller bearings, metal ball or roller bearings, and parts thereof, whether finished or unfinished, for whatever use intended, 10 cents per pound and 35 per cent ad valorem."

This paragraph changes the tariff provision covering antifriction bearing and parts thereof as it appeared in the Underwood Act of 1913, which is as follows:

"PAR. 106. Iron or steel anchors or parts thereof; forgings of iron or steel, or of combined iron and steel, but not machined, tooled, or otherwise advanced in condition by any process, not specially provided for in this section, 12 per cent ad valorem; friction balls, ball bearings, and roller bearings, of iron or steel or other metal, finished or unfinished, and parts thereof, 35 per cent ad valorem."

The new bill, as prepared by the House, changes the act of 1913 in the following particulars:

First. By putting antifriction bearings and parts thereof in a paragraph by themselves.

Second. By increasing the ad valorem rate of duty.

Third. By the assessment of a specific duty of 10 cents per pound in addition to the ad valorem rate.

The paragraph in the House bill was drafted after a full hearing by the Ways and Means Committee and a very careful consideration of the whole subject matter, duties and the dumping and undervaluation of bearings which had taken place under the act of 1913.

In support of the first change we submit that antifriction ball bearings and parts thereof are of the highest type of metal products. These bearings have been imported from several countries and in very large quantities. To avoid confusion in the compilation of import statistical data, essential in determining foreign competitive conditions, bearings and parts should be placed in a separate paragraph and not combined in a paragraph with iron or steel anchors and rough forgings to which they are in no way related. Furthermore, a separate paragraph for bearings was made necessary in order that proper descriptive phrases might be written into the paragraph.

In support of the second change which carries a change in the ad valorem rate we state that antifriction bearings can be imported under the rates of the House bill sold to American consumers in competition with those produced by manufacturers in the United States. It has been demonstrated by a comparison between the amount of duties collected on imports under the act of 1909, at the rate of 45 per cent, and the duties collected on imports during the first year of the operation of the act of 1913, at the rate of 35 per cent, that more revenue was collected under the higher rate. We are of the opinion that importations will continue in large volume and that more revenue will be collected under the rates of the House bill than would be collected under a lower rate of duty.

The third proposed change consists of the addition of a specific duty of 10 cents per pound to be compounded with the ad valorem rate of 35 per cent. This provision of a specific duty is necessary to compensate, in a measure, for the superior advantage which the foreign producers have in obtaining steel from which imported ball bearings and balls are made. The steel used in making ball bearings is of very superior quality. In its preparation the very highest priced alloys are used to give the material hardness and wearing quality. This steel must be purchased either in the American market or imported, and when imported, a very substantial steel duty is imposed with additional duties if the steel contains alloys. The foreign producer has a distinct advantage over the American producer in the price he pays for his high-grade steel used in making bearings. The Ways and Means Committee of the House, after a careful study of this question, fixed the specific duty at 10 cents per pound. This is excessive and should be allowed to remain in the bill in addition to the ad valorem rate therein fixed by the House. There is another and further reason for incorporating the specific duty of 10 cents per pound. Under the Underwood Act the foreign producers shipped to this country a large quantity of partly worked up material, such as unfinished bearings, balls, races, and other parts to be assembled in this country. Such parts of bearings are not sold either in the foreign markets or in the market in the United States in the condition as imported, and it therefore became impossible to ascertain the value of these uncompleted articles. Investigations abroad disclosed heavy undervaluations, in some instances as high as 100 per cent in the case of finished bearings, but the appraisers and general appraisers found it impossible to fix the value of the unassembled parts because they were not sold in that condition here or abroad. A specific duty of 10 cents per pound, in addition to the ad valorem rate, will tend to check the shipment of unassembled parts to this country and tend to prevent evasion of the ad valorem duties on parts of bearings. Of course the importer should not be denied the right to import his bearings in the knockdown condition and assemble them here, but the Congress should prevent him from obtaining an unfair advantage of the Government and domestic manufacturers. The specific-duty provision in our judgment, assist in preventing the evasion of some of the duties imposed by law.

NATURE AND EXTENT OF DOMESTIC INDUSTRY.

The ball and roller bearing industry in the United States has become an important one. The bearings are used wherever it is desired to reduce mechanical friction to a minimum. These bearings are produced from high-grade steel specially manufactured and tempered. Great precision is required in grinding the balls and in forming and grinding the races in which they are confined.

In the manufacture of antifriction bearings a large investment of capital in plants and machinery is required, but the fact that machinery is largely employed does not, in some industries, reduce the number of workmen, as it is necessary that these machines shall be manipulated by expert mechanics in order that the quality of product may be assured and undue waste of valuable material prevented. In the production of bearings 75 to 80 per cent of the cost of production is paid to labor.

The manufacturing plants are located in eight States. The average rate of pay for workmen is about \$5 per day. In countries in which competing factories are located, the average rate is from one-quarter to one-half of that paid to American workmen.

FOREIGN COMPETITION.

At the present time representatives of foreign producers are offering bearings and steel balls in the United States at prices with which domestic manufacturers can not compete.

Ball and roller bearings, foreign and domestic, are standardized as to size and load-carrying capacity, and foreign bearings can be interchanged with and supplant domestic bearings. For many purposes roller bearings and ball bearings can be interchanged, so that foreign bearings come into direct competition with all kinds of antifriction bearings manufactured in the United States. Large factories making bearings for export to the United States are located in Germany, Italy, United Kingdom, Belgium, Sweden, France, Switzerland, and Austria-Hungary.

In the past imported bearings have been "dumped" into the United States, to the injury of the domestic industry. For example, an automobile manufacturing company, operating in one of the low cost of production countries of continental Europe established a ball-bearing factory in a near-by town to supply its requirements. The bearing factory was organized to produce large quantities of bearings in order to get the maximum economies in production. There was a surplus over and above that required for the company's own automobiles and that surplus was dumped into the United States. These importations ceased during the war, but will, in all probability, be resumed. Bearings from another European country, arriving in large quantities prior to 1915, were undervalued. Some advances in values were made by customs authorities, and the whole line of merchandise was undergoing a value investigation at the time importations were stopped by the war.

Importations to the United States from one neutral country in Europe trebled in value during the war. Investigations by our customs officers into the correctness of invoice values were resisted by the importers, but evidence was finally obtained sufficient to warrant the Board of General Appraisers in advancing the value of finished bearings about 100 per cent. These importations exceeded (on the importer's own valuation) \$1,000,000 per year. This firm also imported many parts of bearings upon which no evidence of the foreign market value was obtained, and in the decision of the general appraisers above referred to parts of bearings were allowed entry into the United States at the importer's own value. In support of the above statements as to undervaluation, reference is made to the published decisions covering reappraisements Nos. 29103-29107; also reappraisalment decisions of the general appraisers dated March 21, 1919, reappraisalment No. 29244.

These dumping operations and undervaluations have not only deprived the Government of revenue and the domestic industry of a part of its protection, but they have operated to distort the statistical data from which the Congress forms its opinion of competitive conditions. The values of foreign imports are computed from the values stated in customs invoices. If these invoices contain undervaluations the amount of importations, for statistical purposes, is reduced below the true amount.

EXPORTS OF DOMESTIC-PRODUCED BEARINGS.

There have been no exports of metal bearings for the reason that the American manufacturer can not compete abroad with foreign producers. The American manufacturer is also handicapped in disposing of his bearings for use in machines for export, for the reason that if the imported bearing are used in such cases, customs duties paid on the imported bearings are refunded to the manufacturer of the exported

machine in the form of drawbacks, so that when a domestic manufacturer of machines for export receives proposals to furnish bearings to be incorporated therein, he can accept the proposal of the foreign producer with the assurance that the duties paid on the bearings will be refunded as drawbacks when the machines containing such bearings are exported from the United States.

De Witt Page, chairman, care New Departure Manufacturing Co., Bristol, Conn.)

ANVILS.

[Paragraph 325.]

STATEMENT OF CAMPBELL M. VOORHEES, COLUMBUS, OHIO.

Senator SMOOT. You may give your full name to the committee.

Mr. VOORHEES. My name is Campbell M. Voorhees.

Senator SMOOT. What paragraph are you interested in.

Mr. VOORHEES. Paragraph 325.

Senator SMOOT. That has relation to anvils?

Mr. VOORHEES. Yes, sir.

Senator SMOOT. Do I understand you speak for a number of manufacturers?

Mr. VOORHEES. At the suggestion of the chairman of the committee, I represent all the manufacturers who are at present in the city, consisting of Fisher & Norris, of Trenton, N. J.; Hay-Badden Manufacturing Co., of Brooklyn, N. Y.; Consolidated Iron & Steel Manufacturing Co., of Cleveland, Ohio; Columbus Forge & Iron Co. of Columbus, Ohio; and Columbus Anvil & Forging Co., of Columbus, Ohio. I am directly connected with the Columbus Anvil & Forging Co., of Columbus, Ohio.

This is known as paragraph 325 of the present tariff bill under consideration, and commonly known as the anvil schedule, inasmuch as the paragraph treats of anvils of all kinds and all manufactures.

The present bill provides for 1½ cents per pound. The Payne-Aldrich bill, as you will recall, provided for 1½ cents per pound; the Dingley bill provided for 1½ cents per pound; the Wilson bill provided for 1½ cents per pound; the McKinley bill provided for 2½ cents per pound. I am relying on my recollection and also memoranda from others.

Senator McLEAN. What does the Underwood bill provide?

Mr. VOORHEES. The Underwood bill provides 15 per cent ad valorem.

The five companies that I named during the war produced all the anvils required by the Government, as well as by the various industries of the United States. There were practically no anvils imported during the war. At the request of the Government departments all of these companies that I have mentioned increased their capacity. I am speaking now of the anvil industry. Some of these companies produce other things, and some of them produce anvils exclusively, but all of them increased their anvil production. So that now they are capable of producing at least 200 per cent more than the requirements of this country.

It is not necessary, therefore, to import any anvils into this country, because for every anvil that is imported here we produce one of like

nufacture. Understand, the English produce a wrought anvil; Sweden produces a cast-steel anvil; Germany produces a combination cast steel and wrought iron. We produce in this country all those kinds of anvils, and the anvils from Sweden are now in most active competition.

I do not wish to burden this committee with statistics, because what I have here were furnished by the Department of Commerce, but to give you a little illustration of what the condition was at the beginning of the war, let me cite the report made by the Department of Commerce as to the number of anvils—I am now speaking of them in the pound—that were entered at the port of New Orleans. The Swedish anvils come in at the port of New Orleans. They come in as ballast. The freight is very nominal. Upon investigation and comparison of actual statistics we found that anvils are coming from Stockholm, Sweden, to New Orleans for less than the freight from New York to New Orleans. At that time they were coming in at 25 cents hundredweight, and my recollection of the rate from New York is that it was something like 30 cents.

Now, for the year 1914—these statistics were furnished by quarters, but it is not necessary to give the quarter, and I will just give the total 264,806 pounds were entered at New Orleans alone; and at that time the American manufacturers of anvils were prepared and had the equipment and all of that to furnish all the anvils this country required.

Senator SMOOT. What year was that?

Mr. VORHEES. That was the year ending June 30, 1914, the fiscal year ending at that time, 264,806 pounds.

Senator SMOOT. The report I have here shows 727,502 pounds.

Mr. VORHEES. Senator, I am speaking of New Orleans, one port only.

Senator SMOOT. That is more than the whole.

Mr. VORHEES. No; I beg your pardon, Senator.

Senator SMOOT. It is from the record I have.

Mr. VORHEES. I have this from the Department of Commerce under date of October 6, 1916, giving the reports for 1914, 1915, and 1916. That is given by John Haan, of the Division of Statistics, 720,502 pounds. That was for the fiscal year ending June 30, 1914.

Senator SMOOT. And 9,687 pounds for the year 1918?

Mr. VORHEES. I have that, Senator, but in another place.

Senator McLEAN. What do you want?

Mr. VORHEES. I want to call attention to the fact of these importations, and where they are entered.

Now, San Francisco seems a long ways off from Stockholm, but Swedish anvils were delivered at the port of San Francisco, with practically no freight, having come in as ballast; and during the year that I speak of, according to the Government report, there were received at San Francisco 83,230 pounds, in competition with American manufacture.

Senator SMOOT. What are you asking for?

Mr. VORHEES. Senator and members of the committee, we manufacturers are of the opinion that we should have 2 cents a pound. We did not consider that 1½ cents of the Payne-Aldrich bill really placed us in a position to meet the competition, and I think the figures will show that to be the fact, because there were imported into this

country in 1911, as shown by the Government reports, 1,310,000 pounds.

Senator McLEAN. I suppose the additional cost is accounted for by the cost of labor?

Mr. VOORHEES. Yes; the difference in labor, because labor goes to make up all the raw material, excepting the raw iron itself; but labor follows it all through. I can give you figures about what the cost of labor is now. It is about 50 per cent higher than it was at the beginning of the war. I am giving you this as comparative figures. I have talked with my fellow manufacturers and I find that it runs about 50 per cent higher than what it was at the beginning of the war.

Freight rates. I can give you an illustration of that. I am not basing it so much on that, because I know in time it will be adjusted, but we in Columbus, Ohio, are paying for our coal—I mean our freight is costing us as much as our coal. Our Hocking coal is costing us from \$1.25 to \$1.40 a ton; the freight on it with the war tax is almost the same amount, \$1.41, something like that. The West Virginia coal costs us under contract \$2.25 a ton, and the freight is \$2.36. That is just a little item I am giving you.

Now, we have prepared a statement, at the suggestion of the Tariff Commission, and have answered every question that was submitted to us. We had no opportunity to be heard before the Ways and Means Committee. We had requested to be notified, but we were not and found the hearings were closed, and this is the first opportunity we have been given to be heard under this bill.

I would be very glad to answer any questions any of the committee desire to ask.

Senator McLEAN. What is the equivalent ad valorem rate of cents a pound?

Mr. VOORHEES. You mean on the American basis?

Senator McLEAN. Yes.

Mr. VOORHEES. Assuming average selling price of anvils at 15 cents per pound, 2 cents per pound would equal 20 per cent ad valorem.

Senator SMOOT. What do you sell these anvils at?

Mr. VOORHEES. By the pound.

Senator SMOOT. I know that.

Mr. VOORHEES. The present price?

Senator SMOOT. Yes; then we can tell.

Mr. VOORHEES. Anvils are now selling at from 12 to 15 cents.

Senator McLEAN. Then your rate is higher than your ad valorem.

Senator SMOOT. 10 per cent would be equal to 2 cents.

Senator McLEAN. You are better off now.

Senator SMOOT. Fifteen per cent ad valorem would be 3 cents. You are not asking nearly as much as the Underwood bill is giving you. Well, you would be on to-day's prices.

Mr. VOORHEES. Yes; it would on to-day's prices.

Senator SMOOT. Just about.

Mr. VOORHEES. We are of the opinion that a specific duty is the only way to fix a tariff on anvils.

It is not necessary for me to discuss the advantage to the Government in the way of revenue.

Senator SMOOT. No; that is all right.

Senator McLEAN. On the ad valorem basis it would not be as high as 2 cents; 2 cents specific would not be as high.

Mr. VOORHEES. Two cents?

Senator McLEAN. Two cents a pound specific duty would not make a very high ad valorem rate.

Mr. VOORHEES. No, sir.

Senator SMOOT. Although under the Underwood bill you have 15 per cent ad valorem, with anvils selling at 20 cents. That is 3 cents a pound. They have been coming in in great quantities, have they not?

Mr. VOORHEES. Do you mean since the war?

Senator SMOOT. Yes.

Mr. VOORHEES. We have no report yet for the fiscal year ending June 30, 1921, but we did have for the previous years.

Senator SMOOT. In 1920 there was shipped in 275,805 pounds. That is at 15 per cent ad valorem.

Mr. VOORHEES. They were almost exclusively of Swedish manufacture.

BRIEF OF CAMPBELL M. VOORHEES, COLUMBUS, OHIO.

We, as manufacturers of American anvils, respectfully present for the consideration of your committee the following facts:

Paragraph 325 of H. R. 7456 provides that: "Anvils of iron or steel, or of iron and steel combined, by whatever process made, or in whatever stage of manufacture, 2 cents per pound."

1. The varieties, grades, and characteristics of domestic and foreign anvils are as follows:

Columbian Hardware Co., manufacturer of all steel, special analysis, one-piece anvil.

Columbus Forge & Iron Co., Columbus, Ohio, manufacturers of wrought steel anvils, made of three pieces, each part welded to the other.

The Hay-Budden Manufacturing Co., Brooklyn, N. Y., forged base, forged top, welded in the middle.

Fisher & Norris, of Trenton, N. J., manufacture an anvil with a cast-iron base, welded to a tool-steel face.

Columbus Anvil & Forging Co., Columbus, Ohio. Wrought iron, top welded to steel base, with tool-steel face.

The German anvil is cast-iron base welded to a forged body.

2. The total investment of machinery and plant in the anvil industry is approximately \$750,000 to \$1,000,000.

3. The raw materials used in domestic manufacture are as follows: Steel castings, iron billets, tool steel, pig iron, steel billets, coke, coal, and oil.

4. The manufacture of anvils abroad is carried on very much in the same way as in the United States, with the exception that labor is paid on a very much lower scale in all operations than in this country.

5. Sweden, Belgium, Germany, England, and France are the source of foreign competition. Their product is directly competitive, and is entirely due to lower costs of labor, lower freight rates from Stockholm, Sweden, to New Orleans, and San Francisco, Calif. Labor and overhead in the cost of the anvil are 70 to 80 per cent of total cost. The material is 20 to 30 per cent.

6. The foreign countries of largest production in their proper order are Sweden, England, Germany, Belgium, and France.

7. Domestic production is equal to 100 per cent of domestic consumption, while domestic capacity is about 200 to 300 per cent of domestic consumption. (See paragraph 10. 11.)

8. All manufacturers in this country are exporting in a limited way a small part of their anvil production. Export prices are the same as domestic.

9. Domestic markets are blacksmiths, railroads, automotor manufacturers, machine shops, farmers, contractors, the mining industry, the oil industry, and shipbuilding. The foreign market is primarily in the Far East and South America, and Russia (in normal times).

10. Wholesale prices from 1910 to 1919 are as follows (in cents per pound):

1910.....	8	1915.....
1911.....	8	1916.....
1912.....	7½	1917.....
1913.....	8	1918.....
1914.....	11	1919.....

During 1920 the price remained 20 cents per pound. The average for 1921 is 19 cents per pound.

The average selling price over a period of years is 10 cents per pound and 10 per cent ad valorem on American valuation would, therefore, be 1½ cents per pound.

We ask for a specific duty of 2 cents per pound, or considering 10 cents per pound as the average selling price, this would be 20 per cent ad valorem, American valuation.

The Swedish anvil at the present time is being imported into this country and prices are ranging about 12½ cents per pound delivered to the interior of the United States.

11. At the beginning of the war the United States Army, particularly, and the Navy to some extent, bought very large quantities of anvils, and virtually forced the American manufacturers to put in sufficient equipment to take care of their requirements, which we are very glad to say we did, at our own expense. The equipment was very costly, and in our opinion it can be used on anvil production, provided we get the necessary protection from foreign competition, so that the market will not be subject to these importations, thereby limiting the possibilities of sales by us.

Referring to United States Government statistics, we add in this connection that in 1894 the duty on anvils was 2½ cents per pound specific, and the importations for that year were 736,915 pounds; in 1895 the duty was reduced to 1½ cents per pound, and the importations for that year and the succeeding year amounted to over 1,000,000 pounds per year. In 1898 the rate of duty was increased to 1½ cents per pound and the importations from 1898 to 1903 averaged approximately 600,000 pounds per year.

In 1907 the importations amounted to 709,749 pounds. In 1910 the rate of duty was reduced to 1½ cents per pound, and the importations for the year ending June 30, 1911, were 1,310,863 pounds. It is evident, from the foregoing, that as the rate of duty increases and decreases the importations decrease and increase, respectively.

The actual normal domestic production, in our opinion, is approximately 4,000,000 pounds per year; of value of \$450,000 at 10 cents per pound.

There are employed in the anvil industry 300 men per year of 300 days each, which if paid \$3 per day per man, would total wages of \$270,000 per year. Of course, this is the labor employed in the manufacture of anvils after producing the raw material.

Importations, fiscal years ending June 30—

1912 (895,908 pounds).....	\$45,000
1913 (969,427 pounds).....	51,000
1914 (1½ cents per pound specific, 168,286 pounds, \$8,423 duty; 15 per cent ad valorem duty, 559,216 pounds).....	32,000
1915 (340,678 pounds).....	29,000
1916 (226,895 pounds).....	13,000
1917 (187,680 pounds).....	11,000
1918 (20,544 pounds).....	2,000
1919 (21,019 pounds).....	2,000

We feel that we are justified in our request that the duty be made 2 cents per pound specific.

IRON OR STEEL CHAINS.

[Paragraph 329.]

STATEMENT OF DAVID S. DAY, BRIDGEPORT, CONN., REPRESENTING CHAIN MANUFACTURING COMPANIES.

Mr. DAY. I appear for eight of the chain manufacturing companies of the country: American Chain Co. (Inc.), Bridgeport, Conn.; Bradley & Co., Philadelphia, Pa.; Bridgeport Chain Co., Bridgeport, Conn.; J. B. Carr & Co., Philadelphia, Pa.; Chain Products Co., Cleveland, Ohio; Cleveland Chain & Manufacturing Co., Cleveland, Ohio; Columbus McKinnon Chain Co., Columbus, Ohio; Seattle Chain Co., Seattle, Wash.; S. G. Taylor Co., Chicago, Ill.; United States

in & Forging Co., Pittsburgh, Pa.; Woodhouse Chain Works, Paterson, N. J.

These were the only companies which appeared before the Ways and Means Committee of the House, and there was no appearance, so far as I was able to find, for the importers of chains.

Senator SMOOT. Are you an importer?

Mr. DAY. We are manufacturers.

Senator McLEAN. In what paragraph of the bill are you interested?

Mr. DAY. Paragraph 329. The tariff on chains as prescribed by the acts of the bills from 1890 to 1913, excepting the acts of 1894 and 1903, gave specific duties and also gave a minimum ad valorem duty of 15 per cent.

In the request before the Ways and Means Committee specific duties were requested, coupled with the minimum ad valorem duty. In the House bill specific duties were granted, but there is no minimum ad valorem duty; and the only request which we have to make of this committee is that there should be some minimum ad valorem duty.

The reason is this: In chain less than five-sixteenths of an inch in diameter, as it goes down to the very smallest sizes, the question of weight is out of all proportion to the value of the product.

Here [exhibiting] is the smallest size of chain made. It is 0.02 of an inch in diameter, and 12 yards of that chain weighs just 2 ounces. At 4 cents, which is the minimum rate, that chain will pay a duty of one-half a cent, while the selling price is 19 cents.

Therefore, on the smaller size of chain the bill gives neither revenue nor protection, for the reason that it is necessary, in order to give adequate protection, that there should be a minimum ad valorem rate. It can not be expected that the minimum ad valorem rate will give in the smaller sizes as complete protection as does the specific rate in the sizes of chain where the duty can properly be determined by weight alone, because as it goes into the larger sizes an ad valorem rate, which would give complete protection in the smaller sizes, would be out of all proportion to the specific rate fixed by the bill.

In working this out I have asked for 25 per cent, which I think is a fair rate. It does not give the same protection in the great majority of sizes as does the 4 cent rate, and in some of the larger sizes it is slightly in excess. But the larger sizes are not imported in competition with the American chain. All the competition is around the chain which is less than five-sixteenths of an inch in diameter.

Senator SMOOT. The House gave you higher rates than the Payne-Aldrich bill?

Mr. DAY. Yes, sir; the House gave us higher specific rates.

Senator SMOOT. I notice that under the Underwood bill you had no imports at all, but you are exporting this very chain.

Mr. DAY. That is true. The American manufacturers are exporting, and under the Underwood bill the first year before the war the imports almost doubled on chain, as I recall. I think it went from 650,000 to 1,100,000. Then the war came on and the imports on chain decreased under war conditions. At the present time, although I have not been able to get the figures, they are increasing very fast, and in the smaller sizes of chain, where the

percentage of labor is the greatest, the importers of foreign chains are underquoting American manufacturers to a very large degree—something like 40 per cent.

In the bill as it was passed by the House there is this provision:

Chain and chains of all kinds, of iron or steel, not specially provided for, 25 per cent ad valorem.

That is surplusage, because there are no unclassified chains. All chains are classified by their diameter and fall into one of the specific classes. But I think it indicates the decision of the House that 25 per cent was a fair ad valorem rate; and the only change that we are asking for is that that clause be taken out and that there be substituted therefor the following clause:

But no chain or chains of any description, except anchor and stud link chain, shall pay a lesser duty than 25 per cent ad valorem.

Of course, the proper minimum ad valorem duty is a technical question, and it is a question that the experts on the committee can advise you upon a great deal better than I can. I am perfectly willing to leave to the decision of the experts the fairness of the 25 per cent rate to cover smaller sizes of chains.

Senator McLEAN. Would you like to leave a brief with the committee?

Mr. DAY. Yes, I would, Senator McLean, but I would like to change it somewhat.

Senator McLEAN. You may do that and file it with the committee.

BRIEF OF DAVID S. DAY, REPRESENTING CHAIN MANUFACTURING COMPANIES

This brief relating to the tariff on chain, paragraph 329, Schedule 3, of the bill passed by the House of Representatives, is filed on behalf of the following manufacturers: American Chain Co. (Inc.), Bridgeport, Conn.; Bradley & Co., Philadelphia, Pa.; Bridgeport Chain Co., Bridgeport, Conn.; J. B. Carr & Co., Philadelphia, Pa.; Chain Products Co., Cleveland, Ohio; Cleveland Chain & Manufacturing Co., Cleveland, Ohio; Columbus McKinnon Chain Co., Columbus, Ohio; Seattle Chain Co., Seattle, Wash.; S. G. Taylor Co., Chicago, Ill.; United States Chain Forging Co., Pittsburgh, Pa.; Woodhouse Chain Works, Trenton, N. J.

A brief on behalf of the manufacturers represented in this brief was filed with the Ways and Means Committee of the House of Representatives, which brief, inasmuch as it was not a part of the record hearings, is refiled as a supplement to this brief. The fundamental questions relating to the protection to be afforded to the chain industry are discussed in the brief filed before the Ways and Means Committee. This brief will be confined to the discussion of a suggested modification in the phraseology of section 329 by the addition of a minimum ad valorem duty of 25 per cent applicable to all classes of chain except anchor chain. Section 329 of the House bill reads as follows:

"Chain and chains of all kinds, made of iron or steel, not less than three-fourths of one inch in diameter, 1 cent per pound; less than three-fourths and not less than three-eighths of one inch in diameter, 1½ cents per pound; less than three-eighths and not less than five-sixteenths of one inch in diameter, 2½ cents per pound; less than five-sixteenths of one inch in diameter, 4 cents per pound; chain and chains of all kinds of iron or steel, not specially provided for, 25 per centum ad valorem; sprockets and machine chains, of iron or steel, and parts thereof, 30 per centum ad valorem; anchor or stud link chain, two inches or more in diameter, 1½ cents per pound; less than two inches in diameter, 2 cents per pound: *Provided*, That all articles manufactured wholly or in chief value of chain shall not pay a lower rate of duty than that imposed upon the chain of which it is made, or of which chain is the component material of chief value."

e duties applying to chain under preceding tariff acts had been as follows:

	1883	1890 (McKin- ley).	1894 (Wilson).	1897 (Dingley).	1909 (Payne-Al- drich).	1913 (Underwood).
	<i>Cents.</i>	<i>Cents.</i>		<i>Cents.</i>	<i>Cents.</i>	
not less than $\frac{1}{2}$ inch.....	1 $\frac{1}{2}$	1 $\frac{5}{8}$	1 $\frac{1}{2}$	7 $\frac{1}{8}$	
than $\frac{1}{2}$ and not less than $\frac{3}{8}$ inch.	2	1 $\frac{3}{8}$	1 $\frac{1}{8}$	1 $\frac{1}{8}$	
than $\frac{3}{8}$ inch.....	2 $\frac{1}{2}$	2 $\frac{1}{2}$	1 $\frac{1}{4}$	1 $\frac{1}{4}$	
than $\frac{1}{4}$ inch.....			3	3	
Ad valorem (per cent).....		45	30	45	45	25 on machine and sprocket and 20 on other chain.

ree-eighths to five-sixteenths inch.

will be noted that each of the tariff acts from 1890 to 1913, inclusive, excepting
acts of 1894 and 1913, prescribed specific duties with a minimum ad valorem duty
per cent. The act of 1894 prescribed an ad valorem duty of 30 per cent and the
of 1913 prescribed an ad valorem duty of 25 per cent on machine and sprocket
n and an ad valorem duty of 20 per cent on other chain without specific duties in
er case. Section 329 of the House bill prescribes specific duties without any
imum ad valorem duty. The specific duties prescribed in the House bill while
iderably less than the amounts requested by the industry, afford protection, at
, against ruinous competition if supplemented by a reasonable ad valorem duty
no request is made for their alteration.

classes of chain where weight of material is fairly proportioned to the cost of
ufacture, the specific duties furnish an adequate method of determining the tariff.
ase of classes of chain where, by reason of the lightness of the material, or the
brateness of construction, weight of material is comparatively small as compared
the cost of production, the rates prescribed by paragraph 329 are inadequate from
standpoint of either protection or revenue. A typical case is the type of chain
rn as weldless chain, constructed of steel wire and in the smaller size of which the
at a flat rate of 4 cents per pound decreases out of all proportion to the intrinsic
and value of the product. This fact can be demonstrated by taking a number of
of single jack chain, a form of weldless chain in common use and comparing the
of duty with the price of the chain.

Diameter of chain.	Weight per dozen yards.	Net selling price.	Duty at 4 cents per pound.
inch.....	2 pounds 4 $\frac{1}{2}$ ounces	\$0. 285	\$0. 081
inch.....	1 pound 2 ounces..	. 228	. 045
inch.....	9 $\frac{1}{2}$ ounces.....	. 214	. 025
inch.....	4 $\frac{1}{2}$ ounces.....	. 19	. 011
inch.....	2 ounces.....	. 19	. 005

a chain of diameter of 0.091 inch the percentage of duty to selling price is ap
imately 27 per cent, while in chain 0.023 inch in diameter the percentage of
y is 2.6 per cent. Without a minimum ad valorem duty, therefore, chain falling
in the smaller classes pays an insignificant duty, less in amount even than the
sent 20 per cent ad valorem duty of the 1913 act. In the discussion before the
ys and Means Committee of the House comparatively little consideration was given
the ad valorem duty, because any ad valorem duty based on foreign valuations
adequate under present conditions would be prohibitive under normal conditions,
lany ad valorem duty adequate against German exporters, who are the chief
opetitors of the American manufacturers, would be prohibitive against all other
untries.

n section 329 of the House bill there is a provision, however, that chain and chain
all kinds of iron or steel, not especially provided for, shall pay a duty of 25 per
it ad valorem. As every type of chain falls within the general classification by
es, this provision is surplusage. It evidences the intention, however, of the House
prescribe 25 per cent as the fair basis of general ad valorem duty. An ad valorem

duty of this amount based on American valuation will not exceed the ad valorem duty of 45 per cent on foreign valuations under normal conditions prescribed in previous tariffs, and the request is made that a minimum ad valorem duty of 25 per cent be prescribed on all classes of chain except anchor chain. It is impossible, of course, to establish any minimum ad valorem rate of duty which will in all cases coordinate with the specific duties, even where adequate protection can be afforded under the specific duties. In the larger sizes of chain an ad valorem duty of 25 per cent under present market conditions slightly exceed the specific duties imposed by the bill. The amount of chain in excess of five-sixteenths of an inch in diameter, imported into this country, as compared with the amount of chain under five-sixteenths of an inch in diameter has been very small, and the direct competition between the domestic and foreign producer has been largely confined to chain under five-sixteenths of an inch in diameter. In the various classes of chain less than five-sixteenths of an inch in diameter a duty of 25 per cent will not in any case exceed the specific duty of 4 cents per pound except in the case of chains of very small diameter and correspondingly small weight, where, for the reasons stated above, the duty clearly should be in excess of the amount prescribed by the specific rate.

With regard to the ad valorem duty of 30 per cent on sprocket and machine chains prescribed by the House bill, none of the manufacturers represented in this hearing are manufacturers of these types of chain. In the proposed amendment of section 329 the phraseology of the House bill with respect to these types of chain is simply restated.

Anchor chain, which is specially excepted from the minimum ad valorem duty, is a form of chain manufactured in part by machine and in part by hand process. The duties on this type of chain prescribed by the House bill are based on comparative costs of production in America and England, which is the only competing country in this class of chain. Chain of this type falls within narrow limits as to sizes, and can be classified for specific duty without requiring a supplementary ad valorem rate.

The recommendation is, therefore, made that section 329 of the House bill be amended to read as follows:

"PAR. 329. Chain and chains of all kinds, made of iron or steel, not less than three-fourths of one inch in diameter, 1 cent per pound; less than three-fourths and not less than three-eighths of one inch in diameter, 1½ cents per pound; less than three-eighths and not less than five-sixteenths of one inch in diameter, 2½ cents per pound; less than five-sixteenths of one inch in diameter, 4 cents per pound; sprocket and machine chains, of iron or steel, and parts thereof, 30 per centum ad valorem; anchor or stud link chain, two inches or more in diameter, 1½ cents per pound; less than 2 inches in diameter, 2 cents per pound; but no chain or chains of any description except anchor and stud link chain, shall pay a lesser duty than 25 per centum ad valorem: *Provided*, That all articles manufactured wholly or in chief value of chain shall not pay a lower rate of duty than that imposed upon the chain of which it is made, or of which chain is the component material of chief value."

SUPPLEMENTAL BRIEF.

The manufacture of chain for the purpose of classification is segregated into two classes:

Chain manufactured for ordinary commercial purposes and running from one-sixteenth of an inch in diameter to one and one-half inches in diameter; and

Anchor or stud link chain running from 1½ inches in diameter to 3½ inches in diameter.

The investment at the present time in the United States in the chain manufacturing industry and in articles fabricated from chain is estimated at \$20,000,000, and the number of men employed in the industry as between 8,500 and 10,000.

In consideration of the general question of tariff protection, one factor must be given particular stress—which will be discussed hereafter more in detail—and that is that competition, actual and prospective, centers largely upon commercial chain less than five-sixteenths of an inch in diameter and on anchor chain. In chain less than five-sixteenths of an inch the proportion of labor cost to material cost is high, which proportion decreases with the increasing size of chain, except that in the manufacture of anchor chain the labor cost increases in proportion to the material cost on account of the fact that the process of manufacture is a combination of hand and machine work. The conditions governing competition between domestic and foreign chain in the case of commercial and anchor chain are so divergent, and the general questions of tariff policy so different, that the tariff on these two classes of chain will be discussed separately.

TARIFF ON COMMERCIAL CHAIN.

The amount of chain actually imported into this country for domestic use has always been limited. This was occasioned of course in part by the protection afforded by the tariffs in force from 1883 to 1913, under which tariffs there were specific duties well as ad valorem duties, except in the Wilson tariff of 1894, in which the tariff is fixed at an ad valorem duty of 30 per cent. With the reduction of the ad valorem duty under the Underwood tariff, and the removal of the specific duties, there was the first year in which this tariff was in effect an increase in the amount of importations from 650,102 pounds to 1,152,252 pounds. Under the war conditions the amount of chain imported after 1915 decreased to a nominal amount. Under the conditions created by the war, American manufacturers largely increased their production to meet the requirements of the domestic trade and the Government and were so enabled to increase appreciably the export business in chain. With the termination of the war and the revival of manufacturing abroad, there is injected an entirely new factor into the situation. The direct competition is largely limited to chain five-sixteenths of an inch in diameter and less, included in which are the sizes having the largest general use, and the sizes in which the labor component is proportionately the largest. The competition in this class of chain is largely confined to Germany, and with that country—by reason of the depreciated currency—the differential between American and foreign cost of production is the largest. Under the present tariff, with its low ad valorem rate of duty, the opportunity is open for the German manufacturer to force the American chain manufacturers from their dominant position in the world trade, and also, by dumping chain in the American market at low cost, to demoralize the manufacturing industry in America.

And the first and most logical step to force the American manufacturer from its dominant position is to attack directly the American market where, by underselling the American manufacturers, their ability to compete in other countries can be curtailed, if not eliminated. That the German manufacturers have already commenced a policy of this kind is evidenced by a letter addressed to the trade generally by the Boker Cutlery & Hardware Co. (Inc.), one of the largest chain and hardware importing houses in this country, which letter, with attached price lists and a statement of comparative prices under this offer and the quotations of the American Chain Co. then in force, are printed in the supplement of this brief.

The Boker quotations show the ability of the German manufacturers to import chain into this country with the tariff paid under the price fixed by the American manufacturer in a competitive market. How large or unreasonable may be the profit distributed between the importing house and the German manufacturer is, of course, impossible of determination. As to the actual comparative costs of manufacture in Germany and in America, there is no complete data. The only information which it has been possible to secure is the fact that German common laborers in chain factories were paid at the rate of 65 marks a day in December of 1920, which is the equivalent of \$1 at this rate of exchange, as compared with 46 cents an hour for an 8-hour day in America, or \$3.68 a day. It can fairly be assumed that the same disproportion exists in other classes of labor employed in the chain business. The ratio of German labor costs to American labor costs is therefore 27 per cent. The labor component in the cost of manufacture averages 35 per cent in the larger sizes to 60 per cent in the smaller sizes. Taking a common denominator of \$1, the labor cost in America would average from 35 to 60 cents to a dollar of goods produced, while the corresponding labor cost in Germany would average from 9.4 cents to 12.5 cents. Except, therefore, in classes of chain having the lowest labor component, the specific duty of 25 per cent for machine and sprocket chain and 20 per cent for other classes of chain will not cover the differential between German and American labor alone. As every component of cost abroad is lower than the corresponding cost in America, with one possible exception—basic materials—the rates of duty imposed by the Underwood tariff are clearly inadequate from the standpoint of either revenue or protection. In order to secure the maximum of protection and revenue and to eliminate the inequality which exists by reason of the exchange situation in favor of Germany and other continental countries where the exchange is the lowest, specific duties should, of course, be resorted to in place of ad valorem duties when such a course is practicable.

Chain is an article which permits of simple and easy classification for specific duties, as is evidenced by the tariff acts of 1883, 1890, 1897, and 1909. Under the 1909 acts, the ad valorem duty of 45 per cent exceeded in the majority of imports the specific duties imposed by the tariff, as is evidenced by the fact that out of the total imports from 1909 to 1913 in excess of 75 per cent of those imports were appraised for tariff purposes under the ad valorem of 45 per cent rather than under the specific duties. The largest proportion of the imports of chain during these years consisted of chain less than five-sixteenths of an inch in diameter, as shown in the Tariff Information Survey prepared by the United States Tariff Commission.

In the case of an actual importation of three-sixteenth of an inch chain, which the typical size of chain falling within the classification of chain less than five-sixteenths of an inch, made in June of 1912, the invoice value per hundred feet was 11 marks and the weight per hundred feet was 32 pounds. The customs value of the mark at that time was 23.80 cents, which gives an invoice value of 3.21 cents per hundred feet. At the specific duty of 3 cents a pound, the duty assessed would have been 96 cents per hundred feet. In consequence, the duty was assessed at 45 per cent, or \$1.44 per hundred feet, which is approximately 4½ cents per pound. This was the prevailing duty under the 1909 tariff act for chain less than five-sixteenths of an inch in diameter. As the manufacturing costs have increased in all classes of chain over 1909 costs, from a minimum of 50 per cent to a maximum of 100 per cent, the specific duties equivalent to the 1909 specific duties should be increased not less than 50 per cent, which increase should be based in the case of chain less than five-sixteenths of an inch in diameter on 4½ cents, the actual duty paid in 1909, rather than the 3-cent specific duty of that tariff.

In the drafting of this article, attention is also called to the fact that chain is not imported alone in its crude form but imported already assembled in various articles of manufacture. Under the tariff act of 1909, there is a ruling that assembled surveyors' chains should be classified as chain, and possibly this interpretation would be applied to other articles. It is suggested, however, that this point be directly covered by the phraseology of the section applying to chain generally.

There is submitted the following recommendation as to the terms of this section: "Chain or chains of all kinds made of iron or steel, not less than three-quarters of an inch in diameter, 1½ cents per pound; less than three-quarters of an inch in diameter and not less than three-eighths of an inch in diameter, 1½ cents per pound; less than three-eighths of an inch in diameter, and not less than five-sixteenths of an inch in diameter, 2½ cents per pound; less than five-sixteenths of an inch in diameter, 6½ cents per pound; but no chain or chains of any description shall pay a lesser duty than 45 per cent ad valorem.

"All articles manufactured wholly or in chief value of chain shall not pay a less duty than that imposed upon the chain of which it is made, or of which it shall be the component thereof of chief value."

ANCHOR CHAIN

In the manufacture of anchor or stud-link chain, the sole competitors of the American manufacturers have been the chain manufacturers of England, which hold a position of actual domination in this class of chain owing to the more extensive development of shipbuilding in that country. Prior to 1917 the capacity for producing anchor chain in this country was limited and confined entirely to a few manufacturers who produced this chain under exclusively handmade processes. The total productive capacity of all plants in America up to the spring of 1917 was approximately 10 suits of chain per week, which would represent a total manufacture in pounds of approximately 20,000,000 pounds a year.

Owing to war conditions abroad and the impetus given the shipbuilding industry in America in consequence thereof, this capacity was fully absorbed in the fall of 1916, for ships in process of building for both American and foreign account.

Upon the entry of United States into the war, and in consequence of the large shipbuilding program of the Emergency Fleet Corporation, calling for over 1,000 ships within a comparatively short period of time, all the manufacturers of anchor chain in the United States were called to Washington to consider the possibility of producing a sufficient quantity of this material to provide for the shipbuilding program and it was immediately apparent that some new and increased method of producing this material would have to be devised. The Navy Department had developed at the Boston Navy Yard a process of producing ship's anchor chain under steam air power hammer, and the American manufacturers agreed to develop this process from a commercial standpoint, with the result that during 1917 and 1918 large investments were made in equipment for this process which, together with the hand-labor previously met the requirements of the shipbuilding program to the extent of all but 15,000,000 pounds imported by the Emergency Fleet Corporation. The actual figures for 1917 imports are as follows:

Calendar years.	Pounds.	Value.
1918.....	5,593,583	\$331,000
1919.....	9,507,120	750,000
1920.....	577,456	44,000

All of this chain came in free of duty under section 4, article J, subsection 5, of the tariff act of 1913, as material of foreign production necessary in the construction of vessels.

The English quotations on which chain was purchased by the Emergency Fleet Corporation during 1919, and the comparative manufacturing costs in the plant of the American Chain Co. (Inc.), under practically the same relative conditions of labor and material in the two countries, and using the most improved methods of manufacture which have been developed, were as follows:

Size.	English price at \$4.86.	English price at \$4.	American factory cost.
1/2 inch.....	\$7.25	\$6.12	\$8.45 per 100 pounds.
3/4 inch.....	7.02	5.96	\$8.01 per 100 pounds.
1 inch.....	7.72	6.44	\$8.92 per 100 pounds.
1 1/4 inch.....	7.90	6.57	\$7.97 per 100 pounds.
1 1/2 inch.....	8.00	6.66	\$8.01 per 100 pounds.

The English quotations given above are f. o. b. English ports. The ocean freight charges on anchor chain have always been and are to-day exceedingly low; the freight from Liverpool to New York at the present time being quoted at approximately 35 cents per hundred pounds, while the carload rate of freight from Columbus, Ohio, to New York is 48 cents per hundred pounds.

The amount of the investment in the manufacture of anchor chain is approximately 2,000,000, and the number of men employed is approximately 1,500. The productive capacity of the American plants in 1920 is conservatively estimated at 100,000,000 pounds a year, as compared with 20,000,000 pounds in 1917.

At the present time, owing to the curtailment of the shipbuilding industry, the manufacture of ship's anchor chain is practically at a standstill, and the competition between American manufacturers to secure sufficient business to hold organizations together is so drastic that anchor chain is quoted in the American market at less than the actual cost of manufacture, and less than the English quotations which have increased owing to temporary conditions in the chain industry in England. This condition is one that can not continue to exist, and by reason of the dominant position of England in the manufacture of this chain, present depreciation in English exchange and the normal difference in the cost of labor, the American manufacture of anchor chain will in all probability be largely curtailed, if not altogether eliminated, unless some measure of protection can be given to it.

It is respectfully submitted that inasmuch as the development of anchor chain in this country was based upon the express requirements of the United States Government during the war, the American manufacturers of anchor chain are entitled, as much as any other manufacturer, to tariff protection which will enable them to compete on a parity with foreign manufacturers.

There is also involved a question of national policy which is entitled to grave consideration. Without doubt, in the normal development of the shipbuilding industry, the total chain requirements of this country can be supplied by English manufacturers, and possibly at a slightly lower cost than the equivalent chain can be manufactured and sold in this country, but if England is given control of the market for anchor chain, the value of American shipyards to the National Government in the case of an emergency under which foreign shipments are cut off is largely eliminated, because the production of ships can not advance at a faster rate than the manufacture of the anchor chain necessary for their equipment.

Whatever added cost may be entailed by reason of tariff protection will not be a material factor in the ultimate cost of ship construction, and is of less importance in any event than the possible elimination of an industry so essential to ship construction. The tariff differential to be adopted should be based on the normal difference in cost of manufacture in America and in England. Actual manufacturing costs in England are not, of course, obtainable, but by deducting a reasonable profit from the English quoted prices given above, and which were quoted under parallel conditions of manufacture existing at that time in this country and in England, give a fair approximation of the English manufacturing cost. It is conceded, of course, that in this particular type of chain only secondary consideration need be given to revenue, and the protection should be the minimum allowance which will permit the American manufacturer to compete.

Taking these facts into consideration, and allowing for a gradual return of exchange to normal, it is recommended that the tariff on anchor chain shall be fixed at 2 cents

a pound for chain 2 inches or more in diameter and 2½ cents a pound on chain less than 2 inches in diameter.

This can be accomplished by amending section 4, article J, subsection 5, of the tariff act of 1913, by adding at the end of such section the words:

“Excepting therefrom anchor or stud link chain, which shall pay a duty as follows: “Anchor or stud link chain 2 inches or more in diameter, 2 cents per pound. and less than 2 inches in diameter, 2½ cents per pound.”

And by amending section 4, article J, subsection 7, by adding at the end thereof:

“Except anchor or stud link chain, which shall pay the duty prescribed in section 6 of this article as amended.”

New York, November 1, 1920

WIEBUSCH & HILGER (LTD.),
New York City.

GENTLEMEN: We are in a position to accept orders for high grade imported electric weld bright machine coil and halter chains for delivery about January 1, 1921, subject to prices specified on attached list.

We shall also receive machine chain in sizes from 4/0 to 10/0 and coil chain in sizes 4/0 to 6/0, but we are not as yet prepared to quote prices on these sizes.

Our imported chain is not for its hardness and tensile strength and the quality is guaranteed. The size and gauge of links conform to the American standard.

We hope that we may again be favored with your orders.

Yours, very truly,

BOKER CUTLERY & HARDWARE CO. (INC)
C. HEIMICK, Hardware Department.

[Boker Cutlery & Hardware Co. (Inc.), Nov. 1, 1920.]

QUOTATION ON IMPORTED CHAIN.

German electric weld machine chain twist link, per 100 feet: 4 and 5, \$6; 3, \$6.50; 2, \$6.55; 1, \$6.85; 0, \$7.10; 00, \$7.80; 000, \$8.45. Less 5 per cent on orders averaging 1,000 feet of a size and over.

German electric weld coil chain twist link, per 100 feet: 4 to 6, \$3.45; 3, \$3.50; 2, \$3.75; 1, \$4.05; 0, \$4.35; 00, \$4.60; 000, \$5.

German electric weld coil chain straight link, per 100 feet: 1, \$4.05; 0, \$4.30; 00, \$4.60; 000, \$5. Less 5 per cent on orders averaging 1,000 feet of a size and over.

German electric weld halter chains, 4½ feet, per dozen: 4 to 8, \$2.25; 3, \$2.30; 2, \$2.45; 1, \$2.70; 0, \$2.90; 2/0, \$3.30; 3/0, \$3.70; 4/0, \$4.20.

German electric weld halter chains, 6 feet, per dozen: 4 to 6, \$2.75; 3, \$2.90; 2, \$3; 1, \$3.60; 0, \$3.60; 2/0, \$4.05; 3/0, \$4.60; 4/0, \$5.20. Less 5 per cent on orders averaging 12 dozen of a size and over. F. o. b. New York. No freight allowance.

Comparison between quoted prices of Boker Cutlery & Hardware Co. and the quoted prices of American Chain (Inc.) then in force.

4½-FOOT ELWEL HALTERS.

CARD CLOTHING AND CARDING MACHINES.

[Paragraphs 337 and 393.]

STATEMENT OF JOSEPH F. LOCKETT, REPRESENTING LEIGH & BUTLER, BOSTON, MASS.

The CHAIRMAN. State your occupation or business.

Mr. LOCKETT. I am a lawyer, with an office in Boston, Mass.

The CHAIRMAN. Whom do you represent?

Mr. LOCKETT. Leigh & Butler, of Boston, who are importers of machinery and card clothing.

The CHAIRMAN. Proceed.

Mr. LOCKETT. Mr. Chairman and gentlemen of the committee, I wish to direct your attention to paragraph 337 of the Fordney bill, which provides for a duty on card clothing, when manufactured with tempered or untempered round iron or steel wire, etc., of 35 per cent ad valorem, based, of course, upon the American valuation.

Under the Underwood law the rate, under paragraph 124, was 35 per cent ad valorem. Under the Payne-Aldrich law there was a duty of 45 cents per square foot, under paragraph 145, on the round tempered steel wire; and 55 cents per square foot when made from plated steel wire.

We desire to go on record in favor of a protective tariff which will represent accurately, as far as can be estimated, the actual difference between the cost of production here and abroad.

It is difficult, however, to analyze the rate of duty which the Fordney bill proposes, namely, 35 per cent, because the said rate of 35 per cent, based on the American valuation, as I can show, is equivalent to a rate of about 89 cents per square foot, or 100 per cent advance over the Payne-Aldrich rate of 45 cents per square foot.

We did not appear before the Ways and Means Committee at the time this bill was under consideration, because at that time it was

suggested in the press that the intention of the Ways and Means Committee was to approximate, so far as possible, the rates of duty in the Payne-Aldrich law. While 45 cents per square foot might be a satisfactory rate to-day under present conditions in estimating the landed costs based upon the present value of the pound sterling, however, as the exchange advances it will, of course, increase the landed cost to the importer with the result that 45 cents per square foot will be too high.

We think card clothing is one commodity as to which, if the committee and Congress desire to have a specific duty, it can be applied with accuracy. In fact, American manufacturers testified before the committee in 1913 and went on record in favor of a specific rate of duty. We favor it here to-day. We think if a specific duty is put on it will help the Government officials in estimating the revenue, will lessen the likelihood of litigation, and will be better and fairer for all concerned.

The fact is that the American valuation plan which this committee has voted to recommend involves a new principle this year which has not been considered heretofore in other and previous tariff revisions.

For instance, if we take a unit of 272 square feet of this material—272 feet long and 2 inches wide of No. 120, so-called, the number indicating the number of points to the square foot—we find the American selling price for such a unit, based on to-day's American value, is \$691.15. If you take \$691.15 at the rate prescribed in the Fordney bill—namely, 35 per cent—the duty is \$241.90, which, as I said a moment ago, is equivalent to about 89 cents per square foot.

If you take the same American value of \$691.15 at 18 per cent you get a duty of \$124.40, divided by the total number of square feet in this illustration, namely, 272, is equivalent to approximately 45 cents per square foot. Therefore, we believe that if it is the desire and the intention of the committee and of Congress——

Senator SMOOT (interposing). Please give the foreign valuation.

Mr. LOCKETT. Senator Smoot, I haven't the foreign valuation in pounds, but I have the foreign valuation reduced to dollars.

Senator SMOOT. I can reduce it to pounds.

Mr. LOCKETT. The foreign value of this article including freight and all charges except the duty, based upon a conversion of \$4 to the pound sterling gives——

Senator SMOOT. It is \$3.62.

Mr. LOCKETT. Well, I will take it at \$3.70. I have it here. That gives \$456.94.

Senator SMOOT. And the American valuation?

Mr. LOCKETT. And the American valuation is \$691.15. Before I proceed, Senator Smoot, are there any more figures you would like to have?

Senator SMOOT. That is, there is a 50 per cent difference?

Mr. LOCKETT. Between these two amounts.

Senator SMOOT. In other words, 50 per cent is profit.

Mr. LOCKETT. Not at all, because duty, profit and selling expenses are not included in the \$456.94.

Senator SMOOT. There is not much untempered steel made in the card clothing industry, is there?

Mr. LOCKETT. No, sir.

Senator SMOOT. I know I ceased to buy it long before I went out the business.

Mr. LOCKETT. Of course, Senator, you know what it is used for.

Senator SMOOT. Oh, yes.

Mr. LOCKETT. It is used to card cotton and wool. The product to sell and import is made by Joseph Sykes, of Huddersfield Bros., England.

Senator WATSON. What percentage of consumption in the United States is made in the United States?

Mr. LOCKETT. I have not those figures, Senator Watson. We had to get them from the statistical bureau, but they were not up to date. I have the figures of imports, which are comparatively small.

Senator LA FOLLETTE. Does the bulk of foreign imports come from England?

Mr. LOCKETT. Yes.

Most of the manufacturers in this country import the foundations, which are in various combinations of cotton, wool, and India rubber. They usually import the round tempered wire. There is a machine which is called a setting machine, which cuts the wire and sets it into the foundations. The cost to the foreign manufacturer to set the points into the foundation is nearly 100 per cent more than the cost to the American manufacturer. We have figures to prove this point. In other words, the labor cost for setting the wire is twice as much in England as it is in this country. Foreign exchange—and I am now speaking of sterling—depreciated only 35 per cent, whereas Sykes Bros. increased their price over 100 per cent.

Senator WATSON. The expert says that practically all the card clothing for use in the carding of cotton is made in the United States; that 50 per cent of that used in carding wools is made in England. What is the difference between the two?

Mr. LOCKETT. I understand about one-half of the cotton card clothing sold in the United States is imported. They have a different kind for cotton and a different kind for wool. I am not an expert on that.

Senator WATSON. Then, the imports for this particular article for carding cotton do not seem to have affected our manufactured product in this country.

Mr. LOCKETT. No, sir.

Senator SMOOT. I never used any unless it was in connection with leather.

Senator WATSON. Do you use it for wool?

Senator SMOOT. Absolutely.

Mr. LOCKETT. The fact is, this product has a world-wide reputation for endurance, that is, Sykes clothing is considered to be the best in the world.

I have testimonials from some cotton mills; one is from the Exposition Cotton Mills of Atlanta, Ga., and I would like to read one part of it for the record and, possibly, file other parts. In these testimonials the users of card clothing state that if for any reason Congress should put a prohibitive rate of duty upon this product, or a rate which would prohibit its importation into this country, the result would be that the American manufacturer would, possibly, increase

his price out of all proportion, and the American cotton mills would have to be satisfied with the domestic product, which they say is essentially inferior. Therefore, it seems to me, Mr. Chairman and gentlemen of the committee, that the fair and just thing to do, as stated in my opening remarks, is to fix a rate of duty which will represent the actual difference in cost of production here and abroad.

A gentleman writing for the Exposition Cotton Mills has this to say—

Senator WATSON. Did I understand you to say that the American product is distinctly inferior to the foreign product?

Mr. LOCKETT. Yes, sir; that is so. That appears from these testimonials which I have here, and I think an investigation will show this to be the fact. The life of the foreign product is longer than that of the domestic product. The manner of putting it together, the setting of the teeth in the wire, and the putting together of the foundations, are all elements making for the success of the foreign product.

One of these gentlemen to whom I have referred, Mr. George B. Harris, president of the Exposition Cotton Mills, Atlanta, Ga., has this to say:

Should a prohibitive tariff eliminate English-made clothing the American mills unquestionably would suffer and our progress be seriously retarded. The quality of American-made card clothing has been held up by reason of the high quality of imported clothing. Without the very best card clothing American mills can not compete in the world's markets, especially in the finer grades of cotton goods. To remove this competition in the manufacture of card clothing would result in the lowering of the quality of the immense product of American cotton mills and would work a serious hardship on this industry for the benefit of a very few comparatively small manufacturers of card clothing and the revenue obtained from such a tariff would be infinitesimal.

Mr. J. E. Hardin, secretary and general manager of the Proximity Manufacturing Co., Greensboro, N. C., said:

If a prohibitive tariff is placed on this English clothing manufactured by Messrs. Joseph Sykes Bros., it would not only prevent our ability to secure a much superior product, but would also enable the domestic makers to greatly increase their price on a decidedly inferior product and monopolize on a very important item required by one of the country's foremost industries.

Similar statements have been received from the Massachusetts Cotton Mills in Georgia and from the Cannon Manufacturing Co., Concord, N. C., and from a concern in Charlotte, N. C., and a number of other mills.

Senator GERRY. Do you advocate a duty such as will put this commodity on the same basis as the imported article, although you say the domestic article is inferior?

Mr. LOCKETT. The point is, Senator Gerry, that we favor a duty which will represent the difference in the cost of labor here and abroad.

Senator GERRY. Then, you want the consumer here to pay a similar price for an inferior article?

Mr. LOCKETT. We do not want him to, of course. That might follow, perhaps, as a result of a duty on this product.

Senator McCUMBER. The superior article will always command the superior price.

Mr. LOCKETT. That is true in some cases. That is why we have been able to sell some of this product under present conditions. But

fact is—and I think it is not disputed—that if the rate of duty it now stands in the Fordney bill is applied, based upon the American valuation plan—and this amounts to a 100 per cent increase over the Payne-Aldrich rate—the rate will be absolutely prohibitive as to card clothing; and the American mills, I contend, ought to have a chance to buy this card clothing on a fair and square basis and the importers ought to have an opportunity to compete. Therefore, we suggest, Mr. Chairman and gentlemen, that if a specific rate of duty is to be put on, it be 40 cents per square foot on round tapered steel and 45 cents per square foot on the plated wire. We strongly urge a specific duty and see no reason why it should not be applied. It was in vogue for years prior to the Underwood bill.

On the other hand, if the committee desires to continue the ad valorem rate, then we strongly urge a rate of 18 per cent ad valorem, based upon the American valuation plan, which is the equivalent, approximately, of 45 cents per square foot under the Payne-Aldrich law.

Senator SIMMONS. Do you mean to say that the substitution of the American plan for the foreign valuation makes a difference in this particular instance of about 89 per cent?

Mr. LOCKETT. No; not 89 per cent, but 100 per cent. It makes the specific duty, under the proposed bill, 89 cents per square foot, whereas under the Payne-Aldrich law it was 45 cents per square foot. In other words, it is an advance of 100 per cent over the Payne-Aldrich law.

Senator SMOOT. But the price that you mentioned is only 50 per cent.

Mr. LOCKETT. This tariff is going to be in effect for at least four years.

Senator SMOOT. I do not know about that. But the figures you gave in your invoice are approximately 50 per cent.

Mr. LOCKETT. I would be very glad to go over the figures if I may. The landed cost was \$456.94. The duty under the Underwood bill—

Senator SMOOT. You said under the Payne-Aldrich bill.

Mr. LOCKETT. Maybe I said it. What I meant to say was the Underwood law. What I now say is this: I say that taking the domestic product at \$691.15 the duty on the American valuation at 35 per cent, you get \$241.90.

Senator SMOOT. Do you spend any more time on it if it is 35 per cent. I understood you to say something else. You had better correct the record and show that it was the Payne-Aldrich law that you had reference to.

Mr. LOCKETT. I say that under the Payne-Aldrich law the duty paid upon the American valuation, at 35 per cent, on \$691.15, it will equal \$241.90, which is equivalent to 89 cents per square foot. If these goods were to come in to-day and the American valuation law applied, irrespective of the foreign cost, the duty would be the equivalent to 89 cents per square foot.

Senator SMOOT. All that I know is your invoice prices show 50 per cent, and you can not affect the other prices in any way, shape, or form if that is the invoice price.

Mr. LOCKETT. You are simply taking the ratio—the difference between the landed price and the imported price.

Senator SMOOT. Yes, that is all the difference we do take.

Mr. LOCKETT. But I am trying to show you now that is but one element. I can carry this illustration along to an extent which might bore you to show you that upon that basis of figuring, with an ad valorem rate of 35 per cent upon the American valuation there would still be a greater difference than you get.

Senator SMOOT. Not under the plan that would be adopted if the American valuation plan is adopted, because whatever difference there is in the invoice that will be all the difference there will be at the ad valorem rate.

Mr. LOCKETT. I do not understand the proposed law will operate that way. As I understand it, the 35 per cent is going to apply to the American valuation irrespective of and independent of any element entering into the foreign cost or the landed cost. You cannot get away from those figures there; that the rate of duty based upon the American valuation of this product is 100 per cent higher than the Payne-Aldrich law.

Senator SMOOT. Then your figures are wrong.

Mr. LOCKETT. I will be glad to check them up. We may be talking at cross purposes.

Senator SMOOT. Not at all. I understood you to say the foreign valuation was \$456.94 and the American valuation was \$691.15.

Mr. LOCKETT. That is perfectly clear, but it has nothing to do with this proposition. That is a mere abstract statement of ratio of increase per se and per foot.

Senator SMOOT. It can not increase per foot?

Mr. LOCKETT. I do not see why.

Senator SMOOT. Because of the very fact that the ad valorem rate of duty upon the price per square foot will be no more than the ad valorem rate of duty upon the value of the total number of square feet.

Mr. LOCKETT. I grant that.

Senator SMOOT. Then that is all there is to it.

Mr. LOCKETT. As I said a moment ago, those figures that I gave you represented the foreign landed cost except duty.

Senator SMOOT. That is right.

Mr. LOCKETT. If we had, for example, a duty of 35 per cent—

Senator SMOOT (interposing). Let us not spend any more time on it, because the question can be figured out by the committee as well as you can figure it.

Mr. LOCKETT. Perhaps they can figure it a good deal better than Senator Smoot, but I do not like to have the impression go abroad that our figures do not substantiate our contention.

Senator SMOOT. You may follow this with a written statement. Put it in right there.

Mr. LOCKETT. I will be glad to do that, but I prefer to have it in a better form than the one I have here. May I have a few minutes now to talk on the other paragraph?

Senator McCUMBER. Your time is more than up, but you may take a little more time. Make your statement as brief as possible.

Senator SMOOT. You wish to speak on paragraph 393?

Mr. LOCKETT. Yes; paragraph 393 is the so-called "catch-all" paragraph in the metal schedule.

gain we are faced with a situation in which we find it difficult to apprehend how the House committee ever arrived at their rate of

Senator SMOOT. The same thing applies here in this situation that have said applies to the other section as far as American valuation is concerned.

Mr. LOCKETT. You mean so far as what the House did is concerned? Senator SMOOT. Yes.

Mr. LOCKETT. But I am speaking about the rate, Senator Smoot. For instance, paragraph 393 of the Fordney bill proposes a duty of 10 per cent on the American valuation. The Underwood law, paragraph 167, carried a duty of 20 per cent; and the Payne-Aldrich law, paragraph 199, carried 45 per cent.

We import the textile machinery, when we can, made by Messrs. Platt Bros. (Inc.), the largest builder of textile machinery in the world.

The cost in England of one of Platt's machines to the importer, under present conditions, is nearly, in some instances, 50 per cent higher than what similar American machines sell for in this country. There are some mills in this country who will have Platt's machinery. On the bulk of Platt's machinery imported into this country during the last ten years a premium has been paid, by the purchaser in this country, in order to obtain it.

We believe in proper protection, but if you should put machinery on the free list and give the importer a bonus as well, we will not be able to undersell the American manufacturer to-day. Therefore, what earthly reason is there for putting a duty on machinery? It does not protect anyone, and the amount of revenue which it produces does not amount to anything.

The value of imported textile machinery in 1918 was, I think, something like \$700,000. That would not pay for equipping a small mill of 25,000 spindles capacity in this country. Only recently an importer was invited to bid upon an outfit for a mill, and the foreign quotation was nearly a million and a quarter dollars, and the American producer quoted about \$500,000.

There is another thing I wish to speak of. I was told by a man who is in a position to know that the labor cost in England is about twice as much as it is here. This only tends to create a monopoly and does not do the consumer a bit of good.

Senator SMOOT. If the monopoly can sell for \$500,000 cheaper than the English manufacturer, it is pretty good, isn't it?

Mr. LOCKETT. That may be true in one respect. If, as I said with respect to card clothing, the product is not as good as the foreign product, the result might be in the long run that the cost to the consumer would be greater.

Senator SMOOT. The purchaser would have to decide that.

Mr. LOCKETT. The purchaser does not know very much about this matter. He does not know whether——

Senator SMOOT (interposing). Then he had better keep out of the business.

Mr. LOCKETT. I am speaking of the consumer. He does not know whether the product is made upon high-grade foreign machinery or American machinery. In conclusion, Mr. Chairman, we would like to see textile machinery put upon the free list. We would like to have an opportunity to try to get some business as best we may

upon a more favorable basis, knowing, as we do, that a tremendous amount of evidence could be procured to substantiate these statements, and knowing, further, that the bulk of users of machinery in cotton mills prefer the foreign machinery if they could get it at a fair price.

Senator SMOOT. I think that is unfair to the American manufacturer. I think you have been fair so far, but you are now unfair. I think you will admit you are unfair, or that it would be unfair to allow the card clothing machinery to come in free.

Mr. LOCKETT. With the pound sterling down, it would not give the English manufacturer an advantage over the American, but it would give the English manufacturer—

Senator SMOOT (interposing). You want to be fair, I am sure, but you are now unfair.

Mr. LOCKETT. I think you are mistaken, Senator, with all due deference. If you will give me one minute, I will try to show you. The sterling exchange depreciated 35 per cent. Platts have a selling basis for different machines. In 1909 the price was list price less 15 per cent. In 1915 it was list price less 5 per cent, and the average peak advance since then over the list price was nearly over 200 per cent.

Senator SMOOT. They may have asked bigger prices than were necessary, like a great many other manufacturers during the war, but when it comes down to a question of competition and when everybody in the world is looking for a market, if they could sell at less, they would do it.

Mr. LOCKETT. Doesn't that answer your question, Senator?

Senator SMOOT. No, it does not.

Mr. LOCKETT (continuing). There has been an increase in the price of over 200 per cent since 1909 with a corresponding depreciation of currency of 35 per cent?

Now, I could go on and give you illustrations of particular kinds of foreign machinery where the selling price of that foreign machinery to-day—and I am taking cognizance of the depreciation in British currency—is nearly 50 per cent more at the English shops than the American manufacturer is charging for similar machinery. I do not see why in the face of conditions that have existed for nearly 20 years there has been a protective duty upon this American-made machinery which has not in any way protected the American manufacturer except by tending to prohibit importations, eliminating a generally competitive business, and making it entirely unnecessary for the American manufacturer, in fixing his selling price, to recognize that there is any competition from abroad. May I have a few days in which to file a brief?

Senator SMOOT. Yes.

Mr. LOCKETT. I thank the committee very much for its attention.

BRIEF OF JOSEPH F. LOCKETT, REPRESENTING LEIGH & BUTLER, BOSTON, MASS.

CARD CLOTHING.

This is directed to paragraph 337, page 65, of H. R. 7456 (Fordney bill), now before this committee, which paragraph reads as follows:

"Card clothing not actually and permanently fitted to and attached to carding machines or to parts thereof at the time of importation, when manufactured of tempered or untempered round iron or steel wire, or with plated wire, or other round or steel wire, or with felt-face, wool-face, or rubber-face cloth containing 35 per cent ad valorem."

Paragraph 124 of the tariff act of October 3, 1913, reads in part as follows:

Card clothing * * *, when manufactured with tempered, round steel wire, plated wire or other than round iron or steel wire, or with felt-face or wool-face rubber-face cloth containing wool, 35 per cent ad valorem."

Paragraph 145 of the tariff act of August 5, 1909, reads in part as follows:

Card clothing * * *, when manufactured with tempered, round steel wire, cents per square foot."

Card clothing is an article made of steel wire staples set through a flexible foundation about three thirty-seconds of an inch in thickness, composed of leather, cloth, or other material. It is usually made in long strips and wound on to and fastened on cylinders and other parts of carding machines. Its function is to card, i. e., to break the fibers parallel, and clean cotton or wool.

The card clothing we import is made by Joseph Sykes Bros. (Ltd.), of Huddersfield, England.

From the outset, we desire to go on record in favor of a protective tariff in the best interests of American industries and labor. We insist, however, that the rate of duty, insofar as it applies to card clothing should be based, as near as may be, upon the actual difference in cost of production of the article here and abroad. We believe we understand that the Republicans in revising this tariff are proceeding upon this theory. We strongly protest and object to any rate on this commodity which is in excess of the said actual difference in the respective costs of production.

From 1897 up to the enactment of the Underwood law, duty on card clothing was assessed at various specific rates of duty for each square foot. We prefer a specific rate of duty on this commodity for the reason that it lessens the possibility of litigation and makes the estimation of the duty by all concerned much less difficult. The Government would receive at all times the same amount of duty at a specific rate and the fluctuation in exchange would not affect the duty in any way.

Card clothing is bought and sold abroad and here at a price per square foot. If it be the desire of the Congress to levy a specific rate of duty wherever possible, card clothing is a conspicuous example where a specific rate of duty can be used with accuracy and precision. The American manufacturers have requested a specific rate of duty. (See brief of American manufacturers before the Ways and Means Committee, 62d Cong., 3d sess., vol. 2, Schedule C, pp. 1304 and 1305.)

Cotton-carding machines, as they are made, are equipped with a set of card clothing which usually consists of one roll for the cylinder, another roll for the doffer, and strips for the flats. As fast as it becomes wornout or damaged, the machines are reequipped with new card clothing.

The life of this commodity depends upon the usage it receives, but, generally speaking, the foreign product is more durable and lasts, upon the average, at least ten years, whereas the domestic product will last upon the average somewhere between five and 10 years, all with ordinary usage.

The total number of points set into the foundations, as heretofore referred to, vary from approximately 60,000 to 100,000 per square foot, according to the mill's requirements. These wire points are commonly known as "teeth," and are set into the foundations by a particular machine called a "setting machine." The men who operate the setting machines in England are called "tenters." In this country these men are called "tenders."

We desire to strongly impress upon this committee that the American manufacturer of card clothing imports most of the cloth and rubber out of which he makes his foundations. He also imports most of the wire used to make and set the teeth with the aid of the said "setting machines."

The difference in wages paid to the operators of these setting machines here and abroad constitutes one of the largest elements entering into the total difference in the cost of production between the American and the foreign product. Most of the card clothing imported into the United States comes from England.

Founders and inspectors, so called, are also employed in the manufacture of card clothing, but the labor cost of these employees is very small in comparison with the cost of the machine tenders. Upon the best information obtainable, it costs the foreign manufacturer over 50 per cent more than the American manufacturer to set the teeth into the foundation. The reason for this is because the American machines are run at far greater speed than the English machines. Furthermore, each American tender operates twice as many setting machines as each English operator.

In addition, each American machine produces a much larger quantity of card clothing per hour than each English machine.

The card clothing made by Messrs. Joseph Sykes Bros., one of the largest manufacturers of English-made card clothing, is a product which has a world-wide reputation

for durability and efficiency. In fact, many American manufacturers prefer Sykes card clothing to the domestic product. Frequently when ordering American machines the mills specifically request their machines be equipped with card clothing manufactured by Messrs. Sykes Bros.

It would be a great misfortune if the American cotton manufacturer can not get Sykes card clothing. The rate of duty now in the Fordney bill would prohibit importation. Evidence was offered at the hearing to show that the competition of Sykes's clothing is necessary to prevent the American maker of card clothing from lowering his quality and increasing his price. It is predicted that this would be the case if the domestic product is the only one which can be obtained. Much testimony can be had to demonstrate beyond all question that the Sykes card clothing is absolutely necessary in the best interests of the American cotton manufacturer and the entire people as well.

In a brief filed in behalf of the American manufacturers with the Ways and Means Committee in 1913 (vol. 2, Schedule C, Doc. 1447, pp. 1304 and 1305) it was stated to the Congress that unless a high rate of duty was imposed upon card clothing it would ultimately destroy the industry in this country. Mr. Hamilton, in speaking before the Ways and Means Committee in 1921 (Tariff Information, 1921, No. 2, pp. 823 and 824) referred to the increase in the manufacturing plants of American manufacturers of card clothing. Apparently the prediction of the American manufacturers in 1913 was fulfilled, even before the World War gave them added protection. From the statistics of imports and duties compiled by the United States Tariff Commission in 1915 and 1916, the total number of square feet of card clothing imported in 1915 was 258,700 and in 1916 it was 222,264. The average number of square feet imported in each of the years, namely, 240,000, was much lower than 311,000, the average amount of square feet of card clothing imported in the years 1909 to 1913, inclusive, under the Payne-Aldrich law in spite of the great increase in the number of new American mills now using card clothing.

Considerably more than one-half of the card clothing used to card cotton in the United States is made in the United States. Practically the whole of the card clothing used is imported from England.

It is at once apparent that the rate of 35 per cent under the Underwood law will result in the importation of large quantities of card clothing, to the detriment of the American manufacturer, prior to 1917 and has not since that time.

It is difficult to understand the reason which actuated the Ways and Means Committee in providing a rate of 35 per cent in said paragraph 337 of this bill.

This rate was not apparently worked out on any mathematical formula. We believe the Finance Committee will carefully consider the fact that the rate now in the Fordney bill is an increase of nearly 100 per cent over the Payne-Aldrich rate.

We believe even to-day the Underwood bill, providing as it does a rate of 35 per cent on card clothing based upon the foreign value, gives to the American manufacturer of card clothing to-day much more protection than he is reasonably and justly entitled to.

As stated to the Finance Committee at the hearing on August 26, 1921, a new method is before us this year in calculating the correct and proper rate of duty on card clothing. We refer to the assessment of ad valorem duties upon the basis of American values.

If the American-valuation plan, so called, is not a part of the Fordney bill at its final passage, the rate of duty mentioned in said paragraph 337, namely 35 per cent, should be reduced to 25 per cent, although as stated heretofore, we prefer a 20 per cent rate of duty.

As it seems reasonable to assume that the Fordney bill, when enacted, will remain in force for at least four years the rate of exchange should be taken into consideration. It constitutes a vital element in arriving at the landed costs of the imported material. It likewise becomes important in estimating with accuracy the rate of duty which should apply on this commodity.

In estimating the correct rate of duty to be assessed upon this product it is imperative that proper consideration be given to the value of the pound sterling in American money. The probability is that before this bill becomes law the rate of exchange will be far in excess of \$3.70, the rate now prevailing. It is also reasonably certain that before the bill is repealed the rate of exchange will be nearer par.

We desire to emphasize the fact that when the pound sterling reached its lowest value in American money it had only depreciated about 35 per cent from par value, while as the price of card clothing in England increased 100 per cent.

The following figures show conclusively that the rate of 35 per cent ad valorem upon the American valuation is not only unnecessary but prohibitive as well. Any law which gives such a result will not prove to be in the best interests to all the people.

rate of duty of 18 per cent ad valorem upon the present American valuation, or 40 cents per square foot, will provide ample protection to the American manufacturer. We are taking for example a lot of card clothing recently received by us to be used on cylinders of cotton-carding machines, each cylinder's equipment being 272 feet by 12 inches, No. 120's, the foundation being made of cotton, cotton, woolen, and cotton. The American value for these goods to-day is \$691.15.

Applying the Fordney bill rate, the duty would be calculated as follows: \$691.15, at 18 per cent, equals \$241.90.

The total number of square feet in this unit is, as stated, 272. If the total duty is \$241.90, the equivalent specific duty is about 89 cents per square foot. This is an increase of almost 100 per cent over the rate of 45 cents per square foot in the Payne-Aldrich law. Certainly this Congress doesn't intend to increase the admittedly high rate in the Payne-Aldrich bill by 100 per cent. We seriously doubt if the Ways and Means Committee intended to make any such increase in the rate on card clothing as is represented.

We maintain that even the specific rate of 45 cents per square foot (the Payne-Aldrich rate) or its ad valorem equivalent, namely 18 per cent (based upon the American valuation), are both too high.

The duty under the Underwood law on this commodity to-day, based on a rate of 3.70 per pound sterling, is equal to about 55½ cents per square foot or a trifle more than 20 per cent above the Payne-Aldrich rate. To now suggest an additional increase of 80 per cent over the Payne-Aldrich rate is uncalled for. Based upon \$4 per pound, the rate under the Underwood law is equal to about 60 cents per square foot. As the rate of exchange advances, the duty per square foot will increase proportionately.

But we have confidence that had the Ways and Means Committee realized the tremendous increase they were making on this commodity, they would have recommended a very much lower rate. An increase of 100 per cent over the rate in the Payne-Aldrich law is contrary to the needs of the case.

We strongly urge this committee to recommend a rate on card clothing not higher than 40 cents per square foot or 18 per cent ad valorem based upon the American valuation. With either rate, the American manufacturer will have due and sufficient protection, the Government will obtain more revenue owing to greater importations, and the American cotton mills will not be deprived of an opportunity to purchase a superior quality of card clothing.

MACHINERY.

This is directed to the last part of paragraph 393, page 87, of H. R. 7456 (Fordney bill), now before this committee, which reads as follows:

"* * * if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with platinum, gold, silver, or colored with gold lacquer, whether partly or wholly manufactured, 35 per centum ad valorem."

The clause above quoted is known as the "catch-all" metal clause, and is substantially the same as paragraph 167 in the tariff act of October 3, 1913, which reads part as follows:

"* * * if composed wholly or in part of platinum, gold, or silver, and articles wares plated with gold or silver, and whether partly or wholly manufactured, 50 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem."

The corresponding provision in the tariff act of August 28, 1897, paragraph 193, reads as follows:

"Articles or wares not specially provided for in this act, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, 45 per centum ad valorem."

We believe in a protective tariff whenever such protection is needed for American industries and labor. The accurate tariff rate on any commodity should reflect the difference between the cost of production in this country and abroad.

It was said not long ago by an official connected with one of the largest American machine builders that the labor cost per machine for textile machinery was less in the United States than in England.

We are importers of textile machinery and have the exclusive selling agency in the United States and Canada for the machinery manufactured by Platt Bros. & Co. (Ltd.), Oldham, England, established in 1821, who employ over 12,000 people. Their product is world famous for its construction, durability, and efficiency. Because of its excellence, it will last longer and will likewise require less repair than American-made

machinery. Most of the machinery which we import is for use in American cotton and worsted mills.

It is inconceivable why the American manufacturers of machinery have been for so long a time such an unnecessarily high degree of protection. In many instances the American selling price of machines made to perform similar service to those we offer for sale is much lower than our machines can be purchased for at the same price in England, to which must be added freight, duty, and charges. The American manufacturer is obliged to pay a premium for the foreign-made machinery, which in many respects superior to the American product.

There is no real competition between English and American machine builders as to price; there never has been under a 45 per cent rate of duty. It is an absolute fact that the major part of English textile machinery could never compete with the American machinery as to price, unless Congress should, in addition to putting it on the free list, grant a substantial bonus on the imported machinery.

Very recently we were asked by one of the large cotton mills to quote them on a complete mill of 25,000 spindles. On following up our quotation we were told that the price was more than double the prices they had received from the domestic manufacturers, in spite of our having figured all our costs upon the prevailing rate of exchange. Irrespective of the merits of the two classes of machinery, it is clear that no protection was needed.

Furthermore, the sales of foreign machinery we have made in the past few years have been in nearly every instance at a higher price than the American-made machinery. In such cases the sales were effected solely because of the insistence of the American mill manufacturers upon having Platt's machinery.

When the Underwood bill was enacted in 1913 a substantial reduction in the rate of duty from 45 to 20 per cent was made. Even with this reduction it has been impossible for the foreign machine builder to compete with the American manufacturer.

If the high rates of duty are continued upon machinery, it will encourage American manufacturers to increase their prices. It will also continue to promote the importation of foreign machinery. It will likewise increase the cost to the domestic consumer in the manufacture of the various products produced by the American mills, for the reason, we believe, that in the long run the goods produced by English machinery will prove to be more advantageous.

The quantity of textile machinery imported into this country in 1916, 1917, and 1918, according to the official statistics of imports, is very small and has absolutely no effect upon American manufacturers or labor. We refer to the statistics of imports and duties published by the United States Tariff Commission for the use of the Committee on Ways and Means, page 609, No. 2810, and under the heading, "All textile machinery," we find the following information:

1916, 20 per cent of \$569,068.....	\$113,814
1917, 20 per cent of \$938,229.....	187,646
1918, 20 per cent of \$699,792.....	139,958

To show the very small quantity of imports of textile machinery during the three years mentioned, namely, 1916 to 1918, the value of the machinery imported during each of the three years was the approximate cost, before the war, of fitting up a small mill of about 25,000 spindles. This would include the erection of the building and all other charges.

To show the absolute monopoly which the American manufacturers have upon the American cotton mills, we call attention to Appendix B on page 97 of a special report of the Department of Commerce, headed "Miscellaneous Series No. 37—The Spinning Machinery Industry," which was issued by the Department of Commerce in 1916. On said Appendix B it is noted that the various machine shops that are referred to manufacture practically 87 per cent of the carding machinery used in the cotton mills of the United States, 92 per cent of the spinning machinery, and practically all of the looms. This places a premium on the manufacture in America of an inferior article. It also imposes a tremendous tax on the purchaser of the best grade of goods, whether the best grade be American or foreign machinery.

How, therefore, can the American manufacturer conscientiously ask this Committee for any protection, much less an increase in the rate of duty on foreign machinery, when, as a matter of fact, there have been practically no importations under the Underwood law at the comparatively low rate of 20 per cent.

When the pound sterling reached its lowest value in American money it had depreciated only about 35 per cent from par (\$4.8665), whereas the price of cotton-textile machinery in England increased over 200 per cent.

We do not believe it is the intention of the Congress to make or the desire of the people of the United States to have the rates on imports so high as to prohibit the importation of foreign goods, after due protection has been given, based upon the difference in the cost of production here and abroad. Many people in this country are disturbed

day over the loss of our export trade. By a prohibitive tariff on foreign-made machinery we not only are preventing the Government from obtaining any revenue on imported machinery, but we are stifling our export trade. The foreign manufacturers will certainly not buy our goods in large quantities unless they can sell our goods to us upon a fair and equitable basis. No one benefits from the monopoly American machine builders now have except the stockholders.

We can submit figures, if the committee desires, to prove conclusively that American-made cotton-mill machinery needs no protection whatsoever.

We, therefore, believe that this machinery should be placed upon the free list.

ALUMINUM WARE.

[Paragraph 339.]

STATEMENT OF B. C. ZIEGLER, CHAIRMAN OF TARIFF COMMITTEE OF THE ALUMINUM WARE MANUFACTURERS OF THE UNITED STATES, WEST BEND, IND.

Mr. ZIEGLER. Mr. Chairman, I am chairman of the tariff committee of the aluminum-ware manufacturers of the United States, consisting of 34 different companies scattered throughout the entire country. Aluminum sheet is the raw material used in the manufacture of our aluminum cooking utensils. Aluminum ware consists of hollow ware and flat ware. Hollow ware is cooking utensils, such as pots and pans, and the flat ware consists of knives, forks, and spoons.

Last spring we prepared a brief in support of the proposition that the aluminum-ware manufacturers were entitled to a higher protective tariff. Copies of our briefs were submitted to the Ways and Means Committee, but the subcommittee on metals had already passed on the tariff on aluminum cooking utensils before our brief reached them, and it is for that reason that I appear here to-day.

Senator SMOOT. For what do you ask?

Mr. ZIEGLER. We are asking for 45 per cent ad valorem and 15 cents per pound specific based on American valuation.

The proposed law intends to give us 28 per cent. Forty-five per cent has been the prevailing rate from 1883 to 1913, except for the last three years of Cleveland's administration. In 1913 the tariff was reduced to 25 per cent on hollow ware and 20 per cent on flat ware.

Senator SMOOT. The House gave you 5 cents a pound and 30 per cent ad valorem. When composed wholly or in chief value of aluminum, 28 per cent ad valorem.

Mr. ZIEGLER. It does not. Pardon me, Senator.

Senator SMOOT. I see. That is the "iron or steel and enameled or glazed."

Mr. ZIEGLER. We want 45 per cent ad valorem and 15 cents per pound specific.

Senator SMOOT. Instead of 28 per cent?

Mr. ZIEGLER. Yes; and no specific. As I have stated, in 1913 the rate was cut to 25 per cent on hollow ware—

Senator WATSON. What were the imports under those rates? Did they amount to anything, or were they large?

Mr. ZIEGLER. Yes, sir; the imports in the last 10 months of 1920 amounted to \$1,900,000.

Senator WATSON. What is the total consumption in this country?

Mr. ZIEGLER. About \$32,000,000 worth.

Senator SMOOT. Do you desire to file a brief?

Mr. ZIEGLER. Yes, sir; I have one prepared. I would like to make a few further statements if I may be permitted.

Germany's wages are one-eighth of ours. German raw material is much cheaper than ours, probably costing them one-half or less. Wages represent one-half of the cost of our product and material the other half. Take an aluminum utensil costing a dollar to produce, and it represents 50 cents labor cost and 50 cents material cost.

Senator SMOOT. Is not that in your brief?

Mr. ZIEGLER. No, sir. For the same article made in Germany it represents 6½ cents labor cost and 25 cents material cost, or a total of 31½ cents.

As previously stated, we are asking for 45 per cent ad valorem and 15 cents specific. Assuming that the cost of production in Germany is 31 or 32 cents a pound, and adding 8 or 9 cents for freight to the United States and a fair profit, the American importer can buy this article in New York for about 40 cents.

On this basis the following indicates the result of applying the rates we ask for with American valuation:

The amount paid by the American importer, 40 cents. Add 45 per cent for the ad valorem duty. Add 15 cents for specific duty and the total is \$1.

The last item is on the assumption that a pound of fabricated aluminum is worth \$1. The actual cost is slightly less than that at the present time; so that the last item in the foregoing computation should be perhaps 12 or 13 cents, indicating that even with the proposed rates the imported German article would slightly undersell the American article.

We can not state positively just what German aluminum ware will cost laid down in the port of New York, but it is fair to figure 40 cents a pound. If the German article can be bought in New York for 40 cents a pound, the rates are adequate. If it can not, they are inadequate; and if the German article costs more than 40 cents the tariff, of course, would be too high. But in that case there is no danger that the American consumer will have to pay artificially high prices for aluminum ware, for three reasons—first, because of the actual and keen competition between American manufacturers of aluminum ware; second, aluminum ware must compete in the United States with enamel ware; and, third, the present manufacturing capacity of the aluminum-ware manufacturers is three or four times the consumption.

Enamel ware and aluminum ware are very much alike. They are used for the same purposes and sold to the same trade and made practically the same in shape. In other words, they are both pots and pans used for cooking devices.

Under the Payne-Aldrich Act enamel ware had an ad valorem duty of 40 per cent and aluminum a duty of 45 per cent. Under the present law aluminum ware has a duty of 25 and enamel ware also 25.

Under the proposed law enamel ware is supposed to be getting 30 per cent and 5 cents per pound specific, compared with 28 per cent for aluminum.

We feel that if enamel ware is entitled to 25 cents specific, aluminum ware is entitled to 15 cents per pound specific.

Senator SMOOT. Are you asking this because of what was given on the enamel ware?

Mr. ZIEGLER. No, sir.

Senator SMOOT. Can you tell me, briefly, why it is you want now 15 cents a pound over and above the Payne-Aldrich rate; particularly, why you want it since the 45 per cent would apply under American valuation and not foreign valuation?

Mr. ZIEGLER. Because of the difference in cost abroad and here as compared with the cost before the war.

Senator SMOOT. That difference existed before the war, did it not?

Mr. ZIEGLER. No, sir; not the way we compute it.

Senator SMOOT. It existed back in 1909, did it not? You got along very well then with 45 per cent on foreign valuation, did you not?

Mr. ZIEGLER. We did; but the labor cost, we contend, in Germany to-day is one-eighth of the labor cost in this country; and that was not the case in 1909.

Senator SMOOT. The only difference that I know of between now and 1909 is that foreign countries who bought aluminum for war purposes perhaps are making it into goods and sending it more cheaply into this country right at the present time than they could possibly do on any other occasion. Before the war America made aluminum goods about as cheaply as any country in the world, did it not?

Mr. ZIEGLER. No, sir.

Senator SMOOT. Then I do not know what the history of it was. I have bragged of it so many times that I had better withdraw my former statement.

Mr. ZIEGLER. Furthermore, under the present act aluminum sheets are given a tariff of $3\frac{1}{2}$ cents per pound, and under the proposed law you increase it to 9 cents per pound, an increase of 150 per cent.

Senator SMOOT. Under the Underwood law it is 25 per cent. It was not 25 per cent under the Payne-Aldrich law.

Mr. ZIEGLER. No, sir; it was 45.

Senator SMOOT. Now you are asking 15 cents a pound specific and 45 per cent on American valuation?

Mr. ZIEGLER. Yes, sir.

Senator SMOOT. I wish that the witnesses would, in an instance like this, simply tell us what they can get along with and not what they want.

Do you mean to say that the aluminum business of the United States has got to have 15 cents a pound and 45 per cent in order to live?

Mr. ZIEGLER. If you raise the tariff on the raw material we will have to have more than we would otherwise.

Senator SMOOT. In 1909 you were living on 45 per cent under foreign valuation.

Mr. ZIEGLER. We feel ——

Senator SMOOT. You think you have to have it?

Mr. ZIEGLER. We think we have to have it.

Senator McLEAN. What is the price of your goods now as compared with the price a year ago?

Mr. ZIEGLER. About 35 per cent less.

Senator McLEAN. How does that compare with the prewar price?

Mr. ZIEGLER. About 75 per cent higher than the prewar price, due to the high cost of raw material and the increased cost of labor.

Senator SMOOT. Are you representing the American Aluminum Co., or what company do you represent?

Mr. ZIEGLER. Thirty-four different companies.

Senator SMOOT. Is the American Aluminum Co. included?

Mr. ZIEGLER. American cooking utensils.

Senator SMOOT. Do you own your mines?

Mr. ZIEGLER. I represent the manufacturers of cooking utensils only. We have no interest in a tariff on sheet. We fabricate only cooking utensils and not the sheet.

Senator SMOOT. The richest aluminum mines in the world are owned by Americans, are they not?

Mr. ZIEGLER. I believe they are.

Senator SMOOT. All the South American mines?

Mr. ZIEGLER. Yes, sir.

Senator SMOOT. Do you want to put one of your briefs in the record?

Mr. ZIEGLER. Yes, sir. I have a supplement attached to our original brief.

Senator SMOOT. You simply want the supplement to go into the record?

Mr. ZIEGLER. I would like to have both of them go in.

Senator DILLINGHAM. Have your wages been reduced since the war?

Mr. ZIEGLER. Yes, sir; from 10 to 25 per cent, in different industries.

Senator DILLINGHAM. How do they now compare with prewar wages?

Mr. ZIEGLER. I should judge that they are about 80 per cent higher.

BRIEF OF B. C. ZIEGLER, REPRESENTING THE ALUMINUM WARE MANUFACTURERS OF THE UNITED STATES.

[Schedule C, pars. 134 and 167, act of 1913.]

PRESENT LAW.

Manufacturers of aluminum, since the tariff act of 1897, have been divided for tariff purposes into two groups: First, aluminum in plates, sheets, bars, and rods, and, second, manufactured articles or wares. In 1897 aluminum products in the first of the two classes just mentioned were set aside under a specific duty of 13 cents per pound, and manufactured articles or wares, composed wholly or in part of aluminum, and whether partly or wholly manufactured, were included in paragraph 193 of the 1897 tariff act under a duty of 45 per cent ad valorem.

Forty-five per cent ad valorem has been the prevailing tariff duty on aluminum articles or wares since 1883. This was reduced to 35 per cent between 1894 and 1900 and after 16 years at the old 45 per cent rate, there was another reduction in 1907. This was accomplished by paragraphs 134 and 167 of the 1913 tariff act.

Under paragraph 134, table, kitchen, and household utensils or other similar hollow ware composed wholly or in chief value of aluminum were reduced from 45 per cent ad valorem to 25 per cent ad valorem; and articles or wares not specially provided for in that section, composed wholly or in chief value of aluminum, and whether partly or wholly manufactured, were reduced from 45 per cent ad valorem to 20 per cent ad valorem. (See Exhibit 1.)

RECOMMENDATIONS.

We ask that paragraphs 134 and 167 of the 1913 tariff act be replaced by a paragraph in the new law which will restore the same protective duty that prevailed almost continuously up to 1913. To accomplish this, the new law could use substantially the same language which for many years covered manufactures of aluminum, viz

"Articles or wares not specially provided for in this act, composed wholly or in part of aluminum, and whether partly or wholly manufactured, 15 cents per pound and 45 per cent ad valorem."

GERMANY CHIEF COMPETITOR.

Before the war, Germany and Switzerland were the leading foreign producers of aluminum hollow ware, and were also the leading foreign producers of all aluminum.

icles or wares other than hollow ware. Under the postwar conditions affecting aluminum manufacturers in Europe, as described in the exhibits to this brief, it is certain that Germany will hereafter furnish the most intense competition in manufactures of aluminum. This prediction as to German competition is borne out by a statement of the Bureau of Foreign and Domestic Commerce, recently made, that Germany is now making a concentrated effort to capture the world's markets on this line. (See Exhibit 2.)

At this point we wish to make reference to a brief prepared by Chairman Henry C. Milligan, of the tariff committee of the enameled ware manufacturers of the United States, which brief has recently been submitted to Congress. Mr. Milligan made a personal investigation of conditions in Europe, and particularly in Germany, bearing on the cost of manufacture in the line in which his committee were interested, namely, enameled hollow ware and flat ware. His studies were made during the winter of 1921. His reports are therefore recent and we believe very accurate. The production of aluminum in all its finished and manufactured forms, and particularly in the form of aluminum hollow ware, involves almost the same identical processes and the use of the same classifications of labor that are called for in the production of enameled ware. The application of the glazed surface to enameled ware is the only process of importance that does not occur in the production of aluminum ware. Therefore, we consider it proper to make free use of the figures and statistics accumulated by Mr. Milligan, and contained in his brief above mentioned, so far as they are applicable in the aluminum industry. No better figures can be obtained as to the labor cost of producing aluminum ware than the figures furnished by Mr. Milligan for enameled ware.

DOMESTIC CONDITIONS.

The undersigned committee recently sent out a questionnaire to 30 establishments manufacturing articles and wares of aluminum in the United States, asking for information in regard to wages and competitive conditions. (Exhibit 3 omitted in printing.) Replies to the questionnaire were received from 25 concerns, and the following facts and tabulation of wages paid in the United States are based upon the answers received. The basis of comparison between wages in the United States and wages in Europe is furnished by the Milligan brief and also by Exhibits 4, 5, 6, 7, and 8; see also information as to wages in foreign countries other than Germany, Exhibit 9.

It should be noted that in the manufacture of aluminum ware there are employed blamakers, buffers, liners, and shop truckers (see Exhibit 4), whose wages have not been included in the comparative statement below, because we have not been able to ascertain what wages these classifications are paid in Germany, but it is safe to say that the proportion between German wages and American wages in the industry would not be appreciably changed if these classifications were put into the average. The value of the mark in the statement below is assumed to be 2 cents.

	Per hour.				Per hour.		
	United States, cents.	Germany.			United States, cents.	Germany.	
		Cents.	Marks.			Cents.	Marks.
Machine operators.....	70½	9	4½	Inspectors, goods in process.....	58½	5	2½
Raw press operators.....	63	9	4½	Inspectors and wrappers, finished product.....	45½	5	2½
Machine press operators.....	54½	8	4	Packers.....	53½	8½	4½
Machine spinners and finishers.....	66½	8	4	Common labor.....	46½	7½	3½
Machine spinners.....	82½	8	4	Average.....	60½	7.20	3½
Machine and beaters.....	59½	8	4				
Machine rollers.....	75½	5½	2½				
Machine rollers.....	48½	5½	2½				

The above shows that in this industry the average wages per hour are about one-eighth as high in Germany as in the United States.

CONCLUSIONS DRAWN FROM INFORMATION SECURED.

The replies received to the questionnaire, when averaged, indicate that 39.31 per cent of the cost of producing manufactured articles of aluminum represents the labor employed thereon. (See Exhibit 5.) We have just shown that this percentage of the manufactured article, under present conditions, costs the German only one-eighth as much as it does the American.

The average labor cost of 39.31 per cent. as determined from the questionnaire represents direct and indirect factory labor, or, as sometimes denominated, productive and nonproductive factory labor. To this should be added another element of cost which is in fact a labor cost, although not ordinarily so classified, viz, salaries of executives, and of clerks, office force, agents and other representatives, and general administrative expense. The inclusion of these easily brings the total cost of labor in the aluminum ware industry in the United States up to 50 per cent of the total cost of production.

The remaining 50 per cent of the finished article represents the material entered into it, mainly aluminum sheet. As to whether the German manufacturer can buy aluminum sheet cheaper than the American manufacturer, we have not any specific figures to present, but since aluminum sheet is the result of earlier manufacturing processes which also involve labor, it seems entirely safe to conclude that aluminum sheet in Europe and particularly in Germany can be bought cheaper than in the United States. This statement is apparently verified by the United States Tariff Commission. (See Exhibit 13.)

The conclusion is unavoidable that without sufficient tariff protection American manufacturers of aluminum ware must quickly go out of business. In fact, German invasion in this industry is already under way. The reduction of the ad valorem tariff from 45 per cent to 20 and 25 per cent in 1913 resulted in an immediate doubling of the amount of imports of manufactured aluminum. (See Exhibit 10.) At the very same time that foreign aluminum ware appeared in the United States in double the quantity theretofore imported, the Government suffered a loss of revenue because of the lowered rate of duty. (See Exhibit 11.) The World War practically stopped international trading in aluminum for four or five years, but immediately after the war importations of foreign-made aluminum ware again appeared in the American market. The rate of duty being only 25 per cent on aluminum hollow ware and 20 per cent on all other aluminum manufactures, foreign manufacturers began to import their wares into this country as soon as they were able to reorganize their business after the close of the war. In 1919 the value of their imports was \$318,407.25; they so rapidly increased their business in the United States that during the next 10 months of 1920 they had attained a volume of \$1,953,039. (See Exhibit 12.)

Thus it appears that there has been an actual demonstration, both under prewar and postwar conditions, of the proposition that a duty of 20 per cent and 25 per cent on manufactures of aluminum will result in an ever-increasing flood of cheap foreign goods coming into the United States. Unless this condition is remedied the American industry will quickly be forced to shut down, throwing out of work more than 6,500 employees and destroying a business which amounted to \$32,630,000 in 1919. (See Exhibit 5.)

In the absence of a world war manufacturers of aluminum ware must have a higher rate of protection than 20 per cent or 25 per cent ad valorem. Just how much higher it ought to be is perhaps difficult to say, but the recommendations made in this report are believed to be the minimum required. The ad valorem duty recommended is the one which prevailed almost continuously, since 1883, except for the last few years; and the additional specific duty of 15 cents per pound, which has been recommended above, will serve to prevent undervaluation and also, in a small degree, supplement the ad valorem duty. The total amount of protection afforded the industry, if the rates we recommend be granted, will still be insufficient, however, unless the present demoralized condition of foreign exchange be overcome by a provision for valuation in American money.

It is proper to say a few words further upon the subject of foreign exchange, and particularly upon the subject of the depreciated value of German money. What has already been stated shows that the depreciated mark has much to do with the cheapness of the labor element in aluminum ware, in Germany, as compared with the same element in American aluminum ware. It is also apparent that the depreciated mark must figure heavily in computing the comparative cost of the material used in German aluminum ware and in the American article. In other words, the cost of export by Germany when translated into American dollars is so low that a duty that might be imposed would be of little avail in preventing our markets from being flooded, unless such a duty were to be based upon the value of the goods produced in this country, rather than on the value in Germany with duty figured at the depreciated rate of exchange, as is the case at the present time. The exchange situation is complicated and bound to vary as time goes on, so that it is impossible to suggest any rate of duty that would protect the aluminum ware industry at all times unless such a rate were based upon the cost of production in the United States.

Upon the facts referred to in this brief, and also upon the figures disclosed by the exhibits, we recommend—

The passage of a measure providing for the establishment of duties on American nations in American dollars at port of entry, instead of the fair market selling prices in the countries in which goods are produced.

That if goods are to be valued at United States fair market selling prices, then a duty of 15 cents per pound and 45 per cent ad valorem be provided for all articles or wares composed wholly or in part of aluminum, whether partly or wholly manufactured.

EXHIBIT 1.

NOTE.—All references in this exhibit, and in other following exhibits, made to survey, mean Tariff Information Survey on the articles in paragraph 143 of the tariff of 1913 and related articles in other paragraphs, prepared by the United States Tariff Commission, and printed in 1921 for the use of the Committee on Ways and Means of the House of Representatives. The particular Tariff Information Survey which these references are made is that which covers aluminum, magnesium, barium, sodium and potassium and their ores, metals and manufactures, pamphlet being designated as C-16.)

Page 62 of Survey.—On this page is shown in outline the tariff history of manufactures of aluminum. It appears that prior to 1897 aluminum in the form of sheets, plates, bars and rods, was classed with manufactured articles or wares composed wholly or in part of aluminum. The tariff act of 1897 made the first distinction between aluminum sheets, plates, bars and rods, on the one hand, and manufactured articles of wares on the other hand. The American industry of manufacturing hollow ware, flat ware, combs, tubes, signs, and numerous other finished products of aluminum, has seen its principal development since 1897. For the manufacturers of aluminum ware and of aluminum goods in general, aluminum sheets, plates, bars and rods constitute raw material, in spite of the fact that the latter are the result of certain manufacturing processes applied to ingot aluminum.

The rate of duty on aluminum and on manufactures of aluminum was fixed at 45 per cent ad valorem by the tariff act of 1883. The 45 per cent rate was continued until 1894, when it was reduced to 35 per cent. The Dingley bill of 1897 restored the 45 per cent rate to articles or wares not specially provided for, composed wholly or in part of aluminum or other metal, whether partly or wholly manufactured; but the act set aside aluminum plates, sheets, bars and rods under a specific duty of 15 cents per pound.

This segregation, based upon the idea that for manufacturers of aluminum wares, plates, sheets, etc., constitute raw material, has been maintained in all of the tariff legislation from 1897 to the present date.

The 45 per cent rate upon manufactures of aluminum which was restored by the tariff act of 1897 continued in effect for 16 years, and included in its operation all articles or wares composed wholly or in part of aluminum, whether partly or wholly manufactured. It will be noted that this language is general, resulting in the application of this rate to every product (not only hollow ware, flat ware, and utensils, but a finished article in whatever form it may be made) of aluminum beyond the stage of plates, sheets, etc.

In 1913 a Democratic tariff revision occurred and the exact changes as to aluminum manufactures are disclosed by the data contained on page 62. The 1913 revision subdivided manufactures of aluminum, and reduced the ad valorem rate as to all such manufactures. Upon table, kitchen, and hospital utensils or other similar hollow ware, composed wholly or in chief value of aluminum, the rate of duty was reduced from 45 per cent to 25 per cent; and upon articles or wares not specially provided for, if composed wholly or in chief value of aluminum, and whether partly or wholly manufactured, the rate was reduced from 45 per cent to 20 per cent. (Pars. 134 and 167, Schedule C, act of Oct. 3, 1913.)

Page 50 of Survey.—Germany and Austria have heretofore been the largest manufacturers of fabricated aluminum in Europe, followed by Switzerland and France. Hollow ware has come chiefly from Germany, and in the past has been both cheap price and inferior in quality. Imports of fabricated aluminum included household and kitchen utensils, and showed annual increases up to the early part of 1915, due chiefly to the low price of the foreign product. After 1915, imports of manufactures of aluminum into the United States became very small, due to war conditions, but in 1919 showed a sharp increase, and in 1920 a further very large increase.

Page 55 of Survey.—While it is not yet known whether the postwar period will show an improvement in the quality of German aluminum ware, it is certain that the German product will be very cheap, and it also appears likely that British aluminum hollow ware of excellent quality may be offered in the United States. This industry in Great Britain was a war development and was greatly stimulated by the high cost of enameled ware formerly imported from Germany.

EXHIBIT 2.

[Memorandum furnished by Bureau of Foreign and Domestic Commerce (European Division), Washington, D. C., under date of April 8, 1921.]

The German aluminum hollow-ware industry, with almost unlimited supplies of raw material, is making a concentrated effort to capture the world's markets in line. Before the war 317 tons of manufactured aluminum were shipped to Russia and 161 tons to Austria. These two markets are now not in a condition to receive supplies and as a result a new market must be found.

EXHIBIT 4.

EXHIBIT 6.

Comparison of wage scale in the United States and Germany based on table in American Machinist of June 3, 1920.

	Germany.		United States (per hour).
	Marks (per hour).	United States money.	
Trained machinists.....	2.94	\$0.0594	\$0.85
Machinist's helper.....	2.69	.0544	.54-.625
Lathe hand.....	2.94	.0594	.85
Tool makers.....	3.00	.0606	1.10-1.15
Fitters.....	3.20	.0647	1.10
Planer, miller, and drill hands.....	2.69	.0544	.85
Turret, lathe, and automatic operator.....	2.75	.0556	.85

Wage rates for the United States are those quoted for Philadelphia and vicinity by the American Federation of Labor August 19, 1920. The computation of wages in Germany was translated into American money on the assumption that a mark was worth a trifle over 2 cents. In fact, the mark is worth now somewhat less than 2 cents, so that the wages of German workingmen to-day, expressed in American money, would be somewhat lower than the amounts shown above. The American Machinist publishes varying rates of wages for different parts of Germany, but the variations are not great enough to impair the value of the foregoing comparison. All of the classes of labor shown in this comparison are of importance in the manufacture of aluminum wares, and as to these classes of labor it appears that wages in the United States are more than eight times as high per hour as in Germany.

EXHIBIT 7.

Comparison of labor costs in Germany and United States, taking the mark on basis of 2 cents in United States currency.

[By Chairman Henry C. Milligan, of the tariff committee of the Enameled Ware Association.]

	United States (per hour).	Germany (per hour).	Germany (per hour).
	Cents.	Cents.	Marks.
Machinists.....	76½	9	1.80
Pressmen.....	65	9	1.80
Spinners, beaders, small punch presses.....	62	8	1.60
Riveters and welders.....	58½	5½	1.10
Picklers.....	58	9	1.80
Dippers (average of men and girls).....	53½	6½	1.30
Inspectors (girls).....	45½	5	1.00
Burners.....	70½	9	1.80
Sorters and wrappers (female).....	35½	5	1.00
Packers.....	58½	8½	1.70
Common labor.....	47½	7½	1.50
Average wages per hour.....	57½	7½	1.50

In other words, the cost of labor in Germany to-day, basing the value of the mark at 2 cents American money, is just one-eighth what it is for the same work here.

The labor rates taken to represent the German costs are taken from the detailed schedule of wages for machine industries, foundries, enameling works, etc., the highest rate being taken in each case and the mark figured at a value of 2 cents in United States currency, which is much higher than its value to-day.

EXHIBIT 8.

REPORT AS TO WAGES PAID IN GERMANY IN THE ENAMELED HOLLOW-WARE INDUSTRY AND ALLIED INDUSTRIES.

The report was made by the British foreign office and board of trade (department of overseas trade) under date of January 24, 1921, and delivered to Messrs. Macfarlane & Robinson (Ltd.), who are English manufacturers of enameled hollow ware, maintaining a branch in New York City. We have extracted from this report the rates of wages paid to German workmen in classifications which are employed in the manufacture of aluminum ware, and we might say here that a large majority of the classifications mentioned in this report are such as operate in the manufacture of aluminum ware. The manufacture of aluminum ware involves very nearly the same process as the manufacture of enameled ware. In a general way it may be said that the only process that is not common to the two lines of manufacture is that which applies the glazing or the enameled surface to the enameled ware.

The parts of the report shown below are copied from the Milligan brief.

FOREIGN OFFICE AND BOARD OF TRADE.
London, S. W. I., January 24, 1921.

GENTLEMEN: With reference to your letter of January 13, I have to inclose herewith a tariff of the rates of wages paid in the enameled hollow ware industry and allied industries in Germany. I have to add that these rates have been in force in the Dusseldorf area since April last, and can be taken as representative, though, if anything, they are slightly higher than those paid in other districts.

Where piecework rates are resorted to, which is the general rule, it is stated that an average worker can earn at least 15 per cent more than the average hourly rate.

Yours faithfully,

J. S. ANDREWS.
For the Comptroller General.

Messrs. MACFARLANE & ROBINSON (LTD.),
Kampen House, 76-8 Southwark Street, S. E. I.

es per hour in machine industries, foundries, locomotive, wagon, and allied industries, and enameling works.

s I(a). Skilled workers having a certificate of proficiency who can prove have had a long and varied experience and practical training, capable working independently in their trade. Doubtful cases are decided by a commission of experts:	Marks.
For workers over 25 years.....	4. 30-4. 50
For workers from 21 to 25 years.....	3. 70-4. 30
For workers who have finished apprenticeship up to 21 years.....	2. 90-3. 20
s II(a). Skilled workers without a certificate of proficiency:	
For workers over 25 years of age.....	4. 10-4. 30
For workers from 21 to 25 years.....	3. 60-4. 10
For workers from 19 to 21 years.....	2. 80-3. 10
For workers from 17 to 19 years.....	2. 50-2. 80
s III(a). Trained workers:	
For workers over 25 years of age.....	3. 85-4. 05
For workers from 21 to 25 years.....	3. 55-3. 85
For workers from 19 to 21 years.....	2. 70-3. 00
For workers from 17 to 18 years.....	2. 40-2. 70
s IV (a). Helpers or mates:	
For workers over 21 years of age.....	3. 55-3. 85
For workers from 18 to 21 years.....	2. 70-3. 00
For workers from 16 to 18 years.....	2. 40-2. 70
For workers from 14 to 16 years.....	1. 90-2. 20

emale workers doing men's work receive 20 per cent less than do male workers of same class.

Classification in the sheet and metal punching and enameling trade.

Mechanical workshop:	Class.	
Turner (called lathe hand in aluminum industry).....	I(a)	III(a)
Fitter (called die tester).....	I(a)	III(a)
Smith (blacksmith).....	I(a)	II(a)
Hammerman.....	III(a)	
Planer.....	I(a)	III(a)
Milling cutter.....	I(a)	III(a)
Punch and planishing works:		
Presser (press hand).....	I(a)	III(a)
Cutter cutting rounds on circular shears.....	III(a)	IV(a)
Cutter operating plate shears.....	III(a)	
Scrap binder and waste stamper.....	III(a)	
Cutter.....	III(a)	
Trimmer.....	III(a)	
Straightener (ironer).....	I(a)	III(a)
Hollow metal worker and drawer.....	I(a)	III(a)
Aluminum presser.....	I(a)	II(a)
Grinder and polisher.....	I(a)	III(a)
Annealer or furnaceman.....	II(a)	
Plumber's workshop:		
Electrowelder.....	II(a)	III(a)
Oxy-acetylene welder.....	II(a)	III(a)
Setter (Anschlaeger).....	II(a)	
Enamel works:		
Picklers.....	I(a)	
Hollow metal worker.....	I(a)	III(a)
Annealer.....	II(a)	
Box maker.....	I(a)	III(a)
Packer.....	II(a)	III(a)
Weigher.....	III(a)	
Assembler.....	II(a)	
First assembler.....	II(a)	
Warehouseman.....	IV(a)	
Female picklers.....	I(a)	
Women cleaners in pickling shops.....	I(a)	

Wages per hour of special female workers:	Mark
For female workers over 21 years.....	2 50-2 70
For female workers from 16 to 18 years.....	1 70-1 80
For female workers from 18 to 21 years.....	1 90-2 10
For female workers from 14 to 16 years.....	1 40-1 50

In special female workers are included Auftraegerinnen (japanners), electro-oxy-acetylene welders, assemblers, printers, machine workers, cleaners in pickling shops (plus 10 pfennigs per hour bonus, aprons, and clogs), and sprayers.

Wages per hour of helpers or mates (females):	Mark
For female workers over 21 years.....	2 40-2 50
For female workers from 18 to 21 years.....	1 80-2 00
For female workers from 16 to 18 years.....	1 60-1 80
For female workers from 14 to 16 years.....	1 30-1 40

To these belong cleaners, washers, packers, other helpers.

SPECIAL PROVISIONS.

In addition to the wages specified above, there are allowances paid to a worker for the support of dependent children; also bonuses for foremen; also, since April 1, 1920, an "increased cost of living" bonus, which is graduated according to age and experience.

EXHIBIT 9.

ALUMINUM HOLLOW WARE.

[Memorandum furnished by Bureau of Foreign and Domestic Commerce (European Division, Washington, D. C., under date of April 8, 1921.)]

France.—We have no data at this office relative to the present wages paid in French factories producing aluminum hollow ware. Owing to the unstable conditions in Europe the standard of living varies between one locality and another and makes it very difficult to determine the wage scale in any industry.

We have received an excellent report from Commercial Attaché Huntington, Paris, dated February 4, 1921, outlining the wages paid in certain of the more important industries of that country. While that of aluminum hollow ware is not mentioned in the report, it may be possible to estimate the wage scale in that industry from the following data on wages in similar trades (48-hour week):

	Francs per hour
Blacksmith.....	2 50-2 70
Structural iron workers.....	1 70-1 80
Plumbers.....	1 90-2 10
Punch press hands.....	1 40-1 50
Boring mill hands.....	1 30-1 40
Skilled machinists.....	2 50-2 70
Common male labor.....	1 30-1 40
Turners.....	2 50-2 70
Fitters.....	1 70-1 80
Molders.....	1 90-2 10

NOTE.—French francs are worth at present about 7 cents in American money.

Belgium.—No information has been received here in regard to the aluminum hollow ware industry in Belgium. However, an idea of the probable wages paid for workers in that trade may be gained by examination of the following data, comprising excerpts from a recent report of Trade Commissioner Cross, Brussels, and showing the wages paid in certain industries in Belgium:

	Francs per hour
Engineering trades.....	2 50-2 70
Boiler makers.....	1 50-1 60

EXHIBIT 10.

Imports of manufactures of aluminum in 1913 were valued at \$739,777. This was accomplished under the tariff act of 1909, which imposed a duty of 45 per cent ad valorem. The new tariff act of October 3, 1913, reduced this duty to 25 per cent ad valorem. An immediate effect was noted in the value of imports in 1914, when

hed \$1,441,253. In other words, the reduction in the rate of duty resulted in the value of importations being doubled during the first year following, even though the first five months of such following year were affected to some extent by European war conditions. It is safe to say that if there had been no European war the reduction of rate of duty would have resulted in a still larger total of imports in 1914 and in progressively increased quantities of imports during 1915 and the years following. The figures shown by the survey make it perfectly clear that when Congress reduced duty on manufactures of aluminum from 45 per cent ad valorem to 25 per cent ad valorem the measure of protection which the American industry had formerly enjoyed was removed; that under the 25 per cent rate the European product, and particularly the German product, would move into this country in constantly increasing quantities, and that this result was only prevented by the war conditions which prevailed during the next four or five years. In other words, it is the war and not the American tariff which has enabled American manufacturers of aluminum to keep their plants in successful operation from 1914 to the present time.

The figures shown on page 58 of the survey indicate that when the rate of duty was reduced British imports into the United States were more than doubled, and German imports made a still larger gain (about 140 per cent). (Page 58 of Survey.)

EXHIBIT 11.

An interesting result of the reduction of the rate of duty from 45 per cent ad valorem to 40 and 25 per cent ad valorem, on manufactures of aluminum, is disclosed by the table on this page. Under the higher rate, which prevailed during most of 1913, Government revenue amounted to \$331,834.79; while under the lower rate prevailing in 1914, the Government revenue was reduced to \$321,931.80, in spite of the fact that the value of imports giving rise to the revenue was twice as high in 1914 as it was in 1913. These figures prove that the reduction of the duty resulted in loss of revenue to the Government, and in loss of business to American manufacturers at the same time. (Page 58 of Survey.)

EXHIBIT 12.

The Bureau of Domestic and Foreign Commerce (European Division), Washington, D. C., reports upon the importation of manufactures of aluminum, under post-war conditions, as follows:

Value of importations of table, kitchen, and hospital utensils, or similar hollow ware, and of all other manufactures of aluminum, for calendar year 1919, \$318,407.

Value of importations of the same aluminum products during the first 10 months of 1920, \$1,953,039.

It must be noted that the figures just given do not include any aluminum imports in the form of bars, strips, sheet, or rods, nor any aluminum leaf or aluminum foil, nor any aluminum scrap, nor in fact any article of aluminum except such as have been fabricated for actual use by the consumer. The manufactures of aluminum included in the figures just given were therefore all subject to the provisions of paragraphs 134 and 167 of the tariff act of 1913, imposing ad valorem duties of 25 per cent on hollow ware and 20 per cent on all other manufactures of aluminum.

The speed with which foreign manufacturers of aluminum ware are increasing their sales in the United States is exhibited by the showing just made for 1919 and the first ten months of 1920. (Figures for the last two months of 1920 are not as yet obtainable.) While only \$318,407 worth of aluminum wares entered the United States in 1919, more than six times that amount came in during the first 10 months of 1920.

EXHIBIT 13.

General statements of the United States Tariff Commission relative to cost of producing aluminum in Europe and United States (1921.)

The aluminum production of France, England, and Switzerland continued without interruption during the war and in some cases was slightly increased. Production in Germany was substantially increased during the war. The continental producers are well organized. The corporations were strong and their manufacturing facilities well located and favorable. (Page 26 of Survey.)

The Swiss and German production of aluminum before the war was something over 10,000 tons per annum (German capital being in control of the Swiss industry), while during the war the German production alone increased to 34,000 tons annually from Austrian bauxite. (Page 32 of Survey.)

As stated above, German capital is heavily interested in the Swiss aluminum industry. During the war the German Government, finding a large increase in the supply of aluminum was necessary, undertook to establish a national industry to produce an adequate supply of aluminum within the country. As a result there were five plants in Germany at the end of the war, four of which are either wholly or partially owned by the German Government. The largest plant, located at Latta in Silesia, and having a capacity of 31,000,000 pounds per year, is wholly owned by the German Government. The Government controls the other three plants through ownership of shares. Still another plant is projected with a capacity of 39,000,000 pounds of aluminum per year. The hydro-electric plant is now under construction on the Inn River in Bavaria and the undertaking will be under direct Government ownership and control. The present capacity of the German Government aluminum plants is approximately 107,300,000 pounds per year. (Page 34 of Survey.)

In tariff hearing before the Committee on Ways and Means of the House of Representatives, prior to the act of 1913, a brief submitted by Julius Hess & Co., Chicago, Ill., gave the cost of 1 pound of aluminum metal at that time as 12 cents in the United States and 6 cents in Germany. (Page 41 of Survey.)

At the present time the most active competition (in the production of aluminum from its ores) comes from Germany, where aluminum production, greatly developed during the war period, is controlled by the Government. The raw materials are largely obtained in Austria, and power charges and labor costs are figured in terms of depreciated currency. (Page 42 of Survey.)

Labor enters into the cost of production of aluminum at every stage of advancement from the mining of the ore to the marketing of the finished product. Present wages in the main classes of labor employed in the reduction works may be taken at approximately \$5 per day, while most recent advices from Germany indicate that similar labor in that country now receives only 40 marks (at present exchange rate, 50 or 60 cents United States currency). (Page 43 of Survey.)

(NOTE.—It has already been shown in this brief that about 50 per cent of the finished article of aluminum represents labor and about 50 per cent represents material; also that as to the labor element, the cost in Germany is about one-eighth of the cost in the United States; and the foregoing statements of the Tariff Commission, which have recently been officially promulgated, make it certain that the 50 per cent of the finished article represented by material is also much cheaper in Germany than in this country.)

SUPPLEMENTAL BRIEF.

On March 16, 1921, the American manufacturers of aluminum ware met at Cleveland, Ohio, to consider the matter of additional protective duties on products of aluminum. It was the opinion of all of the delegates present at this meeting that the duties levied on imports of aluminum ware, under the tariff act of October 3, 1913, were too low to afford any protection to the industry of manufacturing aluminum hollow ware and utensils in the United States, especially in view of the depreciated currency in which European manufacturers paid for their raw material and the cost of labor.

At this meeting of the manufacturers a committee was appointed to give special attention to the question of additional protective duties, and to present the arguments in favor thereof, when the Congress took up tariff revision for consideration. The special committee was called "The tariff committee of aluminum ware manufacturers," and consisted of the following: B. C. Ziegler, chairman, C. E. Swartzbaugh, jr., and H. A. Church. B. C. Ziegler, the chairman of the committee, is president of the West Bend Aluminum Co., of West Bend, Wis. C. E. Swartzbaugh, jr., is president of the Toledo Cooker Co., Toledo, Ohio. H. A. Church is secretary of the Indiana Aluminum Ware Co., Elkhart, Ind.

The tariff committee of the aluminum ware manufacturers has carried on extensive investigations, and has sent out questionnaires to American manufacturers of aluminum, for the purpose of procuring figures and other data bearing on the American industry, and has heretofore prepared a brief for the Congress, copies of which have been furnished to members of the Committee on Finance of the United States Senate and to members of the Ways and Means Committee of the House of Representatives. At the time this first brief was prepared the pending tariff bill, designated H. R. 7544, had not been framed or introduced, so that the brief could not identify the subject under discussion by any reference to paragraphs or schedules of the new tariff bill.

For this reason, the brief prepared by the tariff committee of the aluminum ware manufacturers identified the subject now under discussion as "Schedule C, paragraphs 134 and 167," being the schedule and paragraphs controlling duties on aluminum ware under the tariff act of October 3, 1913.

This supplemental brief is prepared on August 15, 1921. On this date the new tariff bill, H. R. 7456, is pending before the Finance Committee of the Senate. The rates of duty on manufactures of aluminum which were prescribed by the tariff law of 1913 (and which were discussed in our original brief under the head of "Schedule 3, pars. 134 and 167") have been changed by action of the House of Representatives; but if the new rates of duty proposed by the House of Representatives, and embodied in Schedule 3, paragraph 339, of the pending tariff bill, should be enacted into law, the increase over existing rates would be so small that the American aluminum ware industry would find itself without any substantial tariff protection. The tariff committee of the aluminum ware manufacturers, hereinafter called for convenience the aluminum ware committee, have therefore prepared this supplemental brief and argument for the purpose of presenting to the Congress additional reasons in support of the increased duties which we asked for in our original brief.

SUMMARY OF POINTS MADE IN ORIGINAL BRIEF.

1. Since 1883, the prevailing rate of duty on manufactures of aluminum (meaning aluminum hollow ware and other aluminum utensils) has been 45 per cent ad valorem.
2. Under the act of 1913, the rate of duty was reduced to 25 per cent ad valorem on table, kitchen, and household utensils and other hollow ware, and to 20 per cent ad valorem on other articles composed of aluminum, not specially provided for.
3. This reduction in the rate of duty resulted in an immediate increase in the amount of aluminum ware entering the United States from foreign countries. The calendar year in which the lower rates of duty prevailed was 1914. Although general importation from Europe was greatly reduced during the last five months of 1914, by reason of the war, imports of manufactures of aluminum were twice as large during the whole year as they were during 1913, when the 45 per cent rate prevailed.
4. War conditions from 1914 to 1919 prevented European manufactures of aluminum from being exported to the United States, except in very small quantities. The war, therefore, gave to American manufacturers of aluminum ware a measure of protection which existing rates of duty did not provide.
5. In 1919 Europe resumed the business of exporting aluminum ware to the United States. Germany was the principal European country to do this.
6. In 1920, under the rates of duty prescribed by the tariff act of 1913, the value of aluminum ware imported into the United States was more than six times as large as in 1919.
7. The labor cost of producing aluminum ware in Germany is less than one-eighth the labor cost of producing the same ware in the United States. The labor cost of aluminum ware is approximately 50 per cent of the finished product.
8. The raw material entering into aluminum ware is principally aluminum sheet. The cost of aluminum sheet to the German manufacturer of aluminum ware is considerably less than the cost of aluminum sheet to the American manufacturer of aluminum ware.
9. The extreme cheapness with which the European manufacturer of aluminum ware, and particularly the German manufacturer, can produce his goods is due primarily to the lower wages paid abroad; but these lower wages are made still lower by the depreciation of the currency in most European countries. In Germany wages are paid in marks, and in the spring of 1921 a German mark was worth in American money only about one-twelfth of its normal value. On August 15, 1921, the German mark has sunk still lower, it now being worth approximately one-eighteenth of its normal value.
10. American manufacturers of aluminum ware are no longer protected by a war in Europe. They never were protected by the rates of duty provided by the tariff act of 1913. They can not possibly reduce American wages to the level of German wages. Unless they are given a very substantial measure of additional protection by the new tariff bill they will quickly be put out of business by the flood of aluminum ware from Europe, particularly from Germany.
11. Our original brief asked (a) that the ad valorem duty which prevailed for so many years in this industry, viz, 45 per cent, be restored; (b) that in addition thereto manufactures of aluminum be subjected to a specific duty of 15 cents per pound; and (c) that valuation be on the basis of fair market value in American money at port of entry.

PROPOSED INCREASES IN RATES OF DUTY.

Schedule 3, paragraph 339, of the new tariff bill, as it comes from the House of Representatives, covers the bulk of the products of aluminum which this aluminum ware committee has to deal with.

Paragraph 339 raises table, kitchen, and hospital utensils and similar hollow ware from 25 per cent ad valorem to 28 per cent ad valorem. It raises flat ware of aluminum from 20 per cent ad valorem to 28 per cent ad valorem.

There are other paragraphs which affect to a small degree products of aluminum. By these other paragraphs the rate of duty is raised from 20 per cent ad valorem to 25 per cent in some cases, to 30 per cent in some cases, and to 35 per cent in some cases, but since aluminum hollow ware and aluminum flat ware constitute so nearly the entire output of American producers of aluminum goods, it is not considered worthwhile to comment, in this supplemental brief, upon the provisions of any paragraph except those of paragraph 339, carrying a rate of 28 per cent ad valorem.

H. R. 7456 grants to manufacturers of aluminum ware no protection whatever in the way of any specific duty. It grants additional protection, over the rates of the existing law, by an increase of only 3 per cent ad valorem on hollow ware and of 8 per cent ad valorem on flat ware. The American valuation clause is intended merely to equalize exchange rates between the United States and foreign countries.

ARGUMENT.

The aluminum ware committee respectfully request that their original brief be considered in connection with this supplemental brief. Our original brief contains many exhibits and compilations of figures in support of the points made in behalf of American manufacturers of aluminum ware, and we can avoid much repetition by assuming that this supplemental brief and the original brief will be read and considered together.

In our industry it is absolutely essential that American valuation prevail at the present time as a basis of ad valorem duties. Section 402 of the new tariff bill provides for American valuation of imports. We understand that both the Senate and the House of Representatives favor American valuation in substantially the form now proposed by the new bill. If so, we need not here make any argument on the subject. We merely point out that the new tariff bill, if intended to protect American industry, must not only provide normal ad valorem duties sufficient to cover the difference between the usual wage paid in Europe and that paid in the United States, but must have also some simple and automatic device that will overcome at all times and through all fluctuations the lower value of European-made goods which results from depreciated currencies. We believe this automatic regulator is provided by the American-valuation plan contained in section 402 of the pending bill.

We assume, therefore, that American valuation will be in the new tariff law and that American industry will thereby be protected against any influx of manufactured articles which are artificially cheap because paid for in money that is nearly worthless; and we turn our attention to the matter of a fair and reasonable duty on aluminum ware, based upon valuations which by the operation of section 402 have been made the equivalent of prewar valuations.

The aluminum ware committee, in view of the proposed duties contained in paragraph 339 of schedule 3 of the new tariff bill, wish to urge three principal arguments in support of higher duties on imports of aluminum ware, as follows:

1. *Aluminum hollow ware and flat ware should be given a measure of protection equal to that awarded to enamel ware of the same kind.*—Paragraph 339 of the new tariff bill imposes a duty of 30 per cent ad valorem on enamel hollow ware and flat ware, plus 5 cents per pound, while the same utensils, if composed wholly or in chief value of aluminum, carry a duty of 28 per cent ad valorem and no specific duty.

Table, household, kitchen, and hospital utensils and similar hollow or flat ware if composed of iron or steel and enameled or glazed, are identical in shape, form, and size with table, household, kitchen, and hospital utensils and similar hollow or flat ware composed of aluminum. The manufacturers of enameled ware and the manufacturers of aluminum are competing in the same market and are selling their products for the same use. An aluminum teakettle weighs less and costs more than an enameled teakettle of the same capacity.

For practical purposes it can be said that a kitchen or household utensil of any given size and capacity weighs about three times as much in enamel ware as it does in aluminum ware. Therefore, if enamel ware is placed under a specific duty of 15 cents per pound, aluminum ware ought to carry a duty of 15 cents per pound. As to the ad valorem duties, aluminum ware certainly ought to be given at least as high a rate as enamel ware.

we believe, and we earnestly urge, that the rates asked for in our original brief should be enacted into law in the new tariff bill, viz: Forty-five per cent ad valorem and 15 cents per pound, with American valuation. These figures are not too high in the face of the extraordinary conditions which threaten this industry in the United States; conditions which include not merely the usual wage differential, with which American industry has had to cope for many years, but the tremendous cheapening of European products as the result of depreciated currency.

We believe that enamel ware ought to have 45 per cent ad valorem and 5 cents per pound specific, and that aluminum ware ought to have 45 per cent ad valorem and 15 cents per pound specific, which would put the enamel ware industry and the aluminum ware industry on an even basis. But if enamel ware is to be limited to 30 per cent ad valorem and 5 cents per pound, then aluminum ware certainly ought to be given 30 per cent ad valorem and 15 cents per pound. If any discrimination is made in the new tariff bill between enamel ware and aluminum ware, in the matter of the amount of protection afforded, it ought not to be against aluminum ware but in favor of it, for the reason that aluminum ware is a newer entrant in the market and has had as many years in which to establish itself as a commercial and household necessity.

A rate of 28 per cent ad valorem on aluminum hollow ware and flat ware is insufficient to afford any measure of protection to the American makers of these goods.—This point has already been touched upon, and we think it will not be necessary to make much additional argument in support of it. We might call attention to some of the statistics contained in our original brief. The manufacturers of aluminum ware in the United States employ more than 6,500 workers, all of whom are paid the American scale of wages. It would be utterly impossible to cut these wages down to the level of German wages in the same industry, even if the German mark which is used in paying German wages were worth 24 cents as before the war; and it is more conclusively impossible to cut American wages down to the level of German wages when it is considered that the latter are paid in marks that are worth less than a cent and a half. Yet without such a tremendous cut it would be impossible for the American factories to continue to operate in competition with Germany, in the absence of tariff protection.

Assuming that American valuation will be part of the new tariff law, and will operate to overcome the cheapening effect of depreciated currencies in Europe and elsewhere, it allows that valuations for ad valorem duties will hereafter be on substantially the same basis as they were before the war, when the currencies of foreign countries were of a value that we were accustomed to call normal. Having accomplished this, it remains the problem of furnishing adequate protection to the American industry, by proper ad valorem and specific duties sufficient to assure the maintenance of the American wage scale against the lower scales paid by foreign manufacturers. As we have already shown, it was the judgment of Congress, for the greater part of the 38 years since aluminum ware was recognized in American tariff legislation, that 45 per cent ad valorem was the proper duty to place on imported aluminum ware for the protection of the American industry. The reduction of this rate by about one-half, in 1913, immediately increased importations of European-made aluminum ware. Now, under post-war conditions, we submit that the 45 per cent rate is certainly not too high. Wages have gone up all over the world since the war. The increase in many and other European countries is nominal, and not actual; but the increase is equal in the United States. If American manufacturers of aluminum ware are to continue in business, and if unemployment or reduced wages in this industry are to be avoided, an ad valorem rate no less than 45 per cent should be written into the new tariff.

The aluminum ware committee call attention to the fact that increased duties have been placed upon aluminum sheet, which is the raw material consumed by the manufacturers of aluminum ware.—Under the 1913 tariff law, aluminum scrap and aluminum in other waste form carries a duty of 2 cents per pound, and aluminum plates and sheets carry a duty of 3½ cents per pound. The new tariff bill proposes to raise the first class of aluminum (crude) from 2 cents to 5 cents per pound, and the second class (plates and sheets) from 3½ cents to 9 cents per pound. (Schedule 3, par. 374.)

No argument is needed to demonstrate that the manufacturers represented by this aluminum ware committee, all of whom are constantly compelled to purchase sheet aluminum as the raw material for their product, will hereafter find their raw material costing them more under the new rates. If these manufacturers continue to pay the American scale of wages, and pay even more for their raw material than they have heretofore paid, it is obvious that the cost of their product can not possibly be reduced to meet the competition of European manufacturers of aluminum ware. We wish to impress upon the Senators and the Members of the House of Representatives that the aluminum ware committee who present this brief are representatives of the

consumers of aluminum sheet and not of the producers of aluminum sheet. The manufacturers of aluminum ware in the United States would like to buy their raw material as cheap as possible, and will enter any market where they can save money on their purchases. If the American producers of aluminum sheet could stay in business and make a living profit without any tariff protection whatever the manufacturers of aluminum ware represented by this committee would favor putting aluminum sheet on the free list. But we do not wish to ask that aluminum sheet be deprived of its proper measure of protection. We want aluminum sheet to be produced in the United States. It would seriously injure the business of manufacturing aluminum utensils and other aluminum goods to destroy, or even injure, the aluminum sheet industry in this country, for any such situation would force us to seek foreign countries for our supply of the raw material needed in our business.

The aluminum ware committee do not know what measure of protection is needed to enable American producers of sheet aluminum to continue in business in the face of present conditions in Germany and other countries in Europe. In the absence of knowledge on the subject, we do not consider it proper to object to 5 cents per pound on crude aluminum and 9 cents per pound on aluminum sheet, even though these rates will add to the cost of the raw material which our factories consume; but in propriety of these rates being conceded, we call attention to the fact that the consumers of aluminum sheet, to wit, the manufacturers of aluminum hollow ware and flat ware, must be accorded a corresponding increase of tariff protection upon their product.

This has not been done by the slight increase provided in paragraph 339 of Schedule 3 of the new tariff bill. An increase on our products of only 3 per cent ad valorem is so small as to be negligible. If the increased duty on sheet aluminum results in even a slight advance in the price which the aluminum-ware manufacturers must pay for their sheet, the resulting disadvantage to them in their efforts to compete with the European product will not be cured by increasing their protection only to 28 per cent ad valorem.

The aluminum-ware committee believe it is proper at this time to insert in this supplemental brief the following statement:

Charges have been made and circulated by certain importers of aluminum ware to the effect that American manufacturers of aluminum ware are dominated and controlled by the Aluminum Co. of America, which company is the largest producer of sheet aluminum in this country. Importers of foreign aluminum ware are doing their best to prevent the imposition of any tariff duties on aluminum ware which would tend to restrict importations. Their motive in making these charges, therefore, is apparent. The importers allege that the Aluminum Co. of America is a very large and strong institution, and that it needs no tariff protection, and that the manufacturers of aluminum ware need no protection because they are merely subsidiaries of the Aluminum Co. of America. We do not know whether these claims and charges of the importers have had any effect upon Senators or Members of the House of Representatives who have had occasion to consider aluminum tariff schedules; but in order that our silence may not be construed to be an admission, and to make certain that the truth is known, we state here that the Aluminum Co. of America does not own or control or dominate the manufacturers of aluminum ware in the United States. The tariff committee of the aluminum ware manufacturers, which presents this supplemental brief, represents 34 manufacturers of aluminum ware in the United States. A complete list of these 34 manufacturers is found on pages 4 and 5 of our original brief.

The committee are able to state that 32 out of these 34 manufacturers are absolutely and completely independent of the Aluminum Co. of America; that the Aluminum Co. of America has neither stock control nor stock interest, directly or indirectly, of any kind or description, in these 32 companies; and that as to the remaining two companies on the list, the aluminum-ware committee find, after careful inquiry, that in one of them the Aluminum Co. of America is merely a minority stockholder, and has never been anything but a minority stockholder, and does not now control and has never controlled the board of directors or the business operations of the company. This leaves one company out of 34, engaged in the manufacture of aluminum ware, which might be considered controlled or dominated by the Aluminum Co. of America. No member of the aluminum-ware committee has the slightest interest in or connection with the Aluminum Co. of America, and the members of the committee wish to make it plain that their efforts are here put forth solely in behalf of the manufacturers of aluminum ware; that they are not arguing for or against the interests of the Aluminum Co. of America or the interests of any other producer of aluminum sheet; that the manufacturers of aluminum ware wish to buy their sheet aluminum as cheap as possible.

le, but do not believe that their interests would be served by legislation which would restrict or stop the production of sheet aluminum in the United States; that the manufacturers of aluminum ware represented by the committee are independent and competing concerns, and not mere agencies or subsidiaries of the producers of aluminum sheet; and that statements and charges to the contrary are false, and are inspired by persons who hope to reap a profit in the importing business if they can persuade the Congress to deny protection to the aluminum-ware manufacturers.

The aluminum-ware committee submit that it would not be unlawful or immoral for the Aluminum Co. of America to control, by stock ownership or otherwise, a corporation manufacturing aluminum ware. Whether any such control is exercised, and to what extent exercised if at all, is entirely irrelevant to the inquiry. We would not have felt called upon to mention the matter at all, except for the fact that importers of aluminum ware concocted the story in the hope that it would prejudice before the committees of Congress.

IN CONCLUSION.

We respectfully urge that paragraph 339 of Schedule 3 of the new tariff bill be amended, before the bill is enacted into law, so as to provide that the duty on table, household, kitchen, and hospital utensils and similar hollow or flat ware, not specially provided for, if composed wholly or in chief value of aluminum, shall be 45 per cent ad valorem and 15 cents per pound. We would not object to the same rates being provided for enamel ware, the specific duty being reduced to 5 cents per pound because of difference in weight. Aluminum ware ought not to be accorded any less tariff protection, under any circumstances, than is provided for enamel ware.

ENAMEL WARE.

[Paragraph 339.]

BRIEF OF ROSCOE C. McCULLOCH, REPRESENTING THE AMERICAN MANUFACTURERS OF ENAMEL WARE.

On behalf of certain American manufacturers of enamel ware, which is covered by paragraph 339, page 56, of H. R. 7546, I submit the following brief, leave having been granted by the Finance Committee at a hearing on August 26, 1921. The paragraph in the Fordney bill as it relates to enamel ware is satisfactory to the manufacturers who signed this brief.

The act of 1909 provided a duty of 40 per cent ad valorem.

Paragraph 134 of the act of 1913 as it relates to enameled ware reads as follows:

"Table, kitchen, and hospital utensils, or other similar hollow ware composed of iron or steel, enameled or glazed with vitreous glasses, 25 per cent ad valorem."

We ask that the paragraph relating to enameled ware in the new law read as follows:

"Table, household, kitchen, and hospital utensils, or other similar hollow ware, and flat ware composed of iron or steel, enameled or glazed with vitreous glasses, 5 cents per pound and 40 per cent ad valorem."

Note changes in phraseology from act of 1913:

First. Include the word "Household," which will make the paragraph more comprehensive.

Second. Add the words "and flat," which will make the paragraph cover enameled spoons, ladles, tea strainers, etc., which are of a kindred nature.

Before the war, Germany was the leading foreign producer of enameled ware and it is from Germany that intense competition in enameled ware products is now sure to come.

INVESTIGATION IN GERMANY, JUST FINISHED, DISCLOSES STARTLING FACTS.

Henry C. Milligan, chairman of the tariff committee, Enameled Ware Association, representing the enameled ware industry in the United States, returned February 25, 1921, from Europe, where he made a careful, detailed, first-hand investigation into present conditions, and the following data and facts in regard to wages and conditions in Germany in the enameled ware industry are based upon his investigations.

(See verifying exhibits following.)

DOMESTIC CONDITIONS.

In addition to the investigation made abroad, a questionnaire was sent out on January 19, 1921, to 26 establishments manufacturing enameled ware in the United States asking for information in regard to wages and competitive conditions. Twenty concerns answered the questionnaires, and the following facts and tabulations of wages paid in the United States are based upon the answers of these 20 concerns.

(See verifying exhibits following.)

We submit the following tabulations and comparison of labor costs in Germany and the United States, figuring the mark on basis of 2 cents in United States currency.

	United States, per hour, cents.	Germany, per	
		Cents.	Mark
Machinists.....	76½	9	
Pressmen.....	65	9	
Spinners, beaders, small punch presses.....	62	8	
Riveters and welders.....	58½	5½	
Picklers.....	58	9	
Dippers (average of men and girls).....	53½	6½	
Inspectors (girls).....	45½	5	
Burners.....	70½	9	
Sorters and wrappers (female).....	35½	5	
Packers.....	58½	8½	
Common labor.....	47½	7½	
Average wages, per hour.....	57½	7½	

The tabulations show that the cost of labor in Germany to-day, basing the value of the mark at 2 cents American money, is just one-eighth what it is for the same work here.

The labor rates taken to represent the German costs are from the detailed schedule of wages for machine industries, foundries, enameling works, etc., the highest rates being taken in each case and the mark figured at a value of 2 cents in United States currency, which is much higher than its to-day's value.

CONCLUSIONS DRAWN FROM INFORMATION SECURED.

On the basis of the foregoing tabulations in regard to comparative wages, and on the basis of material costs, which are relatively as low, an expert of the Treasury Department figured that it would require an ad valorem duty of 767 per cent to equalize the difference in the cost of production of enameled ware in Germany and the United States.

For example, \$100 in value of enameled ware produced in the United States would cost on the above basis of calculation \$12.50 to produce in Germany.

Mr. Milligan in his report, which is attached hereto and marked "Exhibit 4" clearly points out the important fact that Germany, while defeated in the war, is to-day "in a more formidable position to secure the world's markets on manufactured goods than ever before." Mr. Milligan's conclusions should be read by everyone interested in American industrial prosperity.

The tabulation of the reports of the 20 concerns submitting questionnaires, including a conservative estimate of the concerns not returning the questionnaires, show a grand total of 13,583 persons employed in the enameled kitchen-utensil business in the United States during the year 1920 and a normal force of approximately 15,000 people.

WAGES IN THE UNITED STATES.

The tabulation of wages paid by the various concerns in the various lines of work in the industry in the United States show quite a variation, due likely to the different methods in vogue in different factories; also due to local conditions and to the fact that some plants employ women for certain lines of work where men are used exclusively in others. (See Exhibit 2.) Tabulations have been made on the basis of a 10-hour day and the average for the 20 factories reporting shows wages paid to machine shop employees down to \$3.75 per day for sorters and wrappers (female).

The average wages paid per hour in the entire industry figure at the rate of 57½ cents per hour, as determined by these calculations.

WAGES IN GERMANY.

gainst this are tabulated the present German rates for the same class of work as shown from the detailed schedule of wages for machine industries, foundries, enameled ware, etc., the highest rate on this schedule being taken in each case. Figuring the mark at a valuation of 2 cents in United States currency, which is much higher than to-day's value, it is shown that German workers are being paid the equivalent of 19 cents per hour in American money or an average of 7½ cents per hour, as against 9 cents per hour paid in the United States.

In other words, the cost of labor in Germany to-day, basing the value of the mark at 2 cents American money, is just one-eighth what it is for the same work here.

The questionnaires tabulated show an average ratio of labor cost to the total cost of production of 37½ per cent. Adding to this the indirect labor, such as clerks, foremen, etc., it is seen that the total cost of labor in the enameling industry in the United States is easily 50 per cent of the total cost of production. (See Exhibit 2.)

The present duty of 25 per cent is based on the exchange value of the money of the country from which the shipment comes as determined on day of shipment from the home port. Consequently, with the value of the mark less than 10 per cent of its normal value the present duty of 25 per cent is in reality less than 2½ per cent when translated into United States valuations.

RAW MATERIALS.

Germany and Austria, before the war, according to investigations by the United States Tariff Commission, manufactured about 75 per cent of the world's supply of enameled ware and the strong position of Germany, according to the Tariff Commission, was due to the skill of the German workmen in controlling temperatures in furnaces, practically and theoretically trained chemists and engineers, and to research work carried on in well-equipped laboratories as well as to low costs on raw materials, fuel, and labor."

While Germany's competitive conditions were disturbed and disrupted during the war, yet they are fast getting back upon a prewar basis. (See Exhibit 4.)

Germany has long been known as the producer of the various chemical products entering into the manufacture of enameled ware, glassware, etc., such as soda, potash, various color oxides, etc. Likewise, she is self-contained as to feldspar, fluorspar, silica, etc., which largely make up the enameled mix.

Steel which is used as the base for enameled ware products is largely, if not all, self-produced by Germany. The only important materials which Germany is obliged to purchase on the outside are borax and oxide of tin.

While the report of the United States Tariff Commission discloses that during the war Germany has been somewhat handicapped for fuel and steel, yet it is evident that she is fast recovering her normal competitive advantages as to these materials.

So that it is a fair conclusion to draw from all the facts disclosed, that basing a mark at 2 cents, the same situation applies to the 50 per cent of the cost of manufacture represented by raw materials as applies to labor cost. In other words, the cost of export by Germany when translated into American dollars is so low that any duty that might be imposed would be of little avail in preventing our markets from being flooded, unless such a duty were to be based upon the value of the goods as produced in this country, rather than on the value in Germany with duty figures on the depreciated rate of exchange, as is the case at the present time.

The exchange situation is such a complicated one and one that is bound to vary as the months go on, that it is impossible to suggest any rate of duty that would protect the enameled ware industry at this time, unless such a rate were based upon the cost of production in the United States.

Spain has recently placed a duty of 100 per cent on the importation of enameled ware as a protection to the enameled ware industry developed in Spain during the war.

England as well has just provided a duty of 50 per cent on enameled ware, effective March 31, 1921.

Just prior to the war and during the war, Japan has made rapid strides in the enameled ware field, and there is no question but what we can look for serious competition from this quarter once they are able to obtain the necessary supplies of steel, which they were unable to get during the war. Already samples of Japanese enameled ware are being shown and orders solicited at prices below cost of production in this country.

From the facts disclosed by the investigation of our chairman, we recommend—

1. The enactment of an antidumping bill.

2. The passage of a measure providing for the establishment of duties on American valuations in American dollars at port of entry, instead of the fair market selling prices in the countries in which goods are produced.

3. That if goods are to be valued at United States fair market selling prices, we ask that a duty of 5 cents per pound and 40 per cent ad valorem be provided in enameled ware enumerated.

CHAIRMAN MILLIGAN'S REPORT.

TO THE TARIFF COMMITTEE, SHEET METALWARE ASSOCIATION.

GENTLEMEN: In submitting my report regarding European competition as related to the enameled-ware industry, I take pleasure in stating that we have been fortunate in securing abroad valuable data which should be the foundation of an able appeal to our Government for a just and proper tariff to safeguard the interests of the industry.

Your chairman is attaching to this report, for the benefit of each member of the committee, copies of certain important information which each member should fully weigh in arriving at his respective views. In addition to the copies attached hereto, I have secured a vast amount of inside information, and have tabulated a number of newspaper clippings showing the general feeling of unrest, especially among the manufacturers in England, who have had brought home to them in the most forcible manner what German competition, with the mark reduced from a nominal value of 23.8 cents down to a little over 1½, really means to them, and what it will surely mean to us as soon as the floodgates are thrown open, unless we await to the situation and obtain the necessary relief before it is too late. In Germany, as you are aware, the mark is a mark, and on the basis of the mark their manufacturing costs are computed. England, as intimated, while always recognized as a free-trade country, is now seeking some means of protecting her own industries, which at this time are being destroyed by the low prices made to them by Germany on manufactured articles. They have what is known as a "dumping act," which in years past acted as a protection in a measure to their own industries, but at the present time it has no appreciable effect, so that now they have attached to the reparations bill a tax to be added to the price of German goods which is intended to protect the enameling and other industries from this competition. The bill has passed its second reading in Commons and will probably go into effect the last of March.

Germany, Austria, and Sweden, prior to the World War, as you are aware, were the European centers where most of the foreign enameled ware came from. The cutting up of central Europe, the formation of new states, the division of territory, and the immense cost incurred in the war, have left all these states in a most deplorable condition, financially and economically.

Just prior to the war and during the war Japan made rapid strides in the enameled-ware field, and there is no question but what we can look for serious competition from this quarter once they are able to obtain the necessary supplies of steel, which they were unable to get during the war. Already samples of Japanese enameled ware are being shown and orders solicited at prices below cost of production in this country.

Germany, it would seem, has been an exception. She has not felt as the other sections have the havoc that has been wrought by the war, she having prepared to advance the cost of her contest for world power and trade; and while she has failed on the battlefield and been humiliated, and has met great losses, she to-day is in a more formidable position to secure the world's markets on manufactured goods than ever before. To better illustrate this point, I would advise that in 1913, prior to the war, I talked with bankers and manufacturers in Berlin, Dusseldorf, and Cologne on the matter of a special military tax, which in 1913 was levied. A feeling of indignation existed among all classes, they remarking that they could not understand why a military tax then should be demanded, as they could not see where there was any prospect of war. This special tax was a particular hardship on all classes. In talking with a clerk in the hotel in which I stopped at in Cologne he remarked that the additional tax was the equivalent of one month's pay, and as he put it, "We are not in war and we can not understand why this extra tax should be put on us, as we are taxed now, we feel, up to our limit." Germany has her banking connections in the principal markets of the world, and through these banking connections long credits are given the buyers who in turn, knowing the standard of the foreign buyer, negotiate their acceptances and allow the credit they require, thus enabling the German manufacturer to realize on his shipments by receiving, through these banking channels, ready cash. The German Government has always rendered assistance to their manufacturers by subsidies in one way or another, especially so as they relate to shipping rates. To-day enameled goods are being shipped to South American ports from

burg, particularly to Argentina, at \$8 per ton, against New York shipping rates Argentina of \$27 per ton. This, of itself, is a great handicap to American manufacturers seeking export business, and both the United States and England are without means against these advantages, to which Germany seems to feel she has the exclusive right.

It would seem hardly necessary for me to impress upon each member of the committee, who already knows that Germany was perhaps the most efficiently organized industrial nation in the world prior to the war, that she is holding her own in these characteristics as in the past. I have from most reliable sources information to the effect that almost every industry of importance in Germany is to-day paying larger dividends than before the war, and in England it is specially admitted that her determination to control the world's markets never was more manifest, and that unless the countries which fought her on the battlefield in which she was defeated awaken to the situation, Germany will defeat them by crippling their different industries and dominating the world's markets on all manufactured goods by underselling them. At the writing there are 146 lines of German goods being shown in the city of New York alone, at the Imperial Hotel. I have reliable information to the effect that New York is no exception, but that Germany is being represented all over the world with samples of her cheap manufacture.

With reference to Austria, she no longer is a factor. Sweden, with everything advanced there but her currency (kronen) remaining almost normal, being reduced to its prewar standard of value 0.2680 to only 0.2230, is in no position to compete with Germany. In fact, they are feeling German competition in manufactured wares, but it really revolves itself down to the one competitive country—Germany.

By examining the attached papers relative to wages paid, etc., you will note that the costs are figured on a 48-hour a week basis, yet they know no limit of hours of work, and are utilizing child labor to a very great extent. You will note that the wages paid are a mere fraction of the wages paid in this country for similar work. Overhead expenses are proportionately low, while materials entering into the manufacture of finished ware are lower in Germany with two exceptions, and the prices for such materials used are lower than the prices paid here.

It might be well to stop and think for a moment: Should not self-preservation induce us in asking that some protection by our Government be given an industry employing many thousands, both male and female, as well as involving many millions of capital? It is our duty not only to urge but to do everything in our power to secure protection for our employees, as well as protection for the vast amount of capital involved in our industry, and to give to the congressional committee all authentic information secured and available.

Germany's propaganda is to the effect that if we expect her to pay the indemnity demanded for by the supreme council of the League of Nations, we should buy from her. For the sake of argument, let us admit that exchange of trade is necessary, and to a certain degree admit that in order to ever reach normal conditions, if we sell we must buy; but should we not at this time confine the exchange of trade to such products as will not destroy our industries or throw our factory employees into a bread line? Unless some measure be taken in the way of a protective tariff or a revision of the dumping act—not a prohibitive tariff—a tariff based on just and fair lines, making competition what it should be, instead of Germany paying the indemnity demanded for, indirectly our country will have to pay a very large percentage of it.

It will be interesting for you to know that already combinations of bankers and planters in the South have organized corporations for the purpose of shipping their cotton into Czechoslovakia for conversion. This republic, to my mind, will rise to a high position eventually in the world's estimation of countries. To-day it is impoverished, but has vast natural resources. These, together with its mills and factories, will assure its future economic prosperity through its present republican government, the head of which was formerly in charge of one of our largest institutions in the United States. To-day, however, its crown, normal value 0.2026, is but 0.0128. Labor is on as low a basis as Germany. Now, I have in mind a corporation known as the Mississippi Delta Cotton Exporting & Trading Co., with headquarters at Clarksville, Miss. This corporation is organized with a large capital. Its directors are prominent bankers and planters in the South. The corporation is organized under the State of Tennessee, with domicile at Memphis, Tenn., and with branch offices in New York and different cities in Europe. They have already secured on a conversion basis 50 per cent of the cotton mills in Czechoslovakia. I am informed that other similar syndicates have been formed and are preparing to utilize the cheap labor in Germany and other central European states.

It must be self-evident to those who will give the matter any thought, that it means applying cheap foreign labor where it can be utilized, and thus depriving our own citizens of a just means of earning a livelihood.

In this preamble I have only touched on a few of the many matters and conditions relative to the subject matter, my idea being to present in tabulated form all information obtained so that at the first meeting of the committee they may study every angle and be sufficiently informed to present such a brief to Congress as will be convincing to the honorable Ways and Means Committee when the matter of tariff on the industry comes up for hearing.

Now, in reaching my deductions of the questionnaires sent out to various enamelware manufacturers in the United States, we have received returns from 20 concerns while 6 have made no reply to our several letters urging their cooperation. The not replying are as follows: Lalance & Grosjean, Canton Stamping & Enameling Co., New England Enamel Co., Fletcher Enamel Co., Federal Enameling & Stamping Co., Baltimore Stamping & Enameling Co.

I desire to call your attention specially to the tabulation of the reports of the concerns submitting questionnaires, including a conservative estimate of the concerns not returning questionnaires, showing a grand total of 13,583 persons employed directly in the enameled kitchen utensil business during the year 1920, and a work force of approximately 15,000 people.

The tabulation of wages paid by the various concerns in the various lines of work in the industry show quite a variation, due undoubtedly to different methods in wages in different factories; also due to local conditions and to the fact that some plants employ women for certain lines of work where men are used exclusively in others. Tabulations have been made on the basis of a 10-hour day, and the average for the 20 factories reporting shows wages paid of from \$7.65 per day for machine employees down to \$3.75 per day for sorters and wrappers (female).

The average wages paid per hour in the entire industry figure at the rate of 57 cents per hour, as determined by these calculations.

Against this we have tabulated the present German rates for the same class of work, as taken from the detailed schedule of wages for machine industries, foundry and enameling works, etc., the highest rate on this schedule being taken in each case. Figuring the mark at a valuation of 2 cents in United States currency—which is much higher than its value to-day—it is shown that German workers are being paid the equivalent of 5 to 9 cents per hour in American money, or an average of 7 1/2 cents per hour.

In other words, the cost of labor in Germany to-day, basing the value of the mark at 2 cents in American money, is just one-eighth what it is for the same work here.

The questionnaires tabulated show an average ratio of labor cost to the total cost of production of 37 1/2 per cent. Adding onto this the indirect labor, such as clerks, foremen, office force, etc., it is seen that the total cost of labor in the enameling industry in the United States is easily 50 per cent of the total cost of production.

The present duty is based on the exchange value of the money of the country from which the shipment comes, as determined on the day of shipment from the home port. Consequently, with the value of the mark at less than 10 per cent of its normal value, the present duty of 25 per cent is in reality less than 2 1/2 per cent when translated into United States values.

With reference to the other 50 per cent cost of manufacturing enameled ware which would appear from calculations made from our own cost figures for last year, that cost was divided almost equally between stamping materials, such as steel, hoop iron, wire, etc., and the other raw materials such as chemicals, fuel, packing, and wrapping materials, etc.

Regarding these raw materials, the comparative cost as between Germany and the United States is very much affected by the question as to whether they are produced in Germany or are purchased from the outside world, either in the raw or semi-finished form.

From the data we have, those which are produced in Germany almost without exception stand at a lower cost value (even figuring the mark at par) than the same materials in the United States. Germany has long been known as a producer of the various chemical products entering into the manufacture of enameled ware, glassware, etc., such as soda, potash, various coloring oxides, etc. Likewise, it is self-sufficient as to feldspar, fluorspar, silica, etc., which largely make up the enamel mix.

Also, as to the steel used as the base for our product, it would appear that the bulk, if not all, of the steel used in Germany to-day is self-produced.

The only important materials which Germany is obliged to purchase on the outside are borax and oxide of tin.

Translating the cost of raw materials into United States values, basing the mark at 2 cents, the same situation applies to the 50 per cent of the cost of manufacture represented by raw materials as applies to the labor cost. In other words, the cost of export when translated into American dollars, is so low that any duty that might

posed would be of little avail in preventing our market from being flooded, unless a duty were to be based upon the value of the goods as produced in this country, rather than on the value in Germany with duty figured on the depreciated rate of exchange as is the case at the present time.

The exchange situation is such a complicated one, and one that is bound to vary the months go on, that it is impossible to suggest any rate of duty that would protect at this time, unless such a rate were based upon the cost of production here. If it were possible to obtain a duty of this kind, it would appear as if a rate of 80 per cent would not be any too high to cover the present situation. (In this connection we understand Spain has recently placed a duty of 100 per cent on the importation of enameled ware to protect the several enameled-ware factories established there during the war.) A report from London, dated March 1, is to the effect that the House of Commons, with the consent of the Government, decided that the German reparation law, providing for a sufficient levy on the purchase price of imported German goods, shall not come into effect until March 31, the measure having passed its second reading in the Commons on Monday last, March 14.

From the information above given, your chairman offers as a suggestion for the committee's consideration the advisability of advocating what it would appear now to be the opinion of those in Congress who have given the subject of tariff consideration: 1. The importance of advocating an enactment of an antidumping bill prior to full consideration of a revised tariff, covering the importation of foreign-made goods, taking American valuation of home product as a basis for duty purposes.

2. The passage of a measure as an amendment to the existing tariff law which would assess duties on the basis of value in American dollars at port of entry, instead of the value of the fair market-selling prices in the countries in which goods are produced; that a duty of not less than 80 per cent be asked for.

Comparative American and German prices of enameled kitchen utensils.

[We have taken the weight and cubic measurements of the different cases. The quantities vary according to sizes, but have reduced the weight and cubic measurements to basis of 1 dozen each.]

Item.	Case.	Size.	Gross weight per pound.	Cubic inches per dozen.	United States selling price.	Per cent duty at 5 cents per pound.	Amount of duty at 5 cents per pound.	Duty, 40 per cent ad valorem.	Total duty.	German selling price.	German prices, duty added.	United States selling price.

General average.....						13 $\frac{1}{4}$.67	2.00	2.67	2.17	4.84	5.00

Figuring the above on net weight basis, the average net prices would be as follows: As applied to German prices, \$4.60, instead of \$4.84, this difference being 9 per cent on net weight, as against 13 $\frac{1}{4}$ per cent on gross weight.

MACFARLANE & ROBINSON (LTD.),
New York, March 29, 1921.

HENRY C. MILLIGAN,
The Republic Stamping & Enameling Co., Canton, Ohio.

DEAR MR. MILLIGAN: I duly received your wire of yesterday requesting information regarding the selling prices of German-made white enameled ware for kitchen household purposes, and hasten to state that the prices which are being made to wholesale and export trade figure in most cases about 100 per cent lower than fair market selling prices of similar American-made goods. Consequently, our office in New York has been put almost completely out of business. As to export trade, we are absolutely doing nothing, as we find it impossible to compete with the prices being made by German manufacturers.

It would seem that the different producers of enameled ware have formed sort of a combination, the prices being almost uniformly the same by all manufacturers. I am giving you below a few staple lines with which the prices being made, and which ask for themselves. Should you require the complete schedule for the entire line, kindly advise me and I will prepare the same for you.

The German selling prices to the trade are all figured per piece, and are computed for comparison per dozen, the same as the American prices are figured, per dozen. In converting these figures, I have taken the value of the mark at 2 cents American money.

American style or pattern.

Item.	Size.	Per dozen, net.	
		German prices.	American prices.

The following original letters and data covering Exhibits 1 to 9 were submitted to Hon. John Q. Tilson, chairman of subcommittee of the Ways and Means Committee at Washington, D. C., Friday, March 25, 1921:

DOMESTIC EXHIBITS.

EXHIBIT 1.—*Comparison of labor costs in Germany and United States.*

[Taking the mark on basis 2 cents in United States currency.]

	United States, per hour.	Germany, per hour (value mark at 2 cents).
	Cents.	Cents.
Machinists.....	76½	9
Pressmen.....	65	9
Spinners, beaders, small punch presses.....	62	8
Riveters and welders.....	58½	5½
Picklers.....	58	9
Dippers (average of men and girls).....	53½	6½
Inspectors (girls).....	45½	5
Burners.....	70½	9
Sorters and wrappers (female).....	35½	5
Packers.....	58½	8½
Common labor.....	47½	7½
	11)631	11)81½
Average wages per hour.....	57½	7½

In other words, the cost of labor in Germany to-day, basing the value of the mark at 2 cents American money, is just one-eighth what it is for the same work here.

The labor rates taken to represent the German costs are taken from the detailed schedule of wages for machine industries, foundries, enameling works, etc., the highest rate being taken in each case and the mark figured at a value of 2 cents in United States currency, which is much higher than its value to-day.

EXHIBIT 2.—*Tabulation of wages paid in 20 enameled-ware factories in United States, January, 1921.*

[Basis: 10 hours per day for men.]

Factory No.	Machinists.	Pressmen.	Spinners, beaders, punch presses.	Riveters and welders.	Picklers, male and female.	Dippers, male and female.
1.....	\$3.50	\$3.50	\$7.00	\$4.50	\$6.30	\$4.50
2.....	7.00	6.00	7.00	6.00	8.00	4.50
3.....	8.50	7.25	7.25	6.75	7.75	4.50

PIRNA, den 26 Januar, 1911.

Messrs. MACFARLANE & ROBINSON (Ltd.),
76-78 Southwark Street, London S. E.

DEAR SIR: In receipt of your favor of 11th instant, we beg to inform you that approximate wages for labor paid now in our works are as follows for 46 hours:

Girls—dipping.....	10
Men—dipping.....	12
Burning.....	10
Girls—stamping.....	10
Men—stamping.....	12

SACHS, EMAILLIRWERKE, GEBR. GEBLER

EXHIBIT 6.

RONNEBY, SWEDEN, January 17, 1911.

WILLIAM MACFARLANE, Esq.,
Kampen House, 76-78 Southwark Street, London, S. E.

DEAR WILLIAM: Your kind letter of January the 11th reached me just now. With regard to the wages we pay for labor, I beg to give you the following information:

Girls—dipping, 48 hours.....	10
Men—dipping, 48 hours.....	12
Burning, 48 hours.....	10

As a whole, we pay just as much as you, probably a little more. It depends on the value of your pound.

At the same time, dear William, I would like to inform you that I have retired from my position on the 1st of January. Mr. Gieseke is now my successor. At the end of January I will travel to Dresden, where I intend to take my permanent residence for the summer. I will give you my address as soon as I know it myself, and if you wish, "The Sachsische Emaillirwerke" do not forget to pay me a visit. Hans will accompany me to Dresden in order to see the place where I will live in future. He is now going back to Hughes in London and will take his way via Paris.

Mr. Erik Kockum, who is one of the directors in our concerns, intends to come to London in the beginning of February. I have given him your address and if he calls at your office, I am sure you will be to him as friendly as possible.

I hope you and your dear family are in good health. We have had a very good X-mastime. All the children have been at home and we have made it as pleasant as we could for them, as it was the last X-mas we spent in Sweden.

ALBERT VOLTMEIER

EXHIBIT 7.

FOREIGN OFFICE AND BOARD OF TRADE,
London, S. W. 1., January 24, 1911.

Messrs. MACFARLANE & ROBINSON (LTD.),
Kampen House, 76-8 Southwark Street, S. E. 1.

GENTLEMEN: With reference to your letter of 13th January, I have to inclose herewith a tariff of the rates of wages paid in the enameled hollowware industry and similar industries in Germany. I have to add that these rates have been in force in the Dusseldorf area since April last, and can be taken as representative, though, as a thing, they are slightly higher than those paid in other districts.

Where piecework rates are resorted to, which is the general rule, it is stated that an average worker can earn at least 15 per cent more than the average hourly rate.

J. S. ANDREWS,
For the Comptroller General.

CHINE INDUSTRIES, FOUNDRIES, LOCOMOTIVE, WAGON, AND ALLIED INDUSTRIES,
AND ENAMELING WORKS.

Class I(a), skilled workers having a certificate of proficiency who can prove to have had a long and varied experience and practical training, capable of working independently in their trade. Doubtful cases are decided by a commission of experts:

Wages per hour—	Marks.
For workers over 25 years.....	4. 30—4. 50
For workers from 21 to 25 years.....	3. 70—4. 30
For workers who have finished apprenticeship up to 21 years.....	2. 90—3. 20

Class II(a), skilled workers without a certificate of proficiency:

Wages per hour—	
For workers over 25 years of age.....	4. 10—4. 30
For workers from 21 to 25 years.....	3. 60—4. 10
For workers from 19 to 21 years.....	2. 80—3. 10
For workers from 17 to 19 years.....	2. 50—2. 80

Class III(a), trained workers:

Wages per hour—	
For workers over 25 years of age.....	3. 85—4. 05
For workers from 21 to 25 years.....	3. 55—3. 85
For workers from 19 to 21 years.....	2. 70—3. 00
For workers from 17 to 18 years.....	2. 40—2. 70

Class IV(a), helpers or mates:

Wages per hour—	
For workers over 21 years of age.....	3. 55—3. 85
For workers from 18 to 21 years.....	2. 70—3. 00
For workers from 16 to 18 years.....	2. 40—2. 70
For workers from 14 to 16 years.....	1. 90—2. 20

Female workers doing men's work receive 20 per cent less than do male workers of the same class.

Classification in the sheet and metal punching and enameling trade.

	Class.

First assembler.....	⁷ II(a)	
Warehouseman.....	IV(a)	
Female picklers.....	⁸ I(a)	
Women cleaners in pickling shops.....	⁹ I(a)	

Special female workers.

Wages per hour:	Mark
For female workers over 21 years.....	2.50-2.70
For female workers from 16 to 18 years.....	1.70-1.90
For female workers from 18 to 21 years.....	1.90-2.10
For female workers from 14 to 16 years.....	1.40-1.60

In special female workers are included: Auftraegerinnen (Japanners), edgers, electro-oxy-acetylene welders, assemblers, printers, machine workers, cleaners in pickling shops (plus 10 pfenning per hour bonus, aprons, and clogs), and sprayers.

Helpers or mates (females).

Wages per hour:	Mark
For female workers over 21 years.....	2.40-2.60
For female workers from 18 to 21 years.....	1.80-2.00
For female workers from 16 to 18 years.....	1.60-1.80
For female workers from 14 to 16 years.....	1.30-1.50

To these belong cleaners, washers, packers, other helpers.

SPECIAL PROVISIONS.

1. Payment of child allowance.
The child allowance is 1 mark per shift, and is payable for all children up to the age of 14 years, inclusive, or to the age of 16 years, inclusive, if still at school.
For weak and sickly people this child allowance is also paid above the age of 16 in so far as they are incapable of earning a living. A child allowance is also paid in the case of sole supporters of families.
2. Regulation concerning bonuses for foremen and gangers foremen, and gangers working on piece work receive an hourly extra of not less than 20 pfenning.
Foremen and gangers not working on piece work receive an extra payment of not less than 40 pfenning per hour.

INCREASED COST OF LIVING BONUS FROM APRIL 16, 1920.

This bonus is simply an additional payment per hour, the piece-work basis remaining the same as before.

³ Clothing bonus (suit, apron, clogs, and rubber gloves).

⁴ 20 pfennigs per hour for self-stoking and 20 pfennigs per hour for heating.

⁵ 10 pfennigs per hour for beating.

⁶ 30 pfennigs per hour for self-stoking.

⁷ 20 pfennigs per hour bonus.

⁸ Plus 10 pfennigs per hour bonus.

⁹ Less 20 per cent and clothing bonus (apron, clogs, and rubber gloves).

¹⁰ Less 20 per cent and 20 pfennigs per hour, clothing, bonus, aprons, and clogs.

a) Male workers coming under the tariff (including apprentices) receive as follows, per hour:

	Marks.
from 14 to 16 years of age.....	0. 20
from 16 to 18 years of age.....	. 30
above 18 years of age.....	. 40
above 19 years of age.....	. 60
above 20 years of age.....	. 80
above 21 years of age.....	1. 00

b) The increased cost of living bonus for female workers is as follows, per hour:

	Marks.
workers above 25 years of age.....	0. 80
workers above 21 years of age.....	. 50
workers from 18 to 21 years of age.....	. 30
workers from 14 to 18 years of age.....	. 20

Workers above the age of 23, who are sole supporters of their family, receive a bonus of one mark per hour.

EXHIBIT 8.

MACFARLANE & ROBINSON, (LTD.),
London, England, February 11, 1921.

C. MILLIGAN, Esq.,
The Carlton Hotel, Pall Mall, S. W.

My DEAR MR. MILLIGAN: Confirming our recent conversation, I should like to put on record the very disastrous competition from which all British manufacturers of enameled ware are at present suffering from German and Austrian exports, owing to the low value of the mark.

Last year approximately £500,000 worth of German and Austrian enameled ware was shipped and delivered in this country at prices at least one-third under the English cost of production. This business is, of course, quite profitable to the Continental manufacturers, in view of the fact that they are able to obtain their necessary supplies of raw materials in their own countries and the value of the mark is much higher there than is represented by the international exchange. They can thus easily afford to do business at the low prices charged. The result is that English manufacturers are working at a loss and have been compelled to partially close down.

As far as our own firm is concerned, we are only at present working 22½ hours per week and our experience is by no means in the common.

The British Association of Hollowware Manufacturers has already sent a deputation to the secretary of the board of trade, as it is absolutely essential that this British industry should be afforded a sufficient measure of protection against Continental dumping." Further, and apart from capitalistic or manufacturers' interest, it is most essential that employment should be found for our workers and the State be relieved of the present unemployment allowance.

The writer feels sure from his conversation with you that you entirely concur in these views.

WILLIAM A. MACFARLANE,
Managing Director.

EXHIBIT 9.

GEORGE A. ROYLE & Co.,
London, W. 14, February 10, 1921.

HENRY C. MILLIGAN, Esq.,
The Republic Stamping & Enameling Co., Canton, Ohio.

DEAR SIR: With reference to our conversation of Monday last upon the serious German competition already being experienced, it is perfectly evident that unless something is done to protect the enameled hollowware industry outside of Germany, the German manufacturers will not only very soon have recovered their lost markets but will obtain a still greater hold of the world's markets than they already possessed before the war.

Notwithstanding that wages in the German enameled ware industry have been considerably advanced over the prewar scale, yet these wages are still very much lower than those now paid in other countries.

The present German rate of wages per hour varies with the experience and the workers, ranging from mark 2.70 per hour for helpers or mates to mark 4.50 for skilled workers having a certificate of proficiency. Youths and female laborers are paid on a correspondingly lower scale. In addition to the regular wages there is a "increase cost of living" bonus, and a special allowance for married men with families.

A further and most serious matter to be contended with is, of course, the depreciation in the value of the mark. German manufacturers' prices are at present being quoted plus an advance of 550 per cent, but with the rate of exchange at the United Kingdom ranging around about mark 240 to pound sterling, the goods to be landed in this country at prices against which other manufacturers can not possibly compete, and with the adverse American rate of exchange, Canadian and American manufacturers are now completely shut out of the United Kingdom market. It is stated by merchants here that even if the German prices were quoted plus 1,000 per cent advance, they would still be strictly competitive.

Mr. Lloyd George has stated he has an uneasy suspicion that Germany is not trying to stabilize her money, and it is an undoubted fact that whilst the German mark remains at the present low value outside of Germany, the Germans are in a specially favorable position to compete against all other nations, whilst at the same time receiving an enormously high-mark value for their exports.

As a striking instance of this, a German competitor in our line of goods is offering hurricane lanterns at mark 35.50 each, D/D Hamburg. At the present rate of exchange this works out at 35/-37/- per dozen D/D Hamburg, or mark 426 per dozen. The prewar price of this same lantern was mark 22 per dozen, D/D any town in the United Kingdom. It will be readily seen that this represents an enormous appreciation of the mark value received in Germany over prewar rates, this manufacturer is receiving mark 426 for 1 dozen lanterns without having to pay the freight to England, whereas previously he only received mark 22, which included freight charges to the United Kingdom town. Comment is needless.

The mark is still a mark in Germany, and with such a high return for her exports it would appear that Germany within a very short period will attain a position which must be very dangerous to the manufacturers of other industrial nations.

A high tariff wall against German-made goods, or alternatively restriction or prohibition of imports of German-made goods, appears to be the only means by which this most unfair German competition may be countered, unless our statesmen can find a means to stabilize the exchanges.

During 1919 and the early part of 1920, a greatly increased trade in enameled hollow ware was being done by Canadian and American manufacturers with this country, whilst the overseas demands for these products were far greater than the capacity of the factories could meet. But with the reappearance of German-made enameled ware on the world's markets, the demand quickly fell away in the summer of 1920, and many contracts were canceled in favor of German goods.

According to the table of imports of hardware and cutlery into the United Kingdom during December last, the following figures prove how Germany has completely shut out Canadian and United States enameled hollow-ware manufacturers:

	Quantity.	Value.		Quantity.	Value.
	Tons.			Tons.	
Hollow ware, wrought enameled:			Hollow ware, wrought enameled—Continued.		
Germany.....	366	£33,301	Sweden.....	21	£
Canada.....	1	165	Netherlands.....	42	
United States.....	2	329	Belgium.....	36	

In other hardware lines Germany is showing similar heavy importations over other countries, and unless something is done to check this flow of German exports the Allies may receive some part of the proposed indemnity, but many important industries outside of Germany must be crushed out of existence.

GEORGE A. ROYLE & Co

STEEL SAWS.

[Paragraph 340.]

STATEMENT OF H. C. ATKINS, OF THE E. C. ATKINS CO., INDIANAPOLIS, IND.

Mr. ATKINS. Mr. Chairman, following the suggestion made by the chairman of this committee this morning to be brief and concise, I have conferred with the representatives of Henry Disston & Sons, of Philadelphia, and the Simons Manufacturing Co., of Fitchburg, Mass., who are both here, and speaking for my own company I hurriedly prepared a statement for your committee.

Senator WATSON. Representing all of you?

Mr. ATKINS. Yes; representing all three of us.

Senator SMOOT. Give me the names, please.

Mr. ATKINS. Henry Disston & Sons, of Philadelphia.

Senator SMOOT. And the names of the other companies?

Mr. ATKINS. I do not think their names are down on to-day's list.

Senator WALSH. Who is representing the Simons Manufacturing Co.?

Mr. ATKINS. Mr. Fox.

Senator SMOOT. Proceed, Mr. Atkins.

Mr. ATKINS. We ask that all saws carry an ad valorem rate based on the American valuation of 25 per cent, except band saws, which should carry at least 35 per cent ad valorem, and steel strips, tempered only or tempered and polished, a specific duty of 10 cents per pound and 20 per cent ad valorem.

Senator SMOOT. That is on jewelers' saws?

Mr. ATKINS. No; those rates would apply to saws for sawing metal, band saws for sawing metal or band saws for sawing wood. This is on paragraph 340.

Senator SMOOT. You want on band saws 35 per cent ad valorem; on the other saws you want 25 per cent ad valorem?

Mr. ATKINS. Yes; and then on tempered only or tempered and polished, band-saw steel, 10 cents a pound and 20 per cent ad valorem.

Senator WATSON. That is a new item in there, is it not?

Mr. ATKINS. Yes; and to explain that, the situation has been in the past that band-saw steel, tempered only, or tempered and polished, has been imported into this country and sold directly to the users of sawmills for their filers or the employees in their filing room to make up into finished saws, thereby putting a large amount of equipment out of commission in the saw factories.

It would not be so bad if that had been accustomed to coming in under that sort of a valuation. But it does not always do it. In fact, for a great many years the importations of band-saw steels so specified were almost negligible, whereas there was a large quantity of that material coming into the country continually and being used for that purpose.

Under the Payne-Aldrich bill ample protection was provided under the then existing conditions, which are changed by foreign exchange conditions now to some extent. The Underwood bill offered no protection, but was practically inoperative owing to the war conditions. At the beginning of the operation of the Underwood bill

saws began to come into the country in quantities considerably in excess.

Now, Canadian tariffs carry 30 per cent on saws. We operate a factory in Canada and we can make our saws over there, paying Canadian dollars for our work, and sell in the United States for United States dollars, and with the present duty now in effect it would just about even things up.

Under this bill it is difficult for me to tell where band-saw steel properly belongs, whether under paragraph 316 or paragraph 315; and as a suggestion, referring especially to paragraph 316, after the word "platinum" in line 2, page 49——

Senator WATSON. You have the bill which was introduced as it passed the House?

Mr. ATKINS. Yes.

Senator WATSON. That is where the mistake occurred. What is it you want?

Mr. ATKINS. Where the rates of duty are intended to cover band-saw steel there should be specific reference to steel strips in coils or otherwise, if tempered or tempered and polished, carrying a specific duty of 10 cents per pound and 20 per cent ad valorem, for the reasons given. In the old Dingley bill that carried a specific and an ad valorem duty, and it also did in the Payne-Aldrich bill.

The wage situation is reflected accurately in the foreign competition, and in our industry, for example, the wages paid here and abroad compare as follows: On our sawsmiths, from 65 to 80 cents an hour; in Europe, 31½ cents. For machinists, machine operators, from 55 to 80 cents; in Europe, 28 cents. On ordinary labor, 35 cents per hour—and I have put that down to the lowest limit—Europe, 19½ cents. Those European wages are not German wages; they are wages paid in France.

Senator SMOOT. Do you pay your employees in Canada the same as you pay your employees in the United States?

Mr. ATKINS. Nearly the same. There is not very much difference between Canadian wages and wages paid in the United States; that is, with our class of help.

Senator WALSH. Have all the saw manufacturing concerns plants in Canada?

Mr. ATKINS. No; not all of them. The Simons Manufacturing Co. has and Henry Disston & Sons have. We, also, have a factory at Hamilton, Ont. Then there are two other good-sized plants in Canada operated by Canadians.

To make a comparison between our own costs and foreign selling prices, we took, for instance, a band saw costing us 85 cents per foot. Peugeot Freres in France sells that now at 45 cents per foot. If duty were collected on the 15 per cent American valuation it would amount to 16 cents per foot, a total of 61 cents as against our cost of 85 cents.

On hack-saw blades, 12-inch by three-quarters, 22 gauge, our cost is \$7.90 gross. Ritzsche & Co., of Frankfort, are selling those blades at 3 francs 60 centimes per dozen, or \$3.24 a gross. Allowing 15 per cent American valuation of \$1.21, would leave those at \$4.45. In neither of those cases has any account been taken of landing charges. That would amount to something, although the ocean

ight on either article is not of very much concern, because the ocean rights would be small.

As a comparison of selling prices, on three sizes of narrow band saws, five-eighths, 1-inch, and 2-inch, our extreme price is \$1.51, compared to the French price of 65 cents for the same items. Fifteen per cent American valuation added to the foreigner's price is then only 6 cents.

Senator SMOOT. Mr. Atkins, if you can pass in your brief which you desire to file I wish you would do so and not take up the time of the committee right now.

Mr. ATKINS. All right, sir. I would rather copy it before presenting it, if I may be allowed to do that.

Senator SMOOT. You may copy it and change it in any way you desire and file it as a part of your remarks. You may also take your time in doing it.

Senator WATSON. Is that all you care to say now, Mr. Atkins?

Mr. ATKINS. Just one other thing, and that is this: The rates of duty, if this measure is a protective measure, should be protective in our industry as well as other industries because we can not buy in one market and sell in another. If it is a protective policy, then we feel, and all of us feel, that our industry should have adequate protection, as under the Payne-Aldrich bill or under the Dingley bill.

BRIEF OF H. C. ATKINS, REPRESENTING SAW MANUFACTURERS OF THE UNITED STATES.

We appear before your committee in reference to the tariff on saws, paragraph 340, House Bill 7456, and paragraphs 315 or 316, whichever paragraph applies to band saw steel in strips. We represent an industry employing in its business invested capital of 20,000,000 to 25,000,000; 6,000 to 7,000 workers, exclusive of office and sales employees; with an output of 25,000,000 to 30,000,000 in product.

Under the Payne-Aldrich bill ample protection was provided under the then existing conditions, which have since been changed by the condition of foreign exchange. The Underwood bill offered no protection but was practically inoperative owing to war conditions. Canadian tariffs carry 30 per cent on saws. We can manufacture saws in Canada in our Canadian factory, paying Canadian dollars for labor, and sell in the United States at United States prices in American dollars at about even figures, as the duty is offset by the exchange rate.

We ask that all saws carry an ad valorem rate based on American valuation of 25 per cent, except band saws, which should carry at least 35 per cent ad valorem, and steel strips tempered or tempered and polished only should carry a specific duty of 10 cents per pound and 20 per cent ad valorem.

The wage situation is reflected accurately in foreign competition. In our industry, for example, wages paid here and abroad compare as follows:

Type of labor.	Wages in United States per hour.	Wages in Europe per hour.
	Cents.	Cents.
Sawsmiths.....	65-80	31½
Machinists.....	55-80	28
Common labor.....	35	19½

European wages are not the low wages of Germany, but are wages actually paid in France and are figured on a basis of a franc at 8 cents.

In making the following comparisons between our costs and foreign selling prices we figure our load as it was, not as it is.

Band saw, 4-inch:

Our cost, per foot.....	\$.
Peugeot Freres (France) sell at.....	\$0. 45
Plus 15 per cent American valuation.....	. 16

Hack-saw blades, 12-inch by $\frac{1}{4}$ -inch by 22 gauge:

Our cost per gross.....	-
Ritzsche & Co., Frankfort, sell at 3.60 francs per dozen, or per gross.....	\$3. 24
Plus 15 per cent.....	1. 21

Loss.....

Narrow band saws, 1-inch wide:

Our cost per meter.....	\$.
Peugeot's price.....	\$0. 15
Plus 15 per cent American valuation.....	. 03

Comparison of selling prices on three sizes of narrow band saws, $\frac{1}{4}$ -inch, 1-inch and 2-inch. Our extreme price for three meters, 1 meter of each size, is \$1.15, compared to Peugeot's price of 65 cents for the same thing. With 15 per cent American valuation duty paid, the foreigner's price is only 88 cents.

Crosscut saws made in Sweden are available at a price of \$1.94 for a 5-foot crosscut tooth saw. Add 15 per cent American valuation on our price of \$2.80 and we have the Swedish saw for \$2.36, and at 25 per cent ad valorem American valuation the Swedish saws can be bought at \$2.64.

Foreign selling prices on circular saws vary from \$1.66 per unit in France to \$3.20 in Sweden, as compared to our extreme selling price of \$3.20 for same unit. It is readily be seen that 15 per cent is wholly inadequate, and even 25 per cent is inadequate on the theory that landing charges would absorb the difference.

Referring especially to paragraph 316, after the word "platinum," line 2, paragraph of original draft copy, where the rates of duty are evidently intended to cover saw steel, there should be specific reference to "steel strips in coils or other forms, tempered or tempered and polished" carrying a specific duty of 10 cents per unit and 20 per cent ad valorem, for the reason that such tempered or tempered and polished strips are sold to the user to be toothed and finished, thereby rendering valueless much expensive equipment now available in this country for the manufacture of the finished band saws.

At this time there are in the United States two representatives of the largest manufacturer in Europe gathering complete information regarding the selling prices of hand saws over here, and while we have no authentic information what their prices will be we feel sure that the same comparisons will exist as on other articles that have been mentioned. Canadian manufacturers are in excellent position under duties as proposed in H. R. 7456 to come in here in competition, as explained in a previous paragraph.

Any inadequate protection to one industry under a protective tariff policy is a disadvantage to that industry at the disadvantage of buying material and labor in a protected market and selling in a free market.

The rates of duty as proposed in H. R. 7456 are not protective, as shown by the various examples in the foregoing paragraphs, and unless changed will leave the saw industry in exactly that unfortunate position.

STEEL PENS.

[Paragraph 351.]

STATEMENT OF F. T. BLAKEMAN, NEW YORK, N. Y., REPRESENTING THE SPENCERIAN PEN CO. AND JOSEPH GILLOTT & SONS.

Senator SMOOT. Do you also desire to speak for Mr. Lloyd Smith?

Mr. BLAKEMAN. Yes, sir.

Senator SMOOT. On paragraph 351?

Mr. BLAKEMAN. Yes, sir. We request that the present specific rate of 8 cents a gross be allowed, and we base our request chiefly on the fact that the volume of imported steel pens is very small in comparison with the total number of domestic pens made in this country and the fact that the importers of steel pens are unable to quote a price which will successfully compete with the prices of domestic manufacturers. I would like to go very briefly over this synopsis of the brief which I have submitted. I represent the Spencerian Pen Co. and Joseph Gillott & Sons, the largest importers of steel pens. All of these importations are made from Great Britain with the exception of a very few gross of steel pens imported from France and Germany—roughly 1,000 gross. The amount is negligible. Last year there were 2,950,000 gross manufactured in the United States. There were 750,000 gross imported, 97 per cent of which were imported by the Spencerian Pen Co. and Joseph Gillott & Sons. As against this importation figure there were 450,000 gross manufactured in the United States which were exported, and the prices quoted by the domestic manufacturers on these exportations are from 25 to 33½ per cent less than the price offered to the home trade.

Senator SMOOT. Will you let me know briefly just what changes you want in paragraph 351?

Mr. BLAKEMAN. We request that the present specific rate of 8 cents a gross under the Underwood bill be allowed to remain. The prices of the Spencerian Pen Co. and Joseph Gillott & Sons to the home trade are, respectively, 46 per cent and 57 per cent higher than the lowest price quoted to the trade by domestic manufacturers; and the prices quoted by the Spencerian Pen Co. on Federal and school contracts, which represent a very large part of the domestic business, are 10 per cent higher than the domestic quotations. As a result the Spencerian Pen Co. gets no school bids at all and a very, very small portion of the Federal business.

Very recently the Government has accepted a bid of 43 cents offered by domestic manufacturers on a Porto Rican school proposal. As you will see, gentlemen, that the Spencerian and Joseph Gillott prices, which are from 95 cents to \$1.02 a gross, can hardly compete with 43 cents.

It has been asserted by the domestic manufacturers, in the recent hearings of the Ways and Means Committee, that the labor cost in England of these imported pens is 30 per cent of the total cost. Since that statement was made I have gone very carefully into the matter, and I would beg to contradict that statement, as to my best knowledge and belief the cost of the English labor is 66 per cent of

the total. The remaining 34 per cent is the cost of the raw material, the maintenance of buildings, insurance, etc.

If the American manufacturers can, under the present rate of duty, undersell the imported article in the United States and can afford to offer their products abroad so much under the domestic price, it is evident from the above comparisons and prices, which are more carefully set forth in a brief to be filed with the committee, that the sale of domestic steel pens is not endangered by the sale of our pens. We therefore submit that an increase in duty would result in the importation of less pens, with a constant decrease in revenue to the Government, and we request that the present specific duty of 8 cents per gross be allowed to remain. I thank you.

BRIEF OF F. T. BLAKEMAN, NEW YORK, N. Y., REPRESENTING THE SPENCERIAN PEN CO. AND JOSEPH GILLOTT & SONS.

We hereby respectfully submit the following memoranda: The steel-pen industry is not affected by the importation of steel pens, as shown by the sale in this country last year of 2,950,000 gross of domestic pens, out of which 450,000 gross were exported and against the sale of 775,000 gross of imported pens, 97 per cent of which were imported by the Spencerian Pen Co. and Joseph Gillott & Sons.

The Spencerian Pen Co. was formed in 1858 by American citizens and the stock is entirely held by Americans.

The net trade prices of Spencerian and Gillott pens are, respectively, 46 and 57 per cent higher than the list of domestic net trade prices and Spencerian pens are 68 per cent higher than the prices quoted on school and Federal contracts by domestic manufacturers, Spencerian pens having only one price.

Average list of comparative net trade, school, and Government prices of pens per gross

	Domes- tic.	Foreign.	
		Spence- rian.	Gil- lott.
Lowest net trade price	\$0.65	\$0.95	\$1.00
School price57	.95	1.00
Government price56	.95	1.00

Trade, school, and Government prices per gross of leading domestic pens.

	Ester- brook's.	Hunt's.	Eagle.	Min- ner's.
Lowest net trade price	\$0.71	\$0.70	{ \$0.60 0.50 }	\$0.50
School price61	.60	.52	.50
Government price58	.58	.55	.50

¹ Eagle Perfection.

Comparison of domestic and export prices of the Esterbrook Manufacturing Co. as per letters which they issued to the trade in June, 1920 (copies attached hereto) show that they quote for export from 25 to 33½ per cent lower prices than for the home trade. If the American manufacturer can, under the present rate of duty, undersell the imported article in the United States and can afford to offer their products abroad so much under the domestic price, it is evident that they are not in danger of competition with foreign-made steel pens.

The price of imported pens are fixed by the manufacturing costs, which are governed by the expert skill required for the hand processes and the special steel used in high grade imported pens. Added to the manufacturing costs are the freight charges and

reasonable amount of profit which has determined the price of imported pens, irrespective of the prices asked for pens of domestic make.
We therefore again respectfully submit, having in mind the sharp advance in the general costs of doing business, that the increase of 4 cents will work an undue hardship on the importers of steel pens and especially on the Spencerian Pen Co., who exports 67 per cent of the foreign pens used in this country, and, furthermore, that, owing to the high price of imported pens, the interests of the domestic pen manufacturer are not jeopardized.

S.—Since filing the above brief the purchasing agent for the Government of Porto Rico has accepted the bid of a leading domestic pen manufacturer of 43 cents gross on a school-supply proposal.

JUNE 17, 1920.

the trade:

We have found it necessary, effective from to-day (June 17, 1920), to advance the prices of Esterbrook pens, as follows:

	Advanced price.
pens listed at \$1.20 per gross.....	\$1. 40
gold and silver-plated pens listed at \$1.50.....	1. 60
nickel-plated pens listed at \$1.50 per gross.....	1. 75
No. 343 red ink pen listed at \$1.50.....	1. 60
Department No. 1.....	16. 80
Department No. 3.....	4. 20
Department No. 5.....	44. 80
Departments Nos. 7, 10, 11.....	1. 40
Department No. 14.....	4. 80
Department E.....	1. 40

Nos. 334, 335, 336, 486, 487, 488 (text writers) No. 344 double-line ruling pen, also writing and lettering pens, to remain the same as heretofore.

The above prices subject to the same terms and discounts as heretofore.

Yours, very truly,

THE ESTERBROOK STEEL PEN MANUFACTURING CO.

JUNE 16, 1920.

the export trade:

We have found it necessary, effective from to-day (June 16, 1920), to advance the export prices on Esterbrook and Penesco pens, with the exception of No. 314 relief, as follows:

	Advanced price.
pens now listed at \$1 per gross.....	\$1. 10
gold and silver plated pens now listed at \$1.25.....	1. 35
nickel plated pens now listed at \$1.25 per gross.....	1. 50
No. 343 red ink pen now listed at \$1.50.....	1. 60
Department No. 1.....	13. 20
Department No. 3.....	3. 30
Department No. 5.....	35. 20
Departments Nos. 7, 10, 11.....	1. 10
Department No. 14.....	4. 05
Department E.....	1. 10

Nos. 334, 335, 336, 486, 487, 488 (text writers), also No. 344 double line ruling and relief pens to remain the same as heretofore.

The above prices subject to export trade discount of 50 per cent and a cash discount of 5 per cent.

Our stock of goods is very complete and we are in position to take care of all your orders immediately upon receipt of same.

Waiting your favors, we remain,

Yours, very truly,

THE ESTERBROOK STEEL PEN MANUFACTURING CO.

MECHANICAL PENCILS.

[Paragraphs 352 and 1449.]

STATEMENT OF C. J. FRECHETTE, SECRETARY AND ASSISTANT TREASURER THE WAHL CO., CHICAGO, ILL.

Mr. FRECHETTE. Mr. Chairman and gentlemen, I am representing the Wahl Co., of Chicago, manufacturers of metal pencils. We are interested in paragraph 352, which deals with metal pencils, and also paragraph 1449, which deals with leads, refills.

I have prepared a memorandum for the conservation of time, which I desire to file, if permitted to do so. I also ask permission to file a supplemental statement dealing more specifically with the lead, which is covered by paragraph 1449.

Senator SMOOT. Did you file this brief in the hearings before the Ways and Means Committee of the House?

Mr. FRECHETTE. No, sir.

Senator SMOOT. Then, you may file it as a part of your remarks and try and confine your remarks before the committee to-day to points outside of your brief. There is no need of taking up the time of the committee in discussing the points presented in your brief.

Senator CALDER. You represent whom?

Mr. FRECHETTE. I represent the Wahl Co., of Chicago. Winston Strawn & Shaw are down on the list as representatives of the Wahl Co.

At the outset I would like to make just a summary statement, that the Wahl Co. represents the pioneer concern in metal pencil manufacture in this country. They started in business in 1914 and went along with indifferent success until three years ago when, by large investments and advertising and special machines which make this pencil possible at prices offered, they succeeded in building up quite a profitable business.

Senator WATSON. What is it that you make?

Mr. FRECHETTE. "Eversharp" pencils. Under the old law these metal pencils, plated with gold or silver, were classified as jewelry and as such there was a tariff protection of something like 50 per cent.

Senator WATSON. What law was that?

Mr. FRECHETTE. I can not tell exactly.

Senator WATSON. If you can not tell offhand you need not look it up. You do not mean the Payne-Aldrich law, do you?

Mr. FRECHETTE. I believe so. Under the new tariff bill we would be accorded, if it be allowed to stand as written, 20 per cent under paragraph 352 and 15 per cent on the leads under paragraph 1449. We ask for 50 per cent ad valorem on American valuation.

Senator SMOOT. You have penholder tips, penholders and parts thereof, gold pens, combination penholders, comprising penholders, pencil, rubber eraser, automatic stamp, or other attachment, 25 cents per gross and 20 per cent ad valorem.

Mr. FRECHETTE. Yes, sir; and on mechanical pencils made of base metal and not plated with gold, silver, or platinum, 45 cents per gross and 20 per cent ad valorem. We ask that that be increased to 75 per cent, American valuation.

Senator SMOOT. And still keep the 25 cents per gross?

Mr. FRECHETTE. It is 45 cents; yes. Just increase it from 20 per cent to 50 per cent, for the reason that we can not compete with the foreign manufacturer.

Senator WATSON. You say you are willing to have this 25 cents gross stricken out?

Senator SMOOT. No; he wants both.

Senator WATSON. You want both and 50 per cent ad valorem.

Mr. FRECHETTE. Yes.

Senator SMOOT. Are you interested in the mechanical pencils made of base metal and not plated with gold, silver, or platinum, 45 cents per gross and 20 per cent ad valorem?

Mr. FRECHETTE. Yes, sir.

Senator SMOOT. Do you want any change in that?

Mr. FRECHETTE. We want all the metal pencils coming in under paragraph 352 protected by a 50 per cent tariff.

Senator SMOOT. Besides the 45 cents per gross?

Mr. FRECHETTE. Yes, sir.

Senator McLEAN. How much would that add to the price of the pencil?

Mr. FRECHETTE. In answer to that, Senator, our pencil costs us, the dollar pencil, for instance, of which this is a sample——

Senator DILLINGHAM. Do you call that the dollar pencil?

Mr. FRECHETTE. Yes, sir; it retails at a dollar. It sells to the dealer at \$1, less 40 per cent; net to us, 60 cents. That pencil costs 57 cents, approximately; a little over 57 cents. The German cost that we estimate at 28 cents. In other words, their cost, compared to ours, is about 50 per cent.

Senator SMOOT. The manufacturer makes a little less than 3 cents on it and the retailer makes 40 cents?

Mr. FRECHETTE. Yes, sir; that is, he makes 40 cents gross. He has overhead to pay out of that.

The other pencil referred to in a memorandum which we are filing this one here, which retails at \$3. That brings that net to us at \$1.80. That pencil, according to our estimate, can be manufactured by German concerns at around 70 cents, 69.63 cents, as against \$1.37.

Senator WALSH. Is there equally as good material in it?

Mr. FRECHETTE. Presumably so.

Senator SMOOT. As I understand, on the silver, which costs you 57 cents, you want 45 cents per gross, and then 50 per cent ad valorem?

Mr. FRECHETTE. Yes, sir; American valuation.

Senator CALDER. What is the present duty?

Mr. FRECHETTE. It depends on the classification. It runs between 50 and 60 per cent, classified as jewelry.

Senator CALDER. That is based on the foreign valuation?

Mr. FRECHETTE. Yes, sir.

Senator CALDER. On the American valuation the duty collected would be double, would it not?

Mr. FRECHETTE. Yes, sir.

Senator McLEAN. If you get 60 cents and it is sold for \$1, what does it cost you to make them?

Mr. FRECHETTE. Fifty-seven cents. The labor in that pencil costs us, approximately, 34 cents, and the material 23 cents, making 57 cents and a fraction cents.

Senator DILLINGHAM. That is on the \$1 pencil?

Mr. FRECHETTE. That is on the \$1 pencil. On the \$3 pencil costs approximately 81 cents, and the other expense attached with amount to 56 cents, \$1.37 all told. If we were given 50 per cent protection there, we would have an advantage of about a cent and a half against German manufacturers on the \$1 pencil.

Senator SMOOT. Germany would have to sell it here at 27 cents with all expenses added, to make it equal with you?

Mr. FRECHETTE. Yes, sir; and we estimate that they can sell here for about 28 cents. We are very poorly protected patent-wise.

Senator SMOOT. Have you not a patent on these?

Mr. FRECHETTE. Just certain features of the pencil; the tip, which is very easily surmounted by a competitor and which offers very little protection. For instance, I will offer here for your consideration a German ad which appears in a regular German publication, which copies exactly this pencil in offering it to the public. The cut is a precise cut of this pencil, which is the \$1.75 variety.

Senator DILLINGHAM. At what price do they offer the pencil?

Mr. FRECHETTE. Fifty marks, which is really 55 cents in United States money.

Senator SMOOT. They are offering it at 50 marks?

Mr. FRECHETTE. Yes, sir.

Senator SMOOT. That is 62½ cents.

Mr. FRECHETTE. This pencil costs us 93 cents to make, and, notwithstanding the fact that we have special machinery employed in the manufacture of these pencils, if we are not accorded ample protection, they will really be junk, because they are specially made and specially designed and would not be usable in any other industry.

Senator SMOOT. What name do you give to those pencils?

Mr. FRECHETTE. "Eversharp."

Senator SMOOT. That is the trade name?

Mr. FRECHETTE. Yes, sir.

Senator SMOOT. But do you designate them just as pencil holders, penholders, or pencils?

Mr. FRECHETTE. They are pencils.

Senator SMOOT. You designate them as pencils?

Mr. FRECHETTE. Yes, sir.

Senator SMOOT. If we put on the ad valorem that you are asking for here on ordinary, common pencils, it would be out of all reason—would it not?

Mr. FRECHETTE. On mechanical pencils we ask that the specification be mechanical pencils, unplated and plated.

Senator SMOOT. What is the change you ask for in the paragraph to specifically designate your kind?

Mr. FRECHETTE. "Mechanical pencils made of base metal unplated with gold, silver, or platinum, 45 cents per gross and 20 per cent." That classification is sufficient other than having 20 per cent changed to 50 per cent.

Senator WALSH. You are reading now from the House bill?

Mr. FRECHETTE. This is the report of the Chamber of Commerce of the United States on the bill.

Senator SMOOT. That is in your brief, is it?

Mr. FRECHETTE. Yes, sir.

Senator McLEAN. I do not quite understand. Paragraph 352 lies only to pencils made of base metal and not plated with gold, silver, or platinum. Your pencils are plated with gold or silver, are they not?

Mr. FRECHETTE. In paragraph 352 as referred to in the Chamber of Commerce report of the bill it stated "Mechanical pencils made of base metal, plated with gold, silver, or platinum."

Senator McLEAN. This bill as printed here says, "not plated."

Senator WALSH. It must be a typographical error.

Senator DILLINGHAM. There is no sense in this paragraph as written in the House bill.

Senator WALSH. The witness says that there is no such thing as mechanical pencils not plated with gold, silver, or platinum.

Senator SMOOT. Then, it falls outside of those brackets, the way the House has written this bill. This says 45 cents per gross and 20 per cent ad valorem, the way the House has written it, but it does not apply to Mr. Frechette's goods.

Senator McLEAN. Not at all. He has to have a new bracket. The question is, Are there pencils imported of base metal that are not plated with gold or silver? Is there any such article?

Mr. FRECHETTE. It is hardly likely, Senator. I could not answer that question definitely, but I do not know of any, because the base metal would be brass or tin.

Senator McLEAN. Take an aluminum pencil, for example.

Mr. FRECHETTE. There is such a possibility.

Senator McLEAN. That would not need to be plated and yet would be a very fine pencil, would it not?

Senator SMOOT. Well, it says "or platinum" in this bill. It would not be plated if it were of aluminum; it would be made of aluminum.

Senator McLEAN. Yes; that is what I mean.

Mr. FRECHETTE. There is a possibility of a plate on aluminum, and it might be covered, such as this pencil, with enamel.

Senator McLEAN. Did you appear before the Ways and Means Committee of the House?

Mr. FRECHETTE. I did not; no, sir.

Senator SMOOT. I think that the House has tried here to exempt these articles? They have exempted these things from paragraph 352 and they are not mentioned in any other paragraph. Therefore, they will fall in the basket clause of this schedule, paragraph 393. That would be 45 per cent.

Senator WALSH. This provision in the House bill would cover enameled pencils but not plated pencils. There is evidently no provision for plated pencils.

Senator McLEAN. Excepting the basket clause, and I understand that is 45 per cent.

Senator SMOOT. It is 45 per cent. So you would not be hurt there, would you, Mr. Frechette?

Senator McLEAN. Yes; he wants 50 per cent ad valorem besides.

Mr. FRECHETTE. We are not specially interested in the 45 cents per gross. The 45 cents per gross is immaterial. We might suggest that the 45 cents be omitted altogether, and just make it 50 per cent based on American valuation.

Senator SMOOT. If you fall in the basket clause you will have 45 per cent on American valuation. You will not be hurt, even under

the House provision. And I think that is what the House intended. I think the House intended to give you 45 per cent.

Senator WALSH. Mr. Frechette can leave his brief with us, Senator Smoot?

Senator SMOOT. Yes; he can leave his brief. Under this bill to fall under paragraph 393, "articles or wares not specifically provided for, if composed wholly or in chief value of platinum, gold, or silver, and articles or wares plated with platinum, gold, or silver, or colored with gold lacquer, whether partly or wholly manufactured, 45 per cent ad valorem."

Mr. FRECHETTE. Then, we would get protection, Senator, I understand, on the 45 per cent basis?

Senator SMOOT. Yes; under these provisions of the House.

Mr. FRECHETTE. Without any change being made in paragraph 352?

Senator SMOOT. Without any change being made in that whatever.

Mr. FRECHETTE. May I have permission, then, to deal with the lead situation by filing a supplemental statement?

Senator SMOOT. Will you just file it following your statement here as to the lead?

Mr. FRECHETTE. I was about to say, concerning these leads, that the Eversharp created a demand for this diameter lead, and if allowed to come in under section 1449 on a 15 per cent basis, we would really have no advantage whatsoever on the demand created for this by our pencil.

Senator SMOOT. Have you got a patent on it in this country?

Mr. FRECHETTE. No; we are not patent-wise protected, except as to the packing; but we do submit that if this lead is made in Germany it would put us out of business on this particular product.

Senator SMOOT. Well, what do you want for that?

Mr. FRECHETTE. The same as for the pencils.

Senator SMOOT. You want 45 per cent for that?

Mr. FRECHETTE. Yes.

BRIEF OF C. J. FRECHETTE, REPRESENTING THE WAHL CO., CHICAGO, ILL.

The Wahl Co. was organized under the laws of the State of Delaware on December 19, 1910, for the purpose of manufacturing adding-machine attachments for writers. The company pursued this line of manufacture exclusively for several years succeeding, until the year 1916, when it absorbed the Eversharp Pencil Co., an Illinois corporation with a capitalization of \$50,000.

The Eversharp Pencil Co. was originally incorporated as Keeran & Co., an Illinois corporation, on April 28, 1914, for the purpose of manufacturing and dealing in mechanical pencils, with an authorized capitalization of \$25,000. Subsequently, on February 19, 1915, the capitalization was increased to \$50,000. Later, August 1916, the name of the corporation was changed to the Eversharp Pencil Co.

At the time the Eversharp incorporation was absorbed by the Wahl Co., in 1916, the original capital of the former company had been fully impaired by expenses encountered in the introduction of a mechanical pencil known as Eversharp, the company having encountered the usual vicissitudes as the pioneer company in the mechanical-pencil field.

On January 1, 1917, at the time the Eversharp Pencil Co. was absorbed, the Wahl Co. had an authorized capital of \$2,500,000, of which there was issued and outstanding \$2,327,400.

It is to be noted that during the first four years the industry was not a paying venture, the original stockholders having exhausted in excess of their original investment.

Prior to the advent of Eversharp in the metal pencil field there had been a number of metal pencils introduced on the market, all of which met with very indifferent success, due principally to faulty design and imperfections of manufacture, together with a lack of capital which made it impossible to properly advertise and introduce the mechanical pencil to the world.

Early in 1917 The Wahl Co., having previously, by the expenditure of large sums of money in experimental work in the development of a mechanically perfect tip, which is the outstanding feature of Eversharp, began a vigorous selling campaign embracing a large advertising and sales expense. It was not, however, until about the close of 1918 that results commensurate with the investment and outlay for expenses were attained. Thus the metal-pencil industry was approximately five years in the making. Below are presented for your consideration the results of operation for the period January 1, 1918, to June 30, 1921, together with other relevant data relating to invested capital, etc., for the period under review.

Income and profit and loss account.

	1918	1919	1920	6 months of 1921.
Total sales.....	\$1, 414, 138. 34	\$3, 662, 616. 22	\$7, 382, 850. 22	\$2, 413, 773. 47
Manufacturing cost, selling and administrative expenses.....	\$1, 064, 428. 43	\$2, 609, 697. 08	\$4, 560, 531. 73	\$1, 917, 494. 80
Ratio to sales.....per cent..	75. 27	71. 25	61. 77	79. 43
Net profit before taxes.....	\$349, 709. 91	\$1, 052, 919. 14	\$2, 822, 318. 49	\$496, 278. 67
Ratio to sales.....per cent..	24. 73	28. 75	38. 23	20. 57
Federal income and excess profits tax..	\$168, 305. 85	\$341, 239. 20	\$772, 002. 72	\$113, 168. 98
Ratio to sales.....per cent..	11. 90	9. 32	10. 46	4. 69
Surplus net profit.....	\$181, 404. 06	\$711, 679. 94	\$2, 050, 315. 77	\$383, 109. 69
Ratio to sales.....per cent..	12. 83	19. 43	27. 77	15. 86

Please observe that on a turnover of \$1,400,000 in 1918 the surplus net profit, after taxes, was 12.83 per cent, while the surplus net profit in 1920, on approximately five times the turnover, was 27.77 per cent. The retail price of our products has been very materially reduced during the last six months to accommodate the line to the readjustment conditions which has reduced the surplus net profits to something under 10 per cent after deducting less than 5 per cent for Federal taxes as against an average 10 per cent in the previous years. It is to be noted also that with decreased volume due to general business depression and reduced prices that the ratio of manufacturing, selling, and administrative expense is considerably higher than at any previous period under consideration, with a consequent reduction of from 5 to 18 per cent in net profits before taxes. This is significant for the reason that it does not permit of any leeway to meet German competition by further reduction in prices as the result of operations for the six months ended June 30, 1921, indicate that only a reasonable profit of approximately 15 per cent is in prospect.

Investment in land, buildings, machinery, tools, equipment, etc. (after depreciation).

January 1:	
1918.....	\$480, 140. 94
1919.....	520, 573. 68
1920.....	834, 302. 62
1921.....	1, 513, 781. 49
Increase Jan. 1, 1918, to Jan. 1, 1921.....	1, 033, 640. 55

The company owns and uses in its metal-pencil manufactory, located at Chicago, Ill., a five-story, modern, fireproof, steel and concrete building, 450 by 125 feet, containing 6 acres of floor space and employing at full capacity approximately 2,000 operators, capacity 40,000 pencils and 10,000 fountain pens per day.

Wages paid.

Year.	Amount.	Average rate per hour.
		Cents.
1918.....	\$388, 356. 46	47. 00
1919.....	823, 557. 74	48. 00
1920.....	1, 619, 166. 41	55. 50
1921 (seven months).....	747, 825. 88	59. 50

GENERAL ARGUMENTS FOR A MORE ADEQUATE PROTECTIVE TARIFF.

The Fordney tariff bill provides as follows:

Section 352. "Mechanical pencils made of base metal and plated with gold, or platinum, 45 cents per gross and 20 per cent," later changed to include unplate pencils.

Section 1449. "Pencil leads not in wood or other material, 15 per cent."

The above percentage to apply on the price at the date of exportation at which comparable and competitive products of the United States are offered for sale in this country.

The tariff rates provided in the bill aforementioned are grossly inadequate to protect the metal-pencil industry for the following reasons:

1. The investment of this company as of January 1, 1918, in land, buildings, machinery, tools, and equipment, was \$480,140.94, as against \$1,513,781.49 on January 1, 1921, an increase in three years of over \$1,000,000. This large investment of over a million and one-half consists largely of special machinery, designed and made in our establishment which, if adequate protection is not provided, will be rendered worthless as the machines are not capable of being used for any other than that for which they were specifically designed.

2. Although metal pencils were manufactured and offered for sale upward of a quarter of a century ago, it was not until the advent of the Eversharp that it was considered seriously by the public and classified as a utilitarian. To-day there are in excess of 10,000,000 pencils of our manufacture in use throughout the world in various designs and styles, representing sales in the approximate aggregate of \$10,000,000 at wholesale, or about \$20,000,000 at retail prices. In addition to these sales the company has enjoyed a lead-refill business to June 30, 1921, of something in excess of \$900,000 at wholesale prices, equivalent to over \$1,500,000 at retail, which business would be utterly destroyed if not protected by adequate tariff provisions on a basis hereinafter outlined.

This prosperous business has been developed by an enormous investment of capital unknown heretofore in the industry, by large outlay in the way of experimentation as well as generous appropriations and expenditures for advertising and preliminary work during the pioneer stages of the industry.

This company is the largest manufacturer of metal pencils in the world, and in such, uses more metal tubing and employs larger manufacturing facilities and more employees than all of the other metal pencil companies in the world combined.

3. We submit as a further reason for more adequate protection the enormous contribution of the industry to the support of the Government in the way of taxes, both by direct payment on the part of the company, and indirect payments made to the Treasury Department through the operations of section 905, of the revenue act of 1918. This company has paid in income and excess-profits taxes, for the three years ended December 31, 1920, over \$1,250,000 as shown by the within exhibits, in addition to taxes paid by dealers in our products during the same period, the sum of \$1,000,000 on retail sales.

The discount accorded retail dealers is 40 per cent of list which conservative estimates indicate that it produces approximately 25 per cent net income to the dealers, allowing 15 per cent for overhead. In addition to taxes contributed by the company and its dealers direct, there is a further contribution received by the Government through the employees of the company, which averaged from 1,200 to 1,500 in number, during the last three years of operation, and who have contributed in the way of taxes on a conservatively estimated basis at least \$100 each, every year. All of this wealth thus produced by the industry, exclusive of the private incomes derived therefrom in the way of dividends to stockholders, will be completely dissipated if the industry is not accorded more adequate protective tariff.

4. *Discrepancy in wages paid in the United States versus foreign countries.*—Reference to schedule of wages aforementioned indicates that the average rate per hour paid to skilled workmen in this industry including all productive labor from highly skilled men, such as toolmakers, draftsmen, designers, engravers, etc., down to apprentices, indicates an hourly compensation of over 59½ cents. This rate, in comparison to that paid to skilled workers in Germany, is on the approximate basis of six to one.

In May, skilled metal workers in Germany were paid 6.6 marks per hour, equivalent, at the present rate of exchange to about 10 cents United States money (see New York Journal of Commerce, July 29, 1921; see also report of Francis R. Stearns, consul on detail, Hamburg, Germany, dated June 30, 1921.)

5. *Cost of living in Germany.*—According to commerce report of August 1, 1921, page 666, cost of foodstuffs in Germany in April, 1921, was twelve times the price in the United States.

the same commodities on the average, in 1913-14; heat and light was fourteen times the cost in 1913-14; rents, taken on the basis of rents obtaining in four principal cities in Germany, were only one and one-half times the prewar figure.

From the above it will be seen that the average cost of living in Germany in the recent months of this year was in the neighborhood of twelve times the cost in the prewar period. Despite this fact, the wages of metal workers in Germany at the present time are not in excess of eight times that of the prewar period as reflected by the following data:

The wages of metal workers in Germany are as follows: Sixty-three per cent receive eight times the wages of 1913-14, 36 per cent receive five to eight times greater, 1 per cent receive less than five times greater compensation. (See Commerce Report, July 15, 1921, p. 266.)

It will be noted from the above that despite the fact that living costs are higher in Germany by about twelve times the cost obtaining in 1913-14, the wages paid are not in excess of eight times those paid in 1913-14. The explanation for this condition is the Government subsidy and control of food distributing stations by which medium-sized Government buys on a wholesale basis the foodstuffs for the workmen and distributes the same at less than cost, thus virtually making private industry in this country, which does not enjoy such Government cooperation, competitive with the German Government.

6. *German subsidies to industry.*—It is our information that certain industries of Germany, especially steel and metal, are subsidized to the extent of inland and ocean freight, such subsidies even extending to duties exacted by importing countries in order to render competition by other countries, especially America, impossible. As an instance of the effect of these cooperative movements on the part of the German Government, we are informed that German steel can be laid down in Pittsburgh at \$2.10 per hundredweight versus \$2.75 American cost in Pittsburgh. It will thus be seen that should encouragement be given to German manufacturers of pencils that it would be only a matter of a short time before this company's business would be utterly destroyed, in the event that your committee does not amply protect from such practices the industry which has been almost exclusively developed in this country.

Your attention is respectfully directed to an article appearing in the Chicago Daily News of August 17, 1921, based on the statement of D. E. Hulbert, president of the Merchants Loan & Trust Co., Chicago, who is authority for the statement that the clock industry of Winsted, Conn., has ceased operations entirely, due to German competition which makes possible the delivery of German-made clocks in New York more cheaply than the identical clocks can be produced in the Winsted, Conn., factory.

7. *Project for decreasing unemployment in Germany.*—Your attention is respectfully directed to Commerce Reports, November 24, 1920, page 867, dealing with the matter of the German Government intervention in case of suspension of operations in factories on account of lack of capital, raw materials, coal, etc. This plan is as follows:

Factories employing more than 20 workmen which are intended to be closed down permanently would be required to furnish the Government six weeks' notice; factories intending to close down temporarily would be required to give four weeks' notice. The Government would thus be in a position to investigate, and if the suspension was attributed to lack of capital, shortage of raw material, labor disputes, or any other cause, they would be in a position to render aid through their wholesale purchasing establishments, the proposed National Economic Bank, and through any other agencies of the Government which would be deemed expedient in the premises. The effect of this project is that private capital in this country being amenable to competitive methods and dependent upon the support of private capital and agencies would virtually be in competition with the German Government.

8. We respectfully request that more ample protection be also given to an adjunct of the metal-pencil industry, namely, lead refills under section 1449 of the tariff bill. It is proposed that leads not encased in wood or other materials, be taxed 15 per cent. It is suggested that the tariff rate be increased commensurate with the added protection prayed for on metal pencils, and that refills be placed on the same basis. In consideration of the fact that many styles of metal pencils are sold on a very small margin of profit in order to make their use logical for industrial purposes, the refill is virtually the one source of profit attendant upon such sales. The Eversharp has created the demand for refills of small diameter leads, and we consider that a protection to this adjunct of the pencil business is highly important to the welfare of the industry, especially looking to the day when a saturation point will be reached in the metal-pencil business, and for the further reason that this small diameter lead is part

of the process relating to the Eversharp invention, and for that reason any advantage should accrue to the owners of the patent.

In conclusion we submit a comparative schedule of costs of metal pencils produced by American capital and workmen, as against a similar article produced in Germany by German capital on the basis of wages paid in Germany in the equivalent of United States money.

Comparison of costs, American "Eversharp" versus German metal pencil.

	No. 20 pencil, to retail at \$1 net to Wahl Co., less 40 per cent, equals 60 cents.		No. 60 pencil to retail at \$3 net to Wahl Co., less 40 per cent, equals \$1.80.	
	Labor.	Materials.	Labor.	Materials.
AMERICAN "EVERSHARP."				
Total cost to manufacture and place on market, June, 1921:				
Manufacturing cost—				
Our (Wahl) direct labor.....	\$0.0807		\$0.0773	
Direct material.....	.0880		.4837	
Factory burden (supervision, maintenance, supplies, etc.).....	.1139		.1162	
Total factory cost.....	.2826		.6772	
General overhead (cost to advertise, sell, etc., including salaries of executives, salesmen, clerks, etc.), 103 per cent of factory cost.....	.2911		.6975	
Total cost to manufacture and market.....	.5737		1.3747	
Reclassified as to labor and material—				
Our (Wahl) direct labor.....	\$0.0807		\$0.0773	
Estimated division of material supplied us by outside manufacturers, 75 per cent labor, 25 per cent material.....	.0660	\$0.0220	.3628	\$0.1209
Actual division of our factory overhead labor (superintendents, foremen, material handlers, etc.), equivalent to 79.6 per cent of direct labor.....	.0642		.0615	
Material, etc. (supplies, heat, light, power, depreciations, etc.), equivalent to 20.5 per cent of direct labor.....		.0497		
Division of our (Wahl) general overhead, labor (executives, salesmen, clerical, etc.), 44.8 per cent of total general overhead.....	.1304		.3125	
Material and sundries (advertising, insurance, telephone, office supplies, etc.), 55.2 per cent of total general overhead.....		.1607		
Total labor in cost.....	.3413		.8141	
Total material and sundries in cost.....		.2324		
Total cost American pencil.....		.5737		1.3747
GERMAN METAL PENCIL.				
Labor: German metal workers paid approximately 10 cents per hour against our 60 cents per hour, equivalent to one-sixth of our labor cost.....	.0569		.1357	
Material: Material and other items taken at same figure as ours.....		.2324		
Total cost German pencil.....		.2893		
Per cent German cost to American cost.....		50.4		
20 per cent (as provided in section 352) on wholesale prices of comparable articles, namely, 60 cents and \$1.80, respectively, added to German cost would cost American importer.....		\$0.4083		\$1.1184
Balance in favor of German manufacture.....		.1644		
PROPOSED TARIFF.				
50 per cent on wholesale price of comparable articles of United States manufacture added to German cost, or.....		.5893		
50 per cent on retail price of comparable article of United States manufacture added to German cost.....				
Balance in favor of American manufacture.....		.0156		

Summary, Eversharp pencils.

	No. 20: Retail, \$1; wholesale, 60 cents.	No. 60: Retail, \$3; wholesale, \$1.80.
Estimated German cost.....	\$0. 2893	\$0. 6963
Tariff required to equalize price with United States costs: 30 per cent on retail price of \$1 and \$3; 50 per cent wholesale price of 60 cents and \$1.80....	. 3000	. 9000
Total cost in United States.....	. 5893	1. 5963
Cost to manufacture in United States.....	. 5737	1. 3747
Difference in favor of United States.....	. 0156	. 2216
Per cent.....	2. 7	16. 1

NOTE.—No. 20 class pencils: Silver plate on brass constitute 58.85 per cent of total pencils produced and sold.

Please observe that according to the conservative estimates employed in the foregoing schedule, the ratio of German costs to United States costs is about 50 per cent. In order to give the metal pencil industry an even chance of competition with foreign-made articles of the same character and to obviate any possibility of the entry of foreign goods in competition therewith on a preferred basis, we point out to your committee that the tariff rates proposed are figured on a basis which will only equalize the foreign costs to domestic figures and we pray, therefore, that the suggested rates be given earnest and favorable consideration.

POCKETKNIVES.

[Paragraph 354.]

**STATEMENT OF CHARLES F. ROCKWELL, PRESIDENT MILLER BROS.
CUTLERY CO., MERIDEN, CONN., REPRESENTING THE POCKET
CUTLERY MANUFACTURERS.**

[Representing also the following pocket cutlery manufacturers: Baldwin Cutlery Co., Tidioute, Pa.; Canton Cutlery Co., Canton, Ohio; W. R. Case & Sons Cutlery Co., Bradford, Pa.; Clay Cutlery Co., Ansonia, N. Y.; Challenge Cutlery Corporation, Bridgeport, Conn.; Cattaraugus Cutlery Co., Little Valley, N. Y.; Cronk & Carrier Manufacturing Co., Elmira, N. Y.; Empire Knife Co., Winsted, Conn.; Golden Rule Cutlery Co., Chicago, Ill.; Hollingsworth Cutlery Co., Kane, Pa.; Lackawanna Cutlery Co., Nicholson, Pa.; Landers, Frary & Clark, New Britain, Conn.; Miller Bros. Cutlery Co., Meriden, Conn.; New York Knife Co., Walden, N. Y.; Novelty Cutlery Co., Canton, Ohio; Ohio Cutlery Co., Massillon, Ohio; Robeson Cutlery Co., Perry, N. Y.; John Russell Cutlery Co., Turners Falls, Mass.; Schatt & Morgan Cutlery Co., Titusville, Pa.; Schrader Cutlery Co., Walden, N. Y.; Thomaston Knife Co., Thomaston, Conn.; Ulster Knife Co., Ellenville, N. Y.; Union Cutlery Co., Olean, N. Y.; Utica Cutlery Co., Utica, N. Y.; Valley Forge Cutlery Co., Newark, N. J.; Walden Knife Co., Walden, N. Y.; Warwick Knife Co., Warwick, N. Y.; Winchester Repeating Arms Co., New Haven, Conn.; Remington Arms Co. (Inc.), Bridgeport, Conn.]

Mr. ROCKWELL. We have consolidated the representation of 30 American pocketknife manufacturers, and I shall make my statement very brief, indeed.

We feel that the rates provided in paragraph 354 of the Fordney bill do not equalize the increased difference between labor in this country and abroad, particularly as over 80 per cent of our foreign competition is with Germany.

Senator SMOOT. Do you mean the 40 per cent?

Mr. ROCKWELL. Yes.

Senator SMOOT. What about the specific duty?

Mr. ROCKWELL. We would ask, sir, that the rates as provided in paragraph 354 be continued as provided.

Senator SMOOT. You want the House provisions?

Mr. ROCKWELL. Yes; we want the House provisions of paragraph 354.

Senator SMOOT. What have you to say with regard to the statement made by the former witness?

Mr. ROCKWELL. I will say that this is the first objection or criticism that we have heard on the part of the importing concerns. I may add that the tariff committee of the American industry will be very glad, with your permission, to file a brief in rebuttal, and to supply a representative display of samples, which I think will convince the committee that we are justified in the request that we make.

Senator SMOOT. Let me ask you a question about that. What about the 33-cent knife that was spoken of? Do you know anything about that?

Mr. ROCKWELL. So far as I know, there is no such value as that in American goods.

Senator SMOOT. Is there in the foreign goods?

Mr. ROCKWELL. I imagine so. I did not see the knife at the time it was shown. The importations which have come in since July of last year have been in such tremendous volume that some of them are as low as prewar figures. Some, on the other hand, are as high as 50 per cent advance over prewar values. I should say they would run from 25 to 50 per cent over the prewar figures. That would fairly represent the value of the importations.

Senator SMOOT. Have you a sample of the American knife?

Mr. KASTOR. I will show you some, Senator. This is one that I got at a Woolworth store. It must have been sold by somebody.

Mr. ROCKWELL. My understanding is that the Valley Forge Cutlery Co., during the war, started the manufacture of that knife, found that it was not salable, and sold it out as a job lot.

Senator SMOOT. You mean the American knife?

Mr. ROCKWELL. Yes. It was an article that they got out especially during the war when it was difficult to get a bone stag knife and when cheap knives were difficult to produce. They got out that pattern with the idea that they might be able to retail it at 50 cents, I think it was.

Senator SMOOT. That was a dollar a dozen?

Mr. ROCKWELL. Do not confuse that with this [indicating]. This is the one he said he picked up at the Woolworth store.

Senator SMOOT. I want to get the comparison that was made. I do not want to bring in any other knife.

Mr. KASTOR. This [indicating] is the knife.

Senator SMOOT. This is the 33-cent German knife?

Mr. ROCKWELL. They are of similar pattern, Senator, but not similar value.

Senator SMOOT. That is, the knife is not the same in any respect?

Mr. ROCKWELL. It is similar in kind, but not in quality or value.

Senator SMOOT. Then it would not be comparable at all as to duty.

Mr. ROCKWELL. No, sir.

Senator McLEAN. Your idea is, as I understand it, that the tariff on that knife would have to be figured on the export valuation. There is no comparability or similarity for duty purposes?

Mr. ROCKWELL. It would be similar in kind and construction, but not in quality, as I understand the method of appraising under the bill.

Senator SMOOT. Do you know whether there is an American knife made that would compare with that in any way?

Mr. ROCKWELL. Yes; there has been. It was not manufactured during the war period, but was made in the prewar period. There was a knife similar to that made according to American standards.

Senator SMOOT. What was the American price?

Mr. ROCKWELL. I could not say. Our company did not make it. I do not recall what the price was.

Mr. DEVINE. That was sold for as low as 90 cents. That represented about 25 cents below cost.

Senator SMOOT. Can the American manufacturer make a knife that will compete with the German knife referred to by the former witness?

Mr. ROCKWELL. No, sir.

Senator SMOOT. At a price of 33 cents?

Mr. ROCKWELL. No, sir.

Senator SMOOT. Suppose you made a knife like that, or as nearly as one could be made like that by human skill, what could the American manufacturer sell it for?

Mr. ROCKWELL. Under the present basis of cost, I think that would be in the neighborhood of \$2.50 a dozen.

Senator SMOOT. Instead of 33 cents?

Mr. ROCKWELL. Yes; but it would be a knife. There would be a corresponding pattern.

Senator SMOOT. I do not mean the pattern; I mean the same material and construction.

Mr. ROCKWELL. That class of knives could be made at \$2.50 a dozen—the American knife.

Senator SMOOT. If Germany can make a knife for 33 cents and the American manufacturer can not make it for less than \$2.50, you had better leave it alone, had you not?

Mr. ROCKWELL. Yes.

Senator SMOOT. Then you do not want a duty to take care of it at all, do you?

Mr. ROCKWELL. We would like to get——

Senator SMOOT (interposing). In other words, you want 800 per cent to make it even?

Mr. ROCKWELL. We would on that class of knife; yes; but ours would be a real knife.

Senator SMOOT. You do not think that Congress ought to pass any such rate as that, do you?

Mr. ROCKWELL. That is a pretty cheap sort of knife, Senator. It is hardly a representative knife. It is not fair to pick out a knife of that kind.

Senator SMOOT. I am perfectly aware of that. I want to get the figures on both classes.

Mr. ROCKWELL. Yes.

Senator SMOOT. Is there the same kind of comparison as to the scissors?

Mr. ROCKWELL. I am not familiar with scissors. Mr. Gerard can answer that question.

Senator SMOOT. Take the higher-priced knives that you really do make, and let us see where we will land.

Mr. ROCKWELL. It should be borne in mind, Senator, that as to German pocketknives it is a well recognized fact—that is, imported pocketknives—that there are three grades. There is what is known as the standard grade, which would include knives of the character

of Joseph Rodgers and the IXL brands of English knives, and the Boker and Henckel brands of German manufacture. Then there is a medium grade, which might be described, as Mr. Kastor has said as the Morley brand. There is then a third quality which is not the equal of the Morley brand. That might be described as the Kastor-Wadsworth line and the Wiebusch-Lafayette line. Now, it would make quite a considerable difference as to whether you were comparing the second or third grade quality knives on which the price is different.

Senator SMOOT. Take these two knives that I hold in my hand. Is that a fair comparison?

Mr. ROCKWELL. I should say that it is not, Senator. I should say that that would not be fair.

Senator SMOOT. Is the German knife the heavier knife?

Mr. ROCKWELL. I have no desire to reflect at all upon the class of merchandise manufactured by any American concern, but in order to justify our argument, I think it is perhaps conceded that this line of merchandise is regarded in the trade as a low-price line, largely because of the methods—the quantity-production methods—employed in the factory of this particular company. I say that, too, in the friendliest sort of way, but I believe that is universally recognized throughout the wholesale jobbing trade of the country.

Senator WALSH. You mean to say that the German knife is the better of the two knives?

Mr. ROCKWELL. Yes; that is, the Boker knife.

Senator WALSH. What is the difference as to these two classes of knives?

Mr. ROCKWELL. The German knife costs \$4.78, while the domestic knife costs \$12.25.

Senator WALSH. And yet the German knife is the better of the two?

Mr. ROCKWELL. Yes.

Senator CALDER. The German knife is the better knife.

Mr. ROCKWELL. The standard American premium stag knife of that pattern can be purchased at \$12.50. Mr. Kastor's price of \$12.75 is high.

Mr. KASTOR. That American knife has a nickel-silver lining, and it is not made in wholesale quantities. It is a special grade of knife. That is a knife that we got \$16 and \$18 per dozen for until recently.

Mr. ROCKWELL. It is not a knife that is ordinarily comparable with the Boker pattern. I understand the Boker pattern is of nickel silver.

Mr. KASTOR. I will tell you why we selected that. The other pattern was picked out first. That was a knife for about \$9.75 per dozen. But it was thought that Mr. Rockwell would say that that was not a fair basis of comparison.

Senator SMOOT. Do you import this knife yourself?

Mr. KASTOR. The German knife is imported by the Boker Co. It is a splendid knife.

Senator SMOOT. Do you make this American knife that I have in my hand?

Mr. KASTOR. Yes; you bet we do.

Senator SMOOT. And you have been selling it at \$12.75?

Mr. KASTOR. I would like to take an order from the Senator for 100 dozen right now at \$12 per dozen.

Senator SMOOT. I am not in the knife business.

Mr. ROCKWELL. We will make it \$10.50.

Mr. KASTOR. But not that pattern.

Senator SMOOT. Can any importer import this German knife for \$4.78?

Mr. KASTOR. Yes.

Senator SMOOT. Do you say that, too, Mr. Rockwell?

Mr. ROCKWELL. Certainly.

Senator SMOOT. The American valuation on that same knife is \$10.50.

Mr. ROCKWELL. The Boker knife? I wish you would refer to Mr. Boker.

Mr. DIVINE. Are you referring to the American knife? The price is \$10.50 to \$11 a dozen. That would be the value on the standard straight knife. Of course, there is a wide difference. There are knives with special finish of nickel-silver linings, burnished springs, full radius polished blades, and knurled or milled scale edges. These run in price from \$11 up to \$12, \$14, and even \$15.

Mr. KASTOR. I think Mr. Divine has a knife in his line that he will say is the equal of the foreign knife.

Senator SMOOT. Do you manufacture a knife comparable with it?

Mr. KASTOR. Comparable with the Boker knife?

Senator SMOOT. Yes.

Mr. KASTOR. I also manufacture a cheaper knife known as the P.M.S. which has polished marked sides.

Senator SMOOT. Then it is not the same knife?

Mr. KASTOR. No, sir.

Senator SMOOT. What I want to get at is this: Why would you want to manufacture a knife comparable to this German knife if it costs you \$10 and you can import the German knife for \$4.75?

Mr. KASTOR. In the first place, it costs \$4.78 on the other side and there is 55 per cent on that under the Underwood bill. My cost here is \$7.91. The German knife is sold for about \$13, and costs with duty, \$7.40; that is why I want to make it in the United States of America in competition with the Germans even under the duty provided for in the Underwood-Simmons bill.

Senator WATSON. What does it cost laid down in New York?

Mr. KASTOR. Fifty-five per cent on \$4.78, plus 5 per cent for freight and other charges. It would amount to about \$7.70. My American cost would be about \$7.91.

Senator CALDER. Mr. Rockwell, is there an association of pocket-knife manufacturers in this country?

Mr. ROCKWELL. Yes, sir; they have an association. It was in December, I think, and just about at the close of the war, that the National Chamber of Commerce held a convention in Atlantic City with the war service committees and war service organizations of all industries throughout the country. I was chairman of the several machinery branches, and it was at that meeting that it was urged very strongly upon all manufacturers by Mr. Culver, of the War Trade Board, and by Mr. Redfield, then Secretary of the Department of Commerce, that during the reconstruction period the various groups which had been doing such splendid work, continue during the reconstruction period the work of cooperation in the way of education as to methods and costs, and so on.

Senator CALDER. And as to selling prices?

Mr. ROCKWELL. No, sir; absolutely nothing in that regard. It had nothing to do with selling prices.

Senator CALDER. Were any selling prices fixed?

Mr. ROCKWELL. No; we understand what the Sherman antitrust law is.

Senator CALDER. Hasn't there been at times a distribution of price information?

Mr. ROCKWELL. We have distributed price lists, after they have been made, but that has been as far as it has gone. We understood we were entirely within our rights in so doing. We make no reports as to distribution or production which might in any way be construed as——

Senator CALDER. I have been informed that you gather information from members and distribute that to others with the idea of indicating what you are getting for the different articles, and that at the same time you are using numbers and letters as designations of certain things.

Mr. ROCKWELL. There is no mystery whatsoever about that. The numbers and letters which are used to identify articles are numbers and letters which have come down from war-time classifications authorized by the War Industries Board.

Senator CALDER. Don't the manufacturers in this association attempt to maintain uniform prices?

Mr. ROCKWELL. No, sir.

Senator CALDER. I wanted to be sure of that.

Senator McLEAN. How many men are employed in this industry in this country?

Mr. ROCKWELL. A year ago there were 6,200 employed in the pocketknife industry. At the present time there are less than 1,800 employed, and at least 600 or 800 of these are working on short time.

Senator WATSON. You do not think that has all been brought about by excess importations?

Mr. ROCKWELL. Not altogether. However, the records which are available to you will show tremendous importations. They will continue to retard sales.

Senator McLEAN. How do the wages paid in Germany compare with those paid in America for the same kind of work?

Mr. ROCKWELL. A German cutlery operative receives in America equivalent \$3.75 per week as contrasted with \$30 per week for the corresponding American workman.

Senator McLEAN. What percentage of the cost is labor?

Mr. ROCKWELL. Eighty per cent is labor cost.

Senator McLEAN. Eighty per cent?

Mr. ROCKWELL. Yes.

Senator CALDER. In estimating the difference between the American valuation and the foreign valuation, how much greater duty do we levy, assuming the rate to be the same?

Mr. ROCKWELL. That would vary on different patterns, Senator.

Senator CALDER. Would it be double?

Mr. ROCKWELL. Yes; I think it would be more than double.

May I have permission to file a brief?

Senator SMOOT. You may file any brief you desire.

CUTLERY.

[Paragraphs 354, 355, 357, 358, and 361.]

STATEMENT OF ROBERT N. KASTOR, REPRESENTING CUTLERY IMPORTERS' ASSOCIATION.

Mr. KASTOR. I am speaking for all importers.

The CHAIRMAN. For all importers?

Mr. KASTOR. I am also an American manufacturer and a number of importers that I represent are American manufacturers as well, but I am speaking for the Cutlery Importers' Association, which comprises all the regular cutlery importing houses.

Senator McLEAN. What are your paragraphs, Mr. Kastor?

Mr. KASTOR. 354, 355, 357, and 358.

The CHAIRMAN. What is your occupation?

Mr. KASTOR. I am a manufacturer and importer of cutlery.

The CHAIRMAN. Where do you reside?

Mr. KASTOR. I reside in New York City, sir.

The CHAIRMAN. Where is your place of business?

Mr. KASTOR. In New York City.

The CHAIRMAN. Where do you manufacture?

Mr. KASTOR. At Camillus, N. Y.

The CHAIRMAN. What do you make?

Mr. KASTOR. Pocketknives.

The CHAIRMAN. Go ahead.

Mr. KASTOR. As I was about to say, sir, the Cutlery Importers' Association represents 80 per cent of the imports of cutlery into this country, and its membership comprises all the large leading cutlery importing houses. These houses in most cases are interested in American factories; in fact, all but one of the members of our tariff commission signing this brief have large American interests. And I also speak for myself; we have one of the largest American pocketknife factories in this country. I do not hesitate to put it on a par with any of them, and here is a picture of our Camillus plant showing about what our development has been in the last few years under the Payne-Aldrich, Dingley, and Underwood bills.

Senator CALDER. How many men do you employ, Mr. Kastor?

Mr. KASTOR. At the peak of the boom we employed 325 men.

Senator CALDER. How many do you have employed now?

Mr. KASTOR. About 200, and we are working full time.

Senator CALDER. Are you a manufacturer and importer of pocketknives?

Mr. KASTOR. Yes, sir.

Senator CALDER. What proportion of your distribution do you export?

Mr. KASTOR. During the war 100 per cent American; since the war I should say 75 per cent American and 25 per cent imported.

Senator SMOOT. Before the war?

Mr. KASTOR. Before the war 50-50.

Senator SMOOT. What are your future prospects?

Mr. KASTOR. That depends upon you gentlemen.

Senator SMOOT. That is what I thought.

Mr. KASTOR. We maintain, and will prove to you, that the present rates of duty, combined with American valuation, as amended by

your Finance Committee, are absolutely prohibitive and are an embargo against all imports of cutlery, and I include all the paragraphs that I have mentioned.

Senator SMOOT. That is, paragraphs 354 and 355?

Mr. KASTOR. Yes, sir; and paragraphs 357 and 358.

Senator WATSON. Do you make more than you import?

Mr. KASTOR. I just answered that question, Senator; 75 per cent and 25 per cent.

Senator SMOOT. You mean that the Underwood rates are prohibitive under the American valuation?

Mr. KASTOR. No, sir; I mean that the proposed Fordney rates are prohibitive under the American valuation plan.

Senator SMOOT. You said "the present rates," and therefore I wanted to know just what you meant by that.

Mr. KASTOR. "The proposed rates," I should have said. Thank you, Senator. In the first place, we will show you that the combination of varied specific duties with ad valorem duties is unscientific and arbitrary with reference to classification; in the second place, it is unjust and unfair in operation; and, in the third place, it is prohibitory for a large class of goods, even if the American valuation were not to stand.

We suggest to you that you amend the clause in connection with the branding of the items in question in each of the paragraphs about which I am speaking. I shall go into that in detail a little later. But what we want is to have it read the same way it did in the Underwood-Simmons and the Payne-Aldrich bills.

In the fourth place, in order that we do not appear merely destructive in our criticism, we suggest actual rates which will prove fair to the domestic producer; in short, rates that will provide him with adequate protection and at the same time will permit importation, which will be a good thing for the consumer. Those rates are 40 per cent ad valorem in paragraphs 354, 357, and 358, namely, pocketknives, scissors, and razors, and 20 per cent in paragraph 355, table cutlery.

We also suggest a 20 per cent rate on nail nippers in paragraph 356, but we do not want to go into that in full detail.

Now, gentlemen, I have come before you with actual samples.

Senator SMOOT. That is, you want a straight 20 per cent ad valorem with no specific duties?

Mr. KASTOR. Yes, sir; no specific duties. We urge that specific duties be dropped, and I hope before I am through I shall be able to convince you that they should be dropped, Senator Smoot.

Now, gentlemen, let us go into this American valuation proposition in a little detail. I have here an imported one-blade pocketknife—a boy's knife, that costs abroad, at the Federal Reserve rate at the time it was brought in—and I am taking actual cases—33 cents per dozen. It was pretty cheap.

Senator CALDER. That is 2½ cents apiece.

Mr. KASTOR. Yes, sir. This same item sells—we made it ourselves—for \$1 a dozen in America. Now, let us just assume, for the sake of argument, that the appraiser considers these comparable. I do not ask you gentlemen to consider them comparable, but let us say that the appraiser considers them comparable. What will the duty be on that basis? The knife is valued at \$1 per dozen. The

praiser asks the American manufacturer what he gets for them, and he says \$1 a dozen. They are dutiable under the Fordney act at 5 cents each and 30 per cent ad valorem, which together is 35 cents; but I just said they cost 33 cents on the other side. Needless to say, I could not sell in competition with the American item at cost me, without expenses, transportation costs or profits, \$1.23 a dozen under the provisions of the Fordney bill.

Now, that is just a case with American valuation. But you gentlemen have provided, and wisely probably, that in case the praiser does not find the article similar, that he take the imported value; now import value as you gentlemen define it is the importer's wholesale selling price here. That knife sells for \$1 a dozen here. Before I go ahead you can automatically see that that bears the same duty on import value as it does on domestic. Five cents each and 30 per cent ad valorem is 90 cents a dozen, plus 33 cents, is \$1.23. If we are absolutely excluded, we can not compete.

You have also provided, in case the item has never been imported before, for its valuation on the export value, and I am prepared to show you that the duty on export value and cost of production practically amounts to the same as the other two classes.

The duty in the Fordney bill is 40 per cent. This plus 5 per cent freight, transportation, and expenses, is 45 cents. Add not less than 16 per cent for profit, and you have 55 cents, making a dutiable value of 55 cents per dozen, 5 cents each, and 30 per cent ad valorem, making 77 cents. Now, 77 cents plus 33 cents is \$1.10. Again the item is thrown out. I do not want to take just one instance.

Senator McLEAN. Wait a minute. Here is a knife that is made in Germany, I assume.

Mr. KASTOR. Yes, sir.

Senator McLEAN. At 33 cents per dozen?

Mr. KASTOR. Yes, sir.

Senator McLEAN. That is 2½ cents apiece.

Mr. KASTOR. Yes, sir.

Senator McLEAN. And here is an American knife, which cost—

Mr. KASTOR. It costs 85 cents a dozen.

Senator McLEAN. What rate of duty would the American manufacturer have to have to protect him against a German knife on the foreign valuation?

Mr. KASTOR. Seventy-five per cent, but we are not talking about foreign valuation, sir. The domestic value, I have been impressed by the committee, is what we are here to figure on to-day. These Fordney rates are to apply on the American valuation.

Senator McLEAN. Yes; but I was thinking of what we would have on foreign valuation.

Mr. KASTOR. I buy my marks before I make my purchases. I have to protect myself. You must not figure the mark at the Federal reserve rate or the consulated rate in arriving at our actual cost. We buy our marks in advance of our orders, and we have paid 2 cents, 3 cents, or 8 cents for the marks in the past two years.

This article that I have here was consulated at \$1.26, but I might have paid 2 cents for my marks. The actual knife might have cost 40 or 50 cents. Values are so uncertain to-day that you can not figure it down that close.

Senator WATSON. When did you bring those knives into the country?

Mr. KASTOR. On July 26.

Senator CALDER. Did you get a cheaper price on them?

Mr. KASTOR. This German knife? No, sir; that is the regular price.

Senator SMOOT. When did you buy your marks for 2 cents and 8 cents?

Mr. KASTOR. I have been buying them right along from 8 cents down. We have to average them up, you see.

Senator SMOOT. Oh, if you are averaging them for two years or so.

Mr. KASTOR. No, sir; not one or two years but ever since we have been importing. I have to figure my correct cost.

Senator SMOOT. When you paid 8 cents you figured 8 cents on the goods that you imported at that time?

Mr. KASTOR. Yes, sir.

Senator SMOOT. But that was in July?

Mr. KASTOR. I probably paid around one and one-half for them.

Senator SMOOT. You ought to have bought them for one and a quarter.

Mr. KASTOR. I buy them lower now.

Senator SMOOT. During the month of June they were 1.3 cents. Then in July they fell to 1.22 cents.

Mr. KASTOR. Senator, I place my orders in advance——

Senator SMOOT. Well, it is not material.

Mr. KASTOR. I want to go on record as saying before you gentlemen that the scissor schedule, with or without American valuation, will prove to be an absolute embargo, and I will go into figures with you on scissors. Take this 5½-inch scissor. That scissor costs 85 cents.

Senator WATSON. Under what paragraph do scissors come?

Mr. KASTOR. Paragraph 357—3 cents, 15 cents, and 20 cents specific and 35 per cent ad valorem.

Senator WATSON. Steel laid scissors and shears?

Mr. KASTOR. I am glad you brought that up. That is a good interruption. Steel-laid scissors and shears are made only in the country, and I have not even discussed that paragraph. I do not know what manufacturer had that put in or why he did put it in but I have never heard of a steel laid shear made outside of the country. I will go on record as saying that, and I will explain to you what a steel laid shear is. It means a piece of steel is taken and a piece of iron is laid on top of it and they are riveted together.

Senator WATSON. You say they are not imported?

Mr. KASTOR. They are not made anywhere except in this country. I have never heard of them being made in Germany or elsewhere.

Senator SMOOT. No scissors?

Mr. KASTOR. I said steel laid shears, sir.

Senator SMOOT. Well, there are scissors made elsewhere.

Mr. KASTOR. Yes, sir; and I am going into the subject of scissors right now. This pair of 5½-inch scissors, No. 9338, cost 85 cents abroad. They were consulated at 1.44 cents to the mark on April 1. That was the last invoice of that particular importer of these particular scissors. But the domestic scissors are sold by the A. C. Shears Co. at Bridgeport in the usual quantities for \$2.27. Just

n to your schedule on scissors and see what duties you have to pay on them.

Senator WATSON. What do you pay abroad?

Mr. KASTOR. Eighty-five cents per dozen abroad. They sold for 27 here. Now, let us see what the duty works out to. The bill provides as follows:

Valued at more than \$1.75 a dozen, 20 cents each and 35 per centum ad valorem.

Senator WATSON. What do you say it is?

Mr. KASTOR. Scissors over \$1.75 a dozen.

Senator WATSON. The illustration is over \$1.75.

Mr. KASTOR. It is \$2.27, the comparative American sample. I am working on American valuation, trying to demonstrate how it actually work out.

Senator WATSON. Valued at more than \$1.75 per dozen, 20 cents each.

Mr. KASTOR. Yes, sir; and 35 per cent ad valorem. That would mean that that particular pair of scissors would pay \$3.19 per dozen, duty alone. The American manufacturer sells them for \$2.27. Ask you gentlemen whether or not this is an embargo.

Senator WALSH. The duty would be \$3.19?

Mr. KASTOR. Yes, sir.

Senator WALSH. Then, the cost to the European maker is 85 cents?

Mr. KASTOR. Well, add \$3.19 and 85 cents and you have \$4.04. There are no profits, no expenses, no freight, and no insurance in it \$4.04. And that is the sort of competition we are supposed to run up against.

Senator WALSH. Now, take up some other item.

Mr. KASTOR. I will take razors. No. 525, five-eighths square inch, is a razor that we import ourselves. We imported one on May 10, 1921, at the rate of 1.49 cents to the mark.

Senator WATSON. What paragraph does that come under?

Mr. KASTOR. Paragraph 358. That works out at \$1.17 a dozen. Now, gentlemen, that razor is sold by the J. R. Torrey Razor Co. for \$3.25 a dozen. The duty on that \$3.25 a dozen, if you follow the tariff schedule on articles valued at over \$3, 16 cents each and 30 per cent ad valorem. So the duty is \$2.90.

Senator WALSH. Plus \$1.17, the purchase price in Europe, which makes \$4.07, and the American price is \$3.25.

Mr. KASTOR. Yes, sir.

Senator CALDER. What is the American price?

Mr. KASTOR. \$3.25, without transportation expenses or other charges.

Senator WALSH. How do you know these are the same material?

Mr. KASTOR. I do not claim that they are the same. I will value for you in any way you want. If you say they are not the same, I will take the import value, and I will prove to you that the duty is just as much. If you say, "What if you did not import them here?" I will take the export value, and I will prove that you have shown this so that it does not make any difference how you value them; that with the schedules in the Fordney bill it is an embargo; and I stick by it.

Senator SMOOT. How is it that in the past you have not driven all these people out of business?

Mr. KASTOR. What people, sir?

Senator SMOOT. The American manufacturers. If you can bring that knife in here under the duties imposed in the Underwood bill or the Payne-Aldrich bill at 53 cents, and it is sold here at a dollar, why on earth did you not wipe them out entirely?

Mr. KASTOR. It was not possible to do that until after the war was it?

Senator SMOOT. It was before the war.

Mr. KASTOR. Well, as an American manufacturer I will offer you an interesting instance. We sold knives for \$3.25 a dozen, and the customers preferred to have them—this is the wholesale price—against the imported article for \$1.50 a dozen.

Senator WATSON. When?

• Mr. KASTOR. In 1913.

Senator SMOOT. That is, the American people would pay \$3.25 for an American knife that was not as good as the German knife?

Mr. KASTOR. No; it was much better than the German knife. The American knife is made of crucible steel, and the German knife is made of Bessemer steel.

Senator SMOOT. If that is the case with the ones that you are showing here, they are different goods entirely.

Mr. KASTOR. Senator Smoot, I have explained that I have done my best to get similar patterns. You can look yourself, or ask Mr. Rockwell to come over here and see if he can find anything closer than these patterns.

You provide for four values—domestic value, import value, export value, and cost of production. If you say, Senator Smoot, that these are not similar, I will then take your word for it, and I will figure the whole thing out on import value and show you that the whole thing is prohibitive.

Senator WALSH. You admit that there should be a duty?

Mr. KASTOR. Yes, sir.

Senator WALSH. You say these rates are so high that they amount to an embargo?

Mr. KASTOR. That is just exactly what I have repeated several times.

Senator SMOOT. Senator Walsh, before you go any further, I want to say this: It has been tentatively agreed to change the American valuation plan. No committee has decided as to what changes should be made in the rates. I have not any doubt but what there are many rates here that should be changed in this bill.

Senator WALSH. That is why I think that this is illuminating. You are going to adopt the American valuation plan you want to know by concrete illustrations just how it is going to operate. I do not think you, any more than I, want to stand for unnecessary embargoes.

Senator SMOOT. I think there could be a better example shown than he is showing here now.

Mr. KASTOR. Now, gentlemen, I want to interrupt myself to go to the question of branding.

The branding clause, as it reads at the present time, is to the effect that all articles must be stamped, not only with the name of the country of origin, but with the name of the maker. That, gentlemen, is a little joker that has been slipped in. I am not sure just who did

I am sure that no American manufacturer suggested that. All it would do would be to advertise the foreign manufacturer who made cutlery. It would, at the same time, wipe out with one swoop years of hard work that we importers and jobbers throughout the country have put in to make good our special brands. There are special brands. For instance, we run what is known as the Morley and.

Senator Smoot. If this law goes into effect, it advertises the foreign and and lets the purchaser in the United States know that the article was made in a foreign country.

Mr. KASTOR. No, sir. That is not the point. The "made in Germany" tells him that.

Senator Smoot. But that is put on there so that they can not tell it.

Mr. KASTOR. This will do this. It will tell every dealer in the United States—every Tom, Dick, and Harry—where to go to buy his goods; and they will all go direct to buy, possibly over the heads of the American manufacturers.

Senator Smoot. You mean over the head of the American importer?

Mr. KASTOR. No, sir.

Senator Smoot. Well, do not forget the importer.

Mr. KASTOR. I am not; that is what I am here for.

Senator Walsh. You fear that it will put the unreliable maker on an equal basis with the substantial and reliable maker?

Mr. KASTOR. And the importer. That is the whole story.

Previous bills have recommended "maker or purchaser." I urge that you allow it to be "maker or purchaser." I suggest that you allow the act to stand as the Underwood-Simmons Act and the Payne-Aldrich Act did stand, with "maker or purchaser."

I want to make one more point in that connection. England, many years ago, started this "made in Germany" proposition, when she required that every article made in Germany should be so stamped and automatically advertised.

Senator McLean. I have just been noting the pocketknife importations in 1919. They amounted to 128,000 dozen. That is for 1919. In 1920 the importations amounted to 200,000 dozen; for 1921, up to date—and that is probably for the fiscal year—440,000 dozen. The importations evidently are increasing very rapidly.

Mr. KASTOR. They may be increasing very rapidly, Senator, and in that connection here are some very interesting figures. The exports of cutlery from the United States for 11 months ending in November amounted to \$6,866,727, as against imports of \$2,624,446. Those figures are taken from your Government statistics. That refers to table cutlery.

Senator McLean. I am not talking about table cutlery. I am talking about pocketknives.

Mr. KASTOR. These figures include all.

Senator McLean. Now take scissors. In 1919 we imported 39,000 dozen; in 1920 the number of dozen is not given, but the value is double that of 1919. In 1920 the value was \$154,000.

Mr. KASTOR. And in 1921 it was \$821,392. I can give you that to save you the time.

Senator McLean. I have been reading the wrong figures, I think. The value was \$260,000 in 1920 and in 1921 the value was \$936,000.

Mr. KASTOR. Yes. That bears out the figures that I have.

Senator McLEAN. That shows active competition.

Mr. KASTOR. Take this pair of scissors—No. 9358, 5½-inch. Figured out on the American valuation plan it is \$2.27. At 40 per cent you get a duty of 90 cents, which, plus cost, is \$1.70. That is without profit to the importer, without transportation, and without insurance. I ask you if that is too much margin to give to compete with the American manufacturer?

Take this pocketknife. No. 6666 is a premium stock knife that I have here. The domestic value is \$12.25 per dozen. I have here my own German-silver knife on which I would like to take orders for about 100 dozen right now at \$12.25 per dozen. The duty on that basis is \$4.90, which makes the importer's cost \$9.68 per dozen. As a matter of fact, I have the cost figures on that knife. That knife costs \$7.91 in the American factory, and the European one costs the importer to land, without insurance, freight, or expense of any kind, \$9.68. Isn't 40 per cent enough, in view of that? Isn't that a margin enough? As a matter of fact, the American knife is a better knife. It has a German-silver lining.

Gentlemen, this table in the brief, if it is studied carefully, proves what I have said—that the 40 per cent ad valorem rate on scissors, razors, and pocketknives will prove adequate protection to the domestic manufacturer, and, at the same time, will give the importer a chance to import and will give the consumer competitive goods.

I just want to add one thing, and that is that several gentlemen who will follow me are in the American manufacturing line. If you want to recall me to ask any questions, I shall be at your service either this afternoon or to-morrow morning.

BRIEF OF ROBERT N. KASTOR, REPRESENTING THE CUTLERY IMPORTERS ASSOCIATION.

The Cutlery Importers' Association comprises all the well-known, long-established cutlery importers in the United States, whose aggregate imports represent fully 10 per cent of all the cutlery imported into this country.

The members of the association have given the provisions of H. R. 7456 serious consideration, and it is their opinion that the rates of duty on cutlery, based upon American valuation, as defined in the Senate Finance Committee's revision of section 355 of the bill, will prove to be an effectual bar against importations of almost all cutlery excepting special designs and patterns not manufactured in the United States. As even as to such goods as are capable of being imported despite the tremendous high duty, the uneven and widely varying rates resulting from the imposing of various rates of specific duty, in addition to the ad valorem, will prove prohibitory against a large class of goods.

We herewith assert and shall discuss seriatim the following propositions:

I. The proposed rates, computed on American valuation, will prohibit importation.

II. (a) The combination of ad valorem duty with widely varying rates of specific duty is wrong in principle and unfair in operation. (b) There should be an ad valorem duty only.

III. The branding clause in each of the paragraphs should be amended so as to read as in present Underwood and former Payne-Aldrich bills.

IV. The rates should be revised so that there be a straight ad valorem duty provided for in each of the above paragraphs not to exceed the following rates: Paragraph 354, pocketknives, etc., 40 per cent. Paragraph 355, table cutlery without handles, 40 per cent; table cutlery with handles, 20 per cent. Paragraph 357, scissors, 40 per cent. Paragraph 358, razors, 40 per cent.

I. The proposed rates, computed on American valuation, will prohibit importation.

The discussion of the foregoing proposition is predicated upon the text of section 355 of the bill as amended and revised by the Senate Finance Committee, the phraseology of which we understand to be substantially as in the addenda of this brief.

is our understanding that the Finance Committee has definitely decided to retain the American valuation plan in the bill, and that that question therefore, so far as the committee is concerned, is no longer open for discussion. Accordingly, we shall present no argument against the theory of American valuation, and content ourselves with the mere statement, for the purposes of record only, that in our opinion, based upon an experience of over 40 years on the part of most of our members, and bearing in mind the present chaotic condition of the monetary systems abroad, a change in the method of valuation of imported merchandise is unwise, more especially of administration, provocative of many new and unsolved problems, and probably productive of a vast amount of litigation.

Section 402, as amended, provides for and defines four kinds of value: 1. Domestic value. 2. Import value. 3. Export value. 4. Cost of production value.

Before submitting data and tables under each of these methods of valuation, we desire to make a few preliminary observations.

The "domestic value" of the several thousand articles of cutlery is not easily ascertained.

To illustrate the difficulty which an appraiser would have, we desire to cite as an example recent bids which were made on request of the Engineer's depot of the War Department of the United States Government for 5,000 of a standard jackknife, in May, 1921. In all, 13 bids were received; 7 from high-grade standard pocketknife factories and 6 from agents. These bids for the identical article fully described by the Engineer's depot ranged in price from the lowest at 43 cents to the highest at 63.8 cents—a difference of a little over 20 cents apiece or \$2.40 per dozen between the highest and lowest bid.

It is fair enough to ask, if it is so difficult to get the exact wholesale price of an easily recognized standard jackknife—how can an appraiser be expected to fix the correct domestic value of the thousand and one odd patterns of pen and pocket knives, scissors, and table knives covered by the cutlery schedules.

It is a well-known custom of the cutlery industry that customers are in the habit of placing orders for import in advance for delivery at a later date, which they can not place unless they know the prices of the articles in question. The importer is naturally asked to quote a definite price on such orders, but with American valuation in effect the importer, if he is uncertain whether or not there is a similar article of domestic manufacture, can not know for a certainty whether, in assessing the duty, a domestic value or the export value will be applied. The difference in duty may be considerable, and in this dilemma he would naturally have to pass up all business of this character which forms a great part indeed of the general cutlery imports.

The primary object of a tariff bill, in addition to producing revenue, is to protect the domestic manufacturer against the lower production cost of the foreign manufacturer. If the foreign cost and the domestic cost of similar articles were definitely known and if normal conditions prevailed so that these respective costs could reasonably be expected to continue without substantial change, then the problem of framing the tariff schedules would be simplified.

However, the production cost, both domestic and foreign, is a fickle quantity to rely on. So far as domestic cost is concerned, it would seem to be safe to assert that substantially all changes within the next 12 months at least will be by way of reduction. Some initial reductions, both in labor and in cost of raw materials, have already been made in our domestic cutlery factories, followed by a more or less proportionate reduction in the factory selling prices. Further, and probably greater, reductions are expected to occur within the coming year.

What changes in cost of production, computed in American dollars, will take place in foreign countries, particularly in Germany, with its enormously depreciated currency, can not be foretold. Heretofore when the value of German marks in dollars went down, the cost of German goods in marks went up, so that the cost in American dollars was not materially changed. Then, again, there have been periods in the past 18 months when the rate of exchange fluctuated from 85 marks to the dollar to 40.35 marks to the dollar without any change in selling price, in marks, of a German-made article. Recently the exchange value of the mark has touched the lowest level for the current year and yet, doubtlessly because of the internal economic distress, the selling prices in marks have not made the customary corresponding advance.

The fact remains that economic and monetary conditions in Germany are so chaotic that cost of production is a constantly changing factor. No one can foretell the future with certitude. Many believe the turning point is about to be reached, i. e., either Germany will fall into the depths to which Austria has fallen, or she will adopt such measures as will make for deflation of its currency and greater industrial stability. If the latter course is taken, we can reasonably expect higher selling prices in Germany,

measured in American dollars, to meet the extraordinarily heavy tax burdens which Germany must carry to enable her to meet her tremendous obligations.

Hence we have these two conditions affecting the question of the amount of protection needed by the American manufacturer, (a) the American cost of production is practically certain to undergo a substantial reduction in the near future, and (b) the German cost of production, if conditions are stabilized, will probably be increased. The nearer the two relative costs of production approach each other, the more prohibitory the cutlery schedules in the Fordney bill become with respect to importation.

THE PROPOSED RATES ARE PROHIBITORY.

In order to illustrate graphically the prohibitory effect of the proposed rates of duty when computed on the value of the imported merchandise in accordance with the provisions of section 402, as amended by the Senate Finance Committee, we submit herewith a "Table of duty based on American valuations," showing the amount of duty computed on the four kinds of value prescribed in the aforementioned section. We have selected articles of cutlery which are fairly representative of the great mass of cutlery customarily imported, and which articles were all included in recent surveys of the leading cutlery importers.

Duty based on American valuations.

Article.	Importer.	Invoice date.	Rate of exchange (marks).	Similar domestic article.	Domestic manufacturer.	Foreign cost in mark.

In presenting this table to the Finance Committee we have prepared the same to show what the duty would be, were the appraiser to take domestic value—that is, the wholesale selling price of a similar American-made article—and we give the competing American manufacturer's number with his wholesale selling price; the duty hereon, and the percentage such duty is of the foreign cost.

We then have assumed, in order to fully demonstrate our contention; that the appraiser was unable to find a similar article, and that he was compelled to compute the duty on "import value." We have then figured what the duty would be on the import value, which is the importer's present wholesale selling price.

But in order to further illustrate the full effect of the amended section, we have further assumed that the appraiser was unable to find an "import value" and have, therefore, figured out the duty on the so-called "export value" of the various articles in question in the following manner: We have taken first the price at which the foreign article is freely sold in wholesale quantities, packed in the usual packages and cartons for export to the United States. Then we have figured the duty on this export value in accordance with the rates provided in the Fordney bill. To the aggregate of these two figures (selling price and duty) we have added 5 per cent to cover freight, insurance, and expenses to the United States, a percentage which experience has proven will approximate the actual expenses of transportation, freight, and insurance. To the sum total of these figures we have added a profit of not less than 16 per cent, as provided in the bill. On this final basis we have determined the duty in accordance with the provisions of the Fordney bill, as provided in section 402, subdivision (f) 3. Inasmuch as the figures for cost of production are not available to us, and as the clause (e) of section 402, entitled "Cost of production," is obviously framed to make cost of production equal to export value, we have assumed that the duty on cost of production is equal to the duty on export value and have, therefore, omitted this from the table.

In giving the foreign value in American currency of the articles in question, we have in each case taken the rate at which the particular invoice of the various importers was consulated; but that does not mean that the importer in question paid that rate for the foreign money with which he paid the particular invoice. As a matter of fact, in most cases he paid much more. It has been the custom of all importers since the war, to provide payment for the merchandise which they order by buying foreign bills of exchange far ahead of the time of delivery. As a matter of fact, the importer usually covers for his purchases on the very day he places his order, so that in most cases the importer paid for his marks or sterling considerably more than the rate at which the invoices in question were consulated. This is quite a factor in the import-

ing business as it has been conducted since the war, and should be well borne in mind by the committee whenever they see a quotation of prices in foreign currency. It is not fair to take the arbitrary figure at which the mark may be ruling to-day, to establish the cost of merchandise, as in the violent fluctuations which have taken place in the past two years only an average much higher than the low point and much lower than the high point at which the mark or other currency has been quoted should be taken.

The briefest analysis of our table will serve to show that the duties as at present provided for in the bill are absolutely prohibitive for all of the articles which we have cited, and in fact for all cutlery, for we believe that the examples we have taken are fairly representative of the various grades and kinds of cutlery which are customarily imported.

To be more specific, take the case of knife No. 404, the foreign cost of which is \$1.00 per dozen: The duty on this item is based on the American wholesale selling price (domestic value) of a similar article (5626) and figures to \$0.90, as in our table plus \$0.33 (foreign cost) equals \$1.23, which means that this article plus the duty figured, and without including any costs of transportation, insurance, freight, or other general expenses, and without allowing one cent of profit to the importer, costs the importer 25 per cent more than the same article is sold for in the usual wholesale quantities by the American manufacturer, figuring a liberal profit.

The same thing can be stated with equal force in the case of article 6066, in which the duty, plus foreign cost, amounts to \$12.05, without including freight or expenses, and without any profit for the importer, as against a selling price of \$12.25 per dozen of a similar article of American manufacture.

But these cases of pocketknives are mild when compared to examples in the same schedule. For example, article No. 9338, 5½", figures out to \$4.04 per dozen with duty, but without any amount added for freight, insurance, and without any profit to the importer, whereas a Bridgeport manufacturer sells a similar article of as good quality, at \$2.27 per dozen. This example speaks for itself, and the other examples of scissors, given in the table, show that the rates of duty are proportionally just as high and just as prohibitive.

We do not deem it necessary to comment specifically on the razors, carvers, and butcher knives contained in the table. The figures in the table speak for themselves and only the slightest study of them will serve to convince any impartial reader that the schedules as drawn, in conjunction with American valuation, are unquestionably prohibitive for all the articles in question.

But we have thus far confined ourselves practically to the duty figured on domestic value only. The facts are, however, as the table shows, that section 402 is so framed that the duty figured on import value, export value, and cost of production is almost as high and in some cases higher than the duty figured on domestic value. In short, even where no similar articles can be found or are produced in this country, the duties are so high (as the percentages in our table will show) that they would necessitate selling prices higher than the consumer would or could pay. Therefore, even in the case of articles on which there is actually no competition, they could not be imported as they could not be sold at the tremendous prices at which the high duties would compel their sale.

Inasmuch as the articles given in the table are, in our opinion, fairly representative of all the cutlery customarily imported, we believe that it is fair and just to state that the rates on cutlery provided for in the Fordney bill and computed in accordance with the Finance Committee's amendment are absolutely prohibitive and will effectually bar the further importation of any cutlery, no matter what the country of origin may be.

To illustrate the enormous increase in duty resulting from the adoption of the American valuation plan, instead of computing the Fordney rates on foreign value, we present the following figures for three articles each of pocket knives, scissors, and razors, the three articles in each group costing \$1, \$2, and \$3, respectively:

crease in duty when employing Fordney rates with American valuation over duty employ-
ing same rates with foreign valuation.

Take knife N 9090, costing \$1; the duty, as per Fordney rates, computed on the foreign value, is \$0.90, or 90 per cent; but the duty, as per Fordney rates, computed on domestic value, is \$3.76, or 376 per cent on foreign cost. With the same rates in effect, and by the simple expedient of shifting to the American valuation, the duty has been increased 418 per cent.

The foregoing table, briefly stated, shows: On pocketknives, ranging from \$1 to \$3 foreign value, the average duty on that value as per Fordney rates is 83 per cent. But when the Fordney rates on these same goods are computed on the American valuation you increase the average percentage rate from 83 per cent to 287 per cent if domestic value is used, 213 per cent if import value is used, and 207 per cent if export value is used.

So, also, on the scissors the average duty of 162 per cent on foreign value is increased to 250 per cent for domestic value, 243 per cent for import value, and 257 per cent for export value.

On razors the average duty of 115 per cent (foreign valuation) is increased to 231 per cent for domestic value, 231 per cent for import value, and 208 per cent for export value.

We respectfully submit that rates of duty on cutlery, as high as those shown above, are not only unprecedented, but are certain to be destructive of the entire import business in cutlery. If the decision to incorporate the American valuation plan is unavoidable, then it is imperative that the rates be very much lowered, unless it is a matter of indifference to the committee whether the importation of cutlery is barred or not. If, in order to protect the public against the excessive profits which the domestic manufacturer will be able to enforce if the bill in its present shape is enacted into law, the importation is to be allowed to continue on a basis which gives the domestic manufacturer ample protection, then rates substantially as suggested later in this brief should be adopted.

I. (a) The combination of ad valorem duty with widely varying rates of specific duty is wrong in principle and unfair in operation. (b) There should be an ad valorem duty only.

If the Finance Committee, in view of what has been submitted above, should conclude that the rate of duty as now provided for in H. R. 7456 on cutlery are too high, then we most earnestly urge the committee, in its revision of such rates, to eliminate the specific duties altogether. As a matter of fact, the rates given in the bill, even if computed on foreign valuation, would be prohibitive as to a very large portion

of goods which are now being regularly imported, especially those which fall within that part of each classification where the abnormally high approximate percentages of duty prevail, as shown in the tables given below for pocketknives, scissors, razors, and table cutlery.

A. Pocketknives (par. 354):

The experience of 12 years under the Dingley bill and of 3 years under the Payne-Aldrich bill has shown beyond all doubt that the combination of specific and ad valorem duties on articles of cutlery as embodied in these bills is—

(a) Unscientific and arbitrary with reference to classification.

(b) Unequal and unfair in operation.

(c) Prohibitory as to a large class of goods.

The proposed act, like the tariff act of August 5, 1909, makes arbitrary divisions for the imposition of specific duties. No good reason can be assigned for fixing up the prices of \$1.25 and \$3 as the division lines, all knives costing \$1.25 or less (50 cents) per dozen, paying 5 cents each, knives from \$1.25 to \$3, 10 cents each, and those in excess of \$3, 20 cents each, all in addition to the ad valorem duty of 30 per cent.

From the following detailed table of the duties and percentages on pocketknives the uneven and inequitable operation of the schedule can be seen at a glance:

					Average.....		

Leaving out of consideration the very cheap knives, we can at once see the curious results of the specific and ad valorem duties combined. Knives costing 50 cents per dozen pay only 54 per cent total duty, while those costing 55 cents per dozen pay 105 per cent, or almost two and one-half times as much. As the cost gradually increases the total duty decreases, until we reach the price of \$1.25 per dozen, on which the

is 78 per cent. What possible reason can there be for such a tremendous variance in customs tax on the same line of goods, ranging from 78 per cent to 139 per cent? Now, however, comes one of the arbitrary division lines, for goods costing only cents more per dozen, namely, \$1.30, pay a duty of 122 per cent as against 78 per cent on goods costing \$1.25.

As the prices continue to increase up to and including \$3, the total duty again correspondingly decreases from the high mark of 122 per cent to the level of 70 per cent. Then comes another arbitrary line of division and classification, and, by changing the rate of specific duty on knives costing in excess of \$3, the total duty on knives valued at \$3.20 leaps up to 105 per cent—just 50 per cent more duty than a \$3 knife yields. It is absolutely without justification that two similar articles, differing so slightly in cost, should be taxed at such widely dissimilar rates of duty. As the cost again continues to increase, the duty decreases, so that with the importation of an \$8 knife the duty is 60 per cent, whereas with a knife costing \$8.10 the duty is 75 per cent.

A most cursory examination of the table of duties given above must soon convince the most ardent defender of the system of dual duties that such a wide divergence in rates as the table discloses is bound to keep out of our markets all such articles as would have to pay the comparatively higher rates, and, therefore, that as to them at least the proposed tariff act is prohibitive. For instance, you will find very few, if any, imports of knives costing from \$1.35 to \$1.65 per dozen which would have to be taxed at the practically prohibitive rates ranging from 122 per cent to 105 per cent. Likewise, you will not find many knives imported costing from \$3.10 to \$3.90 on which the duty ranges from 103 per cent to 93 per cent.

Our tables and the figures which we have cited above show the practically prohibitive rates on most classes of pocketknives in the proposed act, figuring the duties on foreign valuation. It must be remembered that the pocketknife industry is one that is well established in this country for a period of well over a quarter of a century, and figures of recent years indicated that the domestic industry turned out an amount of pocketknives equal to \$10,000,000 a year. This, compared to the imports of pocketknives for the 11 months ending May 31, 1921, of \$764,747, is a tremendous sum indeed and dwarfs by comparison this amount of imports. It is our conclusion, therefore, that the duties as proposed for these schedules are as already stated:

- a) Unscientific and arbitrary with reference to classification.
- b) Unequal and unfair in operation.
- c) Prohibitory as to a large class of goods.

B. Scissors (par. 357):

In a much greater degree all that has been said above in reference to the operation, effect, and character of the system of specific and ad valorem duties combined on pocketknives is true of and applicable to the specific and ad valorem duties combined on scissors and scissors.

The schedule for scissors worked out in table form below will show the tremendous percentages of duty provided for under this new act, and the actual facts are that these duties, even figured out on the foreign valuation, are absolutely prohibitive, and range from the lowest duty on a very high-grade scissors of 83 per cent to the tremendous duty on a cheaper grade scissors of 334 per cent.

The actual increases in duty in dollars and cents over the present duty as provided for in the Underwood bill are staggering and are shown clearly in the table:

SCISSORS.

						Average.....			

The actual facts in connection with the scissors industry in this country are in two branches of the industry there is practically no competition whatsoever abroad, and that the product of these two branches is exported to every corner of the world:

1. Steel laid shears, which are made nowhere but in the United States of America but for which a duty of 10 cents each and 30 per cent ad valorem has been provided.

2. Cast scissors, which have always been more successfully produced in this country than in any other country in the world, as our export statistics clearly prove.

American cast scissors enter into competition with all other scissors in the world's markets and have successfully met all competition from all sources.

An interesting sidelight on the actual state of the American cutlery trade is provided by the monthly summary in the Bulletin of Foreign Commerce of the United States, a monthly publication issued by the United States Government, which shows the following:

Exports and imports for 11 months ending May 31, 1921.

Exports:

Table cutlery.....	\$2,624,446
Safety razors.....	1,000,000
All other razors.....	200,000
All other cutlery, not specified, including scissors.....	200,000

Total exports of cutlery..... 6,000,000

Imports:

Pocketknives.....	500,000
Razors.....	500,000
Scissors.....	500,000
All other.....	400,000

Total imports of cutlery..... 2,000,000

In short, as against a total of all cutlery exported of \$6,866,727, there was imported but \$2,624,446. In fact, the one item alone in our export statistics headed "All other cutlery" is worth \$2,624,446.

ery, not specified, including scissors," amounts to more in dollars and cents than total of all cutlery imported, including table cutlery.

would appear on the surface that the American manufacturer is well able to com- with other countries in the world markets.

hen it is borne in mind that scissors are an article of household use and that the posed tariff will compel the American householder to pay 50 cents for a 25 cent cle and between 75 cents and \$1 for a 50 cent article, the actual effects of the sors schedule will be promptly borne home to every household and school.

Razors (par. 358):

hat we have said about scissors and pocket knives is equally applicable to razors, the table which we cite below indicates the tremendous percentage of duty ified in the proposed act. The lowest percentage duty is 54 per cent and the best 150 per cent, as against 35 per cent and 55 per cent under the Underwood

RAZORS.

Rate of duty.	Actual duty.	Approximate percentage.	Value per dozen.	Rate of duty.	Actual duty.	Approximate percentage.

a the case of razors, the heaviest percentage of duty bears on the cheaper grade of rs, which will, of course, compel the man in the street to pay an exorbitant price his cheap razors, which, due to the general liquidation, have just gotten down to odest basis again.

. Table cutlery (par. 355):

further reference to the export and import statistics given on page 21 will show inconsistency of the very heavy specific and ad valorem duties proposed for e cutlery.

hen it is realized that the exports of table cutlery for the 11 months ending May 1921, amounted to \$2,618,044, but \$6,000 less than the total imports into this country ll cutlery, it seems somewhat out of date to treat this as an infant industry and to vide specific and ad valorem duties ranging as high as 150 per cent for the cheaper lees of table cutlery.

he table-cutlery industry, by which is meant table knives, butcher knives, kitchen ves, carvers, and all other articles enumerated in paragraph 355, has been domi- ed by the American manufacturers for years. What have been imported have n specialties that are not made here and certain grades of table knives, butcher ves, and carvers, all of which had to be sold at higher prices with the present y of 30 per cent than goods of American manufacture that were similar.

he present law exacts a duty of 25 per cent ad valorem on all such articles without dles and 30 per cent with handles. We are recommending that this paragraph -changed or amended so as to provide 20 per cent ad valorem, on American valua- , which rate of duty affords more than ample protection to the American manu- xurers of these goods, and any substantial increase in the rate will prove prohibitive.

Our domestic manufacturers have competed successfully with foreign manufacturers in foreign markets in these articles, as may be seen by the table of statistics which we give you herewith and which was taken from Government records.

We would further call your attention to the contemplated change in the duty on carvers and table-knife blades, finished or unfinished, from which you will see that it is proposed to classify these blades with the finished article of the highest grade, such as have pearl handles attached, etc.

We herewith give you a comparison showing how the proposed duty would work out as compared to the finished article:

	Value.	Rate of duty.	Actual proposed duty.	Present duty.	Total percent increase or decrease
Table-knife blades.....	\$1 per dozen.	16 cents each and 35 per cent.....	\$2.27	Per cent. 25	
Finished table knife, with the same blade, but with a celluloid handle.	\$2 per dozen.	8 cents each and 25 per cent.....	1.66	20	

The foregoing analysis and review of the proposed cutlery schedules in H. R. 11340 demonstrate beyond doubt that they are arbitrary in classification, unequal in operation, and prohibitory as to a large class of goods. The proposed rates as they stand, would be prohibitory even if computed on foreign valuation, as has always been the practice. But when these rates are put into operation and applied on the American valuation they will surely be found to be absolutely and irretrievably prohibitory. The substitution of the American valuation for the foreign valuation has the effect of doubling and trebling the duty, although there is no change in rates.

III. The branding clause in each of the paragraphs, 354-361, should be amended so as to read as in present Underwood and former Payne-Aldrich bills.

We respectfully refer to the clause in paragraphs 354, 355, 357, 358, 359, 360, and 361, reading:

"Provided further, That all the articles specified in this paragraph, when imported shall have the name of the maker and beneath the same the name of the country of origin die sunk conspicuously and indelibly on the shank or tang of at least one blade, or, if practicable, each and every blade thereof."

This paragraph is quite a change from all previous tariffs, including the Underwood, Payne-Aldrich, and Dingley, which always provided that the articles specified in the cutlery schedule when imported shall have the name of the maker or purchaser stamped or die sunk conspicuously and indelibly on the shank or tang of at least one, or, if practicable, each and every blade thereof.

The actual result of compelling each article to bear the name of the maker would be three-fold:

1. It would destroy the hard work of 40 or 50 years which cutlery importers have put in to establish their own trade names and brands. In some instances extensive advertising campaigns have been entered into by importers who have spent thousands of dollars in protecting and making their names good before the public. This would compel each importer to put the name of the various manufacturers from whom he purchases his goods abroad on each and every article, and would give away his trade secrets to every customer.

2. Many customers of the importers insist on buying their merchandise under their own special brand and mark which they in turn have established after years of pioneering and at considerable expense. This paragraph, as now worded, would sweep aside legally protected trade-marks and would violate long established property rights by compelling the customers of the importers to buy the name of the foreign manufacturer stamped on the merchandise they buy.

3. This provision would eventually prove to be as big a boomerang as the famous "Made in Germany" provision was for England. It will be recalled that the English were the first to compel all articles to be stamped with the country of origin. The result was that "Made in Germany" became a by-word, not only in England and her colonies, but throughout the world for certain classes of merchandise, and Germany got more free advertising through this provision than she could possibly have had.

get by the expenditure of hundreds of millions of dollars. In this instance, the American Congress would be providing every foreign manufacturer with the best of free advertising and far from protecting Americans by the provision, would doubtably do incalculable harm, as the American public would become accustomed to the names of the various German manufacturers and would, if satisfied with their product, insist on their merchandise.

We would recommend therefore that the wording of this clause read as follows:

"Provided, further, That all the articles specified in this paragraph, when imported, shall have the name of the maker, or purchaser, and beneath the same the name of the country of origin die-sunk or branded conspicuously and indelibly on the shank or tang of at least one or, if practicable, each and every blade thereof,"

it did in the previous bills, without harm to any American manufacturer.

IV. The rates should be revised so that there be a straight ad valorem duty provided as follows:

	Per cent.
Paragraph 354, pocketknives.....	40
Paragraph 355, table cutlery.....	20
Paragraph 357, scissors.....	40
Paragraph 359, razors.....	40
Paragraph 361, pliers and nippers.....	20

It has always been the policy of the Cutlery Importers' Association to advocate rates of duty on cutlery which would be fair to both the domestic manufacturer and to the importer, as well as to the public.

This attitude was evidenced in the hearings before the Ways and Means Committee in 1913 when the Underwood bill was in the making, at which time, although the Underwood bill as originally framed provided a duty of 35 per cent for pocketknives and razors and 30 per cent for scissors, this association went on record as advocating a duty of 50 per cent on pocketknives and razors and 35 per cent for scissors.

But rather than seem to be merely destructive in our criticism, and in order to provide for a tariff in which the schedule affecting cutlery shall be fair and just to the importer, to the domestic manufacturer, and to the consumer, we have suggested the rates appearing above, and have prepared a table showing the foreign cost of several specific articles, which cost is taken from actual import invoices of recent date, and, as shown thereon, the corresponding domestic value, the duty based upon such domestic value, computed at 40 per cent ad valorem on pocketknives, scissors, and razors and 20 per cent ad valorem on table cutlery, and have also added a column showing the resulting cost to the importer of the imported article with the 40 per cent duty on the domestic value. It is to be noted, however, that this "cost to importer" does not include any charges for transportation, freight, insurance, and other incidental charges. In the last column of the table will be found the percentage which such duty, based on domestic value, is on the foreign cost. In scrutinizing the column of percentages, it will be found that the percentages are actually higher than the duties which have been levied in any previous tariff bill, including the Payne-Aldrich and Dingley bills.

It will also be observed from this table that the difference between the cost to importer and the domestic value is in no case greater than sound business principles would require, and in some instances, as, for example, article No. 2610, 7½-inch scissors, the domestic value is \$8.66, whereas the cost to the importer (exclusive of freight, transportation, insurance, and other charges), is \$8.59, or a margin of only 7 cents per dozen.

In the table are given examples of articles which are fairly representative of the great bulk of the goods imported, and what the table shows with reference to these specific articles will be found to be substantially true with reference to practically all the cutlery imported.

We submit that it is evident from the tables presented that a straight ad valorem duty of 40 per cent on pocketknives, razors, and scissors, and 20 per cent on table cutlery, as suggested, will provide more than adequate protection to the domestic manufacturer, and at the same time will permit the continuation of imports, which, however, will pay a much higher rate of duty than was received under either the Payne-Aldrich or Dingley bills.

Straight ad valorem duty of 40 per cent on pocketknives, scissors, and razors, and 20 per cent on table cutlery.

Article.	Foreign cost.	Domestic value.	Duty 40 per cent.	Cost to importer.	Percentage on foreign cost
Pocketknives:					
404.....	\$0.33	\$1.00	\$0.40	\$0.73	220
614 DW.....	.60	2.75	1.10	1.70	283
N2000 St.....	.80	3.60	1.44	2.24	280

Razors:					
520½ SP.....	1.17	3.25	1.30	2.47	211
101½ SP.....	6.23	11.70	4.68	10.91	175
Table cutlery:					
Wilson butcher knife.....	2.79	3.50	1.70	3.49	125
55 stag carver.....	23.35	50.40	10.08	33.43	143

¹ 20 per cent.

It must be remembered that this proposed duty of 40 per cent is based upon the American valuation, and that such duty is equivalent to rates anywhere from 67 per cent to 209 per cent upon foreign value, as may be seen from the table.

For the reasons more fully discussed under proposition No. "II," we again most earnestly urge the elimination of all specific duties on cutlery.

The Underwood bill provides two rates of ad valorem duty on pocketknives—namely, 35 per cent on articles valued at not more than \$1 per dozen, and 55 per cent on articles valued at more than \$1 per dozen. We know of no reason whatsoever why there should be two rates of ad valorem duty on knives any more than that there should be a combination of ad valorem and specific duty. The 35 per cent rate should be abolished. It is open to all the objections which may be urged against mixed duties, i. e., a combination of specific and ad valorem duties on the same articles, and which objections we have already fully discussed.

In reference to the duty on scissors and shears, we find that because of changing conditions of the past few years, the rate of 30 per cent as provided for in the Underwood bill, computed on foreign cost, does not at this time provide ample protection either to the manufacturers who were engaged in this industry before the war, or to those manufacturers of scissors and shears who acquired and equipped their factories within the past three or four years. We do feel, however, that a duty of 40 per cent computed upon American valuation, affords more than ample protection, because this rate, based on the American valuation plan, is actually equivalent to an average rate of well over 100 per cent, based on foreign valuation. In other words, the rate proposed by us is at least three times the amount of duty now in force under the Underwood bill.

Our reason for recommending a rate of 20 per cent on table cutlery as against 40 per cent on other cutlery, is that our experience under the Underwood bill has demonstrated that the American manufacturer of table cutlery does not need any protection greater than that provided for in the Underwood bill, and, therefore, in recommending a rate of 20 per cent, based on American valuation, we are suggesting a duty actually far in excess of the needs of the American manufacturer.

The fact that the domestic manufacturers of table cutlery do not need additional protection beyond that provided for in the Underwood bill is fully demonstrated by the table, setting forth exports of table cutlery from United States for the 11 months ending May 31, 1921.

This proves that the American manufacturers have fully demonstrated that they can compete successfully with foreign competition in the markets of the world as they have been doing in the past.

In conclusion we submit, that if the schedules in H. R. 7456, paragraphs 354-357 are revised in accordance with the suggestions herein made, adequate protection will be provided for the American manufacturers, and it will give just that stimulus through foreign competition, which, according to the old adage, "is the life of trade."

SECTION 402, AS AMENDED BY SENATE FINANCE COMMITTEE.

SIMILARITY.

Sec. 402. (a) Wherever in this act reference is made to the similarity of merchandise (whether manufactured, partly manufactured, or unmanufactured) to other merchandise, such similarity to establish a price shall be based on similarity in material, quality, construction, and kind.

DOMESTIC VALUE.

(b) The domestic value of the imported merchandise shall be the price at the time of exportation of the imported merchandise, at which similar domestic merchandise, packed ready for delivery in the principal markets of the United States, is sold or freely offered for sale to all purchasers in such markets, in ordinary course of trade and in the usual wholesale quantities.

IMPORT VALUE.

(c) The import value of imported merchandise shall be the price, at the time of importation of such merchandise, to the United States, at which such or similar imported merchandise is freely offered for sale, packed ready for delivery, to all purchasers in the principal markets of the United States, in the ordinary course of trade and in the usual wholesale quantities.

EXPORT VALUE.

(d) The export value of imported merchandise shall be the price, at the time of exportation of such merchandise to the United States, at which such or similar merchandise is freely offered for sale to all purchasers in the principal markets of the country from which exported, in the usual wholesale quantities and in the ordinary course of trade, for exportation to the United States, plus, when not included in such price, the cost of all containers and coverings and all other costs, charges, and expenses incident to placing the merchandise in condition, packed ready for shipment to the United States, less the amount, if any, included in such price, attributable to any additional costs, charges, and expenses, and United States import duties incident to bringing the merchandise from the place of shipment in the country of exportation to the place of delivery in the United States, and plus, if not included in such price, the amount of any export tax imposed by the country of exportation on merchandise exported to the United States.

COST OF PRODUCTION.

(e) The cost of production of imported merchandise shall be the sum of—
(1) The cost of materials of, and of fabrication, manipulation, or other process employed in manufacturing or producing, identical or substantially identical merchandise, at a time preceding the date of shipment of the particular merchandise under consideration which would ordinarily permit the manufacture or production of the particular merchandise under consideration in the usual course of business;
(2) The usual general expenses (not less than 10 per cent of such cost) in the case of identical or substantially identical merchandise;
(3) The cost of all containers and coverings, and all other costs, charges, and expenses incident to placing the particular merchandise under consideration in condition, packed ready for shipment to the United States; and
(4) An addition for profit not less than 8 per cent of the sum of the amounts found under paragraphs (1) and (2) equal to the profit which is ordinarily added, in the case of merchandise of the same general character, as the particular merchandise under consideration, by manufacturers or producers in the country of manufacture or production who are engaged in the same general trade as the manufacturer or producer of the particular merchandise under consideration.

VALUE.

(f) For the purposes of this act, the value of imported merchandise shall be—
(1) The domestic value.
(2) When the domestic value can not be ascertained to the satisfaction of the appraising officer, then the import value.

(3) If neither the domestic value nor the import value can be ascertained to the satisfaction of the appraising officers, then the export value, plus if not included a such price, duty, cost of transportation, insurance, and other necessary expenses from the place of shipment to the port of arrival in the United States and a reasonable addition for profits and general expenses not less than 16 per cent.

(4) If neither the domestic value, the import value, nor the export value can be ascertained to the satisfaction of the appraising officer, then the cost of production, plus duty, cost of transportation, insurance, and other necessary expenses from the place of shipment to the port of arrival in the United States and a reasonable addition for profits and general expenses not less than 16 per cent.

SUPPLEMENTARY BRIEF OF ADOLPH KASTOR & BROS.

In reply to request to classify hair clippers and toilet clippers under paragraph 393 (scissors and shears) instead of paragraph 357 (basket clause of Schedule 3) of H. R. 745.

We earnestly urge your committee to allow hair clippers and toilet clippers to be classified, as they have been under all previous bills, in the basket clause, which is paragraph 393 of the Fordney bill, covering articles composed wholly or in chief value of iron, steel, etc., and are taxed at the rate of 35 per cent ad valorem.

It has been suggested by certain American manufacturers that clippers be classified specifically under paragraph 357, and that they bear a duty of 25 cents each and 35 per cent ad valorem.

We contend that they are correctly classified in the Fordney bill, and that 35 per cent ad valorem in conjunction with American valuation will provide more than adequate protection for the American manufacturer.

The most prominent clippers sold throughout the United States are the styles or sizes known as No. 1, No. 0, and No. 00, and we submit below some data based on these numbers, demonstrating that a specific duty of 25 cents per piece, plus 35 per cent ad valorem, will be prohibitive and act as an embargo, whereas an ad valorem duty of 35 per cent under paragraph 393 will afford the domestic manufacturer ample protection without strangling importation.

NO. 1 CLIPPER.

On a No. 1 cut clipper, which is a coarse cut, the price in marks is 23 marks per piece, which, figuring the mark at the rate of 1.20 cents, is 28 cents. The comparative American clipper is sold by the Universal Shear & Novelty Co. for 55 cents.

Under the rates requested by some domestic manufacturers the duty would be 25 cents each and 35 per cent ad valorem on 55 cents, which would total 44 cents. This sum, plus the foreign base cost of the clipper, without any charges for transportation, insurance, general expenses, or profits, would be 72 cents.

Obviously, this clipper could not be imported to compete with the American, which is sold for 55 cents.

NO. 0 CLIPPER.

On the No. 0 clipper the price is 27 marks, which, at the rate of 1.20, is 32 cents. But the American clipper, similar in material, quality, construction, and kind, is sold for 80 cents.

At the requested rates, the duty would be 25 cents specific, plus 35 per cent of 80 cents, which would total 53 cents. This sum, plus the base cost of 32 cents, amounts to 85 cents, without charges for transportation, insurance, general expenses, or profits. Needless to say, the importer could not sell this foreign clipper in competition with the American article.

NO. 00 CLIPPER.

No. 00 clipper is one of still finer cut. The price of this in Germany is 31 marks, which amounts to 37 cents; but the American clipper of like quality is sold at the usual wholesale quantities for 90 cents, so that the duty would be 25 cents specific and 35 per cent of 90 cents, which would total to 57 cents. This, plus the original cost of the clipper would amount to 93 cents, without charges for transportation, insurance, and other expenses, so that the foreign clipper could not be sold against the similar American item, which is selling for 90 cents.

On the other hand, if the duty on each of these items is 35 per cent ad valorem only, as is the case under the Fordney bill, it would provide adequate protection.

the American manufacturer and still permit the importer to compete, as may be seen from the following:

Thirty-five per cent on the No. 1 clipper selling for 55 cents is 19 cents; plus the base cost of 28 cents, gives a total of 47 cents; so that the importer could not make a very large margin of profit if he were to compete with the American article.

In the No. 0 clipper, 35 per cent of 80 cents is 28 cents; plus the base cost of 32 cents, gives a total of 60 cents, without transportation charges, insurance, and other expenses, which scarcely leaves the importer a sufficient margin to sell his clipper in competition with the American.

In the No. 00 clipper, 35 per cent of 90 cents is 32 cents; plus the base cost of 37 cents, gives a total of 69 cents, leaving the importer (without charges for transportation, freight, and other expenses) to compete with the American clipper selling for 90 cents. We submit, moreover, that during the war, when there was no competition from abroad on clippers, that the American clipper manufacturers got monopoly prices, and that it was only under the influence of the foreign competition that these prices were brought down to a point where clippers could be bought by the man in the street.

American clipper manufacturers have for years exported their product in competition with the manufacturers of foreign countries to all parts of the world, and they are still doing so.

It must be remembered that under the Underwood-Simmons bill there was a duty of only 20 per cent on hair clippers, based on foreign valuation. With clippers in the basket clause, as at present, they will be dutiable at 35 per cent, based on American valuation, which is in itself an increase in duty of from 200 to 300 per cent.

We submit, therefore, that the facts do not justify the request for a specific duty in addition to 35 per cent ad valorem, and urgently request the Senate Finance Committee not to classify clippers in paragraph 357, but to allow them to remain in the basket clause in the Fordney bill as proposed at present and as was the case in all previous tariff bills.

STATEMENT OF J. A. CHRESTENSEN, REPRESENTING THE ONTARIO KNIFE CO., FRANKLINVILLE, N. Y.

The CHAIRMAN. Where do you reside, Mr. Chrestensen?

Mr. CHRESTENSEN. I am with the Ontario Knife Co., of Franklinville, N. Y., and I am interested in paragraph 355 of this proposed tariff bill. I also represent American Cutlery Co., Chicago, Ill.; American Tap & Die Co., Greenfield, Mass.; John Chatillon & Sons, New York City; Clyde Cutlery Co., Clyde, Ohio; Goodell Co., Antrim, N. H.; Lamson & Goodnow Manufacturing Co., Shelburne Falls, Me.; Turners, Frary & Clark, New Britain, Conn.; Meriden Cutlery Co., Meriden, Conn.; Northampton Cutlery Co., Northampton, Mass.; and John Russell Cutlery Co., Turners Falls, Mass.

The CHAIRMAN. What is it you want with reference to this bill, Mr. Chrestensen?

Mr. CHRESTENSEN. In the first place, I want to state that I represent not simply the Ontario Knife Co. but 12 manufacturers of cutlery who produce more than 90 per cent of all the cutlery manufactured in this country, as covered by paragraph 355.

I had not anticipated, Mr. Chairman, that it would be necessary, under the careful manner in which this matter was presented before the Ways and Means Committee, to make a further presentation, and to appear here to substantiate in any way the schedules which are already incorporated. I had planned to come here simply and ask permission to file a brief: but as the result of what I might term a vicious and rather hysterical attack against this schedule and the other cutlery schedules before this committee yesterday afternoon, I feel that it is up to us to substantiate to this committee the schedules which are already in this paragraph.

We propose to do that by a line of samples showing the import values as compared with the American selling price.

The first item is a 9-inch cook knife that comes under paragraph 355. This knife was made in Germany, imported into this country at a price of 261 marks per dozen, and at the time it was brought into this country marks were on the basis of 85 marks to \$1, or about \$0.0117. I have figured it on that basis. I think the German mark to-day is somewhat below that figure. The last quotation, I believe, the closing market of yesterday, states it to be \$0.015½ as against \$0.0117.

That means, gentlemen, that this knife, in terms of dollars, was \$3.07 per dozen.

I have here a sample of a comparable knife in every respect made by Landers, Frary & Clark, of New Britain, Conn., the selling price of which, to-day, and also at the time at which this knife was brought in, is \$11 per dozen.

The proposed tariff, which this gentleman yesterday afternoon told you is absolutely prohibitive, figures out in this way:

There is an 8-cent specific duty upon this knife. That means 8 cents specific duty per dozen. There is a 35 per cent ad valorem duty upon the American value, which figures \$3.85 per dozen, making a total tariff of \$4.81. Add that to the cost of \$3.07, and it makes \$7.88. For full measure add to the initial cost of \$3.07 5 per cent to cover ocean freight and insurance, and you have a landed cost laid down to the same trade that is sold to in this country of \$8.03 per dozen as against \$11 per dozen.

The next item, gentlemen, to which I wish to call your attention is an 8-inch butcher knife. This also was imported from Germany at 147.2 marks per dozen. Figured on the same basis of value, this knife would cost in terms of dollars \$1.73 per dozen. I have a sample of a knife made by the Ontario Knife Co. which, if you gentlemen wish to examine, you may. It is selling at \$5.86 per dozen. A knife made by the Northampton Cutlery Co., of Northampton, Mass., sells at \$6.10 per dozen. A knife made by Landers, Frary & Clark, of New Britain, Conn., sells at \$6 per dozen. We therefore have taken the average of these prices, which is practically \$6 per dozen, and figured our tariff upon that basis, the specific duty amounting to 96 cents per dozen; 35 per cent on the American value is \$2.10, giving a total tariff of \$3.06, with an initial cost of \$1.73, which makes a value of \$4.79. Adding again 5 per cent to cover ocean freight and insurance, it makes a landed value to the same trade to which we sell of \$4.99 as against \$6.10.

The next item, gentlemen—because I want to cover this as rapidly as possible—is a 10-inch butcher knife. This knife is brought in from Germany at 201.6 marks per dozen, which, translated into American currency, means \$2.37 a dozen.

Senator WALSH. Is that the wholesale price or the price the importer pays?

Mr. CHRESTENSEN. That is the price at which it comes in and at which anyone can buy it.

Senator WALSH. So, then, it is the wholesale price?

Mr. CHRESTENSEN. Yes, sir.

Senator WALSH. You are not giving us the importers' prices, but the wholesalers' prices?

Mr. CHRESTENSEN. I am giving you the price that goes to the same as that we do. Understand this——

Senator WALSH. Is it not true that the importer adds something to that?

Mr. CHRESTENSEN. I do not know what they do.

Senator WALSH. Do you mean to tell me that you do not know that an importer buys and sells goods for the same prices? He does not pay a commission on?

Mr. CHRESTENSEN. I do not know what their profit is.

Senator WALSH. Are you giving us the import price plus the profit of the importer or not?

Mr. CHRESTENSEN. I am giving you the price to the same trade to which we sell our goods. You may call them importers or what you please.

Senator WALSH. It is the wholesale price, then?

Mr. CHRESTENSEN. All right; it is a mere matter of terms. On comparable articles, a knife made by the Ontario Knife Co. sells to the trade at \$7.96 per dozen. A knife made by Lamson sells at \$9 per dozen——

Senator WALSH. These are the same kinds of knives?

Mr. CHRESTENSEN. These are comparable knives. A knife made by the Northampton Cutlery Co., of Northampton, Mass., sells for \$8.50. A knife made by the Clyde Cutlery Co., of Clyde, Ohio, sells for \$8.10 per dozen. A knife made by Landers, Frary & Clark, of New Britain, Conn., sells for \$8.30 per dozen. Taking the average price of these five representative American manufacturers it gives a price of \$8.37 to the wholesale trade. Figuring in again the specific duty under the new tariff, it is 96 cents per dozen; 35 per cent upon the American valuation, \$2.93, making a total tariff of \$3.89. Adding that to the initial cost of \$2.37, it gives a value of \$6.26. Adding 5 per cent again for freight and insurance, it gives a price of \$6.38 against an average price of \$8.37.

Senator WALSH. Do you mean to assert here—I do not mean to dispute you, but I want to understand the fact—that you can buy a German-made knife comparable to the five knives that you have described here as made by American concerns for \$2.37—did you say?

Mr. CHRESTENSEN. To which knife do you refer?

Senator WALSH. The German knife, the imported knife.

Mr. CHRESTENSEN. Which particular one?

Senator WALSH. This last sample that you have been describing here. You named five knives, three of which were made in Massachusetts, and you compared them with a German-made knife.

Mr. CHRESTENSEN. A 10-inch knife.

Senator WALSH. What is the price of the German-made knife, the wholesale price in America?

Mr. CHRESTENSEN. Including tariff and everything?

Senator WALSH. Including the tariff under the Underwood bill.

Mr. CHRESTENSEN. I have not figured it out. Under the proposed law it is \$6.38.

Senator WALSH. But you have attempted to give us the wholesale price of these five different knives produced by American concerns to-day, and you have not here with you a comparable German-made knife and can not tell us what the wholesale price of it is?

Mr. CHRESTENSEN. \$6.38.

Senator WALSH. That is what I asked you, and you could have told me before.

Mr. CHRESTENSEN. Is there anything further, Senator?

Senator WALSH. No.

Senator McLEAN. I do not quite understand. Is the price of that German knife \$6.38?

Mr. CHRESTENSEN. Yes, sir.

Senator McCUMBER. With duty and everything. Is that the duty on the American valuation?

Mr. CHRESTENSEN. Under the American valuation; under the proposed tariff.

Senator McLEAN. What was the price to the wholesaler here that German knife?

Mr. CHRESTENSEN. \$6.38 laid down.

Senator McLEAN. But that is duty paid. I mean without the duty.

Mr. CHRESTENSEN. \$2.37.

Senator WALSH. Without the Underwood duty?

Mr. CHRESTENSEN. Without any duty.

Senator WALSH. And the Underwood duty, you say, is the difference between \$2.38 and six dollars and some odd cents?

Senator McCUMBER. No; that was the American article——

Senator WALSH. I am trying to have him tell me what the wholesale price of the German knife is in the market without any consideration of the Fordney or any other proposed legislation.

Senator McCUMBER. What does it cost to produce that knife in Germany and what is it sold in Germany for?

Mr. CHRESTENSEN. \$2.37 a dozen.

Senator WALSH. So that you can buy to-day on the open market a knife comparable to these five American-made knives that you say have an average price of \$8.50 for \$2.37?

Senator McCUMBER. In Germany, I asked him.

Senator WALSH. What is the price to-day in this country?

Senator McCUMBER. Six dollars and something, he says.

Senator WALSH. If that is so, the tariff rate and the profit of the importer is the difference between \$2.30 and \$6?

Senator McLEAN. No; he is talking about the American knife. I understand it. Will you not explain that?

Senator WALSH. Can you give us the price on the open wholesale market to-day of that German-made knife that you have in your hand, with which you are making a comparison with five American knives?

Mr. CHRESTENSEN. May I make a statement here?

Senator WALSH. Certainly you may.

Mr. CHRESTENSEN. I am here for the purpose of substantiating the schedules under the proposed law. The statement was made here yesterday afternoon that those schedules were absolutely prohibitive. I am showing you what the price would be to the same trade to which we go to-day based upon those schedules.

Senator McLEAN. And that would be \$6.38?

Mr. CHRESTENSEN. Yes, sir. I have tried to make this as clear as possible.

Senator WALSH. So the difference to-day, then, between the German knife and the American samples that you produce here is about \$2?

Mr. CHRESTENSEN. \$2 per dozen.

Senator DILLINGHAM. That is, under the schedules of this bill?

Mr. CHRESTENSEN. Yes, sir.

Senator DILLINGHAM. I understand you to say that you have not made any computation under the Underwood bill, the existing law.

Senator SUTHERLAND. The price of that knife, \$6.38, duty added, \$2.37 in Germany?

Mr. CHRESTENSEN. \$2.37 in Germany.

Senator WALSH. I would like to ask the members of the committee, if there is any member who can tell me, the price in the open market to-day of that German knife. I want it for the purpose of accuracy. We can then deduct the Underwood rate and find out what the German import price may be and the profit of the importer.

Senator SUTHERLAND. He has given you the German import price—\$2.37.

Senator WALSH. I wish you would figure it out for me if you can.

Mr. CHRESTENSEN. Twenty-five per cent of \$2.37 is 59 cents, which added to the price, makes \$2.96, plus your 5 per cent, which would be 12 cents, making \$3.08 under the Underwood tariff.

Senator WALSH. So the wholesale selling price of that knife is \$3.08 and not \$6.

Senator McLEAN. That is under the Underwood bill.

Mr. CHRESTENSEN. I have not stated that the price to-day was \$6.

Senator WALSH. The price to-day is three dollars and how many cents?

Mr. CHRESTENSEN. \$3.08 under the Underwood tariff.

Senator WALSH. So that you can go into the market and buy a dozen of these knives for \$3.08, and you have to pay for the same knife made in America \$8.50?

Mr. CHRESTENSEN. You can go to the German market, import those knives and pay the duty, and have them landed in New York for \$3.08.

Senator WALSH. That is what I understood you to say.

Mr. CHRESTENSEN. Yes, sir.

Senator McCUMBER. Then there is a profit to the importer.

Mr. CHRESTENSEN. I have not said anything about any profit to any importer.

The CHAIRMAN. Are these different kinds of cutlery from different countries of the same standard of efficiency and make-up? In other words, is the steel about equal in all of them?

Mr. CHRESTENSEN. Yes. All these various knives, samples of which I have shown, of German manufacture are of the best goods made in Germany.

The CHAIRMAN. Are they as good as similar goods made in America?

Mr. CHRESTENSEN. Those knives are as good as these knives made in America. I should say it was a fifty-fifty proposition.

Senator SUTHERLAND. I do not quite understand from the witness's statement how he arrives at the \$6.38.

Mr. CHRESTENSEN. Figuring upon the proposed schedule—

Senator SUTHERLAND. Just give the details of the figures—how you arrive at \$6.38. Take the German article and add the various additions that are necessary to be made.

Mr. CHRESTENSEN. The German price per dozen, translated in American money, is \$2.37 per dozen. The selling price of a comparable American-made article to the wholesale trade is \$8.37 per dozen. The proposed Fordney tariff levies a specific duty of 8 cents each, to begin with. That makes a specific duty of 96 cents per dozen. Then it provides that in addition to that there shall be an ad valorem duty of 35 per cent on the American value, which is 35 per cent of \$8.37—\$2.93. Add that to the specific duty of 96 cents and it makes \$3.89 that must be added to your cost of \$2.37, which makes \$6.26. Added to that I have taken 5 per cent of the \$2.37 to cover ocean freight and insurance, which makes the total landed cost for anyone who wishes to buy this, the importer or whoever he may be, \$6.38.

Senator WALSH. The experts say to me that you must add to that 25 to 30 per cent for the overhead charge of the importer. Is that a fact or not? You have not given a cent to the importer. You have put 5 per cent on for ocean freight and insurance. Is he going to get something out of this transaction? How much are you going to add for him?

Mr. CHRESTENSEN. I do not know.

Senator WALSH. The testimony is that they usually add 25 per cent.

Mr. CHRESTENSEN. Then let them add 25 per cent.

My contention is this, that we sell these 10-inch butcher knives to the trade, in New York, in Massachusetts, in Ohio, and California, and all over the country. Those same people to whom we sell the 10-inch knife at \$8.30 per dozen can go direct to Germany and buy them themselves and have them laid down in New York at \$6.38.

Senator DILLINGHAM. Under the provisions of the proposed law?

Mr. CHRESTENSEN. Yes, sir. That is the point.

Senator McLEAN. Mr. Kastor, who is an importer and has connections in Germany, can easily put that knife down in this country for the price that you have stated?

Mr. CHRESTENSEN. I assume that Mr. Kastor could purchase the knives through his German factory at German domestic prices, which are lower than German prices for export to the United States.

The next item, gentlemen, is a German-made so-called boning knife.

Senator SUTHERLAND. Do you know, as a matter of fact, what the price named by importers of that knife at this time would be, subject to this proposed tariff?

Mr. CHRESTENSEN. The only evidence, Senator, that I have is a bill for these samples purchased for us from the people who reported the knives—Graef & Schmidt, of New York City.

This 9-inch cook knife, which I have figured out, has a landed value under the proposed tariff of \$8.03, was sold to our customers upon their requisition for \$20 per dozen.

The 8-inch butcher knife, which I have figured under the proposed tariff as being able to be bought for \$4.88 per dozen, was sold to our customers under an invoice at \$12 per dozen.

Do you desire any more information beyond that?

Senator SUTHERLAND. That is the information I wanted to get. As a matter of fact, they are not putting those knives on the market.

at the low price of \$6.38 in competition with the American-made ones?

Mr. CHRESTENSEN. They are able to put them on the market at prices below what we can sell them for. If they are able to get 200 or 300 per cent profit and can get away with it, they will do so. As conditions change and they are compelled to reduce their prices, they will do so.

The CHAIRMAN. Is there any difference in quality between the German product and the English product?

Mr. CHRESTENSEN. No. As between the high-grade products of Germany, such as the Henckels line, and the high-grade products of Great Britain, there is no difference, so far as one can determine, probably no difference. The German knife is a better finished knife, and has a nicer appearance. The English goods are more crude.

Since you have brought up the matter of English knives, Senator, I want to say that the statement that was made yesterday afternoon that these schedules are prohibitive would apply to goods of English manufacture. We claim that these schedules are fair and that at the present time cover the difference in cost between Germany and this country, because Germany is the country of the lowest cost of production. English costs to-day are pretty comparable to our own, and therefore——

Senator WALSH. And Canadian costs are very much so.

Mr. CHRESTENSEN. There is practically no cutlery made in Canada.

Now, we are between the devil and the deep sea as to whether you are going to keep out English cutlery by a tariff or whether it would be kept out in competition, on a lower tariff, with the German goods that are brought into this country; because, positively, English goods when imported into this country could not compete with the German articles any more than could our goods. So you are going to keep them out either one way or the other.

Senator McLEAN. If we can equalize the exchange——

Mr. CHRESTENSEN. That is just what I was going to say. If in the wisdom of this committee you could devise anything which would equalize the difference in the depreciation as between those countries so that they will be brought to a nearer basis, the American manufacturers would be very glad to have it done.

Senator McLEAN. That would make possible some reduction in duty and still give you ample protection?

Mr. CHRESTENSEN. Yes, sir.

Senator WALSH. Do you know of any way of doing that?

Mr. CHRESTENSEN. I do not.

Senator WALSH. There is a way, is there not——paying their debts and taking them on our own shoulders?

Mr. CHRESTENSEN. I would not at this time, under any consideration, take over the work of the Finance Committee.

The CHAIRMAN. It is a hard job.

Mr. CHRESTENSEN. It surely is.

I have some other samples in other lines here.

Senator McLEAN. I think we understand it.

Mr. CHRESTENSEN. There is just one thing, if I may ask for just a moment.

In the brief submitted here yesterday afternoon—and I have only a very few minutes to go over it in a very cursory way—I want to call your attention to the exhibits in the schedules pertaining to table cutlery, paragraph 355.

This gentleman appeared here yesterday afternoon representing more than 80 per cent of the total importations of cutlery into this country. He came here and stated, or left the impression with the committee, I believe, that practically every one of those importations were at the same time honest-to-goodness American manufacturers of cutlery with large investments in this country in manufacturing plants, giving work to American workmen. That, gentlemen, you can investigate as well as I. The only exhibit that this gentleman puts in under table cutlery is an English butcher knife imported by Herman Boker & Co. I do not believe that Herman Boker & Co., in the first place, are in the habit of importing any considerable quantities of English-made knives; and the very fact that this association made up of those who have large interests in Germany, could not find in the whole range of their importations a German-made butcher knife that they could present to this committee, is evidence that they have a pretty weak case, and that they have got to get an English butcher knife in order to prove their case. We grant that the proposed tariff is an embargo, practically, upon some English cutlery.

Furthermore, as a matter of interest—

Senator WALSH. Wait a moment. The proposed tariff bill you are talking about is an embargo on all English-made goods?

Mr. CHRESTENSEN. Upon some English cutlery.

In addition, this Wilson butcher knife would be imported into this country—I do not care whether you put 500 or 1,000 or 2,000 per cent upon it; all the Wilson line of butcher knives have been imported into this country for years and they go to a peculiar trade that demands their knives and their knives only. They will not have any others.

You will find that under the column of tariff upon these butcher knives this figures out \$3.14. If this gentleman in any way can figure that beyond \$2.18 under the proposed tariff, I would like to see his figures.

May I have permission to file a brief later?

The CHAIRMAN. You may.

SCISSORS AND SHEARS.

[Paragraph 357.]

STATEMENT OF CAMILLE L. GAIROARD, REPRESENTING J. WILSON & SONS CO., NEWARK, N. J.

The CHAIRMAN. You will simply speak on what has already been heard by the committee, will you not?

Mr. GAIROARD. No, sir.

Senator McLEAN. He represents the American producers.

Mr. GAIROARD. The American manufacturers of scissors and shears in this country that were established before the war.

The CHAIRMAN. What is your occupation?

Mr. GAIROARD. I am sales manager of J. Wiss & Sons Co., New York, N. J. I am also chairman of the tariff committee of seven large manufacturers of shears and scissors who previous to the war practically furnished 90 per cent of the total that was turned out in the United States.

The CHAIRMAN. Briefly speaking, what do you want with reference to the bill? Are you satisfied with the way it was passed in the House?

Mr. GAIROARD. We are, Senator; but we think we should have at least five minutes to counteract the effect that was attempted to be produced yesterday regarding valuation.

The CHAIRMAN. The committee has exhaustively heard everyone's valuation. You are satisfied with the rate that the House has given, are you not?

Mr. GAIROARD. I am; but I just want to have five minutes to say something which I think will interest you.

Senator McLEAN. Mr. Chairman, you were not here yesterday afternoon—

The CHAIRMAN. Some of the time, but not all the afternoon.

Senator McLEAN. The witness who closed yesterday claimed that these rates would operate as an embargo against German imports, and it is in reply to that that this witness wishes to put in these exhibits.

The CHAIRMAN. Go on. Of course, you must bear in mind that all of these rates will be carefully examined by the Treasury expert, and this committee. I think, is not going to permit any prohibitive rates.

Mr. GAIROARD. We understand that. We do not want any prohibitive rates. We think that all that is before this committee is the question of wages which have to be equalized.

Our importing friends come here and talk about the dear American public. We think that the dear American public is the workman—

Senator McLEAN. We understand that. Get right down to your reply to Mr. Kastor.

Mr. GAIROARD. I have here a 7½-inch barber shear imported by A. Witte, of New York City, about January 1, 1921, at about 344.80 marks, which makes the United States value \$4.59 per dozen, plus a duty of \$1.37 per dozen under the Underwood bill. That is sold by a retailer for \$3 per pair. A pair of American barber shears comparable to the above would sell wholesale at \$11.40 per dozen. Added on the proposed tariff the duty and German cost would equal 0.89 per dozen.

I am citing that to show you that the American public would not suffer if the proposed tariff were to be put on a barber shear of that kind.

The CHAIRMAN. Were there any shears imported recently into the United States?

Mr. GAIROARD. Yes, sir.

Senator McLEAN. Very large importations.

Mr. GAIROARD. The importation into the United States previous to the war averaged about 400,000 dozen per year.

The CHAIRMAN. Steel-laid scissors and shears?

Mr. GAIROARD. Very few steel-laid scissors and shears are imported but of all other shears and scissors 400,000 pairs on a yearly average were imported into the United States.

During the month of June, 1921, over 57,000 dozen were imported. That shows you the condition of affairs. The factories that are making these goods are working half time with half forces, and if the importations continue for six more months I think the United States will have a sufficiency for the next two years.

Mr. McLEAN. Take up the line of goods referred to by Mr. Kast yesterday, if you have anything to say with regard to them.

Senator WALSH. He did not get down to scissors, but he left some samples to be examined to-day.

Senator McLEAN. He had something to say about scissors.

Mr. KASTOR. If there is anything brought up here that you are not sure about, I request that I be asked about these particular samples.

Senator McLEAN. I suppose you want to reply to the witness who testified yesterday with regard to some samples which he showed. Do you not?

Mr. GAIROARD. Exactly.

The witness yesterday said that under the present valuation system and the proposed tariff it would mean an embargo on these goods. What I am to show you is that it would not mean an embargo on these goods at all. Here is a scissors which is imported from J. Henckels of Germany, which he says costs \$5.13 in Germany. In the United States that scissors sells to the user for \$3 per pair.

The American sample shown by the German importer is not comparable.

J. Wiss & Sons Co., of Newark, N. J., make a comparable barbed scissors which they sell to the wholesalers at \$12.40 per dozen.

The cost of the imported scissors plus proposed tariff would be German cost \$5.13, duty \$6.74, total cost \$11.97 per dozen, against American price of \$12.40 per dozen.

Furthermore, you will find that the importer has figured the German marks much higher than the existing rate.

Senator McLEAN. He gave some figures here estimating the duty that would be assessed under the proposed rates, showing that on the prices of those scissors there would be an embargo against German manufacturers.

Mr. GAIROARD. It would not. I am proving that right here. There would not be an embargo. A scissors of that kind could sell for—

Senator WALSH. What is the price of that scissors you just had in your hand?

Mr. GAIROARD. In Germany, \$5.13.

Senator WALSH. What is the duty under the Fordney bill on American valuation? \$8.66, is it not?

Mr. GAIROARD. The duty based on American wholesale price of \$12.40 would be \$2.40 per dozen specific and 35 per cent on \$12.40 which is \$4.34, making a total duty of \$6.74 per dozen.

Senator WALSH. Then, that is \$13.79. You say you can produce in this country for \$12.40?

Mr. GAIROARD. We could.

Senator WALSH. Does not that amount to an embargo?

Mr. GAIROARD. No.

Senator WALSH. Those are the scissors he used yesterday.

Mr. GAIROARD. Why did he not use these scissors here [indicating]?

Senator WALSH. Show it. We are not taking sides here.

Mr. GAIROARD. No. 9123, 6-inch——

Senator WALSH. What is the foreign cost?

Mr. GAIROARD. 85 cents per dozen.

Senator WALSH. The domestic value of that is what?

Mr. GAIROARD. The domestic value, he claims, is \$2.27. We claim \$1.58.

Senator WALSH. Under the Fordney bill the duty upon that is 85 per cent, making \$3.19. So it makes it more of an embargo than even he claims.

Mr. GAIROARD. 85 cents a dozen makes it how much?

Senator WALSH. \$3.19, he claims.

Mr. GAIROARD. That is wrong.

Senator WALSH. That is the way he figured it out.

Mr. KASTOR. That is correct if based on \$2.27. I can figure it out for you very easily on \$1.58. Fifteen cents apiece is \$1.80; 35 per cent on \$1.58 would, roughly, be 50 cents. That is \$2.30. The duty is 30, which is absolutely an embargo——

The CHAIRMAN. It will be very difficult for the stenographer to follow this running debate.

Mr. GAIROARD. I suggest that you take their brief and we will file our brief, and you review it.

The CHAIRMAN. We will leave it that way.

Mr. GAIROARD. We can show the difference.

Senator WALSH. Have you any more scissors that you want to bring out?

Mr. GAIROARD. No, sir.

Senator WALSH. You have shown us two already on which you admit that the duty amounts to an embargo.

Mr. GAIROARD. In this particular case here.

The CHAIRMAN. Are you through?

Mr. GAIROARD. The point that I desire to make is this, that while a German importer may claim that he has to sell these for \$8.66, the fact of the matter is that he does not have to sell it for \$8.66. He is selling it for considerably more than that. It is in the selling price, and he can go ahead and pay the duty.

The CHAIRMAN. Have you a brief that you desire to file?

Mr. GAIROARD. We are going to file a brief.

**BRIEF OF CAMILLE L. GAIROARD, REPRESENTING J. WISS & SONS CO.,
NEWARK, N. J.**

You will find upon close study that the brief filed on behalf of the Cutlery Manufacturers' Association is very misleading. Here are the main points on which its arguments are deceptive:

1. They use a very high mark value, which in one case is about 60 per cent higher than the present-day average of the mark value.

2. They base their comparisons on goods that do not at all compare as to value.

3. They base most of their American selling prices on goods made and sold in this country by firms largely interested in German industries, and have at present time small temporary American factories.

One can not help but be impressed with the fact that the gentlemen representing the Cutlery Importers' Association have selected articles imported at times when the mark value was very much higher than it has been or is now. The German mark has been decreasing steadily, and very likely will decrease still further. It is very possible that before the proposed tariff bill is finally acted upon that German scissors, which they claim now cost \$5.13 per dozen in United States currency, will cost only \$3.08½ per dozen in United States currency, due to the mark declining to \$0.01 or perhaps less. Records of the United States Customs Service show that while the mark is decreasing in value, the cost of scissors imported from Germany is likewise decreasing. The German manufacturers are not increasing their price in marks while the value of the mark is decreasing, and in the meanwhile the cost to the importer in this country is decreasing accordingly.

A scissor similar to No. 1535, 3½-inch, imported from J. A. Henkel, Germany, is comparable as to quality and finish with a scissor made by J. Wiss & Sons Co., Newark, N. J., No. 663½, which is sold by the American manufacturer at \$9.50 per dozen wholesale. Assuming that the imported cost of \$3.23 in United States currency would be correct, the proposed tariff would make the cost \$8.95, against the American wholesale selling price of \$9.50. But it was shown to the Ways and Means Committee by samples and actual invoices that the Wester Bros., a large importer of New York City, is importing a scissor similar to the J. A. Henkel scissor, No. 1535, 3½-inch, No. 156, at 138.60 marks per dozen on a mark cost of 1.10, or \$1.52 in United States currency. This scissor, which is also comparable to the Wiss scissor, would therefore cost the importer under the proposed tariff \$6.65 per dozen, which certainly allows the importer more than a chance to compete with the American scissors at \$9.50.

Scissors No. 2610, 7-inch, imported from J. A. Henkel, Germany, does not at all compare with the sample offered as sold by the Newark Cutlery Co. It compares with a scissor such as made by the W. H. Compton Shear Co., Newark, N. J., or J. Wiss & Sons Co., Newark, N. J., which sells to the wholesale trade at \$12.40 per dozen for the same quality and finish as the imported Henkel scissor. Figuring the cost of this Henkel scissor at \$5.13 per dozen United States currency is correct at the mark value, which they claim, the proposed duty would bring the cost of the German article at \$11.87 per dozen against the American wholesale selling price of \$12.40 per dozen. But that same scissor figured at a mark value of 0.01 would bring the cost to the importer to \$1.18 per dozen, including proposed duty, against the American selling price of \$12.40 per dozen.

In the office of the Ways and Means Committee is a sample of a 7-inch solid steel trimmer handle scissor imported from J. A. Henkel, Germany, at a cost of 216.80 marks, which, figuring the mark at 1.10, equals in United States currency \$2.38 per dozen. This scissor is comparable to a scissor, No. 31, made by J. Wiss & Sons Co., Newark, N. J., which is sold by them to the wholesale trade at \$12 per dozen. Figuring the proposed duty on the German scissor will bring the cost to \$8.98, which also gives the importer more than a chance to compete. Similar comparisons can be made on the entire line.

I also wish to call your attention to the fact that when comparing German-made scissors with American-made scissors the Cutlery Importers' Association has been very careful to make the comparison not with scissors made by American factories which existed previous to the war but with factories under the control of principals whose interests have always been in the importing of German-made cutlery. It is only since the war that M. Klass started in the scissor business in the United States. It is only since the war that the Newark Cutlery Co. has been making scissors in the United States. The Newark Cutlery Co. is owned by the principals of a firm who have acted for years as agents in the United States for J. A. Henkel, of Germany. It is only natural to assume that their interests are greater in Germany than they are in the United States, and that their small American factories are only serving a temporary purpose. Certainly if those interests could continue to import scissors under the Underwood tariff or under a minimum tariff their American factories would be closed as far as the manufacture of scissors is concerned.

The comparison of the M. Klass scissor, No. 876½, 3½-inch, made in Germany with a scissor made by M. Klass, of Newark, N. J., is odious. The quality of the German scissor is considerably better and it is better finished, and the American scissor made in Newark, N. J., does not at all compare with it. There are other scissors made in the United States which would be comparable with it, which naturally sell at a higher price than the Klass scissor made in Newark.

But the other scissors are naturally not used by the Cutlery Importers' Association for the purpose of comparison. The very same argument holds with the No. 1535 and No. 2610 J. A. Henkel, of Germany, scissor. They compared with scissors made by the same principals in their American factories, and the scissors made in their American factories are not of the same quality or the same high finish as other scissors made in the United States, therefore could not be considered a comparable article. Other American manufacturers make comparable scissors which are sold at a higher price than sold by the Newark Cutlery Co., but if the representatives of the Cutlery Importers' Association used samples of these scissors their contention would be because at the price at which the American factories sell scissors that would compare with the J. A. Henkel scissor, plus the proposed duty, the American scissors would be much higher in price, thereby permitting the German importer to compete.

It has been insinuated by the Cutlery Importers' Association that higher duty would mean a higher cost on scissors to the consumer in the United States. My experience has been that no matter how low the cost of importation has been the selling prices of the German importers have always remained high enough to merely undersell the American manufacturer. Take their own brief and you will find that they acknowledge that to-day their No. 2610, 7½-inch scissor, imported from J. A. Henkel, Germany, and which they claim cost \$5.13 per dozen and on which the present duty is \$1.53½, making a total cost to the importer of \$6.66½, is sold by them to the wholesale trade at \$15.50 per dozen, or at 50 per cent profit, and in turn this is sold by the wholesale trade to the consumer at \$3 each.

Government publications, mostly taken from the Department of Commerce, show that the average earnings of experienced men in the scissor trade in Germany is about 50 cents for a day of eight hours. In the United States the same class of men have to be paid not less than \$4 per day of eight hours. In Germany 75 per cent to 80 per cent of the total cost of a scissor represents labor. The proposed tariff bill as written will permit the American manufacturers to pay their men a reasonable rate of wages and still compete with the cheap labor cost of Germany and Japan.

Bear in mind that the scissor industry in the United States is an infant industry which was very necessary during the war. Our Army and Navy Medical Departments had to have thousands of pairs of surgical scissors, which were not made in this country before the war. The then existing American factories successfully equipped their factories and trained men to do this work. You will therefore recognize that special care must be taken of this industry or else we are going back to the conditions which prevailed previous to the war, when over 95 per cent of the scissors used in this country were imported. The objection of the Cutlery Importers' Association to the branding clause is ridiculous. The proposed tariff has in mind the protection of the consumer in the United States. By all means the clause as to branding should stand as written in the proposed bill.

PRUNING SHEARS AND HAIR CLIPPERS.

[Paragraph 357.]

STATEMENT OF CHARLES F. WIEBUSCH, REPRESENTING J. T. HENRY MANUFACTURING CO., HAMDEN, CONN., AND OTHERS.

Senator DILLINGHAM. You are from New York?

Mr. WIEBUSCH. My address is 110 Lafayette Street, New York City.

Senator DILLINGHAM. You wish to be heard on paragraph 357?

Mr. WIEBUSCH. Yes. I really represent two groups of manufacturers: First, manufacturers of hair clippers, and also manufacturers of pruning shears, and with your permission I should like to speak on pruning shears first.

Senator DILLINGHAM. Under what section?

Mr. WIEBUSCH. I would like to have it under section 357, where shears are provided for.

In order that we may visualize the articles I will discuss, I will display a few samples of pruning shears. Pruning shears are made by a number of manufacturers: The J. T. Henry Manufacturing Co., Hamden, Conn., of which Mr. Henry is here; the Peck, Stow & Wilcox Co., of Cleveland, Mr. T. J. Ray, vice president of the company, being also here; Seymour Smith & Son (Inc.), Oakville, Conn.; Boker Cutlery & Hardware Co., of New York, with factory at Hilton, N. J.; the Cronk & Carrier Manufacturing Co., of Elmira, N. Y., and the Clyde Cutlery Co., of Clyde, Ohio.

Pruning shears are cutlery, so recognized among manufacturers and the trade generally, and until the end of the year 1916 were always classified for customs purposes as shears under the cutlery schedule in the tariff of 1913, under paragraph 128.

In 1916 a firm of importers representing a Swiss manufacturer protested against the payment of duty on the ground that pruning shears were agricultural implements, and as such should come in free of duty. The matter came before the Board of General Appraisers and the Court of Customs Appeals, and their decision (D. 36904) classified pruning shears as agricultural implements and since then they have come in duty free. While the war lasted it was not so important, as no goods could come from Germany, and Swiss and French manufacturers had only a limited output and asked high prices, but now that Germany is sending large quantities of goods here at unprecedentedly low prices the situation is becoming very serious for the American manufacturers.

Just to give an instance of present German prices we will compare a recent German quotation on a leading style of pruning shears, California pattern, black handle, 9-inch, with a corresponding American pruning shear. The German is quoted at marks 159.36 per dozen, which, figured at the present rate of exchange and allowing 10 per cent for expense to bring the goods here, figures less than 100 per dozen, much below the actual cost of production of a corresponding American shear which sells here for \$6.50 per dozen. Many other patterns have been compared and show a similar ratio. It would be useless to give you all the figures, but on polished nickel-plated shears and some different models and patterns, the ratio is practically the same as in this particular pattern.

Senator McLEAN. Do you mean to say that these articles do come in free?

Mr. WIEBUSCH. They do come in free of duty.

Senator McLEAN. Under what paragraph should they be placed?

Mr. WIEBUSCH. In about two minutes I will reach that point and you will allow me to continue. It is well known that labor in Germany is now being paid about one-third or less than American labor, and considering that about 75 per cent of the cost of a pruning shear is labor, it will be seen how imperative it is to suitably protect the American industry if it is to survive.

Senator WATSON. You mean under the Underwood law they come in free?

Mr. WIEBUSCH. Under the Underwood law, until the court decision was rendered, they paid the duty, but since this decision was rendered by the Court of Customs Appeals they have all come in free of duty. They are coming in free of duty to-day.

Senator WATSON. Do they come in under agricultural instruments are on the free list?

Mr. WIEBUSCH. Yes, sir. Referring again to the court decision already mentioned, we would say that the court in deciding that pruning shears are agricultural implements gave a highly technical interpretation, and we believe that could the framers of the tariff have seen such a decision they would certainly have made special provision for pruning shears under the cutlery paragraph. While it is true that quite a few pruning shears are used for pruning in yards and orchards, for which reason the court held that they are to be classified as agricultural implements, there are as many or more used by gardeners, nurserymen, and thousands of individuals who have their own gardens and prune trees, shrubs, hedges, and so on, who would not be classified as farmers or agriculturists.

Senator WATSON. Where do you think they ought to be?

Mr. WIEBUSCH. My next paragraph tells. In the present tariff pruning knives which are used for the identical purpose as pruning shears are specially mentioned and dutiable, which we consider correct and more logical than to class pruning shears with plows, harrows, reapers, and agricultural implements used for tilling the soil. My recommendation is that under Schedule 3, paragraph 357, there inserted after the words "All other shears and scissors and blades of the same," the words "also pruning shears of all kinds." The situation is a very serious one for the American manufacturers of pruning shears, and we hope that our request that pruning shears be made dutiable as cutlery will be granted.

Senator WATSON. Why not say "all other scissors and shears, including pruning shears"?

Mr. WIEBUSCH. The way I suggested was the way I thought it might be best, but you gentlemen who carefully examine the wording of these tariffs and have had so much experience in the matter will undoubtedly see that it is properly inserted so that the pruning shears will pay the same duty exactly as other shears.

Senator DILLINGHAM. I think they understand your point.

Mr. WIEBUSCH. I have made myself as brief as possible. While I am here, let me say that I represent another group of manufacturers, but I will take no more time on that than I have on pruning shears. I represent Mr. Priest, president of the American Shear Manufacturing Co., Nashua, N. H., who is scheduled to be here, but unfortunately he could not come; also the Coates Clipper Manufacturing Co., Worcester, Mass.; and the Boker Cutlery & Hardware Co., New York, with a factory at Hilton, N. J.

Hair clippers, including toilet, horse, and fetlock clippers, have never been specially mentioned in any tariff, but have always been classified for customs purposes as "manufactures of metal." Under the tariff of 1913, which is now in effect, the duty is 20 per cent ad valorem. In the Fordney tariff, paragraph 393, the rate of duty on articles composed wholly or in chief value of iron, steel, etc., has been made 35 per cent ad valorem, and if no special provision is made for hair clippers this is the rate that would apply when the bill becomes law. This rate, however, even based on the American valuation, is entirely inadequate protection under existing conditions.

During the last 12 months thousands of pairs of clippers, sold at unusually low prices, have flooded this market from Germany; according to an estimate several hundred thousand pair in all, and the goods are on the shelves of practically every jobber and retailer of this class of goods in the country. Only a few houses whose policy has been not to buy any German goods, irrespective of price inducements, have confined their purchases to the American articles. The result has been that the demand for American clippers has dwindled to insignificant proportions, and the very existence of the industry is menaced.

Clippers are offered by German manufacturers at 48 marks, 27 marks, and even less each, which figures even with 35 per cent duty added makes the cost laid down here considerably less than the cost of production of corresponding American models. American manufacturers feel that their industry is entitled to the same protection that is accorded to similar articles in the cutlery line. Clippers are cutlery the same as knives, shears, etc. All the arguments that apply to tariff protection for pocket knives, table knives, shears, scissors, surgical instruments, etc., apply with equal force to hair clippers.

We recommend that under Schedule 3, paragraph 357, before the word "provided," there be inserted: "hair clippers, 25 cents ad valorem and 35 per cent ad valorem."

The condition in regard to marking the goods with the name of the country of origin should also be enforced for these goods the same as for shears, scissors, etc.

The hair-clipper industry is not one of the large industries of this country but nevertheless important. If the industry languishes, it affects more than the manufacturers and their employees for whom it speaks. It will mean that they will buy less steel from the steel manufacturers, fewer malleables from the foundries, fewer castings from the manufacturers who make these; fewer screws, supplies, boxes, labels, and many other items that go to make up the product. Unless the goods can be sold at a profit, however small, over the cost of production the industry is bound to decline, and this will react all along the line to the miners of metal and coal. There is no industry that is more deserving of consideration than the hair-clipper industry, and we confidently trust that the necessary protection will be granted.

I wish to add just one matter, which perhaps is not essential but is of interest: The hair-clipper industry really started in the city of Nashua in 1865, where Mr. Priest made some of the first clippers that were ever made. It was peculiarly an American industry, and in the eighties and nineties thousands of pairs of American clippers were sent to Europe. It was only after that time that Germany began to make clippers, at first satisfying the European demand, thereby stopping the exportation of American clippers to Europe, and now we have come to a point where the things are turned around and German clippers are coming into this country, where they originated and were first produced and exported.

There, I think, is a logical argument that if there is any industry that needs protection against the lower cost of production in Germany it is the clipper industry.

TESTIMONY OF CHARLES F. WIEBUSCH, REPRESENTING J. T. HENRY MANUFACTURING CO. AND OTHERS.

Supplementing my testimony, in which I recommended a duty of 25 cents and 35 per cent ad valorem for hair clippers, I will give an estimate of the cost of importing clippers under conditions existing to-day.

One of the most popular clippers which has been imported very largely from Germany is a No. 00 neck shave, which can be bought to-day in Germany at marks 40 each, and under the proposed duty the cost laid down in New York would figure as follows:

Marks 40, at 1.25 cents per mark	\$0. 50
Freight—freight, insurance, etc.	. 02½
Duty, 35 per cent on American valuation of \$1.60	. 56
Ad valorem duty	. 25

Total cost laid down in New York	1. 33½
Compared to American selling price of	1. 60

For a more expensive clipper, corresponding to one that is sold by American makers at \$2, figures as follows:

Marks 50 each, at 1.25 cents per mark	\$0. 625
Expenses—freight, insurance, etc.	. 031
Duty, 35 per cent on American valuation of \$2	. 70
Ad valorem duty	. 25

Total cost laid down in New York	1. 608
Compared to American clipper	2. 00

In applying the proposed duty to the very cheapest clippers sold at marks 26 and marks 27 each, the cost, laid down in New York, would come a little higher than the prices now established by American makers, but if the duty as proposed would go into effect it is more than likely that the efficiency and industry of the German manufacturers would enable them to produce competing clippers at a still lower cost abroad, and, furthermore, the appraiser might consider that such cheaper clippers might be compared to cheaper grades that are made in this country, thereby reducing the American valuation correspondingly.

The large bulk of importations, however, has been on the kinds of clippers which are covered by the estimate first given.

RAZORS.

[Paragraph 358.]

TESTIMONY OF H. L. HENRY, REPRESENTING THE GENEVA CUTLERY CORPORATION AND OTHERS, GENEVA, N. Y.

The CHAIRMAN. Where do you reside?

Mr. HENRY. Geneva, N. Y., sir.

The CHAIRMAN. What is your occupation?

Mr. HENRY. Manufacturer of standard razors.

The CHAIRMAN. What is your company?

Mr. HENRY. The Geneva Cutlery Corporation. I represent nine manufacturers of standard razors, as follows: J. R. Torrey Razor Co., Worcester, Mass.; W. R. Case & Sons, Bradford, Pa.; S. R. Moescher, Cranford, N. J.; Henkle Clauss Co., Fremont, Ohio; National Razor Manufacturing Co., Fremont, Ohio; Union Cutlery Co., Plain, N. Y.; George W. Korn Razor Manufacturing Co., Little Valley, N. Y.; Poughkeepsie Cutlery Co., Poughkeepsie, N. Y.; manufacturing practically 100 per cent of all the standard razors made in the United States.

The CHAIRMAN. In different parts of the country?

Mr. HENRY. Yes, sir. The nine factories referred to employ normally about thirteen hundred highly skilled artisans.

The CHAIRMAN. What is it that you want with reference to the bill?

Mr. HENRY. I wish to show, sir, that some of the testimony already given is not accurate: that the rates which we went over in great detail and on which we spent considerable time with the committee of the House would put us in shape so that we could start our idle factories again. While the rates would not be sufficient, we feel that in the course of a reasonable length of time, at least, by further shop economy, we could meet competition based on the proposed rates in the House bill.

The CHAIRMAN. Are these shops closed now, largely?

Mr. HENRY. Yes, sir; very largely. Our own factory, for instance, normally employing 650 to 700 people, is running about 90 to 100 and running on half time—a skeleton organization.

I want to say, gentlemen, that the plants that I represent, including my own, have no divided interests. We have no foreign investments, nor have we any desire to bill from abroad to ourselves in this country at temporarily convenient prices.

I think you gentlemen will recall considerable activity on the part of the American manufacturers of cutlery in the years 1912 and 1913, occasioned by very flagrant undervaluations. It was so serious that the very life of our industry was threatened. The Treasury Department interested itself; Secret Service men were used, and eventually that practice, in so far as we know, at least, was largely stopped.

That reminds me that the gentleman testifying yesterday made a very strenuous plea for ad valorem rates. There is no better way of putting a quietus on undervaluation than by specific rates.

The CHAIRMAN. That is Republican doctrine.

Mr. HENRY. Yes, sir; and it is a very good doctrine.

There were some samples shown yesterday. There were prices quoted by the importer, who stated that he also was an American manufacturer, and I think he left the impression generally in the room that he was an American manufacturer of standard razors. So far as I know, this German importer has never made any quantity of standard razors in the Camillus plant. I believe practically all their razors are made in their own factory in Germany and in other German plants.

A comparison was shown here between a German razor, which cost 78.40 marks, the stated German price per dozen, at the exchange rate quoted, I believe, would figure \$1.17 per dozen in American currency. The so-called American comparative was a Torrey razor, which the witness testified he bought from the Torrey Co. himself, and paid \$3.25 per dozen for.

Wishing to check that statement and testimony, I talked with Worcester, Mass., over the phone last night, and I have here a telegram signed by the J. R. Torrey Razor Co., and I will read it:

Last quotation to Kastor, April 14, 1920, \$4.05 per dozen. Last order August 12, 1918, \$3.70. If more information is wanted, wire or phone.

J. R. TORREY RAZOR CO.

That, gentlemen, I think, throws out absolutely the testimony in regard to comparatives on that grade of razors.

another comparison was a Boker "Red Injun" razor. The American equivalent or comparative was a razor made by one of the smaller American factories. They are not comparable in any sense of the word, except, possibly, in price, and that I am not prepared to say.

The Boker razor is a beautiful piece of work, made by bonus-paid workmen. Personally, I do not believe there is any better razor available than that Red Injun.

The Geneva Cutlery Corporation make razors that are comparable with the Boker razor, and we would be very glad to submit, and will submit, comparative samples and prices.

The CHAIRMAN. What is the peculiarity of this razor and its special excellence?

Mr. HENRY. Beautifully ground, Senator. They are beautifully finished, nicely balanced, and made from excellent steel.

I want to refer just a moment to the razor submitted by the witness yesterday and also to its so-called American comparative. The German cheap razor is made, in most cases—those razors that come in a dozen—of Bessemer steel or a very cheap grade of Swedish steel. They have no quality. They are roughly finished, but they have the advantage of a ridiculously low price to the wholesale purchaser in the United States. I can buy them and have bought them. I was forced to buy them under the Payne-Aldrich and the Underwood laws. They were landed at 35 per cent duty. Prior to that time the Geneva corporation made a great volume of medium-priced razors, but we, like other American manufacturers of standard razors, made them out of high-grade steel, and, regardless of price, those razors were guaranteed for shaving service, and they would stand up and would shave.

That cheap razor eventually got to the consumer at approximately the same price as the other razor.

These cheap German razors were often packed in individual cases stamped "fully concave, fully warranted." I have some in my bag and some samples that have come in within a few months, some of them cases marked \$3 or \$3.50 each—a practice which we were forced to follow in an effort to hold trade, but a practice which we would be very glad to get away from.

Senator WALSH. Do you consider that those cheap German razors are inferior to the American cheap razors?

Mr. HENRY. Not in appearance, but in quality; yes.

Senator WALSH. Do they compete with your razor?

Mr. HENRY. Not in quality, but unfairly in price to the trade.

Senator WALSH. To certain people it could be discovered that there is a difference, and yet they were put on the market at the same price?

Mr. HENRY. Not always; and in the last turnover, or in the last purchase, the men in the street, not knowing the difference, did pay a price at which they should have been able to buy shaving quality.

Senator WALSH. Of course, we can not legislate to make the American purchaser discern the difference between two articles.

Mr. HENRY. I quite agree with you; but the point I want to make is that it would be a kindness on the part of this committee to get that stuff out of the country and keep it out.

I want to state that in the last analysis you gentlemen are here to conserve the industry of the United States and the welfare of the Commonwealth. All that any clean-cut American manufacturer asks for is an opportunity to compete on a fairly even basis. The importations of standard razors are increasing by leaps and bounds. The Government stores are carrying enormous stocks to-day. They are coming in in increasing volume. Gentlemen, it is only going to be a question of a few months when there will have accumulated in the United States stocks of German make sufficient to carry the country's normal consumption for a long, long while to come.

Senator McLEAN. I see they have more than doubled since last year.

Mr. HENRY. Yes, sir. I wish to plead for quick action. Primarily, that is what I am down here for. We want relief, and we have got to have it soon. If we do not get it, God knows this industry will be ruined.

Senator McLEAN. You are more interested in protection of your business than you are in the reduction of excess-profits taxes?

Mr. HENRY. Very much so. The excess-profits taxes are not going to worry us this year. If we can survive the enormous losses that are going to pile up this year, we will be mighty fortunate. We hope our banks will carry us.

I wish to add in regard to these increasing importations and the vital necessity of haste that I hope the committee can arrive at a workable plan for some equalizing of exchange or a retroactive feature in the tariff bill that will tide us over until the passage of the bill. I have really little else to say, except that I shall request and do request the privilege of filing a brief.

The CHAIRMAN. You may file your brief and correct your statement.

Senator WATSON. Is your factory closed down?

Mr. HENRY. Our factory is employing about 90 men out of normal 650 or 700, and we are working those 90 alternate weeks.

Senator WATSON. How much of that is due to the imports and how much to general industrial conditions of the country?

Mr. HENRY. That is a rather hard question to answer.

Senator WATSON. I am asking your opinion about your own business.

Mr. HENRY. In our own business, I would say that I presume it is about equally divided.

Senator WALSH. The witness yesterday, who was an importer, submitted a brief in behalf of the cutlery importers' association, in which he has a diagram which I would like to ask you to examine. He attempts to show a certain grade of razors, what they cost in Germany and what they cost in America, and how the Fordney tariff bill will operate as amounting to an embargo. Have you examined these statements he has made up?

Mr. HENRY. No; I have not.

Senator WALSH. So you are not able to say whether it is accurate or not?

Mr. HENRY. No, sir.

Senator McLEAN. Suppose you spend a little time on it and give it to the committee in your brief.

Mr. HENRY. I will do that; yes, sir.

DENTAL INSTRUMENTS.

[Paragraph 359.]

STATEMENT OF DR. HOMER C. BROWN, COLUMBUS, OHIO, REPRESENTING THE NATIONAL DENTAL ASSOCIATION.

Senator SMOOT. Dr. Brown, there are a number of witnesses here dental and surgical instruments. Mr. John J. Douglas and Mr. Julius M. Meirrick are present to speak on that subject. Do you speak for them?

Dr. BROWN. I only speak for the National Dental Association.

Senator SMOOT. Mr. Meirrick also speaks for that association.

Dr. BROWN. Mr. Meirrick is not authorized to speak for the National Dental Association. I am their official representative. I do not know him, neither do I know if he is here. And I will say this, that no one except myself is authorized to speak for the National Dental Association upon this subject at this time.

Senator SMOOT. Proceed, then, Doctor.

Dr. BROWN. Mr. Chairman and gentlemen of the committee, as chairman of the legislative committee of the National Dental Association, an organization with approximately 30,000 members, I appear before you to present our protest against the duties relating to dental instruments as provided in paragraph 359 of H. R. 7456, which is under consideration at this time.

The provisions of this paragraph place surgical and dental instruments in the same classification in all respects, while these industries are quite dissimilar in at least two particulars.

First, the manufacture of dental instruments is a wholly developed American industry whose preeminence is as well recognized throughout the world as that of the American dentist. In fact, the preeminence of each has been through the close harmony and cooperation of both, and as an evidence of this the ratio of exports to imports is in excess of 20 to 1. Therefore, no unusual protection is required for this industry, as may be advocated by the surgical instruments manufacturers.

Second, many or probably most of the dental instruments coming within the provisions of this paragraph are very small and inexpensive, and the specific duty of 60 cents per dozen adds so much for this item of expense that it becomes wholly out of proportion to the cost of the same.

Senator SMOOT. Will you simply suggest what you have in mind as to the proper rate?

Dr. BROWN. Yes; I will in just a moment.

Senator SMOOT. The House provides for a value of not more than \$5 a rate of 60 cents per dozen. What would you suggest?

Dr. BROWN. I have one brief statement prior to reaching that, Mr. Chairman.

I want to first emphasize the fact, in connection with the statement that I just made about small and inexpensive instruments, that nerve broaches and burrs, torturous as they are to those upon whom they are used, are two of the items most frequently imported, and the wholesale price of them is such that the duties under this paragraph, under the present system of valuation, increases the pres-

ent duty of from 20 to 30 per cent to 175 to 300 per cent, and in some instances in excess of that. Therefore, any revenue which might accrue from such duties is completely nullified, for such duties will prohibit any importations.

Further, this supposed protection becomes a farce and will soon work to the disadvantage of all.

In view of this I respectfully recommend that the words "and dental" be stricken out of paragraph 359, and that a new paragraph to be known as paragraph 359-A be inserted, as follows:

Dental instruments, or parts thereof, composed wholly or in part of iron, steel, copper, brass, nickel, aluminum, or other metal, finished or unfinished, 35 per cent *ad valorem*: *Provided*, That all articles specified in this paragraph, when imported shall, when practicable, have the name of the maker and beneath the same the country of origin die sunk conspicuously and indelibly on the outside, or if a jointed instrument on the outside when closed.

The unreasonableness of these duties appears somewhat similar to the dental profession and the dental manufacturers, as is evidenced by the fact that the officers and representatives of these two groups held a conference on July 30 with the result that the changes outlined were agreed to as being fair and equitable to all interests concerned; and when I say "all interests," please bear in mind that this includes all those we serve professionally; since in the final analysis they are the ones assuming all of such overhead increases in tariff duties as well as other sources.

I again desire to emphasize the fact that we do not wish in any way to interfere with what may be considered ample protection for the surgical instrument industry in order to develop this important activity in our country, but, on the other hand, there is no good reason why the separation should not be made as recommended; and also the elimination of all specific duties from the dental instrument paragraph.

In conclusion, we, like many others, are more or less confused with reference to the American valuation plan as incorporated in this bill. The *ad valorem* duty of 35 per cent as recommended may be approximately four times the present duty on dental instruments—artificial teeth, dental supplies, toothbrushes, etc. If that is the case, it should be adjusted accordingly.

Please understand that dental service is a well-recognized factor in health conservation; and in presenting our protest to this increased duty we consider that we are promoting the best interests of the American public.

For further information and specific data I respectfully refer you to hearings before the Ways and Means Committee of the House of Representatives, January 14, 1921.

Senator WATSON. Doctor, do you use foreign instruments altogether?

Dr. BROWN. No, sir. The American dental manufacturers export twenty times as much goods as are imported into this country.

Senator WATSON. Are the American instruments quite as good as the others?

Dr. BROWN. Quite as good, sir, and even better in most instances; but there are a few items which are manufactured abroad which many dentists like to have access to.

Senator WATSON. What are some of those?

Dr. BROWN. Tube teeth, a platinum pin tooth. Others are nerve braces and burrs that are of very excellent material and well made and that can be brought into this country under a reasonable tariff duty.

Senator WATSON. And the like of which are not made in this country?

Dr. BROWN. No; not that.

Senator WATSON. Or not made so well?

Dr. BROWN. No. They are well made in most instances, and they can bring them into this country and pay a duty which will help in revenue and they can be sold, then, on a parity basis with the goods that can be purchased here.

Senator WATSON. From what country do you procure those goods?

Dr. BROWN. Principally from England and Germany. In fact, most of the supplies that come in come from England and Germany.

Senator WATSON. Do any come from Japan?

Dr. BROWN. I have not used any myself.

Senator WATSON. Surgical instruments do?

Dr. BROWN. Yes; but Germany and England are the principal makers of dental instruments in foreign countries.

SURGICAL INSTRUMENTS.

[Paragraph 359.]

STATEMENT OF JOHN J. DOUGLAS, REPRESENTING FRED HASLAM & CO., BROOKLYN, N. Y.

The CHAIRMAN. Mr. Douglas, where do you reside?

Mr. DOUGLAS. Brooklyn, N. Y.

The CHAIRMAN. What is your business?

Mr. DOUGLAS. The manufacture of surgical instruments. I am resident and general manager of the Fred Haslam & Co., and I also represent the American surgical instrument manufacturers.

The CHAIRMAN. You want a duty on surgical instruments?

Mr. DOUGLAS. Yes, sir.

The CHAIRMAN. Are you satisfied with the bill as it passed the House?

Mr. DOUGLAS. Yes, sir.

The CHAIRMAN. Then you do not want any change made?

Mr. DOUGLAS. No, sir; but I just want to speak on a matter that has been brought up by the dental association in reference to similar matters, if I may. I have a short statement.

The CHAIRMAN. On what subject?

Mr. DOUGLAS. On surgical instruments.

The CHAIRMAN. You say you do not want any change made?

Mr. DOUGLAS. We want the change made suggested by Dr. Homer Brown yesterday, who represented the National Dental Association. We are satisfied to have the change made, and dental instruments taken out of the surgical instrument clause, that is, from paragraph 359, so that this paragraph will apply only to surgical instruments. Our reason for this is the advance in dentistry—

Senator WATSON (interposing). Do you make dental instruments?

Mr. DOUGLAS. No, sir.

Senator WATSON. Then why argue their case? They have argued their own case. They have already testified about dental instruments.

Mr. DOUGLAS. Very well, unless you will permit me to say something: I want to state that the present tariff as designed by the committee, containing the American valuation, will be satisfactory, because it will enable us to make from 60 to 65 per cent of the goods in the United States, and that is what we should have, to give us a little opportunity in times of war as well as peace.

Senator SUTHERLAND. By the "present tariff," you refer to the Fordney tariff bill pending before this committee?

Mr. DOUGLAS. Yes, sir. Under the Underwood bill we only make 20 per cent in this country, which was a handicap during the war.

Senator WATSON. You have an ever increasing importation of surgical instruments from Japan as well as from Germany?

Mr. DOUGLAS. Yes, sir. The Japanese goods are not as high grade as the German, and the Germans are the ones that we fear they keep us down to 20 per cent production.

I do not think it is necessary to take up any of your time. I have said all I have to say, and I am saying it for the American surgical instrument manufacturers. We are willing to write volumes; we have done it for a year and a half, and we had the bill up to the House all but passing.

I may speak for our own factory, with which I am entirely familiar. We are working only 20 per cent of our force that we had a year ago. If that bill had been passed a year ago, we would have had four or five times as many men employed as we have now.

Senator SUTHERLAND. I would like to have the gentleman say briefly why he thinks the dental instruments should be left out of this paragraph.

Mr. DOUGLAS. I will say this, the dental industry is fundamentally an American institution. The world looks to America to matters dental, and even the Kaiser had an American dentist, Dr. Davis, and the dental instrument manufacturers are exporting quite largely. In the case of surgical instruments it is less than 2 per cent. A matter of fact—

Senator SUTHERLAND (interposing). Only 2 per cent of the surgical instruments manufactured in this country exported?

Mr. DOUGLAS. Yes, sir; about 1½ or possibly 2 per cent. Canada buys from us because we are nearby; they do not buy so much because of price, but because of the accommodation we can give them.

STATEMENT OF JAMES A. GARVEY, REPRESENTING THE HOSPITAL CONFERENCE OF THE CITY OF NEW YORK, THE HOSPITAL ASSOCIATION OF PHILADELPHIA, THE WISCONSIN HOSPITAL ASSOCIATION, AND THE ILLINOIS CONFERENCE OF THE CATHOLIC HOSPITAL ASSOCIATION.

As you have under consideration at the present time the Fordney tariff bill H. R. 7456, I, as the representative of the Hospital Conference of the City of New York, the Hospital Association of Philadelphia, the Wisconsin Hospital Association, and the Illinois Conference of the Catholic Hospital Association of the United States (credentials of which are attached hereto), take this opportunity to present to you the protest of the above associations against the proposed tariff on surgical instruments, x-rays, and other hospital supplies.

The hospitals and sanatoriums of this country are a very great asset to the Nation and as such are entitled to as just and equitable a protection as manufacturing industries.

To give you an idea of the tremendous work that is being performed and the large d covered by them, I will give you the figures just published by the official organ the American Hospital Association, which association has already appealed to the ys and Means Committee for the protection of the interests of our hospitals.

In January, 1921, there were in the United States 9,471 hospitals and allied institutions with a total hospital bed capacity of 720,092.

The industry of the manufacture of surgical instruments, according to the figures mitted to your Tariff Commission, consisted of 25 firms in the year 1914. The Wholesale Surgical Trade Association, consisting of American manufacturers and porting firms, had a membership of 21 firms in 1914, 5 of which manufactured ly furniture and sterilizers, 3 of which made thermometers, syringes, etc., leaving ly 13 firms manufacturing surgical instruments (Tariff Information Series 7), 2 ploying normally possibly 100 people, 5 employing normally about 50 people, 6 ploying normally about 15 to 25 people.

There were only about 958 people employed in the manufacture of surgical instruments in the year 1914. I am quoting 1914 because this was the most recent year at could be considered normal in this industry. The World War created an unnatural and unprecedented demand for instruments and the Council of National fense allocated the manufacture of surgical instruments to jewelry and fine-tool akers. Even under the heavy strain of war emergency there were only 2,150 people employed in this industry.

Compare this industry, employing normally less than 1,000 people, with the field operations covered by 9,471 hospitals and allied institutions having a daily resident population of over a million and consider that each year more than 8,000,000 persons become resident patients in hospitals, with an average stay of from 17 to 18 days each.

From a questionnaire directed to the entire field it was found that a conservative valuation of hospital grounds, buildings, and equipment is \$3,279,520,372. If the valuation were figured on the basis of present day costs, it is safe to assume that the total valuation would be in excess of \$5,000,000,000.

The hospitals of the country are always under a severe financial strain and almost every one of them reports a deficit every year.

As a whole, the hospitals and surgeons of the country are opposed to any unnecessary increase in tariff. I quote the following:

"The Hospital Conference of the City of New York passed a resolution on April 13, 1921—

"*Resolved*, That the conference would respectfully call the attention of Congress to the injustice that would be wrought upon charitable institutions by an increase in the tariff on surgical instruments."

"On April 21, 1921, the Hospital Association of Philadelphia passed a resolution as follows:

"*Resolved*, That the Hospital Association of Philadelphia would respectfully call to the attention of Congress the injustice that would be wrought upon charitable institutions by an increase in the tariff on surgical instruments."

In a letter of May 28, 1921, pertaining to the tariff on surgical instruments, Dr. Charles H. Mayo, of Rochester, Minn., says:

"It is my opinion that any tax which adds to the cost of, or hinders the education of, our people or the care of their health is a mistake in policy."

The Illinois Conference of the Catholic Hospital Association of the United States and Canada passed the following resolution:

"*Resolved*, That the Illinois conference would respectfully call the attention of Congress to the injustice that would be wrought upon charitable institutions by an increase in the tariff on surgical instruments."

Rev. C. B. Moulinier, president of the Catholic Hospital Association of the United States and Canada, says in a letter dated June 8, 1921:

"As this will affect hospitals in a very large measure there should be no hesitation on the part of those interested in hospitals to oppose such measure. I feel, therefore, that I am justified in saying that the 574 hospitals conducted by Catholic sisters will suffer from such an increase in tariff to a measure that should not be countenanced by legislators who have at heart the interests of such valuable and charitable institutions. Their financial burden is already a very heavy one. I therefore, as president of the Catholic Hospital Association, protest against any such legislation, in the name of this vast body of devoted workers in the cause of better health for our people."

A resolution was unanimously adopted by the convention of the Catholic Hospital Association of the United States and Canada, June 24, 1921:

"That the Catholic Hospital Association goes on record as opposed to the bill now in Congress imposing an increase in the tariff on imported surgical instruments for the reason that it will entail greater hardships on our charitable organizations."

A letter dated June 8, 1921, from Dr. Sol. G. Kahn, secretary of staff of the Holy Cross Hospital of Salt Lake City, Utah, says:

"At a recent meeting of the staff of Holy Cross Hospital it was resolved that we indorse the action taken by the Hospital Conference of the City of New York regarding the proposed increased tariff on imported surgical instruments and laboratory supplies."

On June 16, 1921, St. Francis Hospital, of San Francisco, Calif., passed this resolution:

"Resolved, That the trustees of this institution would respectfully call to the attention of Congress the injustice that would be wrought by an increase in the tariff on surgical instruments."

On June 15, 1921, St. Francis Hospital, of Wichita, Kans., passed this resolution:

"That the St. Francis Hospital of Wichita, in the State of Kansas, is opposed to the increase because of the additional burden it will entail in our charitable work."

On or about June 7, 1921, the Council of the Sisters of St. Mary, representing St. Mary's Infirmary, St. Louis, Mo.; St. Mary's Hospital, Madison, Wis.; Mount St. Raphael Sanatorium, St. Louis, Mo.; St. Francis Hospital, Blue Island, Ill.; St. Joseph's Hospital, St. Charles, Mo.; St. Mary's Hospital, Kansas City, Mo.; passed the following resolution:

"That the council would respectfully call to the attention of Congress the injustice that would be wrought upon charitable institutions by an increase in the tariff on surgical instruments."

Under date of June 9, 1921, C. E. Sparrow, superintendent of the Delaware Hospital, writes:

"Kindly add the name of the Delaware Hospital to the list of hospitals protesting against the increased tariff on surgical instruments."

Under date of June 5, Lucia L. Jaquith, superintendent of the Worcester Memorial Hospital, of Worcester, Mass., writes:

"The trustees of the Memorial Hospital of this city fully indorse the resolutions of the Hospital Conference of the City of New York, as the burdens now placed upon charitable institutions is almost more than they can bear."

Mrs. J. H. Bevin, corresponding secretary of the board of trustees of the Jamaica Hospital, Jamaica, N. Y., writes under date of June 9, 1921:

"The board desires to go on record as favoring legislation looking toward the remission of duties on all surgical instruments used by charitable institutions."

G. W. Boot, M. D., president of staff St. Francis Hospital, Evanston, Ill., writes under date of June 10:

"The executive committee of St. Francis Hospital wish to protest against any increase in tariff on surgical instruments and laboratory supplies. When dealers are charging \$9 for tracheotomy tubes, which we formerly bought for \$3, we feel that any increase in tariff will work an injustice."

Dr. Fred W. Phifer, chief of staff of the Wheatland Hospital, of Wheatland, Wyo., writes under date of June 6, 1921:

"We are heartily in sympathy with the resolution passed by the Hospital Conference in the City of New York, opposing the bill to increase the tariff on surgical instruments."

Mr. Daniel D. Test, superintendent of the Pennsylvania Hospital, Philadelphia, writes a letter to Hon. Joseph W. Fordney, dated July 22, 1921, wrote:

"You doubtless realize that all of the best instruments are hand forged, and you may have been informed that nearly all the instrument makers in this country capable of making these fine instruments are of foreign birth. Many of them left this country during the war and very many have not returned, so it is an absolute fact which cannot be successfully challenged that to-day it is possible to buy in this country only a small percentage of the grade of instruments that are used in the Pennsylvania Hospital and other prominent institutions of the country and by our better surgeons everywhere."

"To-day we are compelled to use a grade of instruments which we would not have thought of buying a few years ago and for more than nine months I have had trouble in for certain instruments which are vital in our work and which I can not get because they are not being made in this country. There are not enough men in Philadelphia who can make high grade instruments in the quantities needed and I am told that the same condition exists in New York City."

"Only recently I had an inquiry from the superintendent of one of the most prominent hospitals in a large eastern city asking me whether there was any instrument maker in Philadelphia who would be able to successfully handle their instrument making and repairs, as it was impossible for him to get satisfactory service in his city. I was compelled to tell him that we were in the same fix and that Philadelphia could not help him."

The statements which I am making can not be truthfully contradicted as I know the situation throughout the east generally. My statements will be contradicted by manufacturers of second and third grade instruments who are interested in foisting on the hospitals and surgeons a cheap grade of instruments at a high price." Peter Superior of St. Nicholas Hospital, Sheboygan, Wis., writes, under date of August 1, 1921:

"We wish to enter the protest of St. Nicholas Hospital against tariff bill 7456. This hospital as the servant annually of many hundreds of your constituents respectfully requests you to secure exemptions of medical and surgical supplies from this proposed bill."

Geo. F. Clover, superintendent of St. Luke's Hospital, New York, testified before the Tariff Commission (see Tariff Information Series 7) as follows: "I know of no institution that ought not to be enlarged."

and again:

"A great many instruments used in hospitals are not made here at all, other instruments made here are not as good as those which we get from abroad. Some American instruments are of a very good quality, these are made of the softer metals, which we use and shall continue to use."

It is interesting here to state that the American instruments of soft metal are sold at a lower price in the United States than the imported, and, therefore, do not need protection. In Tariff Information Series 7, on page 25, the statements of three manufacturers of instruments regarding the effect of tariff reduction on business are quoted (referring to the tariff reduction of 1913, when it was reduced from 45 to 20 per cent):

"The reduction of duty did not seriously affect the manufacturers of soft metal instruments. It must also be acknowledged as a fact that the status of soft metal goods is different from that of the steel goods. Even though the duty on instruments, under Underwood bill, was lowered to 20 per cent, nevertheless the manufacturers of metal goods found it possible, under this new duty, not only to continue their business at a profit, but also to expand and enlarge in some cases four times their normal capacity."

In many countries, notably our neighbor Canada, surgical instruments are admitted free of duty and classified as scientific apparatus for educational and charitable purposes. Before the customs laws of 1913 went into effect, Congress made a very careful search and it was then determined that the surgical industry did not need any better protection than 20 per cent and the duty was lowered from 45 to 20 per cent ad valorem.

The total operating expenditure of the hospitals of the United States is estimated at \$237,119 yearly. Of this amount private benevolence contributes about \$440,000 and Government, State, county, and municipal authorities about \$110,000,000 together.

Statistics show that about 65 per cent of the cases treated are free or charity cases, therefore it is easy to deduce that private benevolence spends about \$286,000,000 yearly for the alleviation of pain and saving of life among the poor. Is it fair to tax the private contributions to charity?

Take the scales of justice. On the one side place the small surgical-instrument industry and the small sum that an increased tariff would yield in revenue, and on the other side place the fact that our private benevolence has given to charity \$440,000 in one year. Again place on the one side the 1,000 people employed annually in this industry and on the other side the 5,200,000 people treated annually of charge. Would not the interest of our hospitals appear paramount?

Does it not seem reasonable that tax should be levied on articles that are luxuries for financial gain, rather than on those that are used for charitable purposes?

Competent hospital and health authorities estimate that fully \$2,000,000,000 must be expended during the next five years on new hospitals in order to meet the needs of our country. How can this be accomplished if we are subjected to an increased tariff? It is only a question of time when our burden will become too great to carry and we shall be forced, against our will and desire, to turn the charity patients over to the Government, State, county, or city for care and attention.

The chaotic state of business in our country to-day demands that all efforts be concentrated on keeping the cost of maintenance of our charitable institutions down to a minimum.

We therefore appeal to your sense of justice that you allow the tariff on surgical instruments to remain as it is, or place on the free list surgical instruments and laboratory supplies used in hospitals founded and maintained for charitable purposes, so that we may be able to continue in our great work and increase and expand in proportion with our growing population.

Our objections may be summarized as follows:

First. A very large number of surgical instruments used by specialist surgeons are not made in this country and must be imported, for the reason that either the domestic quality is not good enough or that the cost of production is prohibitive, due to small quantities of each type consumed.

Second. Any increase in the tariff would inevitably result in an advance of prices of the domestic goods to the hospitals, otherwise the domestic manufacturers could not justify their clamor for a higher tariff.

Third. Our surgeons would be deprived of the advantages resulting from foreign invention in the art of surgery, due to the exorbitant cost of imported instruments, and the progress of science resulting from interchange of new ideas would be retarded.

Fourth. That revenue would fall very far short of expectations because the importations will fall off in proportion to the rise in tariff.

STATEMENT OF DAVID WALKER, REPRESENTING THE KNY-SCHEEERER CORPORATION, NEW YORK, N. Y.

The CHAIRMAN. You desire to address the committee with reference to surgical instruments?

Mr. WALKER. Yes, sir.

The CHAIRMAN. The committee is very familiar with the surgical instrument proposition.

Mr. WALKER. I just want to address myself to the question of what the rates in the proposed bill mean as applied to surgical instruments.

The CHAIRMAN. Whom do you represent?

Mr. WALKER. The Kny-Scheerer Corporation, of New York City. The old Kny-Scheerer Corporation was taken over and sold by the Alien Property Custodian.

Senator SMOOT. Are they importers?

Mr. WALKER. Yes, sir.

I may say that the whole breadth of the surgical instrument industry probably covers 10,000 items. The items of domestic manufacture probably cover no more than 20 per cent, so that it would make no difference if a Chinese wall were built around the United States; there would have to be some importation of surgical instruments from abroad.

I may say that shortly after the war was over one of the manufacturers who will appear here before the committee as a domestic manufacturer came into my office and asked me to come down to Washington and secure a provision in the consular regulations—and I was the first man in Europe to buy.

The rate provided in the proposed bill is 60 cents a dozen on \$5 valuation or less, and in addition thereto 35 per cent. Inasmuch as the vast majority of surgical instruments cost over \$5 a dozen, the limit of \$5 may be discontinued, as far as that is concerned. It simply means 12 per cent plus 35 per cent, which is 47 per cent. That is plain.

The Payne-Aldrich law provided 45 per cent under the omnibus metal schedule.

A vast amount of these instruments must come from abroad. It is noted that in Canada these goods are admitted free of duty. Last year Canada imported from the United States \$567,299 worth of surgical and dental instruments. With no duty at all, the American manufacturer sent more than twenty times the surgical instruments into Canada than he imported.

If you take the noncomparable surgical instruments as imported and apply the rates of the proposed bill you get a rate of duty of exactly 220 per cent. That is what this bill means when applied to noncomparable goods.

I have prepared a statement of comparative costs that I would like to submit to the committee covering the importation of certain surgical instruments, and I have put against that the prices as sold in the United States.

Let me say in this connection that the supply must of necessity be limited. It covers 137,000 surgeons and 9,000 hospitals. That is to say, the field can not be increased. The vast amount of surgical instrument items, numbering 10,000, means a tremendous manufacturing proposition. If you make the rate prohibitive, even then the American manufacturer could not cover all the surgical needs of this country, because his overhead would be so vast that the cost of production would put them absolutely out of reach. Inasmuch as it is a highly specialized industry it must have a world market in order to make the production necessary to bring down the cost.

With reference to the noncomparable——

Senator SMOOT. If it is noncomparable, under the provisions that will be adopted if the American valuation plan is adopted, it would not take the same rate as provided in this bill.

Mr. WALKER. Senator, then I am speaking of something that I do not know anything about.

Senator SMOOT. I am only telling you.

Mr. WALKER. I am glad to know it. It is a comfort, at least. I have prepared these sheets that show just what the rates would mean when applied to the present situation.

Senator LA FOLLETTE. Make that a part of your statement.

Mr. WALKER. If you take a hæmostatic forceps, it is \$5.28. The Ny-Scheerer Corporation make it for \$10.20; Haslam, \$10.20; Sklar, \$10.20; and Pilling, \$12. Taking the American valuation and adding to it, it would bring the cost at New York from \$9.33 to \$11. You will find here that the rate of duty applied upon the American selling price of the comparable article is 123 per cent. That simply makes it so that merchandise which this paragraph covers will be absolutely prohibited under the present bill.

The CHAIRMAN. Did you present that objection to the Ways and Means Committee of the House of Representatives?

Mr. WALKER. No, sir; I do not think it was presented there.

Senator SMOOT. Mr. Chairman, this will always show in the profits wherever there is an article such as scissors and knives and surgical instruments the profit on which is over 100 per cent.

Mr. WALKER. Let me say, in answer to the Senator from Utah, that that probably is true, but it must be borne in mind that in caring for the surgical-instrument demands in this country there must be a tremendous stock.

Senator SMOOT. Nobody questions the statement that you made in the first place. I recognize that, and I think the committee does.

Mr. WALKER. You can not do a surgical-instrument business to-day without 50 per cent profit on your selling price. I figure, on the noncomparable merchandise which you tell me is not necessary to produce because the bill is to be changed——

Senator SMOOT. On the item that you speak of, forceps, the cost in New York is \$5.28. You say that article sells as high as \$12.

Mr. WALKER. That is the Pilling price.

Senator SMOOT. Yes; \$10.20 is the next price. So there is 100 per cent difference there, or within 1 per cent. Others are over 100 per cent, and that would make the difference.

Mr. WALKER. If you will take the Kny-Scheerer Corporation price of \$10.20 and allow them 50 per cent profit on that, it would be \$5.10. That is exactly 18 cents less than the landing cost. Is that fair?

Senator SMOOT. It is absolutely the case, and I say that it need not necessarily be where there is 100 per cent difference in the cost of a foreign article and an article made in this country.

Mr. WALKER. I do not see how it could be less when you have to take care of the tremendous amount of stock to care for the domestic needs.

(The statement referred to is as follows:)

Comparative cost of surgical instruments.

Title.	Present cost.		Present selling price of imported and domestic makes.				Under proposed American valuation.	
	Germany.	New York.	Kny-Scheerer Corporation.	Haslam.	Sklar.	Pilling.	Cost will be in New York.	Equal to duty of—
Hæmostatic forceps, 20 per cent.....	\$4.20	\$5.28	\$10.20	\$10.20	\$10.20	\$12.00	\$9.33	Per cent 13
Minor operating knives, 20 per cent.....	4.20	5.28	7.80	6.60	7.80	7.53	70
Bandage shears, 30 per cent..	6.00	8.16	16.20	12.48	12.00	15.00	12.00	94
Thumb forceps, 20 per cent..	2.40	3.00	5.40	4.00	4.20	4.50	5.79	95
Sponge forceps, 20 per cent...	6.60	8.28	16.20	12.00	12.00	12.00	12.54	91
Dressing forceps, 20 per cent..	6.60	8.28	15.60	13.20	13.20	15.00	13.20	92
Uterine dilator, 30 per cent..	33.00	41.28	72.00	48.00	13.20	66.00	57.21	78

NOTE.—If the American-valuation plan is adopted, we respectfully suggest that the proposed duty be eliminated and the ad valorem duty be fixed at 10 per cent, or at most 15 per cent, because we find that the present revenue on a basis of 20 per cent duty would (if applied to "American valuation") be equal to 7-11 per cent.

Mr. WALKER. I would like to have the consent of the committee to file a brief.

The CHAIRMAN. You may file a statement.

STATEMENT OF E. J. SOVATKIN, REPRESENTING THE SELASKE MANUFACTURING CO., BROOKLYN, N. Y.

Mr. SOVATKIN. Mr. Chairman and gentlemen of the committee represent the manufacturers of surgical instruments, and I have come here to ask you gentlemen to give us a fair rate of tariff that will give us an opportunity to compete with the importers of German instruments. They are our sole competitors.

Before the war about 80 per cent of the instruments used in this country were imported from Germany. During the war period

industry was built up to quite an extent, a large amount of capital is invested in the business in this country, and surgical instruments are made in six different States, normally employing about 4,000 men. Senator SMOOT. Are you interested in the manufacture of dental instruments?

Mr. SOVATKIN. No; just surgical instruments.

Senator WALSH. How many men does your company employ?

Mr. SOVATKIN. Normally, a little over 200 men.

Senator WALSH. How many of the 10,000 varieties of surgical instruments do you make?

Mr. SOVATKIN. In our own plant a little over 3,000.

I understand a witness yesterday made the statement there were about 10,000 different styles of surgical instruments, and only about 2 per cent made in this country. I know there are over 7,500 patterns of surgical instruments made in this country. He also made the statement that \$567,299 worth of American-made surgical and dental instruments were imported in Canada in one fiscal year. I don't believe that over 10 per cent of that was surgical instruments. It may have been dental instruments, but not surgical. We do not export 2 per cent of our product to all parts of the world.

Senator WALSH. Give the name of your company.

Mr. SOVATKIN. The Sklar Manufacturing Co., located in Brooklyn, N. Y.

In the making of surgical instruments anywhere from 75 to 95 per cent is the labor cost. Our mechanics are earning now from 40 to 50 cents an hour, and in Germany the same class is being paid 5½ to 8½ marks an hour, equivalent at the present ratio of the German mark to about 6 cents an hour. I know that German factories are working with increased forces on full time.

Senator SIMMONS. Do you think that the German mark in Germany will not buy any more than 8 cents will buy on this market?

Mr. SOVATKIN. Let me get your question again, please.

Senator SIMMONS. Do you think that 8 German marks in Germany will not buy any more than—probably it should be—12 cents in this country?

Mr. SOVATKIN. Hardly that.

Senator SIMMONS. I am asking you about what it will buy.

Mr. SOVATKIN. Yes.

Senator SIMMONS. Do you believe it will only buy about what 12 cents will buy on this market?

Mr. SOVATKIN. I think it will buy more, Senator.

Senator SIMMONS. It will buy more?

Mr. SOVATKIN. I think it will. I have just come back from Germany.

Senator SIMMONS. You think that the purchasing power of 8 German marks is more than their gold value, measured by the American standard?

Mr. SOVATKIN. Yes, sir.

Senator SIMMONS. How much more?

Mr. SOVATKIN. I can not figure it out in cents. I could give you the prices of foodstuffs in Germany in July of this year, because I was there.

Senator SIMMONS. I wish you would.

Mr. SOVATKIN. I could give them to you right here. I have the prices of certain foodstuffs that I took notations of when I was over there.

Senator McCUMBER. Are those wholesale or retail prices?

Mr. SOVATKIN. Retail prices marked on the windows of the stores in Germany.

Senator SIMMONS. These are retail prices?

Mr. SOVATKIN. Yes, sir. Meats sold from 9 to 10 marks a pound. That is the German pound, which is, I believe, 10 per cent more than our pound. Their pound is heavier than our pound.

Senator SMOOT. Two thousand two hundred and forty pounds a ton?

Mr. SOVATKIN. It is more than 16 ounces.

Senator SIMMONS. Meats were selling for what?

Mr. SOVATKIN. Nine and ten marks a pound, without the bone.

Senator SIMMONS. What sort of meat?

Mr. SOVATKIN. Steak.

Senator SIMMONS. How much would that be measured in gold?

Mr. SOVATKIN. 12½ cents.

Senator SIMMONS. Per pound?

Mr. SOVATKIN. Yes, sir.

Senator SIMMONS. How much would 12½ cents buy on this market?

Mr. SOVATKIN. I don't believe that it would buy more than a quarter of a pound of good steak, would it?

Senator SIMMONS. Then you can take that 12 cents over there and buy a pound with it, or with the mark?

Mr. SOVATKIN. Yes, sir.

Senator SIMMONS. And it will take how much American money to buy a pound in this country? Would it be 40 cents?

Mr. SOVATKIN. I believe so.

Senator SIMMONS. Forty cents would buy a pound?

Mr. SOVATKIN. I think so.

Senator SIMMONS. So that the German laborer with his hour's work can buy a pound of meat, and you pay your labor 40 cents an hour and it takes an hour of his work to buy a pound of meat on the American market? Is that not so?

Mr. SOVATKIN. Yes, sir.

Senator SIMMONS. So that the wages that a German gets for an hour's work will buy as much meat on that market as the wages you pay your common laborers will buy on this market?

Mr. SOVATKIN. That is right. Do you want any more of these food prices?

Senator WALSH. Yes.

Mr. SOVATKIN. Margarine. There is not very much butter there. They use a lot of margarine. That sells at 6 marks a pound. Eggs at 12 marks a dozen, fresh eggs. Beans are 2 and 3 marks a pound. Peas are from 3 to 5 marks a pound. Bread is from 1½ to 3 marks a pound.

Senator SMOOT. Have you reduced the kilos to pounds?

Mr. SOVATKIN. They sell it in pounds there.

Senator SMOOT. I never knew that.

Mr. SOVATKIN. That is the way they sell at retail.

Senator SMOOT. I never heard of that before.

Senator SIMMONS. The long and short of it is that the wage the German laborer receives will buy as much food products over there as wages you pay in this country will buy over here?

Mr. SOVATKIN. I think the average will probably buy more. The same thing applies to clothing and shoes. I priced clothing and I priced shoes. I stopped at the best hotel in Tuttlinger, which is a northern German center for making surgical instruments, where the best surgical-instrument plant in the world is located.

Senator SIMMONS. The value of the dollar is measured by what it will buy?

Mr. SOVATKIN. Yes; that is right. I was there eight days, and my bill for the eight days, including all meals and some liquid refreshments with every meal, was 409 marks and 20 pfennigs, for eight days.

Senator SIMMONS. What is that in our money?

Mr. SOVATKIN. That would be about \$5.50 for the eight days, including half a bottle of wine with every meal.

As I said before, the wages are $6\frac{1}{2}$ to $8\frac{1}{2}$ marks an hour in northern Germany and $5\frac{1}{2}$ to $7\frac{1}{2}$ marks an hour in southern Germany. That is the reverse of what it was before the war. The mechanics in northern Germany were paid higher wages before the war than the mechanics in southern Germany were paid. It is just the reverse now, because foodstuffs are cheaper down there.

Paragraph 359 of this proposed tariff bill provides 35 per cent ad valorem plus a specific rate of 60 cents a dozen on surgical instruments costing \$5 a dozen or less, and 12 cents per dozen for every dollar per cent over that. That is on the American valuation. With that rate of duty I believe that we could manufacture perhaps 50 per cent of the instruments that are required in this country.

I would recommend a rate of 60 per cent ad valorem, plus that specific rate. I think we could then make about 90 per cent of the instruments used in this country.

Senator SMOOT. You mean 60 per cent instead of 35 per cent ad valorem.

Mr. SOVATKIN. Yes, sir.

Senator SMOOT. And the specific?

Mr. SOVATKIN. Yes, sir; because in the making of instruments so much of it is included in the cost of labor. It is almost all the cost of labor.

Senator McLEAN. Have you made an estimate of the difference in the cost of labor in this country and over there?

Mr. SOVATKIN. No; this is based on the cost of the instruments laid down here. I have got the invoices for goods I bought while I was over there this last summer. I know what the goods cost laid down here; I know what they cost in Germany; I know what it costs to manufacture them here, and I know what the wholesale selling prices are here. The importers of German instruments to-day are not basing their selling price on the cost of the goods laid down here. They are basing it on the American selling price, and cutting it enough under it to get the business. The result is that our plant is running about 20 per cent.

Senator McLEAN. And your idea is that they could sell them much cheaper?

Mr. SOVATKIN. They could sell them for half the price they are selling them now and make a profit. And, furthermore, the price

the German manufacturer is charging for his goods now, on the American market or any foreign market, is higher than they are selling the goods for inland. The reason for that is they want a differential so they can reduce their price when the tariff in the other countries is raised. They told me that when I was there. The different organizations have taken that attitude. Every industry over there is organized.

Senator McLEAN. Basing your estimate on the selling price here you need 60 per cent ad valorem plus the specific rate you refer to.

Mr. SOVATKIN. Taking it on the selling price here we need the 60 per cent to be able to make 90 per cent of the goods required here. If you would put a duty of 100 per cent on surgical instruments you would not keep all German goods out.

Senator SIMMONS. What are the importations now?

Mr. SOVATKIN. There is no way of telling, Senator.

Senator SIMMONS. I am advised by the experts that there are practically no importations now. Is that true?

Mr. SOVATKIN. Senator, I can show you invoices right now for goods that have arrived in this country, and some are on the way.

Senator SIMMONS. I know some are coming, of course.

Mr. SOVATKIN. Large quantities.

Senator SIMMONS. How many?

Mr. SOVATKIN. I have 500,000 marks worth of instruments consigned to our firm now on the water or in the customshouse in New York.

Senator WALSH. Why do you get instruments from Germany if you are an American manufacturer of surgical instruments?

Mr. SOVATKIN. We imported them before the war.

Senator WALSH. Is it because you can not make them as cheaply in your own factory?

Mr. SOVATKIN. No; they are cheaper and we have to have them to stay in business.

Senator WALSH. You went over to Germany and bought how much?

Mr. SOVATKIN. I bought about 2,000,000 marks worth of instruments.

Senator WALSH. You imported them to this country and went into the importing business here?

Mr. SOVATKIN. We have been in the importing business a good while.

Senator WALSH. And some of these instruments are identical with those you make here?

Mr. SOVATKIN. Yes, sir.

Senator WALSH. So you practically intend to close down that part of your factory and sell German instruments?

Mr. SOVATKIN. If the tariff is not put on there we will have to close it down.

Senator WALSH. Some of the dumping that has been going on has been done by the manufacturers themselves.

Mr. SOVATKIN. We are just getting our goods in. We are not dumping them. We will have to sell them at the same price as other importers are selling them and will have to go out of the manufacturing business altogether if we don't get a tariff.

Senator WALSH. How much less could you buy them for from the Germans than you could from the importers in New York?

Mr. SOVATKIN. I have not asked for any quotations from New York importers on their goods.

Senator SMOOT. Have you bought heavier this year than heretofore?

Mr. SOVATKIN. Yes, sir.

Senator SMOOT. If you have a great quantity of goods on hand, and we give you the protective tariff that you are asking for here, you will make a handsome profit on those goods you have already bought.

Mr. SOVATKIN. That is also true of all the importers.

Senator SMOOT. Is that the reason you went over and bought heavier this year than you generally do?

Mr. SOVATKIN. Well, Senator, we have had a bill—I appeared before this committee in 1919 and asked for a tariff on surgical instruments. You may recall that.

Senator SMOOT. I am aware of it.

Mr. SOVATKIN. We were turned down. There was nothing left to do but to import German instruments if we were going to stay in business. We have been in the surgical instrument business for 28 years and expect to remain in it, either as manufacturers or importers.

Senator SIMMONS. You say you bought 2,000,000 marks worth?

Mr. SOVATKIN. Yes.

Senator SIMMONS. That is about \$30,000 is it not?

Mr. SOVATKIN. Yes; hardly that.

Senator SIMMONS. What was the output of your factory?

Mr. SOVATKIN. In 1918 our output was a little over a million dollars.

Senator SIMMONS. And you imported about \$30,000 worth this year?

Mr. SOVATKIN. Yes, sir. We have one factory in Philadelphia that has a larger output.

Senator SIMMONS. Is that your plant?

Mr. SOVATKIN. No, sir. There are about 50 manufacturers all told in the United States, by and large.

Senator SIMMONS. You have not taken the trouble to find out, although you are here asking for 60 per cent tariff, what the importations of last year were.

Mr. SOVATKIN. There is no way of determining that, because they are included in the basket clause. That is where surgical instruments are. They have no separate classification. We have tried to get it and could not.

Senator SMOOT. Do you export surgical instruments.

Mr. SOVATKIN. Very little.

Senator SMOOT. What do you call "little?"

Mr. SOVATKIN. I don't believe we export 2 per cent of our product.

Senator SMOOT. The statistics show there were about \$800,000 worth of surgical instruments exported from the United States last year. Do you know what manufacturers in America exported those goods?

Mr. SOVATKIN. I can not tell you. I could easily ascertain by questioning our other manufacturers and requesting them to give

me a statement of what they exported last year That must include other than surgical instruments.

Senator SMOOT. No; it does not.

Mr. SOVATKIN. It must include dental instruments.

Senator SMOOT. No; it does not include dental instruments at all. It simply includes what is designated as surgical instruments, \$800,000 worth of goods exported from America last year. What I want to know is how much you exported of those \$800,000 worth?

Mr. SOVATKIN. I could give you the exact figure by looking it up.

Senator SMOOT. Have you imported goods from Germany and exported any of those German goods?

Mr. SOVATKIN. Not that I know of.

Senator SMOOT. To Canada or South America?

Mr. SOVATKIN. Very little, if any. In Canada we have no duty at all on instruments, and they import direct from Germany and England.

Senator SMOOT. We sell a good many goods over there, a good many surgical instruments from America.

Senator SIMMONS. You do not make in this country all kinds of surgical instruments, do you?

Mr. SOVATKIN. Almost all kinds.

Senator CURTIS. It was demonstrated during the war that we could make in this country nearly any surgical or medical instrument made in the world. There is no question on earth about it. We can make them all.

Senator SIMMONS. That was not the question I asked him. I asked if he did make them all.

Mr. SOVATKIN. We make every instrument that is required in surgery. We made them during the war period, and I believe they are being made to-day.

Senator SIMMONS. You make every instrument being used in surgery?

Mr. SOVATKIN. Oh, no.

Senator SIMMONS. That is what I asked you.

Mr. SOVATKIN. There are some special patterns we do not make.

Senator SIMMONS. Can you tell us what part of these instruments that are imported to this country are not made in this country?

Mr. SOVATKIN. I can not tell you that, Senator Simmons.

Senator SIMMONS. Do you make all the kinds of instruments that are imported?

Mr. SOVATKIN. No, not all.

Senator SIMMONS. What percentage of this \$30,000 worth that you imported are of kinds that you do not make?

Mr. SOVATKIN. Perhaps 10 per cent.

Senator SIMMONS. Not over 10 per cent?

Mr. SOVATKIN. I don't think so.

Senator McLEAN. Do you sell your imported articles for less price than those you manufacture?

Mr. SOVATKIN. We have not had any imported articles to sell. They are on the way now.

Senator McLEAN. Have you not imported them in the past?

Mr. SOVATKIN. Before the war.

Senator McLEAN. Is it customary to sell those at a less price than you sell your own manufactured article?

Mr. SOVATKIN. Yes, sir.

Senator McLEAN. Is it your judgment that if you are driven out of business and prevented from producing them in this country you will be able to supply the American market at a lesser price?

Mr. SOVATKIN. Yes, sir. There was something said before the Ways and Means Committee on this bill in regard to that.

Senator SIMMONS. How do the surgical instruments made in this country compare with the German article as to quality?

Mr. SOVATKIN. I think they are just as good in every case, and in some cases better.

Senator CURTIS. Mr. Chairman, it was demonstrated and shown at the special hearings last year that there were better articles produced in this country than in any other country in the world.

Senator SIMMONS. That is true of a large part, but it is not true of all of them.

Senator CURTIS. I did not say all of them. I said it was true as to certain articles.

Senator SIMMONS. That would be true as to many, but taking it as a whole, how do they compare?

Mr. SOVATKIN. I think they compare very favorably.

Senator SIMMONS. Some are better and some not so good?

Mr. SOVATKIN. Some are better and some not so good.

Senator SIMMONS. Are there some instruments that the operators in this country prefer the German make over the American make?

Mr. SOVATKIN. I don't know. There may be some special types of instruments, special instruments that are made only in Germany, which the American surgeon or specialist would prefer.

Senator SIMMONS. Not made in this country at all?

Mr. SOVATKIN. Yes, sir. We have some types that are only made abroad.

Senator McCUMBER. Is there any reason why we can not make them here?

Mr. SOVATKIN. I don't know that there is.

Senator McCUMBER. As far as material and skill are concerned, we can produce them?

Mr. SOVATKIN. As far as material and skill are concerned, we can produce them.

The Tariff Commission held hearings in New York in 1918 on surgical instruments, and in the report that they published is a statement that the Bellevue Hospital and allied hospitals of New York spent one-tenth of 1 per cent of their appropriation for surgical instruments. You can see what a small item it is in the entire expenditure. One hospital in Brooklyn that I am connected with and which opened last November, the institution costing something over half a million dollars to put in their equipment, and the total expenditure for the initial equipment of surgical instruments was a little over \$2,100. You can see what a small percentage it is. The general practitioner, the doctor, does not spend very much for surgical instruments. He does not have to have them. It is the surgeon or specialist that buys them, and in proportion to the fees they get their expenditures for surgical instruments are not very great.

Senator CURTIS. You are going to file a brief, are you not?

Mr. SOVATKIN. I have not prepared one. I will be glad to file one if it is desired.

Senator CURTIS. Mr. Chairman, I would like this witness to prepare a brief and submit it within a reasonable time for printing in the record. I do that for the reason that he has been in Germany recently, and knows the wages and costs and can supply information of that kind which will be valuable to the committee. In our hearing a few months ago the only thing we did not have was the price of commodities and also the wages paid. If we had that now we could take the old hearings and we have a complete case made. We went into this question very thoroughly, heard witnesses for days, but we did not have the wages then paid in Germany or what they were paying for their product.

Senator SIMMONS. Have you any other competitors in the production of these articles except Germany?

Mr. SOVATKIN. We did have Japan as a competitor, but they never came up to the American or German instrument in quality, so that they do not figure very much.

Senator SIMMONS. I have not been able to find that we have any competition anywhere in the world, from the testimony at these hearings, except Japan and Germany.

Mr. SOVATKIN. In surgical instruments we have not.

Senator SIMMONS. We have not in anything else that has been talked about since these hearings began.

The CHAIRMAN. You mean in number?

Senator SIMMONS. We have not got the number yet.

If you were given a 60 per cent protection, do you think there would be any further importation of surgical instruments into this country?

Mr. SOVATKIN. I believe there will be some; yes, sir.

Senator SIMMONS. Do you think the amount that will come in under that rate will be more than a very negligible quantity?

Mr. SOVATKIN. I believe somewhere from 10 to 20 per cent of the instruments used here will be imported just the same.

Senator WALSH. No matter what the rate is.

Mr. SOVATKIN. I said at 60 per cent.

Senator SIMMONS. No matter what the rate is. Why?

Mr. SOVATKIN. Because of special types of instruments made over there.

Senator SIMMONS. If no rate will keep them out, tell me why?

Mr. SOVATKIN. There are certain special instruments made there that are not made here. There are new instruments being designed all the time.

Senator SIMMONS. Then you say with a 60 per cent duty practically no importations of those articles would come in, except those that are not produced in this country?

Mr. SOVATKIN. Yes, sir.

Senator SIMMONS. Then you are asking an absolute prohibitive duty as to instruments produced in this country?

Mr. SOVATKIN. We are asking for a rate of duty that will protect our industry here.

Senator SIMMONS. You practically said it would be prohibitive as to all instruments produced in this country.

Mr. SOVATKIN. I can give you the figures of what the 60 per cent duty would mean with the present prices in Germany and present selling prices here.

Senator SIMMONS. I do not want your figures. I want your judgment and your testimony. As I have understood your testimony—and if you want to change that testimony, you have that privilege—but as I understood you, you said that 60 per cent would practically exclude all instruments not produced in this country.

Mr. SOVATKIN. I did not say that would exclude them. It would put us on an even par with them. If their goods laid down here cost almost the same as ours then we can compete with them. We can not compete with them now.

Senator SIMMONS. I asked you, if that 60 per cent rate is imposed would there be any importations into this country, and I understood you to say there would practically be none except as to articles not produced in this country.

Mr. SOVATKIN. I misunderstood you then. If you will permit me, I would like to change that.

Senator SIMMONS. All right.

Mr. SOVATKIN. No matter what the rates of duty may be, there are certain special types that will be imported anyway. This 60 per cent tariff, the way I estimate it, will bring the German goods into this country at about the same price that the wholesale prices are and give us a chance to compete with them, and that is all we are asking for. It will not be an embargo on them. It will not be a tariff wall that will prevent importation. They will still import them.

Senator SIMMONS. It will not be a tariff wall, but it will be so near a tariff wall that you can not tell one from the other.

Mr. SOVATKIN. They will be about the same selling price here.

Senator SIMMONS. I think I understand you.

Senator McLEAN. Put in your brief the total production in this country, and the nature of competition.

Mr. SOVATKIN. Yes, sir.

The CHAIRMAN. Senator Curtis, you wanted to have a brief filed?

Senator CURTIS. Yes. I would like to have this gentleman or some other party to bring to this committee for our inspection the instruments made in this country, together with similar instruments made in other countries. It would be most interesting to this committee to see. We had those exhibits before the committee heretofore, and I would like to have this committee see them.

The CHAIRMAN. Could you do that before next Wednesday?

Mr. SOVATKIN. I believe I can. Some of these goods are on the way now and probably will not get in by Wednesday. I would like to bring some of those German instruments here and compare them with the American-made instruments.

Senator CURTIS. We had some exhibits before the committee a few months ago that will answer the same purpose.

The CHAIRMAN. I think what is available will be sufficient. If you can come along between now and next Wednesday the committee will be glad to hear you, at Senator Curtis's request, in the way you have described.

Mr. SOVATKIN. Very well. I thank you.

Senator SMOOT. Did you have some exhibits before the Ways and Means Committee?

Mr. SOVATKIN. I don't believe we did, Senator. We had them before your committee.

Senator WATSON. They had exhibits before our special committee of instruments made in the United States, Germany, and Japan.

ENGINEERING AND SCIENTIFIC INSTRUMENTS.

[Paragraph 360.]

STATEMENT OF JAMES G. BIDDLE, PHILADELPHIA, PA.

Mr. BIDDLE. My business is that of a merchant who sells engineering and scientific instruments, including some optical instruments. I may add that I have been engaged in this business for more than 30 years, 25 years of that period having been on my own account. I have been identified with manufacturing to some extent, largely with importing, and also with buying and selling instruments of American manufacture.

As of to-day probably 75 per cent of my business is importing and 25 per cent is in goods that are produced in this country.

The paragraphs that interest me are Nos. 228, 360, and 393. Actually they are all more or less alike, and if you please I will confine my remarks to paragraph 360, as really covering the general situation.

First of all, I should like to request that the committee consider the advisability of striking out from paragraph 360 the requirement as to name of maker.

In general I have no objection to that. In fact, when we are importing high-class instruments we prefer that the maker's name shall be on them, because it helps to give them standing; but occasionally we uncover on the other side, just as is done here, some article produced by an unknown maker, and my feeling is that when an importer in the same way as a dealer over here, does something in the way of introduction he is entitled to the protection that comes from not disclosing the name of the maker.

By all means have the name of the country of origin on the instrument, as we have had under previous acts, but I would like to see the requirements as to the name of the maker omitted.

It is very difficult for one who has grown up in Philadelphia to be anything but a Republican. That has been my background all these years, and I am not opposed to a tariff. But I do feel very strongly that the tariff as suggested in paragraph 360 interpreted in terms of American valuation, if I am able to understand what that means will be largely prohibitive in the matter of a great many scientific instruments, to this extent: Either they will not be imported at all because the scientist or purchaser can not afford to pay the price—

Senator SMOOT. What do you want?

Mr. BIDDLE. If we must have American valuation, I believe that the equivalent of 40 to 45 per cent would be 15 per cent in terms of American valuation. I confess that I do not know just what it means but that is as near as I can come to it.

I will illustrate this point a little further. I have been importing for some 30 years under tariffs varying from 20 to 45 per cent, accompanied at the same time with free trade for educational institutions. I understand that this bill contemplates withdrawing the duty-free privilege. It is a fact that I have not been able to see in all these years any variation in the effect on the business of importing, whether the tariff is 20 per cent or whether it is 45 per cent. In other words, scientific instruments are selected almost entirely on the basis of quality and fitness for a given purpose, and not on price.

I remember, back in 1890, when I was quite a young fellow, the Weston Electrical Instrument Co. was established over at Newark, N. J. Dr. Weston—he was Mr. Weston then—had the ability to develop a line of electrical instruments, ammeters and volt meters, which were absolutely better than anything which had been made before. I was then connected with the old house of James W. Queen & Co. We were importing such instruments from France and England.

When the Weston instruments were put on the market at substantially higher prices than we were charging for the foreign instruments, we were absolutely put out of business in those instruments, and deservedly so, because the Weston instruments were infinitely better.

Take the business of X-ray apparatus. I remember very well when Prof. Roentgen made his announcement back in 1895. At that time we were importing induction coils and such things from Europe. To-day all of those things are made in this country. It is not a question of tariff protection; it is a question of superior goods. The General Electrical Co. to-day is manufacturing X-ray tubes that are selling for \$125 on merit, whereas tubes from the other side can be picked up here and sold for perhaps \$25. But they do not sell. They do not fill the bill. Forty per cent duty, ad valorem, in terms we have known in the past I should not object to. I think it is a bit high, but I should not object to it. But actually, if I have any conception of American valuation, it is equivalent to not less than 300 per cent duty in terms of foreign value. In other words, if we make the—

Senator SMOOT. Your statement before was 300 per cent.

Mr. BIDDLE. I do not think so, if you will pardon me.

Senator SMOOT. You said 45 per cent was equal to 15, or 45 per cent on foreign value was equal to 15 per cent on American value. So that is a 300 per cent increase.

Mr. BIDDLE. I was not attempting to hew exactly to the line. I do not know whether 15 is just right or not.

Senator SMOOT. In other words, on foreign valuation, in order to make it equivalent, the instrument which you would import here at \$3 would sell for \$3?

Mr. BIDDLE. No. I can answer your question, perhaps, with another illustration which I happen to remember, if I may.

Senator SMOOT. Yes.

Mr. BIDDLE. This is entirely empirical. We will take an instrument which may cost \$36 in England or Germany or Switzerland. We will assume it costs about 10 per cent to land it over here. We will assume that the importer is satisfied with a gross profit of 20 per cent on the selling price out of which his expenses must be paid. That is too low, but we will assume that for the argument; 40 per cent of \$100 is \$40. That is the duty; add \$40 to your cost of \$40 and you have a total cost of \$80 and you sell for \$100, because you are allowing a gross profit of 20 per cent on the selling price out of which the importer's expenses must be paid—

Senator SMOOT. Why do you not carry on your illustration which you started with? You started with \$36. Ten per cent of that would be \$3.60; 20 per cent would be \$7.20.

Mr. BIDDLE. Twenty per cent profit on the selling price?

Senator SMOOT. I am speaking of the importer's price on the foreign goods, now. You got that far, and then you quit and went back to \$100. Why did you not carry your case on in the way you started?

Mr. BIDDLE. The purchase price, Senator, is \$36.

Senator SMOOT. The foreign price?

Mr. BIDDLE. The importing expenses are \$4.

Senator SMOOT. Three dollars and sixty cents, you said—10 per cent.

Mr. BIDDLE. I thought I said \$4.

Senator SMOOT. The profit for the importer is 20 per cent—

Mr. BIDDLE. On the selling price over here, Senator—

Senator SMOOT. I am trying to get at what they would come to now for under existing law.

Mr. BIDDLE. I will tell you exactly how that would work out. I have the comparison as between American valuation and foreign valuation.

Senator SMOOT. I wanted to figure it out, and then I could tell you exactly what it would be; but if you have not got it I will not crowd you any further in getting that information, but let you put it in the way you want to.

The proper way to get at it is to take an instrument that costs \$36 now in a foreign country, on foreign valuation, and add your profits and all the expenses to it, and then the duty at 40 per cent. Then take the American valuation on that same identical instrument and figure it out the same way—

Mr. BIDDLE. I think I have the equivalent of that here. Perhaps I have gone at it backwards, from your viewpoint. If I have done my figuring correctly, if we sell this instrument for \$100 on the basis of American valuation, the importer's gross profit is \$20, 20 per cent of the selling price. Its cost is \$36. I have added \$4 for expenses, making \$40, or a total cost of \$80 landed, or f. o. b. warehouse, including duty. That is on the basis of American valuation.

Senator SMOOT. Why do you not say that if you would sell it for \$200 or \$300, then you would show a bigger difference than that?

Mr. BIDDLE. Certainly.

Senator SMOOT. Are you selling \$36 goods for \$100?

Mr. BIDDLE. We would have to if we have to pay 40 per cent duty on American valuation.

Senator SMOOT. Then you want to get \$40 on that?

Mr. BIDDLE. No, sir; only \$20.

Senator SMOOT. Well, go on.

Mr. BIDDLE. It is absolutely clear, Senator. On the basis of 40 per cent duty, on foreign valuation, the selling price would be \$76 and the gross profit would be 20 per cent. The importer would make \$14. I am sorry that I do not make myself clear to you, but it is absolutely clear to me.

Senator SMOOT. If you could make all profits that way and carry them up that way you would be well off at the end of the year.

Mr. BIDDLE. I do not think I am singular in that, am I?

Senator SMOOT. No; I do not think so.

Senator McLEAN. You say it costs one-third as much to manufacture these articles abroad as it does here?

Mr. BIDDLE. I do not know. I know this, that—

Senator McLEAN. According to your figures I should judge it was about a third.

Senator SMOOT. Not one-third.

Senator McLEAN. Not quite; no.

Senator SMOOT. That is why I said if you would put it at \$200 you would make it even better than that as against American valuation.

Mr. BIDDLE. That just illustrates my inability to understand American valuation. Evidently I am wrong; but I have figured out that at a duty of 40 per cent under American valuation would be five times the duty that we would pay to-day on similar goods under the Underwood bill.

Senator SMOOT. Under what rate?

Mr. BIDDLE. Twenty per cent.

Senator SMOOT. Then, in other words, your proposition is immediately this, that on those goods you want 250 per cent, and if that is what you are making on scientific instruments, then your figuring is right.

Mr. BIDDLE. I am not making that.

Senator SMOOT. Then the proposition is not right. Five times as much at 20 per cent——

Mr. BIDDLE. We would not do that, Senator. I am trying to show that 40 per cent on American valuation is equivalent to five times 20 per cent on foreign valuation.

Senator SMOOT. Five times twenty is a hundred, is it not?

Mr. BIDDLE. Yes.

Senator SMOOT. And two and a half times 40 is a hundred. Of course, if you make 250 per cent, then it will be what you say—five times as much. If you want to make 500 per cent, it will be ten times as much.

Mr. BIDDLE. Who could do that?

Senator SMOOT. Who could make 250 per cent? We are not trying to protect you or anybody else for 250 per cent.

Mr. BIDDLE. I do not want you to, Senator.

Senator SMOOT. I mean, to give you the advantages you say you have had in the past, or a profit of 250 per cent. That is just what I mean. It does not mean anything else. I will admit what you say if you admit that you are making 250 per cent profit.

Mr. BIDDLE. I do not admit it, Senator.

Senator SMOOT. Then I do not admit the other.

Senator SIMMONS. This is a very interesting controversy. I would like to know what it is about.

Mr. BIDDLE. I thought I knew something about my business. but apparently I do not.

Senator SMOOT. You say 40 per cent, American valuation, is five times the amount of a valuation of 20 per cent. That is your statement, is it not?

Senator McLEAN. That is, the duty would be that.

Senator SMOOT. Is not that your statement?

Mr. BIDDLE. The duty would be equivalent to five times the duty at 20 per cent foreign valuation.

Senator SMOOT. Or, in other words, five times the duty at 20 per cent, which is equal to 40 per cent, is 100 per cent. It is two and one-half times 40 per cent, which is 100 per cent, to make it equal. There is a profit of 250 per cent, and if you are going to have that profit, then your statement is absolutely correct.

Mr. BIDDLE. I do not say we are going to have it at all, Senator. I am merely trying to indicate——

Senator SIMMONS. Let me see if I can understand this.

Senator WALSH. Wait a moment. Are any of these instruments made in this country?

Mr. BIDDLE. Yes. I am thinking in terms of instruments that are not made here.

Senator WALSH. What is the duty upon those?

Mr. BIDDLE. Under the bill we are discussing?

Senator WALSH. Yes.

Mr. BIDDLE. Forty per cent, American valuation.

Senator WALSH. Is not that a high duty for goods that are not made here at all?

Mr. BIDDLE. It would be practically prohibitive.

Senator WALSH. Even on goods that we have got to have and that are not made here?

Mr. BIDDLE. A man has got to have a big pocketbook to bring them over.

Senator WALSH. Some of the finest and most necessary instruments are made abroad and not here?

Mr. BIDDLE. Absolutely.

Senator McLEAN. You said that the price does not count on American made goods; it is the quality.

Mr. BIDDLE. Within certain limits that is true.

Senator McLEAN. Of course, I do not suppose you could tell what the price is over there. You do not know what the foreign valuation would be on those articles, so that you could tell us what the price would be?

Mr. BIDDLE. No; I do not know. I have made a mistake, apparently, in attempting to make an empirical illustration. I do not know how it came about.

Senator McLEAN. I do not think so.

Senator SMOOT. We have present the experts from the Treasury Department, and I will ask one of them.

What would you judge from the statement the witness has made. Is it not five times the amount of duty?

Mr. McCoy. His claim, reduced to simple terms, would be that the proposed rate of duty is five times the Underwood rate.

Senator SMOOT. That is exactly what I said.

Mr. BIDDLE. Yes; that is what I claim. That is what I was trying to say.

Senator SIMMONS. I was not here when you started. What were you talking about?

Mr. BIDDLE. Apparently I do not know, Senator.

Senator SMOOT. It is paragraph 360.

Mr. BIDDLE. I was trying to talk about scientific instruments and I am trying to suggest——

Senator SIMMONS. What is the present duty?

Mr. BIDDLE. The present duty under the Underwood bill is 20 per cent.

Senator SIMMONS. On foreign valuation?

Mr. BIDDLE. Yes, sir.

Senator SIMMONS. If you substitute the present duty under American valuation, how much would it increase that duty, so far as potential protection is concerned?

Mr. BIDDLE. I should say it would increase it two and a half to three times.

Senator SMOOT. You just said five times.

Mr. BIDDLE. Pardon me. Senator Simmons is speaking of 20 per cent.

Senator SIMMONS. Under the present duty, if you apply the American valuation instead of the foreign valuation it would increase the Underwood duty three and a half times.

Mr. BIDDLE. Two and a half to three times—if I understand what American valuation means.

Senator SIMMONS. It is proposed to double the Underwood rate, is not?

Mr. BIDDLE. That is my understanding.

Senator SIMMONS. If you double the Underwood rate, instead of increasing the present rate of potential protection two and a half times, you increase it five times?

Mr. BIDDLE. That is what I think.

Senator SMOOT. That is what I told him.

Senator SIMMONS. Then the American valuation, you think, so far as applied to this item, would raise the protection that the American producer would get about two and a half times. Under the new schedule if you double that rate it will raise it five times?

Senator SMOOT. That is, provided—

Senator SIMMONS. I am just trying to find out how much this American valuation is going to raise the duty.

Senator SMOOT. That is, providing the importer makes 250 per cent.

Senator SIMMONS. I do not understand he has made any proviso about it.

Senator SMOOT. If they were both exactly the same, they would not be increased that much.

Mr. BIDDLE. I shall have to go home and think that over, because I did not realize that I was making that much profit. I am glad to know about it.

Senator WALSH. Will you give us for the record a list of these scientific instruments that are commonly used and that, under the terms of the tariff, will be prohibited from entrance here?

Mr. BIDDLE. That is rather a difficult thing to do, Senator. That is covered rather fully in a paper which was prepared by the Tariff Commission perhaps in 1919. That is quite completely covered.

Senator SMOOT. Are these instruments made exactly the same in the United States?

Mr. BIDDLE. There is another great difficulty. Two scientific instruments are about as much alike as two horses.

Senator SMOOT. Then the American valuation would not apply. Under the plan that this committee has agreed to virtually the American valuation would not apply at all.

Mr. BIDDLE. May I ask what you have in mind there? That is the best news I have heard to-day.

Senator SMOOT. I have this in mind: An instrument such as you speak of, where we have not anything exactly like it in this country, dutiable under the foreign price, plus the freight and the casing and the expense to handle to New York, and whatever profits there are on such an instrument sold by the importer. The price is just the

same as it is to-day where there are no goods made in this country like them.

Mr. BIDDLE. I see.

Senator SMOOT. We will cut out comparison and competition entirely.

Mr. BIDDLE. Do I understand that the tariff which the importer will pay on these instruments which are not comparable or competitive will be precisely the same within 5 per cent of what he would have paid under the Payne-Aldrich Act with the 45 per cent duty?

Senator SMOOT. It would be whatever the wholesale price of the goods is in that country.

Mr. BIDDLE. That is American valuation, is it not?

Senator SMOOT. It is American valuation as to what the importer sells the goods for. If he makes that profit here of 250 per cent. of course he would pay under that arrangement a duty on that profit.

Mr. BIDDLE. The profit, Senator Smoot, that I have figured in this case I gave you is 20 per cent, not 250 per cent.

Senator SMOOT. Then I could tell just exactly what it would be here under the valuation plan.

Mr. BIDDLE. The instrument costs \$40 in New York.

Senator SMOOT. And your profit is what?

Mr. BIDDLE. Twenty per cent on the selling price.

Senator SMOOT. No, I am speaking of your profit on what it costs you.

Mr. BIDDLE. That adds 25 per cent.

Senator SMOOT. Then your profit is 25 per cent. That would be \$50. That is exactly what the duty would be on \$50. That is your wholesale price.

Mr. BIDDLE. That would make the instrument \$90?

Senator SMOOT. No; 40 per cent on \$50; that would be \$70.

Mr. BIDDLE. Yes; \$70. I did not know of that plan. Under these conditions that 15 per cent might be changed slightly for the American valuation on instruments which are not comparable competitive under it.

In regard to instruments that have been imported free of duty for educational institutions, I understand that it is intended to withdraw that privilege. I have in my hand what you gentlemen have received—a resolution adopted by the American Association for the Advancement of Science, a scientific body of 12,000 members, which requests that this duty-free privilege shall be continued.

Senator SMOOT. Just put that in the record. Every one of the committee has received one.

Mr. BIDDLE. I would like to have it in the record.

(The document referred to is as follows:)

DUTY ON SCIENTIFIC APPARATUS FOR EDUCATIONAL INSTITUTIONS.

The following resolution regarding duty-free importation of scientific materials and scientific books in the English language into the United States by educational institutions have been passed by the American Association for the Advancement of Science:

"Whereas the scientific education of the youth of the United States is among the most fundamental and important functions of the Republic, education being the only means by which the advantages of present civilization may be transmitted to coming generations of citizens and by which the future progress of the Republic may be assured; and

hereas the prosecution of the said scientific education of the youth requires unrestricted employment of the apparatus and materials of science in educational institutions, this being increasingly true for more advanced education; and
 hereas the scientific materials and apparatus to be used in educational institutions ought to be selected, as far as possible, without consideration of their place of origin, since science is world-wide in its scope; and
 hereas any increase in the cost of scientific equipment for education is to be greatly deplored, since the funds available for its purchase by educational institutions are invariably inadequate in comparison with the great needs and possibilities of education; and
 hereas institutions for higher education must still be relied on for the most fundamental and far-reaching steps in the advancement of knowledge, through the scientific researches of their faculties and students; and
 hereas both financial and patriotic considerations clearly require that the Republic should aid fundamental scientific research in every possible way, especially avoiding the erection of artificial barriers across the path of the advance of true knowledge; and, finally,
 hereas in consideration of the foregoing clauses, the American Association for the Advancement of Science, with its 12,000 members, almost all of whom are citizens of the United States—representing the fundamental scientific interests of the country from the standpoint of scientific research as well as from that of instruction, and representing especially the institutions for higher education and their staffs—views with very serious concern the proposal to repeal section 573 of the tariff act of October 3, 1913, which allows the duty-free importation of scientific materials by educational institutions: Therefore be it

Resolved, That the American Association for the Advancement of Science respectfully calls the attention of the Congress of the United States to the very great drance and burden that would be imposed upon the scientific education and arch in the Republic if its educational institutions were to be deprived of the vilege of duty-free importation of scientific apparatus and materials, which they e enjoyed for many years.

Resolved further, That the American association also respectfully urges the restora- of the corresponding privilege of duty-free importation of single copies of sci-ific books in the English language by recognized educational institutions and the alties, such books constituting an important item of both institutional and personal ipment for advanced instruction and research, especially since it is undesirable t scientific publications in languages other than English should be artificially ored in the United States.

Resolved finally, That these resolutions be forwarded to the proper committees of Congress of the United States to the National Academy of Sciences, to the National search Council, and to the secretaries of the scientific societies affiliated with the erican association, that they be published in Science, official organ of the asso- tion, and also that they be sent to each member of the association."

Mr. BIDDLE. I am a member of that association, and personally it kes very little difference to me whether these goods are admitted e of duty or not, but I am absolutely sincere in believing that it ll work a great hardship on our colleges and schools and I believe ll not be of corresponding benefit to American manufacturers.

Senator McLEAN. Why?

Mr. BIDDLE. Because the American manufacturers have been con-nted by this free trade for many years, and manufacturers of entific instruments have been growing and developing in this untry right along in the face of it.

Senator McLEAN. Do I understand you to say that the free im-rtation of these instruments for educational institutions will not nefit them?

Mr. BIDDLE. Oh, yes; it will benefit the institutions, but I do not ink it will harm the manufacturers to any such extent as it will nefit the institutions.

Senator McLEAN. I did not understand you.

Mr. BIDDLE. That is the point I desired to make.

I think that is all I have to submit, Senator.

Senator Smoot, do we understand each other now on this great profit I am making?

Senator SMOOT. No; not on the American valuation, but where the goods are comparable we do.

STATEMENT OF HARVEY N. OTT, REPRESENTING THE CENTRAL SCIENTIFIC CO.

Senator Smoot. You have appeared before, have you not, Mr. Ott?

Mr. Ott. Yes; with reference to another paragraph.

I am appearing now on paragraph 360 for Mr. Roberts, of the Central Scientific Co. He could not be here.

I will say that the duty of 40 per cent under paragraph 360 is satisfactory to the gentlemen interested. My chief object in appearing before you at this time is to refute some statements made by Mr. Biddle on Tuesday afternoon with regard to this matter. Mr. Biddle said, for instance, that these industries were large enough to take care of themselves. I do not have to go any further than to take some of the Government reports to show that that is a mistake.

Some of you gentlemen will remember that this matter was up in connection with House bill No. 7785 a year and a half ago. That bill did not pass. The Ways and Means Committee went into the whole matter very thoroughly. I want to read from a report of the Ways and Means Committee on this House bill 7785. Speaking of this optical glass and the scientific instruments, etc., the report says:

All of these industries, with the exception of dental and surgical instruments, which operated in a very limited manner, are new industries brought into existence by the needs of America and the allied countries in successfully prosecuting the war against the Central Powers. Prior to 1914 the value of the products covered by this bill produced in the United States was negligible; this was due mainly to two reasons: First, the low rates of import duty, which enabled the manufacturers of Germany and Austria and other countries of Europe to undersell the American manufacturer; and secondly, the duty-free provisions of paragraph 573 of the present tariff and past tariff laws permitting religious, scientific, and educational institutions, and other similar institutions, to import scientific apparatus, utensils, etc., free of duty when used for educational purposes.

This accounts, to some extent, for Mr. Biddle's statement that he had not noted much difference between the duties under the different paragraphs.

The report goes on to say:

These new industries can well be termed "key" industries, for their products are not only necessary in the teaching of scientific studies in our schools and colleges but are essential to the very existence of many highly important industrial institutions. Chemical apparatus and scientific instruments are indispensable in the laboratories which control the manufacturing of steel, iron, rubber, dyes, chemicals, sugar, etc., and particularly munitions and explosives.

The committee went into a very exhaustive examination of the subject.

Senator Smoot. Mr. Ott, we have that report. If I were in your place I would not take the time to read it, because we can refer to it when we come to your testimony.

Mr. Ott. I just want to call attention to the number of witnesses who are uninterested.

Then Mr. Parson's report states the vote of the American Chemical Society. The American Chemical Society, or its executive committee, voted 85 in favor of doing away with this duty-free clause.

Doubtless you gentlemen have received a little booklet from the American Association for the Advancement of Science in which is printed a resolution against the leaving out of this duty-free privilege. This resolution is printed in a booklet with other resolutions. The other resolutions were passed by the whole association at its meeting in Chicago in December—the latter part of last December—but this resolution with regard to the duty-free clause was not passed at that time, but was passed only by the executive committee of 11 members out of 12,000. That point should be noted. It should be remembered that that is not the word of the American Association or the Advancement of Science, as you might possibly be led to believe if you overlooked the fact that this resolution was passed on April 24 last; and the association meets but once a year.

Mr. Biddle also handed in some reports from the Tariff Commission against the leaving out of the duty-free clause and against the duty for some of these instruments. There was a report put out by the Tariff Commission to that effect. It was hurriedly gotten up, but when they went into the matter more carefully they got out a revised report which favored the bill. In fact, the Tariff Commission sent out a number of letters to different professors and to teachers of the different universities. They received about 20 answers. I can not say how many letters they sent out. Out of the 20 answers 17 were in favor of doing away with the duty-free clause; 1 was against it; 1 was noncommittal; and 1 made suggestions for alterations.

There was also a little propaganda put out, signed "Friends of Science," against leaving out the duty-free clause. This was taken up by Mr. Herty, and he printed an exposé of the source of this propaganda.

I will just leave with you some reprints of that exposé, and that will be all.

FILES.

[Paragraph 362.]

STATEMENT OF WALLACE L. POND, REPRESENTING NICHOLSON FILE CO., PROVIDENCE, R. I.

The CHAIRMAN. What is your address?

Mr. POND. Providence, R. I., Senator.

The CHAIRMAN. What is your business?

Mr. POND. File manufacturer. I am sales manager of the Nicholson File Co., of Providence, R. I., operating factories at Providence, Philadelphia, Paterson, N. J., and Anderson, Ind.

The Nicholson File Co., of Providence, R. I., being manufacturers in the United States of files and rasps, which I will simply speak of as files, respectfully suggest the importance of the careful consideration by your committee on an increase in the rates of duty on their product over the rates provided in House bill 7456, and submit for your consideration the following facts to reasonably justify their request:

There are in the United States some 25 to 30 makers of machine-cut files, with plants located in Illinois, Indiana, Massachusetts, New Jersey, New York, Ohio, Pennsylvania, Rhode Is-

land, and Wisconsin, employing, when in full operation, approximately 9,000 hands, besides from 30 to 40 smaller concerns scattered throughout the country.

There exists and has always existed between the file makers of this country actual and active competition of the keenest kind. These file makers are, at least in so far as this company is or has been concerned, or is aware, entirely independent of each other in the conduct of their business, with no trade agreements or relations of any character, either directly or indirectly, affecting their affairs.

The manufacture of files is a complex process, and one which can be undertaken successfully only by workmen long skilled in the industry. Each file from the time when it is cut from a bar of specially rolled steel until the time when it is placed in our finished stock ready for shipment must pass through from 20 to 26 processes or operations, and must be handled from 75 to 90 times.

The making of files is not in any sense of the word an automatic process. While machinery is used to perform the principal operations, each machine requires one, and in many cases two attendants, and in the great majority of cases the operation includes only one file at a time.

No less than 6,000 varieties of files are regularly made by this company. Every one of these files is a fine-edged tool, and after passing the cut stage is a very delicate tool and easily ruined or damaged if not handled with the utmost care.

In this industry only skilled workmen, together with a small number of helpers and laborers, are employed. This skilled class of labor, having been trained for many months before becoming proficient, is invaluable to the industry, and commands extremely good wages—wages far in excess of those paid in any other country in the world for the same class of labor.

In the manufacture of files the percentage of labor cost is very high; in many cases as high as from 80 to 90 per cent of the total cost.

We present herewith, marked "Exhibit A," a 2-inch round file. In producing these files 1 pound of steel, costing 38 cents, will make a dozen files, having a net value of \$144.89. The labor expended on this pound of steel enhances its value three hundred and eighty-one times.

We also present herewith, marked "Exhibit B," a 5½-inch needle file. One pound of this steel, costing 25 cents, will make 8 dozen files, having a net value of \$13.99, the labor enhancing the value of the steel fifty-two times.

We also present, marked "Exhibit C," a 14-inch flat bastard file. One dozen of these files requires 21 pounds of steel, at a cost of 4 cents per pound, or 94½ cents for the dozen files. These files have a net value of \$4.92 per dozen, the labor enhancing the value of the steel five and two-tenths times.

A casual examination of the samples shown will, we believe, demonstrate the reason for the great percentage of labor cost in the cost of any finished file.

Prior to the year 1915 the Nicholson File Co. had made no advance in the price of any of their products for a period of upward of 15 years, but had, year by year, constantly and continuously reduced their prices in competition with other file makers, these reductions

price having been effected during that time in spite of the fact that manufacturing costs within the same period had greatly increased, due to advances in rates of wages paid, cost of material, fuel, and supplies, and also due to large increases in fixed charges through reductions in operating time enforced by State legislation.

Since the year 1915 the selling prices of the products of the Nicholson File Co. have increased an average of 113 per cent. On March of this year these prices were reduced an average of approximately 5 per cent, and a further reduction of about the same amount was made effective July 1. It is a gratifying fact that while the selling prices of numerous other articles manufactured from steel as a base, and in which the cost of labor does not carry as high a percentage as does in the cost of files, have increased in the last six years anywhere from 200 per cent to 300 per cent, files advanced only 113 per cent. It may also be noted that advances in prices made by this company for their product have been materially less than advances in prices that have been made by several other file manufacturers.

During the World War in order that the demands of the Allies and our own Government might be met in the fullest manner and with the utmost of promptness, the Nicholson File Co. made extensive additions to their manufacturing facilities. If these manufacturing facilities are to be steadily and continuously employed it is essential that the duty on files shall be placed at such a figure as not to materially permit of any increased importation in volume.

The CHAIRMAN. There are no imports now?

Mr. POND. Some.

The CHAIRMAN. It is negligible, whereas the exports of the American products is very large?

Mr. POND. Yes; but of the class of files that are imported the importations are, in proportion to the quantity that is manufactured in this country, large.

The CHAIRMAN. The figures indicate a negligible condition there. do not know about it.

Mr. POND. In the sum total they do.

The CHAIRMAN. It will be difficult, will it not, to defend a very heavy increase in duty, as none of the articles are being imported?

Mr. POND. It would not be difficult provided we could demonstrate to the committee the class of files that are being imported; but, unfortunately, that is hard to demonstrate.

The CHAIRMAN. Can you not make a classification that would apply only to those particular files?

Mr. POND. That would be extremely hard to do, because files are sold by size and kind; that would include those files in with regular files.

The CHAIRMAN. What kind of files are imported?

Mr. POND. Largely the smaller, finer-cut files, such as are made in Switzerland, in Sweden, and to some extent in France, and possibly so in Japan at the present time.

The CHAIRMAN. I should not think there would be any difficulty in defining them. But still, proceed.

The fact remains that the importations seem to be nothing.

Mr. POND. Experience for the 10 years prior to the year 1914 shows that files were imported on a basis of approximately 70,000 dozen per annum. Immediately following the enactment of the Under-

wood-Simmons tariff law the volume materially increased, reaching a total during the year ending June 30, 1914, of 121,786 dozens. This increase was directly due to the reduction in the rate of duty made under the new law, and although the volume of the importations increased nearly twofold, the amount of duty collected was one-third less than the average duty collected per year for the preceding 10 years. The fact that importations of files increased nearly 100 per cent in volume during the first year of the operation of the Underwood-Simmons tariff law, when the law was actually in effect for only a portion of that year, is sufficient to demonstrate that had the war not intervened importations of files in succeeding years would have been vastly increased and to a point that would have caused a very material curtailment in the operation of file factories in this country. It is certain that in average years there will be approximately the same volume imported as occurred during the 10-year period prior to the year 1914, and there will be a distinct advantage in the matter of revenue from the enactment of a law carrying the increases in the rates of duty under this schedule that will hereinafter be suggested.

For over 35 years prior to the enactment of the Underwood-Simmons tariff law the duty on files had been specific. The specific duty is preferable because the actual duty is a fixed and certain amount based upon the quantity of goods actually imported and is not subject to the vagaries and fluctuations of foreign market values nor to fluctuations in value of exchange. Under a specific duty there would be no incentive for foreign file makers to undervalue invoices of files for the purpose of securing their entry into the United States at a low-duty cost. Undervaluation of invoices covering files would be exceedingly difficult to detect because of the fact that files of various grades and quality are so nearly alike in appearance that their difference could not be detected except by a file expert. This is well illustrated by the three samples herewith submitted, marked "Exhibit D." For these reasons this company strongly recommends specific rates of duty rather than ad valorem rates.

In every tariff law for the past 35 years prior to the enactment of the act of 1913 files were classified according to size and a graduated duty assessed under the different classifications. Under the tariff act of 1897, and again under the tariff act of 1909, files were in four groups, i. e., No. 1 files, 2½ inches in length and under; No. 2 files, over 2½ inches and under 4½ inches in length; No. 3 files, over 4½ inches and under 7 inches in length; No. 4 files, 7 inches in length and over.

This company is convinced after a careful study of the entire question through an experience covering many years that under usual conditions of the industry in this country and in the principal file-producing countries abroad the rates of duty given to this paragraph in the tariff act of 1909 were as low as could then be assessed without definite danger of an excessive volume of importations and the consequent curtailment of the industry here and loss of employment to American labor. In view, however, of the fact that prices of commodities in general have advanced heavily and with the certainty that these advances will in large part be maintained for a considerable number of years, because of the very excessive burden of taxation now existing and for some time sure to exist, and a

view of the further fact that it is desirable from the standpoint of revenue as well as the safeguarding of the industry itself, it is recommended that the following rates of duty per dozen be assessed on files:

Group No. 1, files 2½ inches in length and under-----	\$0. 40
Group No. 2, files over 2½ inches and under 4½ inches in length-----	. 75
Group No. 3, files over 4½ inches and under 7 inches in length-----	1. 00
Group No. 4, files 7 inches in length and over-----	1. 20

The above rates of duty are as low as should be included in the proposed tariff law when conditions of the industry both in this country and abroad are considered.

The principal file-producing countries of the world outside of the United States are England, Germany, France, Sweden, Switzerland, Austria, and Japan. Within the past three or four years very extensive increases have been made in the file-producing establishments in England and a vast amount of new and additional capital has been invested in the file industry there. One such concern recently incorporated had a capital of £2,000,000. Another manufacturer of iron and steel products, the largest in England, has very recently engaged in the manufacture of files, with the announced determination of intensively seeking an outlet for their product in all markets. It is inevitable that these file makers will strongly compete with domestic manufacturers here for the markets of the United States. While rates of wages paid to file operatives in England have advanced heavily during the war, they are to-day very much lower than the average wages paid for the same class of operatives in this country.

Some very extensive file-manufacturing establishments have been developed in Sweden, and these are also keenly competitive for the markets of the world. As to the actual rates of wages paid in these factories, there is no specific data, but a comparison of average rates of wages in Sweden and in the United States shows that operatives here in the same general classes receive a remuneration from 66⅔ to 80 per cent more than the same character of employment receives in Sweden.

Within the present year we have seen actual quotations in the hands of New York distributors quoting files made in Austria laid down in New York duty paid at fully 20 per cent lower than the lowest price now being quoted by American makers to the largest distributing trade.

In Japan there are at least two fully equipped file factories in active operation. It is from that source where rates of wages are only a very small fraction of the wages paid in this country that we must look for some very serious competition in years to come. It is without question that the ingenuity and perseverance of Japanese mechanics will produce, in any line of manufacture to which they may devote their attention, an article that will compare favorably in quality with the same article produced in other countries, and with their exceedingly small labor cost this material can be sent into this country in tremendous volume unless adequate preventives in the form of rates of duty are assessed against such importations.

For the reasons above given this company recommends the adoption of rates of duty applying to files that will conform with the schedule herein suggested.

Senator WATSON. What is a float?

Mr. POND. A float is simply a term applied to one kind of a file. It is a technical term.

Senator WATSON. It says here "Files, file blanks, rasps, and floats."

Mr. POND. A float is really and simply a file that has one course of row of teeth crossing it, called a "float file."

The CHAIRMAN. Is that all you desire to say?

Mr. POND. Two other largest makers, the Henry Disston & Co. and the McCaffrey File Co., of Philadelphia, have both included our brief in writing to the Ways and Means Committee.

BRIEF OF WALLACE L. POND, REPRESENTING NICHOLSON FILE CO. PROVIDENCE, R. I.

The undersigned, the Nicholson File Co., of Providence, R. I., being manufacturers in the United States of files and rasps (hereinafter included in the general term of files), respectfully suggest the importance of a careful consideration by your committee of an increase in the rates of duty on their product over the rates provided in House bill 7456, and submit for your consideration the following facts to reasonably justify their request:

There are in the United States some 25 to 30 makers of machine-cut files with plants located in Illinois, Indiana, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, and Wisconsin, employing over 100,000 hands in full operation approximately 9,000 hands, besides from 30 to 40 smaller concerns scattered throughout the country.

There exists and has always existed between the file makers of this country actual and active competition of the keenest kind. These file makers are at least in so far as this company is or has been concerned or is aware—entirely independent of each other in the conduct of their business, with no trade agreements or relations of any character, either directly or indirectly, affecting their affairs.

THE MANUFACTURE OF FILES.

The manufacture of files is a complex process, and one which can be taken successfully only by workmen long skilled in the industry. Each file from the time it is cut from a bar of specially rolled steel until the time when it is placed in our finished stock ready for shipment, must pass through 20 to 26 processes or operations and must be handled from 75 to 90 times.

The making of files is not in any sense of the word an automatic process. While machinery is used to perform the principal operations, each requires one and in many cases two attendants, and in the great majority of cases the operation includes only one file at a time.

No less than 6,000 varieties of files are regularly made by this company. Every one of these files is a fine-edged tool, and after passing the current is a very delicate tool and easily ruined or damaged if not handled with utmost care.

In this industry only skilled workmen, together with a small number of helpers and laborers, are employed. This skilled class of labor, having been trained for many months before becoming proficient, is invaluable to the industry and commands extremely good wages, wages far in excess of those paid in any other country in the world for the same class of labor.

In the manufacture of files the percentage of labor cost is very high in many cases as high as from 80 to 90 per cent of the total cost.

We present herewith (marked "Exhibit A") a 2-inch round file. In producing these files 1 pound of steel costing 38 cents will make 83 dozen files having a net value of \$144.89. The labor expended on this pound of steel enhances its value 381 times.

We also present herewith (marked "Exhibit B") a 5½-inch needle file. A pound of this steel, costing 25 cents, will make 8 dozen files having a net value of \$13.99, the labor enhancing the value of the steel 52 times.

We also present herewith (marked "Exhibit C") a 5½-inch needle file. A pound of this steel, costing 25 cents, will make 8 dozen files having a net value of 94½ cents for the dozen files. These files have a net value of \$4.92 per dozen, the labor enhancing the value of the steel five and two-tenths times.

A casual examination of the samples shown will, we believe, demonstrate the reason for the great percentage of labor cost in the cost of any finished

Prior to the year 1915 the Nicholson File Co. had made no advance in the price of any of their products for a period of upward of 15 years, but had year by year constantly and continuously reduced their prices in competition with other file makers, these reductions in price having been effected during that time in spite of the fact that manufacturing costs within the same period had greatly increased, due to advances in rates of wages paid, cost of material, fuel, and supplies, and also due to large increases in fixed charges through reductions in operating time enforced by State legislation. Since the year 1915 the selling prices of the products of the Nicholson File Co. have increased an average of 113 per cent. On March 1 of this year these prices were reduced an average of approximately 15 per cent and a further reduction of about the same amount was made effective July 1. It is a gratifying fact that while the selling prices of numerous other articles manufactured from steel as a whole and in which the cost of labor does not carry as high a percentage as does in the cost of files have increased in the last six years anywhere from 100 per cent to 300 per cent files advanced only 113 per cent. It may also be noted that advances in prices made by this company for their product have been materially less than advances in prices that have been made by several other file manufacturers.

During the World War in order that the demands of the Allies and of our own Government might be met in the fullest manner and with the utmost of promptness, the Nicholson File Co. made extensive additions to their manufacturing facilities. If these manufacturing facilities are to be steadily and continuously employed, it is essential that the duty on files shall be placed at such a figure as not to materially permit of any increased importation in volume. Experience for the 10 years prior to the year 1914 shows that files were imported on a basis of approximately 70,000 dozen per annum. Immediately following the enactment of the Underwood-Simmons tariff law the volume of imports materially increased, reaching a total during the year ending June 30, 1914, 121,786 dozens. This increase was directly due to the reduction in the rate of duty made under the new law, and although the volume of the importations increased nearly twofold, the amount of duty collected was one-third less than the average duty collected per year for the preceding 10 years. The fact that importations of files increased nearly 100 per cent in volume during the first year of the operation of the Underwood-Simmons tariff law, when the law was actually in effect for only a portion of that year, is sufficient to demonstrate that had the war not intervened importations of files in succeeding years would have been vastly increased and to a point that would have caused a very material curtailment in the operation of file factories in this country. It is certain that in average years there will be approximately the same volume imported as occurred during the 10-year period prior to the year 1914, and there will be a distinct advantage in the matter of revenue from the enactment of a law carrying the increases in the rates of duty under this schedule that will hereinafter be suggested.

For over 35 years prior to the enactment of the Underwood-Simmons tariff law the duty on files had been specific. The specific duty is preferable because the actual duty is a fixed and certain amount based upon the quantity of the goods actually imported and is not subject to the vagaries and fluctuations of foreign market values nor to fluctuations in value of exchange. Under a specific duty there would be no incentive for foreign file makers to undervalue invoices of files for the purpose of securing their entry into the United States at a low duty cost. Undervaluation of invoices covering files would be exceedingly difficult to detect because of the fact that files of various grades and quality are so nearly alike in appearance that their difference could not be detected except by a file expert. This is well illustrated by the three samples herewith submitted (marked "Exhibit D"). For these reasons this company strongly recommends specific rates of duty rather than ad valorem rates. In every tariff law for the past 35 years prior to the enactment of the act of 1909 files were classified according to size and a graduated duty assessed under the different classifications. Under the tariff act of 1897, and again under the tariff act of 1909, files were in four groups, i. e., No. 1. Files $2\frac{1}{4}$ inches in length and under. No. 2. Files over $2\frac{1}{4}$ inches and under $4\frac{1}{4}$ inches in length. No. 3. Files over $4\frac{1}{4}$ inches and under 7 inches in length. No. 4. Files 7 inches in length and over.

This company is convinced after a careful study of the entire question through an experience covering many years that under usual conditions of the industry in this country and in the principal file-producing countries abroad the rates of duty given to this paragraph in the tariff act of 1909 were as low

as could then be assessed without definite danger of an excessive volume of importations and the consequent curtailment of the industry here and loss of employment to American labor. In view, however, of the fact that prices of commodities in general have advanced heavily, and with the certainty that these advances will in large part be maintained for a considerable number of years because of the very excessive burden of taxation now existing and for some time sure to exist, and in view of the further fact that it is desirable from the standpoint of revenue as well as the safeguarding of the industry itself, it is recommended that the following rates of duty be assessed on files:

	Per dozen
Group No. 1. Files 2½ inches in length and under-----	\$1.00
Group No. 2. Files over 2½ inches and under 4½ inches in length-----	.75
Group No. 3. Files over 4½ inches and under 7 inches in length-----	1.00
Group No. 4. Files 7 inches in length and over-----	1.25

The above rates of duty are as low as should be included in the proposed tariff law when conditions of the industry both in this country and abroad are considered.

The principal file-producing countries of the world outside of the United States are England, Germany, France, Sweden, Switzerland, Austria, and Japan. Within the past three or four years very extensive increases have been made in the file-producing establishments in England and a vast amount of new and additional capital has been invested in the file industry there. One such concern recently incorporated has a capital of £2,000,000. Another manufacturer of iron and steel products, the largest in England, has very recently engaged in the manufacture of files, with the announced determination of intensively seeking an outlet for their product in all markets. It is inevitable that these file makers will strongly compete with domestic manufacturers here for the markets of the United States. While rates of wages paid to file operatives in England have advanced heavily during the war, they are to-day very much lower than the average wages paid for the same class of operatives in this country.

Some very extensive file-manufacturing establishments have been developed in Sweden, and these are also keenly competitive for the markets of the world. As to the actual rates of wages paid in these factories, there is no specific data but a comparison of average rates of wages in Sweden and in the United States shows that operatives here in the same general classes receive a remuneration from 66½ per cent to 130 per cent more than the same character of employment receives in Sweden.

Within the present year we have seen actual quotations in the hands of New York distributors quoting files made in Austria laid down in New York at prices paid at fully 20 per cent lower than the lowest price now being quoted by American makers to the largest distributing trade.

In Japan there are at least two fully equipped file factories in active operation. It is from that source, where rates of wages are only a very small fraction of the wages paid in this country, that we must look for some very serious competition in years to come. It is without question that the ingenuity and perseverance of Japanese mechanics will produce in any line of manufacture to which they may devote their attention an article that will compare favorably in quality with the same article produced in other countries. With their exceedingly small labor cost this material can be sent into this country in tremendous volume unless adequate preventatives in the form of rates of duty are assessed against such importations.

For the reasons above given this company recommends the adoption of rates of duty applying to files that will conform with the schedule herein suggested.

SHOTGUNS, RIFLES, AND AUTOMATIC PISTOLS.

[Paragraphs 365 and 366.]

STATEMENT OF E. P. GEBHARD, REPRESENTING THE MILFORD CO., MILFORD, DEL.

We respectfully submit for your kind consideration the following suggestions and comments respecting the contemplated changes to be made in the present tariff law covering shotguns, rifles, and automatic pistols, as reported in paragraphs 365 and 366 of the Fordney Act:

Paragraph 365 says that the present duty of 35 per cent is to be retained on pistols and rifles. In addition there is to be added to each gun or rifle, according to its value, a further sum of from \$1.50 to \$10.

Paragraph 366 says that there is to be a duty of 25 per cent on automatic pistols, and in addition there is also added the sum of \$1.25 to \$3.50 on each pistol, according to its value.

In addition to the above, the values of the imported articles are to be determined by the wholesale selling prices ruling in our country on similar goods.

To our mind, none of the above changes should be made if it is the intention of Congress to protect the American people against the already overprotected few dozen or so manufacturers of firearms in this country and the very few hundreds of laborers employed in said factories, who are also overprotected.

The present duty of 35 per cent under the Underwood law is more than ample to protect both manufacturer and laborer, as is shown by the fact that foreign-made guns and rifles are almost entirely off the American market to-day. And for this reason we think the duty of 35 per cent should be reduced if we are to have any competition at all. The few American manufacturers have the field to themselves to-day and require absolutely no further protection at the hands of Congress.

The manufacturers of firearms in this country are the best-protected, most prosperous, and richest manufacturers of such goods in the world. Where has it ever failed? They rolled in wealth before the war, coined money during the war, and now they ask you to further protect them by putting up a tariff wall that will absolutely prevent a foreign-made gun coming into our country. They are far behind their orders, can not fill an order for 50 guns for delivery in the coming hunting season, so we have been told by a leading manufacturer. Where will you find any foreign-made guns in this country to-day? You can not find them, for there are none.

Where will you find any foreign-made guns on the other side? You can not find them, for there are none.

Where will you find all this stuff that you hear so much about that is to be dumped into this country? Many have been looking for it, but no one has been able to locate the stuff at last accounts.

Go into the large wholesale or retail sporting goods stores in New York City and see how many foreign-made guns you can find on sale or how soon they think they can get just one gun across the pond for you.

Not many years ago you found listed in the great catalogues of the wholesale hardware houses, also in the catalogues of the large wholesale and retail sporting-goods houses, guns of foreign make. Where will you find to-day foreign-made guns listed in any catalogues?

That the American firearms manufacturers have anything to fear from foreign competition is simply rot, for the whole trade in guns to-day in this country is in the hands of the American makers. I am speaking of shotguns and rifles. There have been some foreign-made pistols sold, but after you consider that these contemplated tariff changes will do to the foreign-made pistol you will see what a slim chance one of them has of getting into this country should you adopt these changes.

The claim is made that these changes will not increase the cost to the consumer. Let us consider the facts as they are under the old and new schedules.

Under the present tariff a foreign-made gun invoiced at \$50 is taxed 35 per cent duty, or \$17.50. Package charge, freight, etc., stands the importer, say, 5 per cent, or \$2.50. Importer's profit, 10 per cent, is \$7; war tax, 10 per cent more, \$7.70; total cost to wholesaler, \$84.70. Add to this the wholesaler's profit of 25 per cent, and you have the wholesaler's price to the retailer of \$105.77. The latter's profit of 25 per cent makes the consumer's price of \$132.21.

Now, let us consider what happens to this same gun under the Fordney Act. The appraiser puts it in the same grade with Parker Bros. grade No. G. H. E., the wholesale price of which is \$112.38. Add to this 35 per cent duty, also the extra \$10 duty, and you have with the 5 per cent freight, package, etc., charge a total of \$101.83. Then add the importers profit of 10 per cent and also the war tax and you have a total of \$123.21. To this add the wholesaler's profit of 25 per cent and we have the wholesaler's price to the retailer of \$154.01. Add the latter's profit of 25 per cent and you have the consumer's price of \$192.51, instead of \$132.21, as per the figures under the present tariff. The comparison made above with the Parker grade No. G. H. E. is very conservative, for they used to sell this Parker grade for around \$50 before the prices soared to the present absurd wholesale price of \$112.38.

Now, let us consider the facts as regards the pistol under the two schedules.

The manufacturer on the other side charges the importer, say, \$9 for a 32 caliber automatic pistol. The duty under the present tariff is 35 per cent, or \$3.15. The importer adds 5 per cent for freight, package charge, etc., also war tax, and 10 per cent profit, and you have a total cost to the wholesaler of \$15.19. The latter adds his profit of 25 per cent, and you have the retailer's cost of \$18.98. The latter adds his profit and you have the consumer's price of \$23.72.

Now, what happens to this same pistol under the Fordney Act?

The appraiser puts it into the same class with the Colt 32 caliber, the wholesale price of which is \$19.60 for 23 ounces of steel made by machinery into a pistol that can not possibly cost the manufacturer more than \$6. The importer adds to his invoice price of \$9, 25 per cent duty, also the extra duty of \$3.50. He further adds 5 per cent for freight, package charge, etc., 10 per cent profit, and 10 per cent war tax, and we have the price to the wholesaler at \$21.54. The latter adds his profit and you have the wholesaler's price to the retailer at \$26.92. The retailer adds his profit and you have the consumer's price of \$33.65, instead of \$23.72, under the present tariff.

And they would have the American people believe that they are not increasing the cost to the consumers by this Fordney Act. And they would have them believe that it does not put the importer out of business, nor enable our manufacturers to still further gouge the poor overburdened buying public, who are now and have been crying out to this very Congress for protection and relief from the profiteering prices that still rule in so many instances—especially is this true of the prices of the firearm manufacturers that rule to-day as will be seen in the list of wholesale prices of the guns produced by the few factories in our country. Examine these prices and ask yourselves what justification these manufacturers had in further advancing their prices only last year. Can you conceive of a worse case of profiteering outside of the one just discovered where they are selling coffins to the people of this country that cost \$30 for \$600.

Much has been said about the low value of foreign exchange, etc., and that for this reason the American valuation clause in the Fordney Act is necessary. The truth about this is that you seem to overlook the fact that the foreign manufacturer has made up for the low value of his money by asking much more for his goods, for instance, we have a gun in mind that before the war when the German mark was at par, the cost of this gun to the importer was 100 marks, or \$23.80 in our money; to-day this same gun costs 1,750 marks, figured at, say 1½ cents per mark amounts to \$26.25, and therefore the duty is as much if not more.

Much has been said about protecting American labor, but it must be borne in mind that American-made guns and pistols are machine made, and that the question of labor cuts very little figure. They are made interchangeable, all machinery. You break a spring while hunting in the field and you send a few cents to the manufacturer and he mails to you a new one, which you can use in yourself. The average weight of a shotgun is around 7 pounds. We refer to a double-barrel gun. Figure this weight at almost any fanciful price a pound and you can not help but realize what an enormous profit there must be in the turning out of machine-made guns. As an example, let us consider the wholesale price of the cheapest Parker gun made. We refer to their True grade, which the wholesaler sells to the retailer at \$48.95. Divide this by 7 and you have a cost of almost \$7 a pound for the very cheapest machine-made gun turned out by the Parker Co. The highest possible cost of this gun to the manufacturers can not be over \$12.50 to \$15, for they sold it themselves at one time for \$17.50 and the wholesaler sold it at \$22.75.

Under the American valuation plan you select the ruling wholesale price upon which the comparison of values are made. This we consider entirely wrong. The comparison should be made with the manufacturer's selling price. The importer, to our way of thinking, is in the same position as the manufacturer; they both sell their product to the wholesaler. Why should the importer suffer still more by having the comparison made with the value of the wholesaler, which has included the wholesaler's profit if the importer sold his goods to the retailer? Then we can see the object of making the comparison on a value based upon the wholesale price.

Then the ruling wholesale gun and pistol prices to-day in the American market are profiteering prices and not fair values. Please compare the various prices in the schedule given herein and you will see what an unfair proposition it would be to the American people if such a basis were adopted. Why not

one prior year when prices were somewhere near normal; say, select the year 1915 as a basis to start with; better still, let the manufacturers show their lists to the Government and then agree on a fair basis that will be satisfactory both to the manufacturer and the buying public.

The wholesaler should not be considered in any event, because by so doing you force upon the public a middlemen's profit, which everyone is trying to do away with wherever possible. There was a time when the wholesaler was a necessary cog in the wheel of business, but that time is past, and no up-to-date retailer to-day thinks of buying from the wholesaler unless he is compelled to. He strives to buy at all times from the importer or manufacturer direct and thereby save a profit which enables the retailer to sell cheaper to the consumer. The great success of the catalogue houses is due largely to the fact that they buy direct and save the wholesaler's profit, which they in turn pass on to the consumer.

Much has been said about the Government fixing prices. This Americanization clause may be the solution of that problem to some extent. Let the basis be the manufacturer's prices and then the Government and the people will be able to spot who the gouging middlemen are. Let us get at the foundation head of prices. Make the buying power of the American dollar as near equal as possible in every State in the Union plus the difference in carrying charges from factory to retailer. This can be done by making it impossible for any manufacturer to have more than one selling price to everyone, no matter what State his customer may be located in.

Our gun trade is mostly with farmers, their sons, and colored people. None of these can afford to buy guns at the prices asked to-day. The great majority of guns sold in this country is sold to the above class of trade. As a rule, they pay from \$10 to \$25 for a double-barrel hammerless shotgun. All of these priced guns are off the American market to-day. This class of guns came mostly from England and Belgium, so that in putting up a tariff wall to keep out foreign-made guns you are not hitting Germany as some may think, but you are hitting two of our late allies. The changes contemplated in the Fordney Act will prove to be a hardship on our farmers, their sons, as well as the colored people by depriving them from the little pleasure they get out of a day's hunt now and then. The farmer's son who craves the ownership of a cheap single-barrel gun from the time that he is able to tote a gun used to be able to buy these at \$3.50. Now this same gun costs him around \$12. We used to get this same gun at \$2.75. Now the wholesaler asks \$9.65. The gun we used to get for the farmer for his own use at \$22 we must get now \$60. Parker Bros. 10-gauge grade gun was sold to the farmer at \$25 and even less. Now we must get from the farmer \$60 for the same gun, and when these reasonable prices are added the manufacturers were not in business for their health.

There was a time years ago when the full dinner pail and protection to American industries cut some figure, but that time is past. The American people are in no mood to listen at this time about protecting either manufacturers or laborers. They have had quite enough of this during the past few years. They are crying out from all sections of our country to this Congress for protection from both profiteering manufacturers and laborers. Business is at a standstill because of the unreasonable demands of both. The manufacturer claims he can not reduce his prices because of the unjust demands of labor, and, on the other hand, labor claims they can not live because of the unreasonable prices of the manufacturer. Both statements no doubt are true. Why then make matters worse with this Fordney Act, which undoubtedly will enable the manufacturer to keep up his prices and even increase them if he desires.

The writer has always voted a Republican ticket, but had the Fordney Act been the issue on election day last November instead of the League of Nations and the favoritism shown labor by the last administration, myself as well as millions of other Republican voters would undoubtedly have voted against our party. Let that verdict on last election be a warning. Pass this Fordney Act and deny relief to the overburdened taxpayers of our country who are so justly asking relief from the high prices that rule to-day, and which have put a stop to all business and you will witness a result at the coming elections that will make the 7,000,000 majority last November look small. I firmly believe that you will not permit this to happen by making the necessary changes in this bill that will prove to be entirely satisfactory to masses instead of only a few badly overprotected manufacturers.

Comparative wholesale prices to the retail trade for double and single barrel shotguns and pistols, covering several years.

WATCH MOVEMENTS, WATCHCASES, AND PARTS.

[Paragraph 367.]

STATEMENT OF EMIL N. ZOLLA, REPRESENTING AMERICAN WATCH IMPORTERS AND ALLIED DOMESTIC INDUSTRIES, NEW YORK CITY.

Mr. ZOLLA. My name is Emil N. Zolla. I am general manager of Helbein Stone Co. I represent the watch importers of this country and several allied domestic industries.

This is our first day in court. I say that for the reason that we had no hearing before the Committee on Ways and Means of the House. When the metal schedule was up for hearing, under which watches have always come, the American manufacturers did not appear, and we, being satisfied with the present tariff bill, made no attempt to get a hearing. Later on, under the sundry schedule, about a month later, the American watch manufacturers had a hearing without any notice to us. We did not know of it until after it was all over.

Although we are representing importers, we are not asking for a tariff. We are asking for a tariff that approximates the rate under the old Payne-Aldrich bill.

Senator SIMMONS. You do not mean to say that the rates in the Fordney bill are higher than those in the Payne-Aldrich bill, do you?

Mr. ZOLLA. In this particular case they are, Senator. I will compare them for you.

Senator SMOOT. They are 70 instead of 75; \$1.85 instead of \$2.

Mr. ZOLLA. In the Fordney bill the rates on watch movements, whether imported in case or otherwise, or knocked down for reassembling, and having less than seven jewels, are 75 cents each. In the Payne-Aldrich bill they are 70 cents. That is what we are asking for.

Senator SIMMONS. How much does the American valuation plan change that statement?

Mr. ZOLLA. That is pretty hard to say on watches, as it is almost impossible under the American valuation plan, on account of the different grades of watches, different makes.

Senator SMOOT. You have all those different grades and makes, say?

Mr. ZOLLA. It is a specific rate.

Senator SMOOT. It does not make any difference. You want the Payne-Aldrich rates?

Mr. ZOLLA. Yes; with the exception of certain provisions of the bill, such as the stamping provision.

Senator SMOOT. In the Fordney bill?

Mr. ZOLLA. The Payne-Aldrich bill is partly specific and partly ad valorem, and what we are trying to do is to have them all specific, we have tried to measure it down to specific rates as it would have been under the Payne-Aldrich bill.

Senator SMOOT. I thought in the Payne-Aldrich bill we had the importers and American manufacturers as nearly together on the watch-movement paragraph as any section of the whole bill.

Mr. ZOLLA. I do not know; I can not speak on that schedule.

Senator SMOOT. I was here at that time.

Mr. ZOLLA. The Payne-Aldrich bill is entirely satisfactory, or would be except that it has 17-jewel watches at \$1.25 each and 25 per cent ad valorem. We have tried to reduce that to a specific rate.

Senator LA FOLLETTE. The American valuation would change that would it not?

Mr. ZOLLA. Yes; it would run it up. We have tried to reduce that to a specific rate, and we have got the 17 jewels, instead of \$1.25 and 25 per cent ad valorem, at \$2.50 each.

We have made several changes in the classifications. For instance the Fordney bill has watchcases classified with watch materials. A watchcase is a finished article. The cost of labor has gone into the case, and there is nothing left to be done except to slip the movement in with a few case screws. There is no reason why they should be classified among watch materials. We have set that out as a separate article by itself, and put a duty of 20 per cent on it.

Senator SMOOT. The Payne-Aldrich duty was 40 per cent?

Mr. ZOLLA. Yes, sir.

Senator SMOOT. You want 20 per cent?

Mr. ZOLLA. I will get to that.

Senator SIMMONS. What is the Fordney rate?

Mr. ZOLLA. This whole classification has always been sort of hodgepodge. In one bill chronometers would be among materials, and in another bill they would be classified among watches. What we are trying to do now is to get them classified on a logical basis. We have put down the rate to 20 per cent, for the reason that there are no importations of watchcases to speak of. The importations of watchcases have dropped from about \$58,000 in 1913 to some \$5,000 in 1919 or 1920.

Senator SMOOT. You want them classified the same as they are in the Payne-Aldrich bill?

Mr. ZOLLA. We want watchcases excluded from watch parts.

Senator SMOOT. We have that in the Payne-Aldrich bill.

Mr. ZOLLA. In the Payne-Aldrich bill they have it "watchcases and parts of watches."

Senator SMOOT. Yes.

Mr. ZOLLA. We contend it is not a part of a watch and does not belong there.

Senator SMOOT. It also has "chronometers, box and ship, and parts thereof."

Mr. ZOLLA. That refers to chronometers.

Senator SMOOT. Yes; I know that.

Mr. ZOLLA. I will get to that later, if you will permit me.

Senator SMOOT. I tried to follow it so I could make my copy of the bill correspond, but you may go on.

Senator SIMMONS. Do you contend there should be different rates upon watchcases and parts of watches?

Mr. ZOLLA. What I contend is that watchcases do not belong among watch materials.

Senator SIMMONS. You would not be damaged by reason of that act, unless you wanted a definite rate as between those two things.

Mr. ZOLLA. That is exactly what we want. We want a definite rate between watchcases and materials, and for that reason we want them classified separately.

Chronometers, box or ship. I have a chronometer which you can use for yourselves, one of the high-grade precision watches. There is a logical reason why a chronometer should be put among watch parts.

Another thing about a chronometer, I think there is only one American factory that manufactures it. That is the Waltham people. There is very little or no competition.

We have classified it in the same rating as watches over 17 jewels, the highest classification the Payne-Aldrich bill had, \$5 on each chronometer boxed or shipped.

Senator SMOOT. How many jewels do they generally have?

Mr. ZOLLA. I could not answer that. They vary the same as watches do.

Senator SMOOT. Then they should get the same classification.

Mr. ZOLLA. In the Payne-Aldrich bill the highest rate is on watches over 17 jewels.

Senator SMOOT. I know, but you do not want to put a 7-jewel chronometer in a 17-jewel watch.

Mr. ZOLLA. Chronometers don't go less than 17 jewels.

Senator SMOOT. I asked you that question, and you said you did not know.

Mr. ZOLLA. I did not understand you. There are some that are 17 and 21 jewels. They go no less than 17 jewels.

Senator SMOOT. Then that would be fair?

Mr. ZOLLA. Yes. They are high precision instruments.

Now, we have put a 15 per cent ad valorem duty on watch materials instead of 35 per cent, as provided in the Fordney bill, or 40 per cent, as provided in the Payne-Aldrich bill. Our reason for that is that these materials are not in competition with American manufactures, materials that are imported are used for imported watches, and by reducing the duty on them it simply means you make the cost of pairs to the consumer that much more reasonable. It affords sufficient for revenue purposes, and is in no way injurious to the American industry, and there is no reason why there should be a higher rate of duty on such materials.

The Payne-Aldrich bill, as well as the Fordney bill, has jewels and materials under a separate classification, with a 10 per cent ad valorem duty. We have put jewels and dials among watch parts, as they are disputably parts of watches, with a 15 per cent ad valorem duty.

Senator SMOOT. You mean that is what you want?

Mr. ZOLLA. That is what we want. The bill, as passed by the House, makes no provision——

Senator SIMMONS (interposing). You want the duty on parts increased?

Mr. ZOLLA. No; watch parts are decreased, but the dials are increased, because we have classified them among watch parts. We are trying to get a logical classification here, instead of having them in one classification in one bill and in another classification in

another. We are trying to get it under a classification where it belongs.

The bill makes no provision for what we call "timers." That is a watch which is designed to time comparative rates of speed.

Senator LA FOLLETTE. A stop watch?

Mr. ZOLLA. Yes. We have put in a duty of \$1 each on them, for the reason that 90 per cent of them are used by the Government of the United States.

Senator SMOOT. Suppose I had a watch which could be used as stop watch; would you only want \$1 on it?

Mr. ZOLLA. That watch could not be used for general purposes.

Senator SMOOT. I know of some of the most costly watches we have that are stop watches.

Mr. ZOLLA. That stop watch takes it to the fraction of a second. This goes to the fraction of a second, which a pocket watch could not do.

Senator SMOOT. What I am thinking is that unless we specify something more than a mere stop watch, we will have the highest priced watches that come into this country coming in at \$1.

Mr. ZOLLA. The exact wording of what we have is "Timers constructed and designed to time comparative rates of speed."

Senator SMOOT. We will look at the wording of your brief.

Mr. ZOLLA. That is the wording we have, "Timers constructed and designed to time comparative rates of speed, \$1 each." As I said, 90 per cent of them are used by the Government.

Senator LA FOLLETTE. This watch you showed as an exhibit is not an ordinary stop watch at all. It can be used for no other purpose than timing speed?

Mr. ZOLLA. Timing comparative rates of speed.

Senator LA FOLLETTE. It has but one hand.

Mr. ZOLLA. Yes, sir; that is all it can be used for.

Senator LA FOLLETTE. But your description would include watches which could also have a stop attachment, while they do not mark speed in fractions of a second as that does.

Mr. ZOLLA. They could not very well time comparative rates of speed.

Senator LA FOLLETTE. I do not believe your description is comprehensive enough. It would include a watch with a stop attachment.

Mr. ZOLLA. We have no objection to amending that. We have no objection to making that so rigid that there could not be any possible misconstruction of it.

Senator LA FOLLETTE. I think it would be fine for this committee to have a stop watch.

Mr. ZOLLA. We have omitted from the bill all words or phrases or sentences pertaining to clocks, clock movements, or clock materials. You will find that in the bill, "lever clock movements, watches and clock dials." That is taken care of in paragraph 368, which refers to clocks. It should not be in here at all.

We have omitted any reference to position adjustments. The Fordney bill has made distinctions in what they call "position adjustments." They say "having 17 jewels and adjusted to temperature, \$3.50 each; having 17 jewels and adjusted to three positions, \$4.75 each; having 17 jewels and adjusted to five positions."

6.50 each." We have omitted any reference to position adjustment, for the reason that it does not mean anything. It is evidently attempted as a plausible reason to raise the duty from \$2 on the 5-jewel watch to \$6.50 on the 17-jewel watch. What does position adjustment mean? Every watch, in order to keep time at all, must be adjusted.

I will read you exactly the language, as furnished by the Tariff Commission, by one of the American manufacturers:

The watch is ready at this time to be put through the test for position rating, and is run for 24 hours with the dial up, and a notation made of its rating in that position. The movement is then run with the dial down for 24 hours, and its rating is taken as before. In the third test the watch is run for 24 hours with the pendant upright, and a record made of its performance in that position.

If you take the same watch and adjust it to another angle of 55 degrees instead of 60 to the left, that would be the fourth position; and if you adjust it in the same degree to the right, that would be the fifth position. So that it gets down to a multitude of positions, all of which means that it is a precision instrument, which must be able to run and keep accurate time in any position in which it might be put while it is being carried. It has been commercialized as a selling proposition. They have made a distinction between the three and five positions, purely as a selling proposition.

Another feature that should be eliminated is that it is impossible of administration. No customs official, no customs duty man, could possibly tell by looking at a watch whether it was adjusted to the third or fifth position. He could not tell except by running it off in each position for 24 hours.

Senator SMOOT. I call your attention to the fact that your time has expired, and I am holding this stop watch. In relation to that, under the regulation that you have required, when a watch is imported into this country the number has to be stamped on the watch?

Mr. ZOLLA. Yes, sir.

Senator SMOOT. All of the importers know that.

Mr. ZOLLA. The number of the adjustment ought to be stamped on the watch, but that was insisted upon by the American manufacturers, and we have no objection to it.

Senator SMOOT. The same regulation will be applicable under the passage of this bill.

Mr. ZOLLA. That is the point. If you pass the bill as it was passed by the House——

Senator SMOOT (interposing). I recognize that.

Mr. ZOLLA. That is to us the most vicious part of the whole bill.

Senator SMOOT. My statement only referred to the administrative point that you were criticizing, not the increased duty that is provided for.

Mr. ZOLLA. The administrative part, in the number, has made no difference, because there has been no difference in the rate of duty.

Senator SMOOT. I am aware of that.

Mr. ZOLLA. If there is a difference in the rates, the administrative part will be impossible, because you could not tell by looking at it whether it was a third or a fifth position and what rate of duty must apply.

If you will just give me a moment more, I have on this point a test made of a Waltham made by the Bureau of Standards, supposed to be adjusted to the five positions. On the first test it failed by one second in 24 hours in the first position, being slow one second. In the second position it was fast 6 seconds; in the third position it was fast 17½ seconds; in the fourth position it was fast 12 seconds; in the fifth position it was fast 19 seconds. That does not mean the company did not turn out the watch as it represented it. It means it is impossible to have a standard test by which to examine these watches and test them accurately.

There is no need, as I will show here, of some of these stamping provisions. One feature of the present bill, which changes from the last bill, is the stamping position, where they ask us to stamp the number of jewels and adjustments. The Fordney bill provides that we must stamp either in words or Arabic numerals; or, rather, it provides it shall be in words and Arabic numerals. The Fordney bill says both words and Arabic numerals. The present tariff says either in words or Arabic numerals. If we stamp in both words and Arabic numerals, we do not have sufficient room, as you can see from the size of this watch. It is physically impossible, after stamping the name of the manufacturer, the number of jewels and adjustments, the name of the country of origin, to stamp it in both words and Arabic numerals.

Mr. SMOOT. I think this is the same watch we had in 1909 when complaint was made that it read either in words or Arabic numerals.

Mr. ZOLLA. I do not think that it is the same watch. The objection in 1909 was exactly the same that it is now, that there is not sufficient room there to do this stamping. That is why the present tariff has the words "either in words or Arabic numerals" instead of both.

Senator SMOOT. I remember it very well.

Senator LA FOLLETTE. If it was true then, and was a good illustration of the fault of the bill, it is true now and a good illustration!

Mr. ZOLLA. Yes, sir.

Senator LA FOLLETTE. The fact that it is the same watch does not disparage the illustration.

Senator SMOOT. Not at all.

Mr. ZOLLA. I know it is not the same movement. It may have been one similar to that.

There is one other thing I call attention to, and that is that the word "unadjusted," if it is not an adjusted watch, shall be stamped on the plate thereof. We can not understand why a negative representation of that kind should be required. The manufacturer should be held to strict accountability of all affirmative representations, but there is no reason, I should say, if he does not claim otherwise, why he should be held to a negative representation. If a watch does not give the number of jewels, or does not state whether it is adjusted or not, that is not a misrepresentation. Here is a watch from the Elgin Watch Co. It has not the words "adjusted" or "unadjusted" on it. We might just as well say that a case manufacturer turning out gold-filled cases should be required to put on there "This is not solid gold" if it is plated.

Senator SMOOT. Your time has more than expired.

Mr. ZOLLA. I wanted to show the importations.

Senator SMOOT. Is that in the brief?

Mr. ZOLLA. Yes, sir.

The brief filed by the American watch importers calls attention to the fact that the importations of watches increased tremendously, and infers that it was due to the fact that the Underwood tariff was low. The increase was from \$2,933,964 in 1916 to \$4,975,901 in 1917. This was the year we entered the war, as a consequence of which these large importations of men's wrist watches, commonly called military watches, took place. This was increased in the year 1918 to \$8,274,853, and was due greatly to the fact that by that time we had increased our Army and Navy to almost 4,000,000 men. As against these figures, please note that the last year the act of 1909, known as the Payne-Aldrich Act, was in operation, the year 1914, watch imports amounted to \$2,669,200. During the first year of the act of 1913, or the year 1915, watch imports decreased to \$301,323; and it was not until the year 1917, when we entered the World War, that there was any appreciable increase of watch imports over the last year under the act of 1909, and this was on account of the reasons above stated.

The question is whether the American watch industry needs protection. I will just go along hurriedly on that.

In 1913 the American watch industry asked for exactly the same duties, claiming they must have them as a protection. Let us see if the facts and figures bear them out.

According to Tariff Information Surveys on Watches and Clocks, prepared by the Tariff Commission in 1921, on page 51 thereof, in 1914 there were 15 establishments engaged at that time in the manufacture of watches. The value of their products then was \$14,275,000. In a statement issued by E. F. Hartley, chief statistician on manufactures, the Census Bureau, Department of Commerce, in 1919, there were stated to be 36 establishments. The value of their product then was \$2,100,000. The net gain of the value of the products of the American watch industry in the year 1919 over that of the year 1914, during which time the present tariff act was in existence, was the large sum of \$17,825,000.

Even the exports of American watches increased from \$1,460,424 in 1914 to \$2,155,969 in 1920, and this in spite of the fact that there was an actual shortage of American watches and movements in this country. They almost doubled the sale of their merchandise in foreign lands and competed with European manufacturers without any tariff advantage of any kind between them and the European manufacturers.

As far back as 1914 the domestic consumption of watches and parts of watches was approximately \$1,500,000 larger than the domestic production. That is from the United States Tariff Commission reports.

The Elgin National Watch Co., in the year 1920, had a net earning of \$1,293,203.36. The profits were equivalent to 19.74 per cent on \$6,500,000 capital stock.

The Waltham Watch Co., on March 31, 1919, had a net working capital of \$6,049,022. On March 31, 1920, they had a net working capital of \$8,845,837. The net gain was \$2,796,815. They had a surplus gain in 1919 of \$1,673,977; in 1920, \$2,068,953. They had a surplus gain in 1920 over 1919 of \$394,976.

In addition to that, we quote from the Boston Transcript a statement appearing on or about August 1, 1921, as follows:

The Waltham Watch Co's. business at present is somewhat better than is the case in the general watch trade. Of the 55 different watch movements which the company manufactures it has an active demand for nearly all of them, and for 22 it has orders for more than it can manufacture in the balance of the year. Total unfilled orders to-day are approximately 150,000 watch movements and 50,000 automobile clocks.

I have several quotations of that kind which I do not want to take up your time with now.

The Hamilton Watch Co. declared dividends in 1915 of 15 per cent, and in 1916, 16½ per cent. Later dividends are not reported. It would be interesting to this committee to find out why. I think the reason is that the profits were such that they do not want to quote them.

Under date of April 8, 1921, a letter was sent from the Elgin National Watch Co. to the National Wholesale Jewelers' Association signed by De Forrest Hulbard, its vice president, part of which is as follows:

The watch business seems to be particularly favored, inasmuch as there has been an actual shortage of good American watches during the past few years. The supply has not yet caught up with the demand, and our jobbers have not been able to pile up any stock worth mentioning, but are, on the other hand, eager to get more goods in every grade and size.

The CHAIRMAN. Could not all these figures be printed instead of taking up the time of the committee by reading them at this time? If every gentleman took half an hour we would not get through until Christmas.

Mr. ZOLLA. Just a moment more, Mr. Chairman. According to the Census Bureau, the value of the case factories' product in 1914 was \$7,831,000, and in 1919 the value of their product was \$19,619,000. The American case factories turn out approximately 19,000 cases a day. There are 11,500 cases manufactured each day in excess of movements manufactured. If the case factories did not have these movements imported from Europe they would have to manufacture 11,500 cases less every day, which would mean that two of the American watch case factories could supply the entire market, and the balance—there are 33 altogether—could as well discontinue.

So that the importation of these movements is not only necessary for the encouragement of imports but necessary for the maintenance and sustenance of the American watchcase industry. Furthermore, the American factories, as proved by the profits that I quoted, are in no need of further protection, because the rates we ask are higher than the present tariff, and all these profits have been under the present tariff bill.

I thank you.

BRIEF OF EMIL N. ZOLLA, REPRESENTING THE AMERICAN WATCH IMPORTERS AND ALLIED DOMESTIC INDUSTRIES, NEW YORK CITY.

This is our first "day in court." We had no hearing before the Ways and Means Committee of the House of Representatives. We do not believe this was due to any intentional discourtesy on the part of the Ways and Means Committee of the House of Representatives, but rather to what we make bold to say was a procedure of "shop practice," to put it mildly, by the representative of the American watch industry.

The hearings on watches were always had under the metal schedule, under which schedule watches were classified. The metal schedule, known as Schedule C, was

METALS AND MANUFACTURES OF.

According to "Notice of Tariff Hearings," issued by the Committee on Ways and Means, December 8, 1920, set for hearing under dates of January 12, 13, 14. Our representative attended the hearings of the Committee on Ways and Means on these dates. Nobody appearing in behalf of the American watch industry to object to changes in the present tariff rates on watches, our representative did not ask for any change in our behalf, as the present rates were satisfactory.

On February 9, 1921, under Schedule N—Sundries, Mr. Dueber appeared before the Committee on Ways and Means and filed the brief in behalf of the watch industry.

No notice was given us, and we were entirely ignorant of the hearing until it had taken place. This being an ex parte hearing, it is not surprising that the committee passed the recommendations exactly made by the American watch industry with one exception that it refused to double the duty on small movements. These are the facts upon which we base our opening statement, this is our story in court."

CHANGES IN DUTIES RECOMMENDED.

Watch movements, whether imported in cases or otherwise, assembled or disassembled for reassembling, if having less than seven jewels, 70 cents each; having more than seven and not more than eleven jewels, \$1.25 each; having more than eleven and not more than sixteen jewels, \$1.50 each; having seventeen jewels, \$2.50 each; having more than seventeen jewels, \$5 each; watchcases, 20 per centum ad valorem; watch parts, including jewels and dials for use in the manufacture of watches, 15 per centum ad valorem; chronometers, box or ship, \$5 each, parts thereof 15 per centum ad valorem; timers constructed and designed to time comparative rates of time, 10 cents each: *Provided*, That all watch dials, whether attached to movements or not, when imported shall have indelibly painted or printed thereon the name of the country of origin, and that all watch movements and plates, assembled or disassembled for reassembling, and cases, shall have the name of the manufacturer and the country of manufacture cut, engraved, or die-sunk conspicuously and indelibly on the plate of the movement and the inside of the case, respectively, and that all movements and plates shall also have marked thereon by one of the methods aforesaid, the number of jewels, said numbers to be expressed either in words or in figures, and none of the aforesaid articles shall be delivered to the importer unless they are marked in exact conformity to this direction: *Provided further*, That only the jewels which serve a mechanical purpose as frictional bearings shall be exempt from duty as herein provided.

Reasons for substituting above recommendations in place of duties recommended by paragraph 367, Schedule 3, of the House bill:

After the specific rates on movements, beginning with the word "watches," we have made the following changes, viz:

Have separated "watchcases" from watch parts, chronometers, etc. It is quite evident that a finished article such as "watchcase," consisting frequently of gold or silver, where the cost of labor has already entered, should not be included and considered in the same category as "watch parts," which, for all practical purposes, is similar to raw material.

Our rate pertaining to watchcases is as follows: "Watchcases, 20 per centum ad valorem." The bill as passed by the House calls for 35 per centum ad valorem. Our recommendation is 15 per cent less. We make bold to say that with possible two exceptions, not a single American watchcase company would ask for a higher rate than 20 per cent. Not only can not foreign case manufacturers compete successfully with American case manufacturers, but American case manufacturers are too successfully competing in Europe with European case manufacturers. (See paragraph with reference to growth of case factories in America.)

We have omitted "chronometers, box or ship" from the classification of watch parts, as this is a completed article and does not belong among "parts," but we have included "jewels and dials," which are undoubtedly "parts of watches," so that the change reads "parts of watches, including jewels and dials for use in the manufacture of watches, 15 per centum ad valorem." The bill as passed by the House provides as follows: "35 per centum ad valorem on watch parts, 10 per centum ad valorem on watch jewels, 3 cents per dial and 35 per centum ad valorem on watch dials."

We will discuss them in the order mentioned. The ad valorem duty on "watch parts" should be reduced to 15 per cent, as this will provide a reasonable revenue. The "watch parts" imported are used for movements imported from abroad, and therefore in no form or manner in competition with watch parts for American movements, there can be no need of giving any "protection." The duty should be reasonable, so that the cost to the American consumer of obtaining material for the repair of a watch of foreign manufacture should not be too burdensome.

Jewels and dials being indisputably "parts of watches," there should be no arbitrary differentiation made in the rates of duty. The importation of dials enameled and dial plates decreased from \$54,771 in 1911 to \$7,292 in 1919. (Tariff information survey on watches and clocks prepared by the Tariff Commission in 1921.) To continue the formerly excessive rates would mean to eliminate dial importations altogether.

Chronometers, box or ship, being a completed article, we have taken from the classification with "parts of watches" as set out in the bill passed by the House, and made a separate proviso with a specific instead of an ad valorem duty, which reads "chronometers, box or ship, \$5 each; parts thereof, 15 per centum ad valorem."

The bill as passed by the House makes no provision for timers which are constructed and designed to time comparative rates of speed. As timers are not manufactured at all in this country, and as 90 per cent of all timers imported are used by the United States Government, we believe this article should have a separate classification, and we have therefore added the following sentence: "Timers constructed and designed to time comparative rates of speed, \$1 each."

All words, phrases, and sentences pertaining to clocks, clock movements, clock material, etc., have been omitted by us from paragraph 367, schedule 3, as clocks, clock movements, etc., are taken care of in paragraph 368, schedule 3, where it properly belongs.

These rates closely approximate the schedule of the act of 1909, commonly known as the Payne-Aldrich bill, which was admittedly a high-tariff bill. Being so close to the rates of the Payne-Aldrich bill, we believe they are particularly under the present economic conditions of the world, sufficient for revenue purposes and more than sufficient for "protection" to the American watch industry. Nowhere, in the brief filed by the American watch companies is there a line, word, or figure, showing the necessity for increased tariff duties. There are some "historical" facts mentioned enlightening for general purposes, most of which are obsolete and have been entirely changed by the economic processes resulting from the war; but no statistics, no figures of any kind or character, showing or even tending to show, that the American watch industry has in any way suffered under the existing tariff. Facts and figures speak louder than theories and empty assertions. We shall show later in this brief that not only have they not suffered under the existing tariff, but have greatly prospered more than ever before.

We have omitted any reference to the "position adjustment" classifications among 17-jewel movements. This is vicious. It is an arbitrary classification contained in no other tariff bill and a distinction no other country in the world has made. To retain it would be to absolutely bar the importation of this class of movements. It would mean an increase of over 100 per cent over the rates of the Payne-Aldrich bill of 1909, an admittedly high tariff. It would apply also to ladies' small bracelet watches, which only two or three of American watch companies turn out in very small and very limited quantities, and thereby increase the cost of these watches to the American consumer over 100 per cent.

Position adjustments do not of themselves determine the value of the watch. A 15-jewel watch with only three position adjustments might be better and much more expensive than another 17-jewel watch with five or even eight position adjustments.

Every watch, in order to run and keep time, must be adjusted. Three adjustments of a watch is practically the lowest number of adjustments possible for any timepiece with any degree of dependability. What does three adjustments mean? It simply means that the watch is made to run while lying flat, with the dial upward, then turned flat with the dial downward, and then put in an upright position in which it is generally carried while in the pocket. This is a clear illustration of three adjustments. This applies equally as well to 15-jewel watches as it does to 17-jewel watches.

The net result, therefore, of the bill as passed by the House is, that while it calls for a duty of \$2 on 15-jewel watches of three position adjustments, it calls for a duty of \$4.75 for the same watch with two additional jewels. In other words, it adds a duty of \$2.75 for two jewels. In the case of the same 17-jewel watch being adjusted to five position adjustments—which simply means that the watch is further adjusted to two more angles—there is a difference of \$4.50 for the additional two jewels.

The average cost of two jewels to the American manufacturer of watches—brought by them in large quantities from Switzerland—is less than 50 cents. Is it not, therefore, quite obvious that this attempted classification of adjustments is merely a mask behind which it is hoped to mislead Congress into levying an exorbitant and prohibitive duty on 17-jewel movements?

If a watch is supposed to be valuable it must be adjusted to run in any position. No specified three or five positions will do. It must be adjusted to any position. And if the adjuster or regulator would find it not running while in a position or angle of 60 degrees, he would have to look into the movement and make it run at 55 degrees or at 50 degrees and would then come down to a multitude of numbers of positions.

All of which simply means that a good watch, like any precision instrument, must be regulated to run in the various positions it is put during its use. You will please observe that no attempt was made to make this classification on movements having more than 17 jewels—admittedly higher grade watches.

OBJECTIONS TO STAMPING PROVISIONS OF BILL AS PASSED BY THE HOUSE.

The act of 1913 provided for the marking of the number of jewels and adjustments upon watch movements—"either in words or in Arabic numerals." The bill passed by the House has changed the word "or" to "and," so that the language of the bill reads "said numbers to be expressed in words and in Arabic numerals." To retain the language of the present bill would make it impossible to import the very small movements. Some of these very small movements used in ladies' bracelet watches are smaller than a dime in diameter, and some of the movements used in ladies' lockets measure less than one-quarter of 1 inch across the dial. It must be quite evident that to attempt to put on so small a movement the name of the country of origin, the name of the manufacturer, and, in addition to all that, the number of jewels and adjustments in both words and Arabic numerals, would be physically impossible. It is all one can do, after putting on the names of the country of origin and manufacturer, to put on the number of jewels and adjustments in either words or in Arabic numerals.

The argument made by the American watch industry in their brief that "under the present law a 17-jewel movement could be imported, stamped merely with the numeral '7' and the duty paid accordingly, it being a simple matter to engrave the numeral '1' in front of the numeral '7,' making it '17' after the movement is imported, thus throwing open the door for fraud," is fallacious and will not bear analysis. Any examiner who is at all familiar with watch movements can immediately, with the naked eye, detect any 17-jewel movement that might be marked "7." Fraudulent practices of this kind, if they ever occurred, were of such infrequency and so unusual that no one in the trade ever heard of it being done. Permit us to repeat that to compel the foreign manufacturers of these very small watches or watch movements to stamp the number of jewels and adjustments both in words and Arabic numerals would make it impossible to import them.

In the phraseology of the stamping provisions we have omitted the words "and clock, lever-clock movements with jewels in the escapement," as these provisions properly belong in the clock schedule, which is an entirely different schedule. You will also please notice that in the same proviso after the semicolon, following the words "in Arabic numerals," we have omitted the following sentence "and if the movement is not adjusted, the word 'unadjusted' shall be marked thereon by one of the methods indicated." The reasons for omitting this last sentence is because we believe that stampings should be only affirmative representations and not negative. While the manufacturer should be held to a strict accountability for all affirmative representations made he ought not to be compelled to make a negative representation. One might just as well insist that the watchcase manufacturer who turns out gold-filled cases should have stamped thereon "this case is not solid gold." Provisions of this kind afford no protection whatsoever to American manufacturers but are extremely mischievous in their nature and designed to cause as much inconvenience as possible to American importers. Then again, suppose, for the sake of the argument, a movement is imported with the word "unadjusted" engraved upon the plate and after the movement is imported it is adjusted. In what way can the word "unadjusted" be removed? Only by removing the plate and putting in a new plate at a great cost of labor and material.

TARIFF HISTORY RELATING TO WATCH MOVEMENTS.

The act of 1894 had the ad valorem rate of duty of 25 per cent on all watches and parts thereof, making no distinction as to grades. In 1897 when this duty rate was changed to a compound rate by adding to the former rate a specific rate which varied from 35 cents to \$3 per movement, depending upon the number of jewels contained in the movement, the volume of imports decreased to nearly one-half of what they were during the preceding year of the old law, viz, from \$1,107,080 in 1897 under the old law, to \$566,674 under the new law. It did not recover in volume to equal the amount of 1897 import under the old law until the year 1901—four years later.

These facts seem to indicate that the Government of the United States does not necessarily receive a greater volume of revenue when the rates of duty are exceedingly higher, but on the contrary, it might, as it did in this instance, suffer a loss of revenue.

The statement that the act of 1913, which is the present schedule, in itself caused a great increase of importation of watches, is entirely misleading. Between that

time and including the year 1918, two specific factors caused this tremendous increase. The first was the importation of ladies' small bracelet watches, which according to Mr. Dueber, representing the American watch industry, in his testimony before the Ways and Means Committee on February 9, 1921, the American factories were not in position to turn out except at excessive prices. The second was the importation, in unusually large quantities, of men's wrist watches, commonly called military watches, which name was derived from the fact that 95 per cent of these watches were used by the American soldiers. Without these importations the American soldiers and sailors would have been deprived of the only kind of watch that was convenient and useful to any man in uniform. It is an admitted fact that the American watch manufacturers, either were not equipped or did not want to turn out these watches.

In speaking of the increased imports from Switzerland, the United States Tariff Commission in its Tariff Information Surveys on Watches and Clocks, page 32, 1921 issue, states as follows: "The increases were due to the greater demand in America for small watches. Upon the entry of the United States into the European war gentlemen's wrist watches became very popular with the military; ladies' wrist watches and brooch watches also increased in popularity."

You will observe that the importation of watches increased from \$2,933,964 in 1916 to \$4,975,901 in 1917. This was the year we entered the war, as a consequence of which these large importations of men's wrist watches, commonly called military watches, took place. This was increased in the year 1918 to \$8,274,853, and was due greatly to the fact that by that time we had increased our Army and Navy to almost four million men.

As against these figures, please note that the last year the act of 1909, known as the Payne-Aldrich bill, was in operation—the year 1914—watch imports amounted to \$2,669,200. During the first year of the act of 1913—the year 1915—watch imports decreased to \$2,301,323, and it was not until the year 1917, the memorable year in which the United States entered the World War, that there was any appreciable increase of watch imports over the last year under the act of 1909, and this was on account of reasons above stated. The increase in prices during 1917 and 1918 as compared with former years also swelled the aggregate total in dollars and cents—at least 20 per cent. (These statistics were taken from Tariff Information Surveys on Watches and Clocks, prepared by the United States Tariff Commission in 1921.)

DOES THE AMERICAN WATCH INDUSTRY NEED FURTHER PROTECTION?

If under the existing tariff the American watch industry has prospered in a manner heretofore unknown, has tremendously increased its prices, has sold its entire production, and then found a very large demand which it has been unable to supply, is not this evidence of the most convincing character that they need no further protection? In 1913 the American watch industry asked for exactly the same rates, claiming they must have it as a protection. Let us see if the facts and figures bear them out.

According to Tariff Information Surveys on Watches and Clocks, prepared by the Tariff Commission in 1921, on page 51 thereof, in 1914 there were 15 establishments engaged at that time in the manufacture of watches. The value of their production then was \$14,275,000. In a statement issued by E. F. Hartley, chief statistician of manufactures of the Census Bureau, Department of Commerce, in 1919 there were 36 establishments. The value of their product then was \$32,100,000. The net gain of the value of the products of the American watch industry for the year 1919 over that of the year 1914, during which time the present tariff act was in existence, was the large sum of \$17,825,000.

Even the exports of American watches increased from \$1,460,424 in 1914 to \$2,155,969 in 1920, and this in spite of the fact that there was an actual shortage of American watches and movements in this country. They almost doubled the sale of their merchandise in Europe and competed with European manufacturers without any tariff of any kind between them and the European manufacturers.

As far back as 1914 the domestic consumption of watches and parts of watches was approximately \$1,500,000 larger than the domestic production. (Summary Tariff Information Surveys, United States Tariff Commission, 1921.) Since that time the shortage has been larger. Statements hereinafter following, we believe, confirm this assertion.

PROFITS OF LEADING AMERICAN WATCH COMPANIES FOR PAST FEW YEARS.

Elgin National Watch Co.: Dividends 8 per cent per annum, paid quarterly December 21, 1918, extra cash dividend of 2 per cent was paid, and on December 21, 1919, extra cash dividend of 3 per cent was paid. (Moody's Manual of Railroads and Corporation Securities, 1920. Industrial section.)

At the annual meeting of the stockholders of the Elgin National Watch Co., held June 9, 1921, the income account for 1920, as submitted to this meeting, reads as follows:

Earnings from operation.....	\$1,797,754.51
Earnings from investment.....	185,448.85
Reserve for taxes.....	690,000.00
Net earnings.....	1,293,203.36
Dividends.....	429,269.00
Balance for reserve and surplus.....	864,934.36

The year's net profits were equivalent to 19.74 per cent on the \$6,500,000 capital stock, or \$4.93 per share of \$25 par value.

Inventories were taken at cost or market figures, whichever was the lowest. It was announced that the company has no floating or funded debt, the only current indebtedness being monthly bills.

Waltham Watch Co.: Net working capital, March 31, 1919, \$6,049,022.

Net working capital, March 31, 1920, \$8,845,837.

Net working capital gain of \$2,796,815 for 1920 over 1919.

Surplus gain of 1919, \$1,673,977; in 1920, \$2,068,953.

Surplus gain of 1920 over 1919, \$394,976.

We quote from the Boston Transcript a statement appearing on or about August 1, 1921:

"The Waltham Watch Co.'s business at present is somewhat better than is the case in the general watch trade. Of the 55 different watch movements which the company manufactures it has an active demand for nearly all of them, and for 22 it has orders more than it can manufacture in the balance of the year. Total unfilled orders to-day are approximately 150,000 watch movements and 50,000 automobile clocks."

The following is a portion of an advertisement appearing in the Jewelers' Circular under date of July 31, 1921, inserted by the Illinois Watch Co.:

"There will be no reduction in the prices of Illinois watches. That the trade recognizes the Illinois as the greatest values on the market is demonstrated by the fact that the demand for them continued to tax our manufacturing capacity to its utmost. We have no accumulated stock on hand."

Hamilton Watch Co.: Dividends 1915, 15 per cent; 1916, 16 per cent. Later dividends not reported.

We quote from a letter sent out broadcast to the trade in January 1921, by Jacques Lepollier & Son, who are representatives of the Waltham Watch Co.:

"We have just passed through a period that has witnessed the public buying watches promiscuously, because the dealer was short in his stocks, giving the consumer little, if any, choice in his selection of watches, and the American watch manufacturers were physically unable to procure any quantities sufficient to meet the demand."

"* * * Many orders are in our books and we are eight months behind in deliveries of certain grades, so we feel that with our wide and varied experience, the trade will welcome this expression of opinion on watch conditions for 1921, * * *. Contrary to this decline in prices of Swiss watches, the American made watch has held its own position unassailed, because the increased demand has exceeded the increased output of the manufacturers. The American made watch to-day is in preferred demand by the consumer."

Under date of April 8, 1921, a letter was sent from the Elgin National Watch Co. to the National Wholesale Jewelers Association signed by DeForrest Hulbard, its vice president, part of which read as follows:

"The watch business seems to be particularly favored inasmuch as there has been an actual shortage of good American watches during the past few years. The supply has not yet caught up with the demand and our jobbers have not been able to pile up any stock worth mentioning, but are, on the other hand, eager to get more goods in every grade and size."

So completely and so thoroughly do the American watch manufacturers control their industry, and so independent are they, and unafraid of foreign competition, that only certain selected wholesalers who are put on their lists can obtain their watches. For illustration: In the cities of St. Paul and Minneapolis there are approximately 10 large wholesale watch houses, practically all very high rated, and of good standing, and yet, between these two cities—which is the gateway to the great Northwest—only one wholesaler is on the list of both the Waltham and Elgin Watch Co.'s. Nobody but this one wholesaler can obtain watches of either of these makes in this territory. The same plan applies all over the United States, and unless the wholesaler is placed on the favored lists of these watch companies, no matter how excellent his financial standing, or how large his volume of business, he is unable to

obtain watches from the American watch manufacturers. These facts are indisputable and known all over the country among people in that business and can very easily be proven by subpoenaing any wholesale dealer in American watches from any part of the country. In the light of the foregoing facts what need is there for any further protection?

OTHER PURELY AMERICAN INDUSTRIES AFFECTED BY UNREASONABLE TARIFF ON FOREIGN WATCH MOVEMENTS.

American watchcase factories, whose investments are almost as great as the watch movement manufacturers, are dependent upon the importation of Swiss movements for about 65 per cent of their entire production. According to a statement given out by E. F. Hartley, chief statistician for manufacturers of the Census Bureau, the production of American watchcase factories in 1914 was \$7,831,000 and in 1919 \$19,619,000. According to the same authority there were 31 establishments in 1914 and 33 in 1919—only two additional establishments, while the production during the same time increased so stupendously. This enormous increase in the production of American watchcase factories is due directly to the increase of imported movements. For after all, the watch movement is nothing but the basic product or raw material to the case factories. This \$19,000,000, therefore, of American industry must be materially curtailed if the rates of duty on foreign movements remain as passed by the House. These rates are so prohibitive that they will easily curtail the importation of movements to the extent of at least 50 per cent. We will take, for illustration, the estimated production per day of eight of the leading American watch movement companies, viz:

Elgin National Watch Co.....	3,000
Hamilton Watch Co.....	250
Hampden Watch Co.....	250
E. Howard Watch Works.....	100
Illinois Watch Co.....	60
South Bend Watch Co.....	250
Standard Watch Works.....	1,500
Waltham Watch Co.....	1,500

Making a total of 7,450 movements, as against which we find the seven leading case factories producing per day approximately the following number of cases:

Keystone Watch Case Co.....	4,000
Wadsworth Watch Case Co.....	4,000
Fahys Watch Case Co.....	2,500
Dueber Watch Case Manufacturing Co.....	1,500
Illinois Watch Case Co.....	4,000
Star Watch Case Co.....	2,000
North American Watch Case Co.....	1,000

A total of 19,000 cases.

From only this partial list it is quite evident there are at least 11,500 cases made every day in excess of the sum total of the American movements made. The amount of cases does not take into consideration over 50 other small case makers of fancy designs, who have the sum total production of at least 1,500 cases a day and who are entirely dependent for their continuation upon the importation of Swiss movements.

To furnish cases for the output of only American watch movement manufacturers would require only two of the very large companies. The rest could be discontinued. If such a situation should arise, and it is our earnest belief that if your committee will call before it the heads of the largest case factories they will substantiate our statement, it would result not only in great hardships to the stockholders interested in the case factories and in the unemployment of thousands of working men and women, but would also result in a serious loss of revenue to the Government, due to the fact that the income tax now paid by all these case factories would be materially reduced, if entirely eliminated.

Another American industry that would be vitally affected adversely should there be a substantial curtailment of the importation of watch movements would be the companies engaged in the manufacture of watch bracelets, who are dependent conservatively speaking, for the sale of at least 85 per cent of their production upon the importation of watch movements. As this industry has practically been almost entirely developed in recent years, since the importation of small ladies' bracelet watches, we are unable to give you statistics, but as bracelets are used only on ladies' small watches and as the quantity of ladies' small watches by American movements

manufacturers is negligible, it logically follows that this industry is almost entirely dependent upon imported movements.

The manufacturers of boxes for bracelet watches are also greatly dependent for this and other manufactures upon these imported movements.

MARKETS.

Congress must also take into consideration the fact that during the period of the war Switzerland, from whom we import about 95 per cent of our foreign movements, closed to her the markets of the Central States, Russia, Italy, France, and Spain, before the war, together with Great Britain, took over 60 per cent of the total Swiss exports. We quote from the Tariff Commission Catalogue under the heading "Foreign production and trade:"

"Great Britain and Germany have always been heavy importers of Swiss watches and parts of watches, taking in 1913 over one-third of Switzerland's entire export. Though the United States stood as the sixth largest customer of Switzerland for watches and parts in 1913, the ever-growing trade and special demand in watches for military purposes placed this country in the position of Switzerland's largest customer in 1917 and 1918. Other large customers of Switzerland before the war were Russia, Austria-Hungary, Italy, France, and Spain; these eight countries took over 80 per cent of the total Swiss exports in 1913."

The closing of these markets spurred Switzerland on to export her production as much as possible to the United States, but with the reestablishment of peace and the resumption of somewhat normal conditions, these markets will again be thrown open to her, and it is a well-known fact that the Swiss manufacturer, because of the proximity of these countries to the borders of Switzerland, thereby making trade relations easier, would sooner sell in the markets of these countries than to the American market. This, in itself, will cause a material decrease in the importations of watches to this country.

LABOR.

Since the International Labor Conference in 1919 watchmakers in Switzerland are working only 48 hours a week instead of 56, which means that the cost of labor as a result of this alone has increased 20 per cent. The average cost of labor to-day in Switzerland, figured in gold, is between \$25 and \$35 per week, and adjusters are paid as high as \$50 per week. The duty rates, as recommended in this brief, are equivalent to an ad valorem rate of at least 40 per cent, and in a few instances more than that. Adding 40 per cent to the lowest paid watchmaker to-day in Switzerland—which is \$25—would make the total \$35 for the lowest priced man. To this \$35 per week must be added at least another 30 per cent, which is the minimum of the importer's gross profits, which would make it a total of at least \$45 per week. The reason that the 30 per cent, representing the importer's gross profits, should be added in calculating the relative cost of labor is because in this country the manufacturer sells directly to the wholesaler, while the Swiss manufacturer sells at least 95 per cent of his products through the American importer, and the importer, in turn, sells it to the wholesaler at a gross profit, as stated heretofore, of at least 30 per cent. The average wage earned by the American watchmaker is to-day between \$35 and \$40 per week, with such stories as the Waltham and others announcing a reduction very recently of from 10 to 15 per cent in the wages of their men.

FIXED CHARGES AND OVERHEAD EXPENSES.

While the foreign manufacturers have not themselves the overhead expenses of repairing their watches in repair, the watch importers, through whom these foreign manufacturers sell their watches, have this overhead expense exactly the same as the American manufacturers and must consider it in arriving at the prices at which they sell their watches. They maintain large and expensive repair shops in which they back up their guarantees against defects and put in shape all movements which are to keep accurate time. They, as well as the jobber through whom they sell, carry large quantities of materials available for the repair of all watches they sell.

Because, as shown by this brief, the American watch-movement manufacturers need no further protection than they already have, because we believe that for the protection of American watchcase factories the importation of foreign watches are necessary and indispensable, we respectfully ask that the duty on watches be preserved in accordance with the suggestions and recommendations herein contained.

STATEMENT OF R. C. McCULLOCH, REPRESENTING THE HAMPDEN WATCH CO., CANTON, OHIO, AND OTHER AMERICAN WATCH MANUFACTURERS.

Mr. McCULLOCH. I represent, Mr. Chairman and gentlemen of the committee, the leading American watch manufacturers, including the Hampden Watch Co., of Canton, Ohio, of which I have been a director for a great many years, and I helped as attorney in the preparation of the evidence and the testimony during the consideration of the act of 1909 and the act of 1913, and am familiar in a general way with the business of manufacturing watch movements.

The CHAIRMAN. What business did you say?

Mr. McCULLOCH. The watch-movement manufacturing business.

I want to say just a word about the figures the gentleman who preceded me submitted. He said that the increase in importations of foreign watches was due to the war. I have a comparison here of the act of 1909, the act of 1913, and the Fordney bill; and at the bottom of the sheet I have figures showing the importations of watches and parts for every year from 1895 down to 1920, compiled by the Tariff Commission.

Taking the Underwood bill: In 1913 the importations were \$1,951,579; 1914, \$2,669,200; 1915, \$2,301,323; 1916, \$2,933,964; 1917, \$4,975,901; 1918, \$8,274,853; 1919, \$9,215,189; 1920, \$12,608,624. The importation of foreign-made watch movements during 1919 and 1920 certainly was not due to the war.

I suppose there has been no more thorough investigation and examination made of any paragraph of the Fordney bill than was made of the watch paragraph by the subcommittee of which Mr. Tilson was chairman. They went into every detail of it, and I venture to say no paragraph was more thoroughly investigated during the consideration of the act of 1909 than the watch paragraph.

At the bottom of the analysis or comparison of the paragraph submitted I have given the gist of the changes in the Fordney bill as compared with the Payne-Aldrich bill. The Fordney bill covers movements knocked down for reassembling. In the brief that I will submit—I shall not enter into a detailed discussion about it—we show, and I think prove, that there was a practice, after the Payne-Aldrich bill went into effect, of "knocking down" watch movements, getting them all ready for assembling, and then bringing them in as material and assembling them in this country, thereby evading the duty. The provision I have referred to I believe strengthens the bill.

The Fordney bill classifies clock watches separately. Clock watches were classified under the Payne-Aldrich law with seven-jeweled movements. A clock watch is simply a combination of wheels without jewels or adjustments. It probably has been timed in a general way, but it is not comparable as an effective time-keeping machine with a jeweled watch. In our opinion it was wise to classify seven-jeweled movements separate from clock watches, and therefore that classification was suggested to the subcommittee of the Ways and Means Committee and, after thorough consideration, adopted. We think that classification should be retained.

The Fordney bill also classifies 17-jeweled movements according to adjustments. Seventeen-jeweled movements are manufactured adjusted and unadjusted. The 7-jeweled movement, the 11-jeweled movement, the 15-jeweled movement are all almost universally unadjusted, and so regarded in the trade. Seventeen-jeweled movements, as I have said, are manufactured adjusted and unadjusted; and all movements having over 17 jewels are universally adjusted.

A 17-jeweled movement, adjusted, will cost to produce and will sell for just about three times what a 17-jeweled movement unadjusted will cost and sell for.

Under the Payne-Aldrich law a 17-jeweled movement, unadjusted, comes in at the same specific rate as the 17-jeweled movement, adjusted.

From a revenue-producing standpoint, as well as from the standpoint of protection, the classification of 17-jeweled movements as written into the Fordney bill should be retained.

The gentlemen who preceded me minimized the value of adjustments. The value of a watch movement is determined in two ways: first, by the number of jewels it contains; and, second, by the kind and number of its adjustments. I can not take the time to go into detail in regard to the mechanical differences between mere timing and adjusting, but I call the committee's attention to the statement of J. S. Cory, superintendent of the Hampden Watch Co., of Canton, Ohio, in regard to adjustments, in the brief I shall submit. Mr. Cory describes the many intricate and painstaking processes necessary in adjusting a watch movement so that under all conditions it will run within certain limits of error. A watch movement is an instrument of precision for computing time. In order that it may be an accurate and dependable machine it must be put through the processes described by Mr. Cory, and these processes, as he clearly states, frequently take several months before the watch will run within the required rating. Why a 17-jeweled movement, unadjusted, should come in for the same specific rate of duty that a 17-jeweled movement, fully adjusted, comes in for, when the one is three times as valuable as the other, is hard to explain.

I want to refer briefly to the marking provisions of this bill. The marking provisions of the Fordney bill, as far as they relate to the number of marks and figures that must be put upon the plate, are exactly identical with the marking provisions of the Payne-Aldrich bill. I submitted to the Senator from Utah the small movements he mentioned, marked in conformity with the tentative draft of the Payne bill, which evidently proved to the satisfaction of the Senator

that those marking requirements could be complied with. The law was in operation for a number of years and presumably complied with. If they could do it then, they can do it now.

I also exhibited to the Senator from Utah at that time this little coin [exhibiting] made at the mint, where they die-sunk upon a piece of metal this size the entire Lord's Prayer. There is no doubt about their being able to do it, but they do not want to do it, it seems, and why?

I want to respectfully refer the committee to the evidence of fraud set out in the brief I shall submit, with special reference to the matter of markings:

Effect of stamping provisions on railroad time service. Copy of letter of Webb C. Ball, general time inspector for American railroad systems, mileage of over 100,000 miles, who says:

To permit foreign watches to come into this country without such markings is tampering dangerously with human life and property.

Also letters and affidavits in regard to exhibit fraudulently marked "Time Ball Special," etc., detected in hands of employees of Chicago, Burlington & Quincy Railroad Co.

Also letter of Hamilton Watch Co. in regard to fraudulently marked Swiss movements.

Affidavit of George E. Hunter in regard to fraudulently marked Swiss movements.

All the American manufacturers of watch movements want or ask are rates that will equalize the difference in the cost of production at home and abroad. They are not seeking special favors or any special advantages.

We think that the Fordney bill is fair. The rates are practically the same as those of the Payne-Aldrich bill. We are satisfied with the Fordney bill, and feel that no change should be made in the watch paragraph without serious and careful consideration, which I know it will have.

I ask the privilege of submitting later a brief in detail, meeting the suggestions that were made by the gentleman who preceded me.

At this time I shall refer but to one or two of the recommendations made by him on behalf of the importers. Some of the recommendations made were clearly shown by the general discussion here to be impractical from the standpoint of the Government, for instance the recommendations as to "stop watches." That recommendation would probably be good for the importer, if adopted, but unfair to the Government. It might be that if the recommendation were adopted all high-grade watches when imported would have the "stop-watch attachment and come in for \$1. At least it is but logical that one recommendation of that kind shall put all the others on question. Importers of watches recommend an increase of 5 per cent on jewels or from 10 per cent, the present law, to 15 per cent. I want to call the committee's attention to the facts about jewels. In 1909 it was shown that "the jewels used in the construction of a watch movement amount in many cases to about 50 per cent of the material cost of the movement." Jewels for watch movements have never been manufactured successfully in this country, so that the American manufacturer of watch movements is compelled to import them. I quote:

the following from a letter of one of the leading manufacturers of watch movements in this country upon the subject:

To the American watch-movement manufacturer, watch jewels are the same as raw material. They can not be manufactured in this country successfully, and we are therefore at the mercy of the foreign producers, who by combination fix the price to suit themselves. Since 1914 they have increased prices more than 135 per cent, so that we are now paying duty on jewels in excess of 23½ per cent ad valorem on the prices prevailing when the tariff act of 1913 went into effect. There is no reason to suppose that the prices of jewels will not be still further increased up to the point where the combination of price and duty will check the production of watch movements in this country by compelling the manufacturer to increase the price of watches to such an extent as to lessen the demand. We submit that it is not to the interest of the Government or of the watch industry that production should decline.

There being no watch jewels produced in this country to amount to anything and it being impossible to produce them successfully, the duty provided in the Fordney bill of 10 per cent ad valorem we think is a fair revenue duty and should not be increased.

I want to refer also to the statement made by the representative of the importers that the rates he suggested on watch movements "closely approximate" the rates in the Payne-Aldrich bill. This is not correct; to illustrate: He suggests a specific duty of \$5 each on movements having more than 17 jewels. Under the Payne-Aldrich law, which provided for a duty of \$3 each and 25 per cent ad valorem, according to the figures in "imports and duties," dividing the number of movements cleared into the amount of duties collected shows an average specific duty for the years the law was in operation on movements having more than 17 jewels as follows:

Years.	Number.	Duties.	Specific duty.
Having more than 17 jewels, \$3 and 25 per cent ad valorem converted:			
1910.....	3,766	\$41,432	\$11.00
1911.....	5,410	55,036	10.17
1912.....	5,859	55,056	9.39
1913.....	5,549	56,776	10.50
1914.....	1,626	16,235	9.98

Under the Dingley law, which provided a duty of \$3 each and 25 per cent ad valorem on all movements having over 17 jewels, when converted into straight specific duties the average amount collected on all movements having more than 17 jewels during the entire operation of the law was \$10.73 each. The rates in the Fordney bill "closely approximate" the rates in the Payne-Aldrich bill.

I have covered fully in the brief I shall submit to-day the reasons for the classification of 17-jewel movements according to adjustments and have expressed our reasons for favoring the stamping provisions of the Fordney bill. I do not believe that any of the reasons advanced by the representatives of the importers for changing these provisions are sound aside and apart from the interest of the importers.

The paragraph in the Fordney bill, No. 367, as it relates to watches, is workable and, we believe, fair in every particular.

I may later desire to make some reference to the collateral matters referred to in the brief and statement of the representative of the importers.

I ask, Mr. Chairman, for the privilege of submitting a brief in behalf of American manufacturers of enamel ware——

Senator LA FOLLETTE. Before you leave this matter, will you state, Mr. McCulloch, whether you have any connection with the watch companies that you represent here in any other way than as an attorney?

Mr. McCULLOCH. No; no other way, except that I am director of the Hampden Watch Co.

Senator LA FOLLETTE. Do you know anything about the profits of the company?

Mr. McCULLOCH. Yes. I know there has been no dividend declared recently. But I will say to the Senator in that connection that I will furnish him, for confidential use, anything he wants on that subject. There has perhaps not been any industry in America that has had to struggle like the American watch industry.

Senator LA FOLLETTE. Your address is Canton, Ohio?

Mr. McCULLOCH. Yes, sir. I will furnish the Senator anything he wants on the subject.

I would like to have the privilege of filing a brief on behalf of the manufacturers of enamel ware, which is covered by paragraph 339, page 56, of H. R. 7546, and to say that the provision in the House bill is satisfactory to the manufacturers who signed this brief.

I should also like to have the privilege, Mr. Chairman, of submitting a brief on behalf of the manufacturers of ball bearings, roller bearings, and steel balls, covered by paragraph 321, page 51, of H. R. 7456. They are also satisfied with the Fordney bill.

The CHAIRMAN. Very well.

Senator LA FOLLETTE. Was this statement which you have furnished the members of the committee prepared for you, or did you prepare it yourself?

Mr. McCULLOCH. I prepared it myself, Senator.

Senator LA FOLLETTE. I just submitted the table of imports to Mr. McCoy, and he is not able to get from his records—I am just calling your attention to it—any figures that are in agreement with yours. I thought that perhaps you might wish to take that matter up with him.

Mr. McCULLOCH. Yes; I will see Mr. McCoy. I will tell you how I got these figures. I asked the Tariff Commission to furnish them, and these are their official figures. I will send the Senator a copy of them.

Mr. ZOLLA. Do the committee want to hear from a man who is an expert on the question of adjustments? He was born here and raised here, and has been in the watch business all his life. I would like to have the committee hear him on adjustments, if it is not imposing on your time.

The CHAIRMAN. Has he made an application for a hearing?

Mr. ZOLLA. He has not, because we did not know at that time whether we would be fortunate enough to be able to get him.

The CHAIRMAN. There are a number of gentlemen on the list who have been promised a hearing and who are waiting. It would hardly be fair to put him ahead of them. If you will send his name in to the clerk of the committee he will be glad to notify him. We may be able to hear him at some time to-morrow.

BRIEF OF R. C. McCULLOCH, REPRESENTING AMERICAN WATCH MANUFACTURERS.

COMPARISON OF WATCH MOVEMENT PARAGRAPHS IN ACT OF 1909, ACT OF 1913, AND FORDNEY BILL.

ACT OF 1909.

Watch movements, including
 ie
 ctors, whether imported in
 es or
 , if having not more than seven
 rels,
 cents each;
 having more than seven jewels,
 1 not
 re than eleven jewels,
 \$5 each.
 having more than eleven jewels
 1 not
 re than fifteen jewels,
 \$5 each;
 having more than fifteen and
 ;
 re than seventeen jewels,
 \$5 each and 25 per centum ad
 lorem;
 having more than seventeen
 rels,
 each and 25 per centum ad
 lorem;

Watchcases and parts of
 aches, chronometers, box or
 ip, and parts thereof, 40 per
 centum ad valorem; lever clock
 movements having jewels in the
 apement, and clocks contain-
 ; such movements, \$1 each and
 per centum ad valorem; all
 ber clocks and parts thereof,
 t otherwise provided for in this
 ction, whether separately
 cked or otherwise, not com-
 sed wholly or in chief value of
 ina, porcelain, parian, bisque,
 earthenware, 40 per centum ad
 lorem; all jewels for use in the
 manufacture of watches or clocks,
 per centum ad valorem; enam-
 ed dials for watches or other
 truments, 3 cents per dial and
 per centum ad valorem;

Provided, That all watch and
 ck dials, whether attached to
 vements or not, shall have
 indelibly painted or printed
 thereon the country of origin, and
 all watch movements, lever
 ck movements with jewels in
 escapement, and cases of for-
 n manufacture shall have the
 me of the manufacturer and
 ntry of manufacture cut,
 raved, or die-sunk conspicu-
 y and indelibly on the plate
 the movement and the inside
 the case, respectively, and the
 vements shall also have
 rked thereon by one of the
 thods indicated the number of
 rels and adjustments, said
 mber to be expressed both in
 rds and in Arabic numerals;
 none of the aforesaid articles
 ll be delivered to the importer
 less marked in exact conformity
 this direction.

ACT OF 1913.

Watch movements, whether
 imported in cases or not, watch-
 cases and parts of watches, chro-
 nometers, box or ship, and parts
 thereof, lever clock movements
 having jewels in the escapement,
 and clocks containing such move-
 ments, all other clocks and parts
 thereof, not otherwise provided
 for in this section, whether sepa-
 rately packed or otherwise, not
 composed wholly or in chief value
 of china, porcelain, parian, bisque,
 or earthenware, 30 per centum ad
 valorem; all jewels for use in the
 manufacture of watches, clocks,
 or meters, 10 per centum ad
 valorem; time detectors, 15 per
 centum ad valorem; enameled
 dials and dial plates for watches
 or other instruments, 30 per
 centum ad valorem;

Provided, That all watch and
 clock dials, whether attached to
 movements or not, shall have
 indelibly painted or printed
 thereon the name of the country
 of origin, and that all watch
 movements, and plates, lever
 clock movements, with jewels in
 the escapement, whether im-
 ported assembled or knocked
 down for reassembling, and cases
 of foreign manufacture, shall
 have the name of the manufac-
 turer and country of manufac-
 ture cut, engraved, or die-sunk
 conspicuously and indelibly on
 the plate of the movement and
 the inside of the case respectively,
 and the movements and plates
 shall also have marked thereon
 by one of the methods indicated
 the number of jewels and adjust-
 ments, said numbers to be ex-
 pressed either in words or in
 Arabic numerals; and if the move-
 ment is not adjusted the word
 "unadjusted" shall be marked
 thereon by one of the methods
 indicated; and none of the afore-
 said articles shall be delivered to
 the importer unless marked in
 exact conformity to this direction.

FORDNEY BILL.

Watch movements,
 whether imported in cases or
 otherwise,
 assembled or knocked down
 for reassembling,
 if having less than seven jewels,
 \$0.75 each;
 having seven and not
 more than eleven jewels,
 \$1.25 each;
 having more than eleven
 and not more than fifteen jewels,
 \$2 each;
 having more than fifteen and
 not more than seventeen jewels,
 unadjusted,
 \$2.75 each;
 having seventeen jewels and
 adjusted to temperature,
 \$3.50 each;
 having seventeen jewels and
 adjusted to three positions,
 \$4.75 each;
 having seventeen jewels and
 adjusted to five positions,
 \$6.50 each;
 having more than seventeen
 jewels,
 adjusted or unadjusted,
 \$10.75 each;

Watchcases and parts of
 watches, chronometers, box or
 ship, and parts thereof, 35 per
 centum ad valorem; all jewels for
 use in the manufacture of watches,
 clocks, meters, or compasses, 10
 per centum ad valorem; enameled
 dials for watches or other instru-
 ments, 3 cents per dial and 35
 per centum ad valorem;

Provided, That all watch and
 clock dials, whether attached to
 movements or not, when imported
 shall have indelibly painted or
 printed thereon the name of the
 country of origin, and that all
 watch movements and plates
 lever clock movements with
 jewels in the escapement, assem-
 bled or knocked down for re-
 assembling, and cases shall have
 the name of the manufacturer
 and the country of manufacture
 cut, engraved, or die-sunk con-
 spicuously and indelibly on the
 plate of the movement and the
 inside of the case, respectively,
 and the movement and plates
 shall also have marked thereon
 by one of the methods indicated
 the number of jewels and adjust-
 ments, said numbers to be ex-
 pressed both in words and in
 Arabic numerals, and if the
 movement is not adjusted, the
 word "unadjusted" shall be
 marked thereon by one of the
 methods indicated, and none of
 the aforesaid articles shall be de-
 livered to the importer unless
 marked in exact conformity to
 this direction.

Provided further, That only the
 number of the jewels which serve
 a mechanical purpose as fric-
 tional bearings shall be marked as
 herein provided.

DUTIES IN FORDNEY BILL NO HIGHER ON AVERAGE THAN PAYNE LAW.

The Payne Act of 1909 provided straight specific duties on the lower grades and mixed ad valorem and specific duties on the so-called higher grades.

The following is a comparison of the act of 1909 (showing converted specific duties on all grades taken from figures in Imports and Duties) with the specific duties provided in the Fordney bill.

It will be noted that 7-jewel movements were heretofore classified with clock watches. Under the Fordney bill watches having less than 7 jewels are classified separately. So that the so-called clock watch is not placed in the same classification with the 7-jewel movement.

The Fordney bill classifies 17-jewel movements according to adjustments. Under the Payne law an unadjusted 17-jewel movement was brought in under the same specific rate of duty as a 17-jewel movement adjusted to temperature and five positions no account being taken of the adjustments which as shown by the brief attached are so potent in determining the value of these watches. A 17-jewel movement adjusted to temperature and five positions will cost to produce and will sell for more than three times what a 17-jewel movement unadjusted will cost to produce and will sell for.

The specific rates in the Fordney bill on 17-jewel movements adjusted and unadjusted are low in comparison with the converted specific rates in the Payne law because the converted rates were, without doubt, largely based upon the value of the unadjusted 17-jewel movements.

PAYNE LAW.

[Specific duties on all grades.]

Having not more than 7 jewels, 70 cents each; having more than 7 and not more than 11 jewels, \$1.35 each; having more than 11 and not more than 15 jewels, \$1.50 each; having more than 15 and not more than 17 jewels, \$1.25 and 25 per cent ad valorem, converted as follows:

Years.	Number.	Duties.	Specific duty.
1910.....	11,686	\$34,992	\$2.00
1911.....	17,182	48,589	2.83
1912.....	20,244	54,349	2.68
1913.....	16,860	51,880	3.07
1914.....	2,415	6,706	2.77

Having more than 17 jewels, \$3 and 25 per cent ad valorem, converted as follows:

Years.	Number.	Duties.	Specific duty.
1910.....	3,766	\$41,432	\$10.98
1911.....	5,410	55,036	10.18
1912.....	5,859	55,056	9.39
1913.....	5,549	56,776	10.23
1914.....	1,626	16,235	9.98

FORDNEY BILL.

Having less than 7 jewels, 75 cents each; having 7 and not more than 11 jewels \$1.25 each; having more than 11 and not more than 15 jewels, \$2 each; having more than 15 and not more than 17 jewels, unadjusted, \$2.75 each; having 17 jewels and adjusted to temperature, \$3.50 each; having 17 jewels and adjusted to three positions, \$4.75 each; having 17 jewels and adjusted to 5 positions, \$6.50 each; having more than 17 jewels, adjusted or unadjusted, \$10.75 each.

GIST OF FORDNEY BILL CHANGES.

1. The Fordney bill—covers movements knocked down for reassembling.
2. Classifies clock watch separately.
3. Classifies 17-jewel movements according to adjustments.
4. Provides straight specific duties on all grades which are no higher on an average than the duties provided in the Payne law.

The duties are based on prewar conditions.

Carries the marking provisions practically the same as the provisions of the Underwood and Underwood bills. The provisions of the Underwood bill as to marking are carried almost verbatim with the exception that the provision of the Payne law relating to the number of jewels to be marked both in words and Arabic numerals is carried in the Fordney bill. This requirement is made for the purpose of stopping fraud resulting from bringing a 17 jewel movement in marked "7" jewels and then adding the numeral "1" in front of the numeral "7" after the movement has been tested, thus defrauding the Government.

The following are the official figures furnished on February 10, 1921, by the United States Tariff Commission, showing imports of watches and parts for each year from 1909 to 1920:

.....	\$988, 004
.....	1, 086, 855
.....	1, 107, 080
.....	566, 674
.....	747, 729
.....	969, 406
.....	1, 117, 255
.....	1, 237, 562
.....	1, 443, 184
.....	1, 559, 428
.....	1, 737, 678
.....	1, 912, 811

.....	9, 215, 189
.....	12, 608, 624

STATEMENT IN SUPPORT OF PARAGRAPH OF THE FORDNEY BILL RELATING TO WATCH MOVEMENTS.

The Fordney bill, paragraph 367, is satisfactory to the interests represented.

It has been demonstrated and will not be seriously denied that American-made watch movements are as accurate and reliable timepieces as are manufactured anywhere in the world. From the standpoint of the consumer, American watches have many advantages over the foreign-made product. First of all, they are made in America by American workmen. The quality is uniform, repairs are more easily made because of the interchangeable material which is always available, and the American manufacturer of known reputation stands back of his product. There are no fake watch-movement manufacturers in this country. The American consumer, therefore, gains nothing by buying a foreign-made watch movement.

There is no combination in the business, and the fiercest competition as to quality and prices is evidenced everywhere, so that the public is assured the highest quality obtainable at the lowest possible price consistent with American wages and conditions. From 80 to 90 per cent of the cost of producing watch movements in America is labor. In the light of such conditions, is there any reason in the world why the American market should be turned over to the producers of foreign-made goods?

A circular recently issued by watch importers states that "about 70 to 90 per cent of almost every jeweler's watch business these days is in watches the movements of which are imported." The circular then attacks the Fordney bill in general terms both as to rates and marking provisions, but does not set out the facts in regard to the rates or the marking provisions.

Attached hereto is a comparison and analysis of the paragraph relating to watch movements in the act of 1909, act of 1913, and revision of 1921. Examination of the paragraphs and the analysis will show that the rates of duty in the Fordney bill are

on an average no higher than the rates of duty in the Payne Act of 1909. The marking provisions are practically the same as the marking provisions of the Payne law and the Underwood law. The only real material change or difference is to be found in the strengthening of the provisions that will require the importer to be honest and not cheat the Government and American consumers.

Bearing in mind that the rates are not materially higher than they were under the Payne law and that the marking provisions are practically the same, I call attention to the following official figures of the Tariff Commission showing the history of the importation of watches and parts during every year from 1895 to 1920. These official figures show that the importations of watches and parts increased from \$1,951,579 in 1913 to \$12,608,624 in 1920. The importers claim that they control from 70 to 80 per cent of every jeweler's watch sales. Therefore, the provisions of the Fordney bill being no increase over the Payne law and the marking provisions practically identical, the bill is certainly not unfair to the importer, to say the least.

In connection with the stamping provisions, particular attention is called to the exhibits attached hereto, Exhibit No. 1 showing the effect of stamping provisions on railroad time service with a statement by the general time inspector for American railroad systems that "to permit foreign watches to come into this country without such markings is tempering dangerously with human life and property."

American watch manufacturers in making their recommendations to the Ways and Means Committee made it very plain that all they asked was to have the difference in the cost of production at home and abroad equalized on the basis of prewar conditions. They are seeking no special advantages or special favors. They recommended that duties be provided and that markings be required that will protect the consuming public and the Government against undervaluations and frauds and afford reasonable protection to the American manufacturer and employer of labor.

Some of the recommendations of American manufacturers were adopted by the Ways and Means Committee. Others were rejected. A number of hearings were had before the Ways and Means Committee in charge of the metal schedule. A great deal of evidence was submitted upon every point raised and every change made.

I shall take up in detail the changes that were made in the paragraph, setting out as clearly as I can the facts and arguments submitted in support of such changes.

ANALYSIS OF WATCH PARAGRAPH IN FORDNEY BILL AS COMPARED WITH THE PAYNE LAW.

Knocked-down movements: The words "assembled or knocked down" are added in the third line. Testimony submitted before the Ways and Means Committee showed that quite a business has been built up in this country through a system put into operation for the purpose of evading the payment of duties on complete watch movements.

Foreign-made movements which have been completed and timed are taken apart before being shipped to the United States and for the purpose of evading the duties are brought into this country as material, afterwards being assembled and sold in competition with American watches.

The following affidavit, which is part of the record of the testimony submitted to the Ways and Means Committee, explains fully the system, and the words "assembled or knocked down" added in the third line we believe will, to some degree, remove and make impossible the continuation of this fraud upon the Government:

STATE OF ILLINOIS, County of Sangamon, ss:

Jacob Bunn, being sworn, says that he is the president of the Illinois Watch Co. of Springfield, Ill., a manufacturer of watch movements; that the accompanying watch movement, No. 100,090, being a 21-jewel movement of Swiss manufacture, was purchased in the city of Chicago for \$8; that affiant is informed that said watch movement was imported into this country "knocked down"—that is, all the parts of said movement were, according to affiant's information, brought in as watch material, on which there is a duty of from 10 per cent on jewels to 40 per cent on other parts. According to affiant's said information, all the parts sufficient to make said complete watch movement were brought in at a valuation of less than \$5 C. I. T. Affiant was informed further that said watch movement was imported by the "American Watch Co., Chicago."

Affiant says that the model for said watch movement is an exact copy of a watch movement being manufactured by the Illinois Watch Co. and known as the Illinois Watch Co.'s recent 16-size bridge model. The Illinois Watch Co.'s imports for the cent 16-size model above referred to are the jewels (which in a grade similar to the accompanying movement would be 21 jewels), a balance, a mainspring, a hairspring, and three hands. Affiant says that the material alone which the Illinois Watch Co. imports for said movement is brought in at a valuation of over 70 cents, which, according to the information of affiant, is more than the value placed upon the entire watch movement accompanying this affidavit, imported as aforesaid. Affiant says that said accompanying watch movement was taken down in the factory of the Illinois Watch Co., and that each of the plates of said watch movement has a corresponding number, which is conclusive evidence to affiant that said movement was assembled and timed and adjusted (if it is adjusted, it being engraved adjusted to positions) in Switzerland. Affiant says that he showed the material in said movement to an importer, and that said importer informed affiant that the material in said movement undervalued from 400 to 500 per cent.

JACOB BUNN.

Subscribed and sworn to before me this 3d day of February, 1913.

D. H. IRWIN, *Notary Public*.

Classification: Watch movements having less than seven jewels are classified separately, and the Fordney bill provides such a classification in the following language: "If having less than seven jewels, 75 cents."

Clock watches, which are known as the dollar watch, but which range in price anywhere from \$1 to \$3, contain no jewels. The value of the clock watch is determined upon an entirely different basis than the value of jeweled watches, as will hereinafter explained.

American watches are nearly all jeweled as follows:

Seven-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, and a roller jewel.

Eleven-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, a roller jewel, third upper, fourth upper, escape upper, and pallet arbor upper hole jewels.

Fifteen-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, a roller jewel, third upper and lower, fourth upper and lower, escape upper and lower, and pallet arbor upper and lower hole jewels.

Seventeen-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, a roller jewel, and the third pinion, fourth pinion, escape pinion; pallet arbor, and center staff upper and lower pivots are journaled in hole jewels.

Nineteen-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, a roller jewel, and the third pinion, fourth pinion, escape pinion, pallet arbor and center staff, barrel arbor upper and lower pivots are journaled in hole jewels.

Twenty-one-jewel grades have balance upper and lower end stones, balance upper and lower hole jewels, receiving and discharging pallet jewels, a roller jewel, upper and lower third and fourth hole jewels, upper and lower escape pinion hole jewels and end stones, upper and lower pallet arbor hole jewels and end stones, upper and lower center staff hole jewels.

Twenty-three-jewel grades have the same jewels as 21-jewel movements, with the exception of two additional jewels for the barrel arbor pivots.

It would be impossible to determine the exact number of jewels in a watch movement without removing the dial and hands, and this may cause trouble of various kinds, as there is always the liability of disturbing the adjustments, breaking dials, pivots, jewels, etc., and the rating of the watch should be tested again to insure its being in good condition.

This change in the classification we approve:

Classification complete: Watch movements have been classified, for tariff purposes the past, as follows: Having not more than 7 jewels, having more than 7 jewels and not more than 11 jewels, having more than 11 jewels and not more than 15 jewels, having more than 15 jewels and not more than 17 jewels, and having more than 17 jewels.

Seventeen-jewel movements are made unadjusted, adjusted to temperature, adjusted to three positions, and adjusted to five positions. All movements containing over 17 jewels are perhaps universally adjusted, being adjusted to temperature and to position; while movements containing less than 17 jewels are known as the lower-grade

movements, and are seldom adjusted. In order to make the classification of watch movements complete, therefore, 17-jewel movements should be classified as follows: Seventeen jewels, unadjusted; 17 jewels, adjusted to temperature; 17 jewels, adjusted to temperature and three positions; and 17 jewels, adjusted to temperature and five positions.

A 17-jewel movement adjusted to temperature and five positions will cost to produce and will sell for more than three times what a 17-jewel movement unadjusted will cost to produce and will sell for, so it is apparent that a classification of 17-jewel movements as contained in the Fordney bill will remedy a serious defect in former laws. The difference in the cost of production is due almost solely to the cost of labor in adjusting the movement. Under the Dingley Act, as well as the act of 1909, an unadjusted 17-jewel movement is brought in under the same rate of duty as a 17-jewel movement adjusted to temperature and five positions, no account being taken of the adjustments which are so potent in determining the value of these watches.

The classification in the Fordney bill can be considered complete for all practical purposes and would cover every kind and grade of watch movement manufactured: Having no, or less than 7 jewels; having 7 jewels and not more than 11 jewels; having more than 11 jewels and not more than 15 jewels; having more than 15 jewels and not more than 17 jewels, unadjusted; having 17 jewels, adjusted to temperature; having 17 jewels, adjusted to temperature and three positions; having 17 jewels, adjusted to temperature and five positions; and having more than 17 jewels.

It will be observed from the foregoing that watch movements are capable of a very simple and, at the same time, complete classification, because the grade of all watch movements and their approximate value is determined by the number of jewels each watch movement contains, together with the number of adjustments.

We urged before the committees of Congress in 1908 and 1909 that, in view of the simple classification above outlined and in view of the evidence submitted of cases of flagrant undervaluations, the ad valorem duties provided in the Dingley law on all grades of watch movements should be dropped and a straight specific duty should be provided on all grades. This suggestion was adopted as applied to the lower grades of watch movements, but the old combination specific and ad valorem duty was retained on the higher grades, where the temptation to undervalue the movement is so much greater. The Fordney bill contains the complete classification.

Methods of adjustment: We quote from the opinion of V. S. Corey, superintendent of the Hamden Watch Co., in regard to adjustments. His opinion is printed in the tariff hearings.

"Seventeen-jeweled watch movements are not always adjusted, some of them being merely timed to run within a few seconds per day; others are adjusted to temperature only; some to temperature and three positions; and some to temperature and five positions. Nineteen, 21, and 23 jeweled watches are usually adjusted to temperature and five positions.

"Adjusted to 'temperature,' 'isochronism,' and 'position' are terms used in connection with watches which have been given the following treatment, and all movements adjusted to position are adjusted to isochronism: After the watches have been assembled they are run for a period of time, usually 24 hours, to ascertain whether the arcs of vibration of the balance are maintained within a certain limit. Isochronism, as applied to watches, means that when the long and short arcs of vibration of a balance are made in equal time, irrespective of whether the mainspring is fully wound or nearly run down, the hairspring which assists in the control of the balance is isochronal or isochronous. There are, however, certain influences which can disturb the isochronous spring, as a defective action of the escapement, difference in size of pivots, change in the weight of a balance, or a variation in the motive force.

"The movements are placed in a box constructed with a thermostat or regulator which keeps a uniform temperature of about 102° F., for the purpose of adjusting them to temperature. After running in this box for a number of hours a note is made of the effect of the heat, and the watches are then placed in another box having a temperature of 34° F., and another run is made and the variation, if any, noted. If the watches show a variation in these extremes of temperature, changes are made in the position of the screws to compensate for the error. If this is not accomplished in one trial, similar treatment must be given them until they run correctly.

"In making the changes in the temperature adjustments, moving the screws to correct the error will, in most cases throw the balance 'out of poise.' This necessitates re-poising the balance before proceeding with the position and test. The watches are then run with the pendant vertical and timed in this position until they run within a few seconds in 24 hours. The watch is ready at this time to be put through the test for position rating, and is run for 24 hours with the dial up, and a notation made of its rate in this position. The movement is then run with the dial down for 24 hours and its rate taken as before. In the third test the watch is run for 24 hours with the pend-

upright, and a record is made of its performance in this position. The fourth position is with the pendant in a horizontal position, turned to the left, and a run of 24 hours is again made and its rate noted. The fifth position is with the pendant turned to the right, in a horizontal position, and the 24-hour run is made as before, and its rate recorded. After making these tests it is often found that the watches do not run within the required limit, and the watches are turned over to expert workmen, known as 'position men,' who make changes which, by long experience, have been found necessary to correct the errors which may have been caused in various ways, as the hairspring being soft, not properly trued; defective collecting, studding, brequeting, leveling of the hairspring; or it may be that the hairspring is not free between the regulator pins; the balance pivots may differ in size or be damaged in handling; and the jewels may not be well polished; or there may be too little or too much freedom between the pivots and the jewels, either in their annular bearings or between the ends of the jewels.

The fork and roller action may be defective; the escapement may not be properly adjusted, the draft of the pallets may be unequal, the lock may be too strong or too light. The wheels and pinions of the train may be defective, or the pivots of the pinions may not be free in the jewels. Jewels may be set out of upright, or may be chipped or cracked.

A mainspring with poor temper may cause much trouble, or the wheels which carry the hour and minute hands may be defective. After the changes which have been found necessary are made the movements are again run in the five positions mentioned before, and it is not an unusual thing that a watch may require this treatment many times, and it frequently takes several months before it will run within the required limit.

The material used in manufacturing watch movements, with the exception of the jewels and settings, does not differ greatly in quality in the high and low grades, the nickel plates, brass wheels, steel from which the pinions, screws, springs, and wheels are made being of the same quality in high or low grade watches."

Duties: The Fordney bill provides specific duties only on all grades of watch movements. That watch movements are different from any other article with which the Congress has had to deal is clearly set out in a statement made January 26, 1912, on the floor of the House of Representatives, by Hon. A. Mitchell Palmer. His speech is reported on page 1432 of the Congressional Record, from which I quote the following: "The only articles covered by the metal schedule where an ad valorem system of duties would be likely to result in serious undervaluations are cutlery and watches. The danger is possibly greater in respect to watches than any other articles in the tariff law. A watch movement is an extremely delicate piece of machinery, and its grade and approximate value are determined by whether or not it has been subjected to certain processes of manufacture which can not readily be discovered by the appraisers. The number of jewels and adjustments has always been and will continue to be the true standard for determining the value of the movement. The lowest grade of movements, as classified under the present law, are those having seven jewels or less, and the importations of these at the average unit of value of only \$1.07 have been very extensive. These cheap watches are seldom, perhaps never, adjusted to either temperature or positions, but the higher grade movements, containing more than seven jewels are largely adjusted either to temperature or to positions, and the best watches, containing 17 jewels or more, are all adjusted both to temperature and to five positions. These adjustments require a long time in the manufacture and add much to both the cost and the value of the watch. No appraiser, however skilled, could determine the fact as to these adjustments and the consequent effect upon importing value by an examination of the movement however critical.

"Not even by taking the watch apart, which is obviously not practicable but which would be necessary to do to determine the number of jewels, could the adjustments be discovered. In consequence, solely for the purpose of preventing fraud and undervaluations and to assist in the administration of the law, we have retained all the marking provisions of the present law and have amended them so as to require the plate to be marked if the watch movement is imported 'knocked down.' Under the present law the provision as to marking has been evaded by importing the movements in parts and assembling them here after importation. It is believed this new provision will, to a large degree, stop this practice and make it possible for the Government officers to assess and collect all the revenue on these articles which the law intends shall be paid."

Ad valorem rates of duty are bound to lead the importer to resort to fraudulent practices, because, as Mr. Palmer says, "No appraiser, however skilled, could determine the fact as to these adjustments and the consequent effect upon importing value by an examination of the movement, however critical."

Watch movements, because of their intricate construction, being in a class by themselves, it being impossible to determine their value by inspection, offer to the importer the opportunity for undervaluation, and without rigid stamping provisions and specific duties the door is left open for fraud which can not be detected. The only safeguard for undervaluations is a specific duty and comprehensive provisions as to stamping, such as are provided in the Fordney bill.

Rates of duty: The information submitted in regard to rates of duty, cost of production, etc., before the Ways and Means Committee was based entirely upon prevailing conditions. The rates of duty in the Fordney bill, as shown by the comparison, are no higher than the duties provided in the Payne law, as the specific rates upon the higher grades are practically the same as the combined specific duties collected during the operation of the act of 1909, as the converted figures show.

The Dingley law provided mixed duties, specific and ad valorem, as follows: 7-jewel, \$0.35 and 25 per cent ad valorem; 11-jewel, \$0.50 and 25 per cent ad valorem; 15-jewel, \$0.75 and 25 per cent ad valorem; 17-jewel, \$1.25 and 25 per cent ad valorem; over 17-jewel, \$3 and 25 per cent ad valorem.

Converting these figures into straight specific duties, we have the following: 7-jewel, \$0.59; 11-jewel, \$1.01; 15-jewel, \$1.67; 17-jewel, \$3.19; over 17-jewel, \$10.73.

The above calculations are made by taking as a basis therefor the average declared values in each classification of all watch movements imported into this country under the Dingley law, which figures are taken from the Government's report entitled "Imports and duties."

Under the Dingley law and the act of 1909 there was no distinction made in the classification between so-called clock watches, or watches having no jewels, and 7-jewel watches. In other words, they all came under the same classification, namely, having seven jewels or less, the result being that the unit of value of the low-grade watches in this classification was very materially reduced, which accounts for the fact that under the Dingley law the combined specific and ad valorem duty of 3 cents and 25 per cent ad valorem figured only 59 cents. The duty was increased under the act of 1909 to 70 cents straight specific on these grades of movements.

The amount of 70 cents is not a fair basis on which to determine the protection that should be afforded the 7-jewel movement, for the reason that it applied also to clock watches of much lower value. To correct this inequity and to afford an accurate classification, the suggestion was made and adopted in the Fordney bill that 7-jewel movements be classed with 11-jewel movements and that clock watches and all watches having less than seven jewels be classed separately. The amount of \$1.01 specific duty, as provided in the Fordney bill on movements having 7 jewels and not more than 11 jewels is a fair rate and would be a rate that is not in excess of the duty provided in the act of 1909 because the specific duty of 70 cents under the act of 1909 included low-value clock watches.

Ladies' small-size movements: It is well known that American manufacturers have not been able to compete with foreign manufacturers on ladies' small-size watches and, therefore, foreign manufacturers have in this country almost a monopoly in that business. In order to encourage American manufacturers in producing the small-size ladies' watch we suggest that the following provision be added doubling the duty on these grades.

"Provided, That all watch movements whose diameter on the dial side is 1 inch or less the duty shall be twice the duty hereinbefore provided on each grade."

Marking provisions: The act of 1909 was the first tariff act to provide comprehensive stamping provisions for watch movements. That part of the paragraph was written after an exhaustive investigation and the submitting of testimony showing the frauds that were being perpetrated by importers of foreign-made watches resulting in a loss of revenue to the Government and in practically vitiating the protection to American manufacturers. We attach as Exhibits Nos. 1 and 2 the following upon this subject:

Copy of letter of Webb C. Ball, general time inspector for American railroad systems, mileage of over 100,000 miles: "To permit foreign watches to come into the country without such markings is tampering dangerously with human life and property" (p. 41).

Letters and affidavits in regard to exhibit fraudulently marked "Time Ball Special, etc., detected in the hands of employee of Chicago, Burlington & Quincy Railroad Co.

Letter from Hamilton Watch Co., in regard to fraudulently marked Swiss movements.

Affidavit of George E. Hunter in regard to fraudulently marked Swiss movements.

ACT OF 1913.

the stamping provisions of the act of 1913 were strengthened in a number of particulars. However, there was one change made in the Underwood law which weakened the stamping provisions of the Payne law, and the Fordney bill restores the Payne provisions. The act of 1909 provided for the marking of the number of jewels and adjustments of watch movements, said number to be expressed "both" in words "and" in Arabic numerals. If the importers were able to carry out the marking provisions of the law during the years it was in operation, which provided that the number of jewels and adjustments should be expressed both in words and in Arabic numerals, they certainly would be able to do it under the provisions of the Fordney bill, which is identical. It has been demonstrated by the United States Mint at Philadelphia that on a piece of metal the size of a dime the entire Lord's Prayer can be die sunk, and an exhibit of that kind will be submitted with this brief. The act of 1913 changed the provision of the act of 1909 providing that the number of jewels and adjustments should be marked in "either" words "or" Arabic numerals, the effect of which change is that a 17-jewel movement could be imported stamped merely with the numeral 7, the duties paid accordingly, it being a simple matter to engrave the numeral "1" in front of the numeral "7," making it "17" after the movement had been cleared, thus defrauding the Government without any very great danger of detection. By requiring that the number of jewels and adjustments should be marked both in words and in Arabic numerals the possibility of such a fraud is eliminated.

DEFINITION OF JEWELS.

The Fordney bill provides at the end of the paragraph a definition of jewels which materially strengthens the law. It is a common practice for manufacturers of fake jewels to place upon watch movements jewels which serve no mechanical purpose which are made of celluloid and, therefore, are not jewels at all, but which are fraudulently represented to be frictional bearings. Jewels that determine the value of watch movements must serve a mechanical purpose as frictional bearings. The exhibit attached above referred to marked "No. 1" should convince anyone of the importance of the marking provisions. We believe that if the various provisions of the Fordney bill, paragraph 367, are adopted they will not only serve to protect the American manufacturer by insuring honest collection of the duties provided but will increase the revenue to the Government. No honest importer or manufacturer can object to them and all who are interested in square dealing and honest merchandising should approve of them. They protect the honest merchant, the honest manufacturer, and the public.

OFFICIAL RAILROAD TIME SERVICE AND WATCH INSPECTION.

CLEVELAND, OHIO, May 29, 1909.

H. T. E. BURTON,
United States Senator, Washington, D. C.

DEAR SIR: Again referring to that part of the tariff bill which has a bearing on the importation of Swiss watches, I wish to give you some further information on the subject.

For 20 years I have had charge of the time service and watch inspection departments for several important American railroad companies, and at the present time am general time inspector for the following lines: Union Pacific Co., Southern Pacific Co., Illinois Central Railroad Co., Baltimore & Ohio Railroad Co., Missouri, Kansas & Texas Railway Co., Oregon Railroad & Navigation Co., Rock Island lines, and companies under their control; all the Vanderbilt lines, besides several other large systems, the mileage of which run considerably over 100,000.

You can readily understand this large territory, extending from Boston in the East to San Francisco in the West, and from New Orleans in the South to St. Paul in the North, embraces the most important part of the United States, and the experience I have gained in connection with the administration of this service has acquainted me with all the different makes and qualities of watches of American manufacture, as well as foreign, that are brought into service in the way of timepieces which govern the movement of trains.

The provisions in paragraph 189 of the tariff bill requiring the name of the manufacturer and location, together with the number of jewels and adjustments, be plainly stamped on all imported watch movements, I consider of the greatest importance as a safeguard to the railroad time service and watch inspection now in operation on American railroads, and it applies as well to the safety of the traveling public and the shippers who patronize these railroads.

To permit foreign watches to come into this country without such markings is tampering dangerously with human life and property.

Hundreds of fraudulent Swiss watches are sold to railroad employees who are directly responsible for the transportation of their fellow employees and the traveling public and the shipping of live stock and merchandise.

It is a well-understood fact that certain American-made watches fully meet the requirements of railroad standard watches, and one of the greatest hazards we have to contend with as time inspectors is the Swiss-made watches bearing markings counterfeiting well-established railroad standard watches and which railroad employees are induced to purchase through fraudulent means and misrepresentation.

So complete has been the deception in many instances that our local watch inspectors, who are not experts, due to the fact of their being located in inland towns and not having had experience, these counterfeit watches frequently get into service and remain in the hands of employees sometimes for several months before finally being detected and taken out of service.

Nothing is more important in the safe and prompt movement of railroad trains than reliable watches in the hands of employees in charge of such trains.

A watch can truly be classed as a valuable "safety appliance," for without such watches every wheel would stop.

An instance of this kind occurred quite recently. I refer to the extraordinary snowstorm and blizzard that swept over the country on the 4th of March last, at the time of the inauguration of President Taft.

Nearly everyone traveling to Washington has a keen recollection of the delay and the hazard involved in the movement of trains, due to the fact that telegraph wires were all down and communication in that direction was entirely cut off, and employees in charge of trains were obliged to depend absolutely on the correct reading of the watches in their pockets. The truthfulness of this statement can be verified by inquiring of some of the prominent officials whose trains were delayed, due to extraordinary weather conditions.

As general time inspector for the important railroad lines above enumerated I have about 1,000 watch inspectors located at the terminal points along these lines who inspect and look after the rating of the watches of the employees, under instructions issued from my department, approved by the operating officers of the different lines.

At the large cities it is easy to secure competent expert watch inspectors who are thoroughly familiar with all the different makes and grades of watches, but at inland, small points, we find great difficulty frequently in securing competent, experienced watch inspectors, and we are obliged to keep check on such points by sending over the lines, at frequent intervals, traveling expert watch inspectors to check up the work of these inland inspectors and instruct and educate them as to their duties and the proper way to handle the service.

I have a large corps of assistants who are skilled in this kind of work and, in order to properly administer the service, offices are maintained in Cleveland, Chicago, and San Francisco.

The duties of my assistants connected with these offices are to check up the work of the local inspectors and see to it that the employees' watches are of the proper standard and maintained in reliable timekeeping condition, thereby safeguarding the traveling public, the shippers, the employees, and the railroad companies' interests.

From this general outline you will understand the importance of securing for railroad service watches about which every hazard of doubt and uncertainty is reduced to a minimum.

I have before me a Swiss-made watch which was brought into my office yesterday by a man who loaned a railroad employee \$5 on the watch. The markings on the watch are as follows: "Missouri Pacific," "Specially adjusted," "Extra quality," "Highly 21 jeweled," "Swiss." I find it has five jewels made of glass and the crown jewel, one of the most important bearings in the watch, has the appearance of a real jewel, but upon examination we find it is made of red wax.

The markings on this watch indicate that the figures giving the number of jewels, "21," were stamped on the plates after the watch passed through the customhouse. This is certainly one of the worst frauds that has come under my observation.

I have another watch movement before me which was recently detected in the hands of a railroad employee. It bears the following markings on the plates: "Bell special," "23 Ruby jewels," "Adjusted." On the dial is also marked "Bell special." The number "23" was stamped on this watch evidently after it passed through the customhouse, as it is a very rough job, while the other lettering is plain and well done. This watch has only seven glass jewels. The general inside finish of both watch movements and under the dial, is very rough and poor.

During the years I have had charge of this time service work we have detected and taken out of service hundreds of such dangerous machines, and I do not know

any greater protection that can be afforded the traveling public, the shippers, the employees, and the railroad companies than the enforcement of the provisions in paragraph 189 of the tariff bill; and, furthermore, these same provisions will protect the integrity and high standing of reliable Swiss manufacturers who have spent large sums of money and years of patient skill and experience to produce watches that can be depended on and have gained a world-wide reputation. Certainly no harm can come to them or American merchants and their customers by having the provisions of paragraph 189 of the tariff bill fully complied with.

I wish to further state, if the provisions of this tariff bill in regard to the stamping of Swiss watches are fully complied with, it will render valuable assistance to the time service department in maintaining the service along such lines as will bring the highest degree of efficiency and safety to the railroads and the important interests involved in connection therewith.

Yours, truly,

WEBB C. BALL,
General Time Inspector.

CLEVELAND, OHIO, *February 20, 1909.*

Mr. E. C. FITCH,

President Waltham Watch Co., Waltham, Mass.

DEAR MR. FITCH: Attached herewith please find two letters from E. J. Heather, employed by the Chicago, Burlington & Quincy Railroad Co., at Peruque, Mo., that recite his experience with the Swiss counterfeit watch which you have, and indicating that he purchased it under the impression that he was securing one of our "Ball Railroad Standards."

You can understand that the manufacturers of this counterfeit have provided a very good opportunity for misrepresentation by stamping their movement "Time Ball Special."

Here is a definite instance where the employee of a large railroad system, thinking to secure one of our watches, was deceived into purchasing a worthless imitation.

Yours, very truly,

THE WEBB C. BALL CO.,
Per S. Y. BALL.

CHICAGO, BURLINGTON & QUINCY RAILROAD CO.,
Peruque, Mo., February 7, 1909.

The WEBB C. BALL WATCH CO.,
Cleveland, Ohio.

GENTLEMEN: Your letter of February 5. So far the watch has not showed up. The only thing I will do I will accept your check for \$5. Nothing less goes for the watch. I can get that much for it here, as that 21 J. will sell it. Please return watch or mail your check.

Yours, truly,

E. J. HEATHER.

The WEBB C. BALL WATCH CO.,
Cleveland, Ohio.

PERUQUE, MO., *February 17, 1909.*

DEAR SIR: You asked for the particulars as how I came in possession of the "Ball Special" watch I sent you for examination as to the value and for cleaning. I bought this from one man and a boy. They were dressed fairly good, but claimed they were out of funds and wanted to get to St. Louis and offered the watch in question for sale at a sacrifice, so they put it, claiming that it was "Ball Special," with 23 jewels, and was worth, or cost them, as near as I remember, about \$20, and that it was a number one watch, etc. But before I bought I called up a man over the phone who handles watches as a side line and he told me that the Webb C. Ball Watch Co. was good, of course. I thought I was getting something for nothing and supposed the watch was a regular Webb C. Ball.

Yours, truly,

E. J. HEATHER.

AFFIDAVIT OF EDWARD A. MARSH.

I have this day made a careful and detailed examination of a watch movement, on the top plate of which is stamped the number 172,654; also the following words: "Time Ball Special," "Nonmagnetic," "Six positions," "Highly 23 jeweled"; also the word "Swiss." On the steel cap covering a portion of the regulating mechanism is stamped the word "Adjusted." On the dial are the words "Time Ball Special" and "Jeweled" in Roman letters, and over the second circle the word "Adjusted" in script.

This movement would be briefly described as "18 size, open face, full plate, stem winding, and lever setting."

The construction would be technically known as a "4 pillar model," with a "right-angle escapement" and "going barrel."

In detail it is described as follows: The plates and bridges are of brass, but plated to represent, or imitate, nickel—that being the metal used in the majority of American watches and used exclusively in the higher grades.

The workmanship throughout is coarse and the finish is cheap. The top plate contains four jewels, which are set in the plate itself, although there is an attempt to represent separable settings by surrounding the jewels by circular lines and by the insertion of screws, such as are used in high-grade American watches, to secure the jewel settings in place. The balance cock contains the usual two jewels—a "hole" jewel and an "end stone." The lower plate contains no jewels.

The potance, or lower support of the balance staff, contains one whole jewel corresponding to that in the cock, or upper support of the balance staff, but in place of a jewel end stone, a flat steel disk is used. The pallet (which in all ordinary American watches contains two jewels, which act upon the teeth of the escape wheel) has no jewels at all. The roller, in place of the ordinary "jewel pin," has merely a piece of brass wire. The entire number of jewels, contained in this movement is seven, instead of 23, as stamped on the top plate. Note that the figures "23" are not stamped, but were evidently engraved after the watch passed the customhouse. The body of the balance wheel is composed of a single piece of nickel instead of being bimetallic, as in the regular compensating balances. The rim screws in the balance are really imitation screws. The hairspring is so badly out of proper shape as to be entirely unreliable, and would render impossible any adjustment of the watch to varying positions. Concerning the markings on the top plate, it seems evident that the word "highly" and the word "jeweled" were widely separated, for the purpose of fraudulently inserting a fictitious number, so that while this movement could be invoiced as a "seven jewel" movement, it could, after customhouse inspection, be engraved to describe, represent, or indicate any desired number of excess of seven. The difference in the appearance of the figures and the words between which they appear give strong evidence that this was done. Furthermore, it seems evident that the name "Time Ball Special" was adopted and used to mislead purchasers into the belief that they were buying a watch commonly known as the "Ball Railway Special" Mr. Webb C. Ball being chief time inspector on 70 of the railroads of the United States covering more than 60,000 miles. This belief is confirmed by the accompanying letters from E. J. Heather and Webb C. Ball, the official time inspector above mentioned. While the word "Nonmagnetic" is not absolutely false in fact, its insertion with other markings, which are entirely false, justifies the assumption that it was used with the intent to deceive and mislead the ignorant purchaser.

But more serious than the fraud and its accompanying pecuniary loss to the purchaser of such watches, is the danger to life of the traveling public, if such watches find even temporary use in railway service. It is to insure safety in the operating of railway trains that systematic time inspection has been established on most of the American railway systems. It is, therefore, little short of criminal to issue inferior watches, which are so marked as to deceive any portion of the public.

EDWARD A. MARSH.

WALTHAM, MASS., *February 25, 1909.*

COMMONWEALTH OF MASSACHUSETTS, *Middlesex, ss:*

WALTHAM, *February 25, 1909.*

There personally appeared the above named Edward A. Marsh and made oath that the above statement by him subscribed is true.

Before me,

ROMNEY SPRING, *Justice of the Peace*

HAMILTON WATCH CO.,
December 31, 1908.

HON. SERENO E. PAYNE,
*Chairman of the Committee on Ways and Means,
House of Representatives, Washington, D. C.*

DEAR SIR: We desire to submit to you the following facts in reference to the fraud upon the public practiced by the importers of certain foreign watches.

In this country there is a careful system of inspection of watches designed for use on railroads, and a certain standard of excellence has been established. To conform to this standard a watch must have at least 17 jewels and be adjusted to heat and cold and to three positions. The requirements often go further than this, and call for

jewels and adjustment to heat and cold and five positions. As a result, railroad watches are generally understood by the consumer in this country to be watches of a very high grade. Advantage is taken of these facts, and the public are deceived by the following devices:

1. The use of fictitious names and initials to simulate the names of well-known American manufacturers of railroad watches. An example of this form of deception is shown in Exhibit F, which is a Swiss watch movement in a pasteboard submitted herewith. On this watch movement are the initials "H. W. Co.," and in Exhibit E, which is marked "J. P. Hamlin." Both of these movements are intended to be sold as watches by the Hamilton Watch Co. No such person as John P. Hamlin is believed to exist in Switzerland, and it is obvious that a purchaser might readily mistake a "Hamlin" watch for a "Hamilton" watch. The significance of the mark "H. W. Co." requires no comment.
2. The use of pictures of locomotives on the dial and the use of such names as "Railroad Trainmen Special," "Engineers' Special," "Railroad Special." Exhibits A, B, C, and D are so marked. The only purpose of this marking is to induce the public to believe that they are buying a watch of the grade generally known in this country as a railroad watch.
3. The use of the terms "heat and cold" and "six positions," these words convey the impression that the movements on which they are stamped are adjusted to heat and cold and to six positions, which is not the fact. American-made movements which are so adjusted cost at least ten times as much as the movements in question.
4. The employment of the terms "highly jeweled" and "richly jeweled," with a blank space for engraving, after passing the customhouse as a low-jeweled movement, the words "19-21-23" intending to convey the idea that they are movements containing that number of jewels. For an example of this see Exhibit E, where the letters "21" have been stamped after importation. We particularly direct your attention to this exhibit and to the way in which the letters "21" are placed upon the movement. It is palpable that "21" and "highly jeweled" were not stamped on this movement at the same time.

The cost to the jobber of the various exhibits submitted herewith are as follows:

Railroad Special, Exhibit A.....	\$1. 65
Railroad Trainmen Special, Exhibit B.....	1. 65
Engineers' Special, Exhibit C.....	1. 65
Artford, Exhibit D.....	1. 65
J. P. Hamlin, Exhibit E.....	1. 75
H. W. Co., Exhibit F.....	1. 70
H. W. Co., Exhibit G.....	1. 57½

If such fraudulent movements should be sold at all at retail a reasonable profit could be from 25 to 33 per cent, but by reason of the deception practiced they are sold to the innocent consumer at a profit between 500 and 1,000 per cent. The cheapest genuine railroad watch movements are sold to the jobber from \$16 to \$18. The watch movements submitted as exhibits are, in fact, not highly jeweled, nor adjusted to different positions, nor are they in any respect well made. These movements have been carefully examined by Mr. Hunter, of the Elgin Watch Co., and his affidavit, showing in detail the results of his examination, is hereto annexed and marked "Exhibit A."

Very truly, yours,

HAMILTON WATCH CO.,
By CHAS. D. ROOD, *President.*

AFFIDAVIT OF GEORGE E. HUNTER.

STATE OF ILLINOIS, *County of Kane, ss:*
George E. Hunter, of lawful age, being first duly sworn, upon oath deposes and says that he is the general superintendent of the factories of the Elgin National Watch Co., at Elgin, county of Kane, and State of Illinois, that he has examined the seven watch movements which are herewith transmitted under notarial seal, and that the memorandum hereto attached is a correct statement of his findings therein. And further this affiant saith not.

GEORGE E. HUNTER.

Subscribed and sworn to before me this 28th day of December, A. D. 1908.
MORTIMER S. ALDRIDGE,
Notary Public.

Memorandum of examination of Swiss watch movements, in boxes, marked "A," "B," "C," "D," "E," "F," and "G" and belonging to the Philadelphia Watch Case Co.

Movement in box marked "A":

Stamping: On top plate pieces "R. R. Special," "Specially Adjusted."

Jeweling: Total number of jewels in this movement is 7, distributed as follows:

Top plate (third, fourth, escape and pallet, pivot holes, one each)..... 4

Lower plate (balance pivot hole, no end stone)..... 1

Balance bridge (balance pivot and end stone)..... 2

No jewels in roller or pallet.

A piece of red celluloid or similar substance surrounds upper center pivot hole, to imitate a jewel. The pivot actually runs in the brass plate.

Balance: This is of the compensation type, with bimetallic (steel and brass) rim. The rim is not cut.

Hairspring: Composition.

Escapement: Double roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "B":

Stamping: On top plate pieces "R. R. Trainmen's Special," "Non-magnetic," "Adjusted," "Highly jeweled."

Jeweling: Total number of jewels in this movement is 7, distributed as follows:

Top plate (third, fourth, escape, and pallet pivot holes, one each)..... 4

Potance (balance pivot hole, no end stone)..... 1

Balance bridge (balance pivot hole and end stone)..... 2

No jewels in roller or pallet.

Balance: Solid. German silver.

Hairspring: Composition.

Escapement: Single roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "C":

Stamping: On top plate pieces, "Engineers' special," "Adjusted."

Jeweling: Total number of jewels in this movement is 7, distributed as follows:

Top plate (third, fourth, escape, and pallet pivot holes, one each)..... 4

Potance (balance pivot hole, no end stone)..... 1

Balance bridge (balance pivot hole and end stone)..... 2

No jewels in roller or pallet.

Balance: Solid. German silver.

Hairspring: Steel.

Escapement: Single roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "D":

Stamping: On top plate pieces "Hartford," "Adjusted," "Heat and cold," "Six positions," "Highly jeweled."

Jeweling: Total number of jewels in this movement is 7, distributed as follows:

Top plate (third, fourth, escape, and pallet pivot holes, one each)..... 4

Lower plate (balance pivot hole, no end stone)..... 1

Balance bridge (balance pivot hole and end stone)..... 2

No jewels in roller or pallet.

Balance: Solid. German silver.

Hairspring: Steel.

Escapement: Double roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "E":

Stamping: On top plate pieces "John P. Hamlin," "Adjusted," "Highly jeweled," ("21" has been stamped before the word "Highly" since the plate was finished), "Heat and cold," "Six positions."

Jeweling: Total number of jewels in this movement is 7, distributed as follows:

Top plate (third, fourth, escape, and pallet pivot holes, one each)..... 4

Lower plate (balance pivot hole, no end stone)..... 1

Balance bridge (balance pivot hole and end stone)..... 2

No jewels in roller or pallet.

Balance: Solid. German silver.

Hairspring: Steel.

Escapement: Double roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "F":

Stamping: On top plate pieces "H. W. C.," "Heat & Cold," "Six positions," "Ruby Jewels."

Jeweling: Total number of jewels in this movement is seven, distributed as follows:

Top plate (third, fourth, escape and pallet pivot holes, one each).....	4
Lower plate (balance pivot holes, no endstone).....	1
Balance bridge (balance pivot holes and endstones).....	2

No jewels in roller or pallet.

A piece of red celluloid or similar substance surrounds the center pivot hole in the top plate, also the barrel arbor pivot hole in the barrel bridge, to imitate ruby jewels. The pivot in both instances runs in the brass plate.

Balance: Solid. German silver.

Hairspring: Steel.

Escapement: Double roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

Movement in box marked "G":

Stamping: On top plate pieces "H. W. C.," "Adjusted," "Heat & Cold," "Six positions," "Ruby Jewels."

Jeweling: Total number of jewels in this movement is seven, distributed as follows:

Top plate (third, fourth, escape and pallet pivot holes, one each).....	4
Lower plate (balance pivot hole, no endstone).....	1
Balance bridge (balance pivot hole and endstone).....	2

No jewels in roller or pallet.

Balance: Solid. German silver.

Hairspring: Steel.

Escapement: Double roller.

Adjustment: This movement is not adjusted in the ordinary acceptance of the word.

MOTOR CYCLES.

[Paragraph 371.]

STATEMENT OF WALTER DAVIDSON, PRESIDENT HARLEY-DAVIDSON MOTOR CO., MILWAUKEE, WIS.

Mr. DAVIDSON. I appear before your committee representing our own company, the Harley-Davidson Motor Co., of which I am president, and the motorcycle manufacturers of this country.

I have a comparatively short brief here, which I wish to read and then explain it afterwards.

Senator SMOOT. I do not think it would do any good to read the brief.

Mr. DAVIDSON. It really is an explanation of our whole position.

Senator SMOOT. If that is all, just put it in the record.

Mr. DAVIDSON. But I wish to make a few explanations in connection with it.

Senator SMOOT. Why do you not do that now? Why not put your brief in the record and then make the explanations that you wish to?

Mr. DAVIDSON. I really ought to read it in order to explain it.

Senator WALSH. Mr. Chairman, I have looked over this witness's brief. It is very short and comes directly to the point. I think if every case were presented as briefly and as concisely it would be helpful to us.

Mr. DAVIDSON (reading):

Present law, 25 per cent ad valorem.

Proposed rate, 30 per cent, with clause added.

When imported from a country which imposes a duty greater than 30 per cent the duty would be equal to the duty of the foreign country, but not to exceed 50 per cent.

RECOMMENDATIONS.

First. We hold that classification of paragraph 371 is incorrect and ask that complete motor cycles be considered separately from parts and bicycles, for the reason that in this country there is no connection between the manufacture of motor cycles and bicycles; and motor-cycle parts and bicycle parts are subject to much more severe competition from foreign countries than are complete motor cycles.

Second. We recommend that in place of the proposed tariff of 30 per cent in H. R. 7456 that a tariff of 15 per cent be imposed on complete motor cycles, with the following clause added:

"When imported from a country which imposes a duty greater than 15 per cent the duty would be equal to the duty of the foreign country, but not to exceed 50 per cent."

FACTS ABOUT UNITED STATES MOTOR-CYCLE INDUSTRY.

There are seven active motor-cycle manufacturers in the United States, with capital invested of approximately \$18,000,000. During the year 1920 these manufacturers produced about 68,000 complete motor cycles, employing approximately 6,000 employees, with a pay roll of about \$9,000,000.

Senator WALSH. How many motor-cycle manufacturers are there in the United States?

Mr. DAVIDSON. About seven.

Senator WALSH. And there are no companies which make bicycles and motor cycles at the same time?

Mr. DAVIDSON. There is just one individual, Mr. Swenn, in Chicago, who makes the Excelsior motor cycle and also bicycles, but they are two separate institutions.

The American motor cycles exported yearly for the period 1914 to 1920 inclusive, are:

Year.	Quantity.	Value.	Year.	Quantity.	Value.
1914.....	6,110	\$1,234,194	1918.....	10,509	\$2,341,794
1915.....	8,166	1,494,176	1919.....	24,481	6,667,344
1916.....	17,500	3,369,616	1920.....	37,622	10,736,444
1917.....	16,609	3,404,716			

The importation of motor cycles, and finished parts thereof, not including tires—we have to take it that way, because those are the only figures available so far as parts are concerned—show:

1913.....	\$62,528	1917.....	\$16,375
1914.....	55,869	1918.....	3,500
1915.....	15,428	1919.....	1,125
1916.....	36,104	1920.....	11,575

Senator WALSH. What was the percentage of the imports compared to the exports?

Mr. DAVIDSON. About one-tenth of 1 per cent.

Senator WALSH. And what was the percentage of imports compared to the entire consumption in America.

Mr. DAVIDSON. Practically nothing. There were 41 motor cycles imported in 1920 and 37,000 exported.

Senator WALSH. What was the percentage of exports compared to the production?

Mr. DAVIDSON. Over 50 per cent of the motor cycles produced in 1920 in the United States were exported.

Senator WALSH. So you have practically no competition outside of your own country?

Mr. DAVIDSON. That is what we believe.

Senator SMOOT. Does the Harley-Davidson Motor Co. make motor cycles in this country?

Mr. DAVIDSON. Yes, sir.

Senator SMOOT. Do they import them?

Mr. DAVIDSON. No, sir.

Senator SMOOT. What are you asking for?

Mr. DAVIDSON. We are asking, first, that motor cycles be taken——

Senator SMOOT. Yes; I know, but what are you asking for in the way of rates?

Mr. DAVIDSON. We are asking that the rates be lowered on completed motor cycles from the rate in the Underwood-Simmons bill and the rate in the Fordney bill to 15 per cent.

If we get that lower rate, while there will be comparatively few motor cycles imported, it will give us a chance to get better rates than these other countries. We depend very largely on our export business, and we believe we can go to these other countries and get preferred rates from them if we show them that we are not afraid of competition here. The reason that we are asking to be separated from motor-cycle parts and bicycle parts is that there is severe competition, so far as the parts are concerned, but there is no competition as far as the finished motor cycle is concerned.

Senator McLEAN. Are there concerns in this country that import the parts and assemble them?

Mr. DAVIDSON. There are parts, such as chains and saddles and things of that kind, that are manufactured in England and Germany that are imported here and then again are brought up and made into finished motor cycles, but practically all the material we use is made in this country.

Senator SMOOT. You agree, then, with the resolutions that were passed by the National Association of Automobile Manufacturers?

Mr. DAVIDSON. It is practically the same thing, and we are submitting this as our brief.

It is a selfish attitude, because we believe it is to our benefit to have that rate. We are not doing it for selfish reasons, because we figure that in the future two-fifths of our own business will be foreign business, and the question of rates in these foreign countries is very vital. For instance, Italy not more than six months ago raised the rate from 10 lire to 240 lire, and beginning July 1 she jumped the rate to 900 lire. That makes it prohibitive.

Senator McLEAN. But that is under the Underwood bill. What difference does it make what our rate is?

Mr. DAVIDSON. If we ask for a lower rate here our dealers over here can use that as propaganda.

Senator SMOOT. You want 30 per cent to remain on parts, do you?

Mr. DAVIDSON. I can not tell you about that, because I am not familiar with parts or bicycles, but all we are asking for is a rate on completed motor cycles. We are asking that that rate be reduced.

BRIEF OF WALTER DAVIDSON, MILWAUKEE, WIS., REPRESENTING MOTOR-CYCLE MANUFACTURERS OF THE UNITED STATES.

Present law, 25 per cent ad valorem; proposed rate, 30 per cent, with clause added: "When imported from a country which imposes a duty greater than 30 per cent the duty would be equal to the duty of the foreign country, but not to exceed 50 per cent."

RECOMMENDATIONS.

- 1. We hold that classification of paragraph 371 is incorrect and ask that complete motor cycles be considered separately from parts and bicycles for the reason that in this country there is no connection between the manufacture of motor cycles and bicycles, and motor-cycle parts and bicycles and bicycle parts are subject to much more severe competition from foreign countries than are complete motor cycles.
- 2. We recommend that in place of the proposed tariff of 30 per cent in H. R. 7456 a tariff of 15 per cent be imposed on complete motor cycles, with the following clause added: "When imported from a country which imposes a duty greater than 15 per cent the duty would be equal to the duty of the foreign country, but not to exceed 50 per cent."

FACTS ABOUT UNITED STATES MOTOR-CYCLE INDUSTRY.

There are seven active motor-cycle manufacturers in the United States, with capital invested of approximately \$18,000,000. During the year 1920 these manufacturers produced about 68,000 complete motor cycles, employing approximately 6,000 employees, with a pay roll of about \$9,000,000.

American motor cycles exported yearly, 1914-1920.

Year.	Quantity.	Valuation.	Year.	Quantity.	Valuation.
1914.....	6,410	\$1,234,194	1918.....	10,500	\$2,354,750
1915.....	8,166	1,494,176	1919.....	24,481	6,687,400
1916.....	17,500	3,369,616	1920.....	37,622	10,756,500
1917.....	16,609	3,404,716			

Importation of motor cycles and finished parts thereof, not including tires.

1913.....	\$62,528	1917.....	\$16,970
1914.....	55,869	1918.....	3,800
1915.....	15,426	1919.....	1,120
1916.....	36,104	1920.....	11,330

REASONS WHY TARIFF SHOULD BE LOWERED TO 15 PER CENT.

American motor-cycle manufacturers do not fear competition created through the importation of foreign motor cycles.

The American motor-cycle industry is dependent on foreign markets for disposal of approximately 35 to 50 per cent of its product, and any tariff rate that is higher than is absolutely necessary to give the American industry reasonable protection will tend to retard the development of American motor-cycle business in foreign markets.

This brief is submitted on behalf of the motor-cycle manufacturers of this country after careful study of the entire subject, and it is hoped our recommendations will be given careful consideration both in regard to separate classification of complete motor cycles and reduction in tariff on same.

STATEMENT OF WM. G. McCANN, REPRESENTING THE HENDEE MANUFACTURING CO., SPRINGFIELD, MASS.

Mr. McCANN. Mr. Chairman, I am appearing with Mr. Davidson for the motor-cycle industry. I represent the Hendee Manufacturing Co., and the motor-cycle industry as well, in reference to paragraph 371 of H. R. 7456.

My remarks are practically a continuation of Mr. Davidson's, but they touch more on wherein the restriction of tariff in this country is going to help us in our foreign business or the development of our foreign business.

Senator SMOOT. You have that in your brief, have you?

Mr. McCANN. I have, but I would like to go a little into detail. There are only two pages of my brief. [Reading:]

In continuation of the remarks of Mr. Davidson, let me add that the reduction in the proposed tariff we have requested will not, in my opinion, result in a large increase in the import of completed motor cycles into this country, but it will help American motor-cycle manufacturers greatly in the development of their foreign market, which are of vast importance in the development of the motor-cycle industry of this country.

As evidence of this we submit below a partial list of foreign countries that have put into force excessively high tariffs covering motor-cycle imports which have hindered our development in these countries, and in some cases these tariffs have resulted in practically placing an embargo on the importation of American motor cycles.

These countries are England, with a duty of 33½ per cent; Belgium, 20 per cent; India, 20 per cent; Australia, 50 per cent; Spain, 9 pesetas gold per kilo, fifty-three times what it formerly was, but I have been advised to-day by cable from the commercial attaché in Madrid that this has been decreased to 2 per cent gold, and I would like to point out that that is really the result of our effort, plus the efforts of our distributors in Spain, plus the effort of the American attaché and the American Chamber of Commerce in Spain. Under those rates we have done no export business in Spain during this year. The reduction which went into effect on July 12 really opens the Spanish market to us, which is a vital market.

Senator McLEAN. Where do they make the best foreign motor cycles?

Mr. McCANN. The best foreign motor cycles are made in England. As a matter of fact, the United States and England are the two motor-cycle producing countries of the world.

Senator McLEAN. Does England export?

Mr. McCANN. Yes, sir.

Senator McLEAN. What is the difference in price between your machine and the English machine?

Mr. McCANN. It is hard to get a comparison for the reason that the English production is confined principally to small-type machines. However, we do not fear importation of English machines into this country. As a matter of fact, we rather invite it, because it will help to develop the industry in this country. The reason for that is this: To-day the development of the motor-cycle industry in this country is confined to seven manufacturers. Back in 1913 there were four more and the expense of the development was distributed then among 11, whereas to-day it is distributed among 7. Since 1913 our production and our domestic consumption have decreased, whereas our exportation has increased. We would like to be helped in the development of this industry.

Senator McLEAN. You invite imports from Great Britain in competition with your machine?

Mr. McCANN. We do; yes, sir.

Senator McLEAN. Because it will help to develop your industry?

Mr. McCANN. We expect so; yes, sir.

Senator McLEAN. In what way?

Mr. McCANN. It will help to develop it in dividing the expense of development, and, although we think that perhaps they may come

in, it will be a number of years before they would be able to accomplish what we have accomplished in this country or what we have accomplished in foreign countries.

Senator McLEAN. If they could make as good a machine as you make at a less price, you would not want them here?

Mr. McCANN. They are making a good machine now, but we compete favorably with them in their own market and in every other foreign market. We do not compete like we did a few years ago, because they put on a duty of 33½ per cent. We would like to have something to which to point as an object lesson for them to point to to reduce that.

Senator McLEAN. You will point in vain, I think, my friend.

Mr. McCANN. We accomplished something in other countries which I am leading up to now.

Continuing the list of countries and the duty in those countries there are: Korea, with a duty of 50 per cent; Canada, with a duty of 35 per cent; and Italy, with a duty of 930 lire per motor cycle, which just went into effect, and we will not do any business in Italy this coming year.

Senator WALSH. Is it the object of these countries that you have named to collect revenue, or is it their object to protect the local industries? Take Italy, for instance.

Mr. McCANN. In Italy there is one motor-cycle manufacturer, but his importations do not amount to very much.

Senator WALSH. Their object is to produce revenue?

Mr. McCANN. Yes, sir.

Senator WALSH. Knowing that there is a certain demand for motor cycles and they are coming in anyway, they put a tax on them!

Mr. McCANN. Yes, sir.

Due to the efforts of American motor-cycle manufacturers and our distributors in foreign countries, we have succeeded in bringing about reductions of exorbitant tariffs in at least two instances—namely, Australia, where the tariff has recently been reduced from 40 per cent ad valorem to 30 per cent ad valorem, with a prospect of a further reduction to 20 per cent being obtained in the near future; Spain, where the tariff in November, 1920, was increased from 3 pesetas gold per kilo to 9 pesetas gold per kilo, which was later provisionally reduced to 4.5 pesetas gold per kilo, and advice which we have just received indicates that a further reduction to 2 pesetas gold per kilo is now in effect, which again opens up this market for American motor-cycle manufacturers. In Belgium an effort was being made during the past year to increase a duty of 33 per cent on the importation of motor cycles, but due to our efforts and that of our distributors the duty was finally established on a basis of 20 per cent ad valorem, which was double the rate in effect previously.

These few illustrations of what has been accomplished during the past year by American motor-cycle manufacturers and their distributors in foreign countries in obtaining concessions on import rates into these various countries show the great importance that the question of tariffs has on the development of the American motor-cycle industry.

Senator McLEAN. Do they make them in Germany?

Mr. McCANN. They do; yes, sir.

Senator McLEAN. Good machines?

Mr. McCANN. They have made a good machine, but still we do not fear the German competition to-day.

Senator McLEAN. Why?

Mr. McCANN. Well, we do not think they can come in here and build up an organization that can affect us.

Senator WALSH. What is the condition of the business of the Andee Manufacturing Co.?

Mr. McCANN. The condition during the past four or five months has been very poor; we have not had much business.

Senator WALSH. How much loss have you sustained in employment this last year?

Mr. McCANN. During the past few months we have been operating about 300 or 400 men half of the time, whereas we should operate 600 men.

That is due to a falling off in business in this country and the foreign markets also. So we need every market we can get.

Senator WALSH. Your experience with foreign countries has been that when they raise the tariff the business drops off?

Mr. McCANN. Yes; immediately.

Senator WALSH. So in raising the tariff here you expect the business to drop off on goods imported from those countries?

Mr. McCANN. We do, sir.

It is our belief that by the reduction in tariff on finished motor cycles—understand, we are trying to confine this to motor cycles complete only—entering the American market from 25 per cent to 10 per cent that it will not greatly increase the number of motor cycles imported into this country, but will enormously strengthen our efforts in obtaining further concessions in tariff rates from the countries to whom we are now exporting motor cycles.

Senator McLEAN. Do you import any parts?

Mr. McCANN. No, sir; we do not. There is a possibility, though, of importing parts, such as chains, saddles, and so forth, if we care to, but that is the reason for eliminating the parts from our request; we are confining it to complete motor cycles only. We manufacture all our materials with the exception of accessories, such as chains and magnets.

BRIEF OF WILLIAM G. McCANN, SPRINGFIELD, MASS., REPRESENTING THE MOTOR-CYCLE MANUFACTURERS OF THE UNITED STATES.

In continuation with the remarks of Mr. Davidson, let me add that the reduction in the proposed tariff we have requested will not in my opinion result in a large increase in the imports of completed motor cycles into this country, but it will help American motor-cycle manufacturers greatly in the development of their foreign markets which are of vast importance in the development of the motor-cycle industry of this country. As evidence of this, we submit below a partial list of foreign countries that have put into force excessively high tariffs covering motor-cycle imports which have hindered our development in these countries, and in some cases these tariffs have resulted in practically placing an embargo on the importation of American motor cycles.

	Per cent.		Per cent.
England.....	33½	Spain.....	(¹)
Belgium.....	20	Korea.....	50
India.....	20	Canada.....	35
Australia.....	30	Italy.....	(²)

Due to the efforts of American motor-cycle manufacturers and our distributors in foreign countries, we have succeeded in bringing about reductions of exorbitant tariffs in at least two instances—namely, Australia, where the tariff has recently been reduced from 40 per cent ad valorem to 30 per cent ad valorem, with the prospects of a further reduction to 20 per cent being obtained in the near future; Spain, where the tariff, in November, 1920, was increased from

¹ 9 pesetas gold per kilo.

² 930 lira each.

3 pesetas, gold, per kilo to 9 pesetas, gold, per kilo, which was later provisionally reduced to 4.5 pesetas, gold, per kilo, and advice which we have just received indicates that a further reduction to 2 pesetas, gold, per kilo is now in effect, which again opens up this market for American motor-cycle manufacturers. In Belgium an effort was being made during the past year to impose a duty of 33 per cent on the importation of motor cycles; but, due to our efforts and that of our distributors, the duty was finally established on a basis of 20 per cent ad valorem, which was double the rate in effect previously.

These few illustrations of what has been accomplished during the past year by American motor-cycle manufacturers and their distributors in foreign countries in obtaining concessions on import rates into these various countries show the great importance that the question of tariffs has on the development of the American motor-cycle industry.

It is our belief that by the reduction in tariff on finished motor cycles entering the American market from 25 per cent to 15 per cent that it will not greatly increase the number of motor cycles imported into this country but will enormously strengthen our efforts in obtaining further concessions in tariff rates from the countries to whom we are now exporting motor cycles.

MOTOR-CYCLE ACCESSORIES AND PARTS.

[Paragraph 371.]

STATEMENT OF L. V. FAUVER, REPRESENTING THE TROXEL MANUFACTURING CO., OF ELYRIA, OHIO.

Mr. FAUVER. Mr. Chairman and members of the committee, I am on the directorate of the Troxel Co. and represent here probably 75 or 80 per cent of the bicycle and motor-cycle saddle manufacturers of America. I am not prepared to be as generous as the last two gentlemen who spoke. We come under the same paragraph, under the term "accessories and parts." While we are fully in sympathy with their request that a reclassification be made of that schedule, there is no economic reason why manufacturers of leather saddles should be put on the same basis.

Senator SMOOT. Are you satisfied with 30 per cent on parts?

Mr. FAUVER. No; we think it could be raised above that.

Senator SMOOT. What do you think it should be?

Mr. FAUVER. We think it ought to be restored to the basis of the Payne-Aldrich bill, 45 per cent on parts. Our reason for that is that our business is a hand business. Probably 50 per cent of our costs is labor. As a reason for motor cycles being reduced, of course, they are highly specialized machines.

Senator SMOOT. Of course, if you were on American valuation, 30 per cent would make a difference?

Mr. FAUVER. Yes; I imagine it would.

Senator SMOOT. Would you want that on American valuation?

Mr. FAUVER. Possibly that is high. We do not think it should be lowered below 30. I want to make a few general remarks and I will submit a brief.

The saddle business in America is very narrow and rather small. The gross amount of business normally does not amount to over a million and a half dollars. The saddle manufacturers of America for a year have been substantially closed down. There was some business last year, but practically none since the 1st of January. Everybody was caught with large inventories, and the jobbers and dealers were stocked up with an enormous amount of saddles. I

believe that since the war began there has been practically no importation of saddles from Europe. So we are unable to submit any data to this committee with reference to cost or competition. But we want to be protected and we do not want to be reduced to the 15 per cent.

Senator McLEAN. What was the nature of the competition before the war?

Mr. FAUVER. Before the war under the Payne-Aldrich bill it was 5 per cent.

Senator McLEAN. I know, but what were the importations then? What was the competition?

Mr. FAUVER. I can not give you the amount. The competition was largely English with some German competition.

Senator DILLINGHAM. Was it considerable in amount?

Mr. FAUVER. I would not say it was large. The business is very narrow. The total amount of business, as I have said, does not aggregate over a million and a half dollars a year, and probably since the 1st of January bicycle manufacturers have not been working to the extent of 10 per cent of their capacity. With your permission, Mr. Chairman, I will submit a brief.

Senator SMOOT. Yes; you may do so.

ALUMINUM.

[Paragraph 374.]

STATEMENT OF LAWRENCE M. BRILE, PRESIDENT BRILE & RATNER (INC.), NEW YORK CITY.

The CHAIRMAN. Where do you reside, Mr. Brile?

Mr. BRILE. New York City; 277 Broadway.

The CHAIRMAN. What is your occupation?

Mr. BRILE. President of Brile & Ratner (Inc.).

The CHAIRMAN. What do you speak on?

Mr. BRILE. Aluminum.

The CHAIRMAN. Very well; you may proceed.

Mr. BRILE. Mr. Chairman and gentlemen, the attention of your committee is invited to the fact that no mention is made in paragraph 374 of aluminum coils, which are aluminum sheets or in rolls instead of in flat sheets. I think it is simply an omission. The word "strips" is contained in the bill, by which name aluminum coils are sometimes known.

As the paragraph now reads, we fear that aluminum coils will come under paragraph 393, covering articles or wares not specially provided for. I think it was the intention of the Ways and Means committee that coils should also be included in paragraph 374.

We protest against the rate of 5 cents per pound imposed on aluminum scrap and alloys of any kind, in which aluminum is the component material of chief value in crude form, believing that the said rate will create an embargo against the importation of aluminum in crude form into the United States and will prevent a source of revenue to the Government that might otherwise be derived if a fair, just, and equitable rate of duty were established.

In a brief submitted to the Ways and Means Committee Mr. Davis, president of the Aluminum Co. of America, said:

In the case of so light a metal as aluminum and one so relatively high priced, freight to a distant market is negligible, while on the other hand the nature of the industry requires a large overhead in administrative, technical, and selling staff, etc., and also a large investment in plant. The overhead expense of the Aluminum Co. of America is 6 cents per pound of aluminum it makes. The Aluminum Co. of America has invested a little less than \$1 for each pound of aluminum that it has capacity for producing in a year, so that the interest charge is also nearly 6 cents. Even though the operating costs were the same by ignoring the overhead charges and interest on investment, foreign producers would be able to dump aluminum into the United States at a price which the United States producer could not possibly meet and pay his overhead, but dumping is, of course, all the easier because the foreign producers' operating cost is, in fact, substantially less than the United States producers' operating cost.

It is difficult for us to understand by what process of reasoning Mr. Davis arrived at the fact that the foreign producers of aluminum can ignore their overhead charges and interest on investment any more than the American Co. could ignore their overhead and investment charges. One would gain the natural impression from the language quoted above, from the brief of Mr. Davis, that foreign producers of crude aluminum have no overhead and no investment and no financing charges, and although Mr. Davis submits that these charges as applied to the company he represents total 12 cents per pound, he assumes that the foreigner would disregard these charges of 12 cents per pound, and thereby dump aluminum into the United States. If we accept as authoritative the fact that there are fixed charges of 12 cents per pound, as Mr. Davis states, 6 cents representing overhead charges and 6 cents interest charges, then the foreign producer, whose capacity is much less than the American producer's, must of necessity have higher fixed charges, such as overhead and interest charges, for it has always been our understanding that the larger the output the lower the fixed charge. The foreigner, therefore, if confronted with the proposed rate of duty of 5 cents per pound, and if confronted with the same fixed charge as the Aluminum Co. of America, would have charges of 17 cents per pound to contend with before beginning the manufacture of crude aluminum at all, or only $7\frac{1}{2}$ cents per pound less than the present price for American manufactured aluminum of $24\frac{1}{2}$ cents per pound.

Gentlemen, it is very difficult for us to understand by what process of reasoning Mr. Davis arrived at the fact that the foreign producers can ignore his overhead and his interest charges. Mr. Davis admits that these charges as applied to his company equal 12 cents per pound. The foreign producers have a far less capacity, and yet Mr. Davis assumes that these foreign producers have no overhead and no interest charges to pay, whereas he submits that because of the nature of the industry 12 cents a pound applies to his company for those charges. He said that the foreigner could well ignore these charges altogether and dump aluminum into the United States.

The average price of the crude aluminum ingots for five years previous to the European war, 1910 to 1914, according to Metal Statistics, 1921, page 449, was 21.61 cents per pound. Assuming that 21.61 cents per pound is a fair average price for aluminum and deducting therefrom a duty proposed of 5 cents per pound and

freight and insurance from foreign ports of 1 cent per pound have left 15.51 cents per pound. Assuming that the statistics of Mr. Davis are correct, as quoted above, that there is an expense of 6 cents a pound, and another charge of 6 cents per pound for interest on investments, and since it is reasonable to compare foreign manufacturers with a much smaller production on an equal cost, it would leave a difference between 15.61 cents per pound covering fixed charges of 3.61 cents per pound to pay for overheads, production costs, and profit.

I think that we can say without fear of successful rebuttal that no aluminum manufacturer would or could manufacture on such a basis.

Furthermore, if we are to accept as authoritative the figures made by Mr. Davis to the effect that overhead charges are 12 cents per pound and interest charges also 6 cents per pound, it is not difficult to see how it was possible for the Aluminum Co. of America in 1914, the first year previous to the European war, to sell at an average price of 18.59½ cents per pound. Let us analyze the charges alleged by Mr. Davis in relation to the price of aluminum in 1914. As stated, the average price for the year 1914 for aluminum ingots was 18.59½ cents. (Metal Statistics, 1921, p. 449.) Overhead and interest charges amounting to 12 cents per pound would have left 6.59½ cents, which must include cost of raw material, production, and profit. As a matter of record, we know the net earnings of the Aluminum Co. of America since its incorporation in any year than \$10,000,000 per year. (Mr. Davis testified before the National City Bank of New York and the Senate Committee on Commerce, Nov. 1, 1920, in connection with the sale of certain shares of the company.) We do not know what the earnings of the Aluminum Co. of America for 1914 were, but we do know that since the company's investment has increased from \$30,000,000 to \$200,000,000, the increase representing the earnings of the company, we believe it fair to assume that the earnings of the Aluminum Co. of America in 1914 were no less than \$10,000,000. In 1914, the Aluminum Co. of America produced in America approximately 90,000,000 pounds of aluminum. (Metal Statistics, 1921, p. 443.) If \$10,000,000 were divided by 90,000,000 pounds of aluminum, the profit per pound would be approximately 11½ cents. We therefore have a profit of 11½ cents per pound and interest and overhead charges of 12 cents per pound, whereas the selling price was 18.59½ cents per pound, leaving without question that in 1914 at least the Aluminum Co. of America did not include in their cost any such charges for interest and 6 cents for overhead. If they did, the profit would be 59½ cents to pay for raw material, production, and profit, assuming that the profit were 11½ cents per pound, leaving 48 cents that would be left to include overhead, interest, and profit. The production cost would be about 7½ cents per pound. The average price of aluminum for five years was, 1910, 20.34 cents a pound; 1912, 22.52 cents per pound; 1913, 21.11 cents per pound, and 1914, 18.595 cents per pound. It will be noted that in the four years, 1910-1913, in which there was a tariff on aluminum ingots of 7 cents per pound, the average price in New York was 22.71 cents per pound.

year of the Underwood tariff bill, with a rate on aluminum ingots of 2 cents per pound, the average price fell to 18.59½ cents per pound. The effect of a low tariff is to reduce the price of aluminum to the American consumer, as is clearly shown by the average price after the passage of the 2 cents duty, falling 4.12 cents per pound. High priced aluminum means a diminution in demand and usage of this material. We believe that practically all of the crank cases used on automobiles in America, as well as all of the bodies of automobiles, would be made of aluminum if the price were maintained under 20 cents per pound; and that there would be sufficient aluminum consumed to liquidate the entire production of the world at present producing capacities, if the price were maintained at a fair rate. The effect, however, of artificially stimulating the price by a high tariff is to simultaneously lessen the demand and cause automobile manufacturers, and others who might with profit and with marked advantage to their products, use aluminum, seek other metals in substitution, because of the artificially high price of aluminum.

Mr. Davis said before the committee:

In the last year of the Payne-Aldrich Act in which the duty on aluminum was 7 cents, about 35 per cent of the total consumption in this country was imported. and during the first year of the Underwood Act, when the duty was 2 cents per pound there was substantially the same percentage imported—a little less rather than a little more, so that it can be seen from that that the 7 cents per pound duty was not prohibitive because more came in at 7 cents—relatively more in tonnage—more in percentage came in at 7 cents than at 2 cents.

Mr. Davis failed, however, to point out why the 7-cent rate was not prohibitive and why more aluminum was imported in 1913 under the 7-cent rate of the Payne-Aldrich tariff than in 1914 under the 2-cent rate of the Underwood bill.

The tonnage imported in 1913, the last year of the Payne-Aldrich bill was 26,642,112 pounds in ingots and 1,516,413 pounds in sheets. In 1914, the first year of the Underwood bill, the tonnage imported was 16,420,695 pounds in ingots and 2,775,804 pounds in sheets.

Now, gentlemen, why was not the 7-cent rate prohibitive in 1913, and why did more aluminum come into the United States under the 7-cent rate of duty in 1913 than under the 2-cent duty in 1914? Mr. Davis forgot to inform the committee that in 1913 the average price for aluminum was 23.63 cents per pound, and the average price for 1914 was 18.59½ cents per pound. In other words the duty was reduced 5 cents per pound, and the price of aluminum in the United States was reduced 5.14 cents per pound, and nobody heard the Aluminum Co. complain that they did not make sufficient profit in 1914, when they sold aluminum at 18½ cents per pound.

That is why 7 cents was not prohibitive. On the same basis 10 cents per pound would not be prohibitive if the sole producers in the country simply raise their price in the same proportion as the duty is raised.

It is evident that the consumers of aluminum received the benefit of the reduced tariff in 1914. The tariff was reduced 5 cents per pound and the price of aluminum was reduced 5.14 cents per pound. The imports were less under the 2-cent rate in 1914 than under the 7-cent rate in 1913, as Mr. Davis said; and certainly we are not to assume that Mr. Davis wants to put that rate back to 7 cents per pound in order to stimulate importation. Why, then, does he want

increase the rate to 5 cents or 7 cents—he asks for 7 cents? He wants to do that so that it will be optional with his company at any time to create an embargo against the importation of those goods by simply lowering their price to 18 or 20 cents per pound.

Senator WATSON. What is his company?

Mr. BRILE. The Aluminum Co. of America.

The CHAIRMAN. That is the company that introduced aluminum in this country and put these articles of domestic and manufacturing use within the grasp of everyone, is it not?

Mr. BRILE. That is true.

Senator McLEAN. And if we create an embargo lowering the price to the American consumer, there is no occasion for concern?

Mr. BRILE. That is true; if they do that and are able to supply the entire demand.

Senator McLEAN. You have just said that they do that.

Mr. BRILE. I said they had the power to do it; they could do it if they wanted to, and they could make a substantial profit.

The CHAIRMAN. Then the consumers could not buy these articles at any price until the Aluminum Co. of America put them within their reach? Aluminum was too expensive a material to use in these utensils until the American Co. put it within the reach of all the American people, was it not?

Mr. BRILE. I would not say it was too expensive. The American Co. was one of the earliest producers of aluminum in the world.

The CHAIRMAN. It was the only one, was it not, in this country?

Senator McLEAN (interposing). What is the price of the product now as compared with a year ago?

Mr. BRILE. The price to-day is approximately 3 cents per pound less than it was a year ago. As soon as the Fordney bill was announced in the House establishing a rate of 5 cents per pound—that is an increase of 3 cents over the duty in the Underwood tariff bill—the Aluminum Co. of America at the same time reduced their price 3 cents a pound. That reduction was made just following the announcement of the rate contained in the Fordney bill.

Senator McLEAN. So it is just as you stated, instead of increasing the price anticipating the higher rate of duty, they reduced the price, and that is no concern on the part of the consumer?

Mr. BRILE. If they continue to reduce their price, and we have a rate of 5 cents per pound on ingots, it will prevent the importation of any crude aluminum.

Senator McLEAN. I am taking your statement as to what they had done, which would indicate that the stimulation of American competition has reduced the price to the consumer.

Mr. BRILE. No; foreign competition reduced the price.

Senator McLEAN. You say, anticipating an increase in the tariff—nevertheless, they have reduced the price 3 cents per pound.

Mr. BRILE. They have done that, all right.

The CHAIRMAN. If it had not been for the American aluminum industry you would have very high prices for articles composed of aluminum?

Mr. BRILE. At the present time?

The CHAIRMAN. If we had no American industry producing this aluminum we would be at the mercy of the foreigner and would have had to pay much higher prices for these utensils?

Mr. BRILE. But there is considerable foreign competition.

The CHAIRMAN. I know.

Mr. BRILE. There are manufacturers in practically every country abroad.

Senator WATSON. Did I understand that you are an importer?

Mr. BRILE. Yes.

Senator WATSON. From where do you import?

Mr. BRILE. We are the exclusive representatives of a sheet mill abroad, in Switzerland, at Menziken.

Senator WATSON. How much do you import into this country from that mill?

Mr. BRILE. In sheets?

Senator WATSON. In whatever form you do import it.

Mr. BRILE. We shall have imported in 1921, if all of our contracts are filled, about a million and a half pounds of sheet.

Senator WATSON. Would the imposition of this duty, you think, interfere with your imports?

Mr. BRILE. Absolutely. Our mill has already written us that they will be unable to compete with the American prices if they must pay a duty of 9 cents per pound, which is the rate imposed on sheets. I have not gotten to that price on sheets. We can say absolutely that the rate of 9 cents per pound on sheets is prohibitive.

Senator WATSON. What wages do you pay there, as compared with the wages in the same branch of that industry here—manufacture of aluminum sheets?

Mr. BRILE. I have no information as to the relative wages that are paid.

Senator WATSON. Have you any information as to the final cost of production in both places?

Mr. BRILE. The only information that we have received is that they can not compete under a 9-cent rate of duty with the American prices on sheets.

Senator WATSON. You just have that information, but no figures?

Mr. BRILE. No figures, except that we can get at it by giving you the figures of the American cost of production of sheets. We have those figures.

Senator WATSON. That is of no value unless you can give the cost of production over there.

Mr. BRILE. Yes; it is. I will show you why. I have said that the 9 cents per pound rate on sheets, bars, and circles will create an absolute embargo. I am copying in my brief the condensed-data sheet of the chief producers in this country, in which they show the advance or extras or cost above crude aluminum for producing aluminum coils or sheets. On March 30, 1920, their published extra above crude aluminum for producing coils was 7.6 cents per pound on 50-ton lots.

The rate of duty proposed is 9 cents per pound, or 1.4 cents per pound more than the entire admitted cost of March 30, 1920, plus profit, of producing coils by the chief producer thereof. In other words, the foreigner is asked to pay 9 cents per pound, or 1.4 cents more than the admitted cost—selling price plus profit—of the Aluminum Co. on coils.

Senator WALSH. Do you know what percentage of that is labor?

Mr. BRILE. I have had experience in the production of aluminum sheets. I was formerly the vice president and sales manager of the only concern at that time who competed in a small way with the American Aluminum Co. in rolling sheets. We could roll from the ingot, which we purchased from the Aluminum Co. of America, a flat sheet at approximately 5 cents per pound, and we could roll a coil at approximately 4 cents per pound.

Senator WALSH. They had advanced during the war?

Mr. BRILE. They had advanced during the war period, but they are materially less—less even than when we could produce at 5 to 4 cents per pound in sheets and coils.

Senator WATSON. You mean wages now are lower than the prewar level in your establishment?

Mr. BRILE. In that particular establishment I think that wages now are equal or lower than they were in 1913 and 1914.

Senator WATSON. You have not yet said what part of that cost is labor, which was the question the Senator asked you a moment ago.

Mr. BRILE. Perhaps 33½ per cent would be an approximation—the nearest approximation I could make.

Senator WALSH. What percentage of the aluminum sheets used in America are produced here and what percentage are imported?

Mr. BRILE. Practically all, with the exception of 1,000,000 or 1,000,000 pounds, which, I presume, is only about one-twentieth of the consumption here, has been made in America. There has been no great importation. There have not in any one year been more than 1,000,000 pounds imported.

Senator WALSH. Preventing the natural tendency to accept the profit?

Mr. BRILE. Absolutely; not only that but the Aluminum Co. of America to my knowledge has never been able to take care of the demand for sheets. While their ingot capacity has been sufficient, their rolling capacity has not been sufficient to take care of the demand for sheets, especially among body builders and cooking utensil manufacturers, so that of necessity they had to go abroad, or else close up their plants. They could not get sheets, and that has constantly been the fact, even before the war; even before the war they were six or eight months behind the producers of sheets; and if we prevent foreign competition on sheets by establishing a 9 cents per pound rate of duty, the cooking utensil people and the body builders will have absolutely no other source of supply for sheets. At times they can not get them because the capacity is tied up, and further than that, the Aluminum Co. of America is an actual competitor of the people who produce cooking utensils, owning the largest cooking utensil factory in the country and having an interest in the second largest cooking utensil plant in the country. So that in effect, if we do not have foreign competition, the consumer of aluminum sheets for cooking utensils must buy from his own competitor; and we claim that under a 9 cent rate of duty of sheets would be in a position to fix prices arbitrarily, and by being enabled to lower or raise the price of the finished product, since he controls the two largest manufacturing concerns in those products, and at the same time have the control of the raw material price the other cooking utensil manufacturers could not compete if the Aluminum Co. of America saw fit to prevent competition.

Senator WALSH. You said the Aluminum Co. of America have two manufacturing plants which they control for manufacturing cooking utensils?

Mr. BRILE. Exactly.

Senator WALSH. How many manufacturing companies are there in America that compete with those two companies?

Mr. BRILE. About 39, and probably the 39 companies are not as large as the one Aluminum Co. of America.

Senator WALSH. Thirty-nine aluminum manufacturers will be obliged to pay any price this American Aluminum Co. charge them if this bill amounts to an embargo and goes through?

Mr. BRILE. Yes, sir.

Senator SUTHERLAND. Do any of those 39 companies produce the ingots?

Mr. BRILE. No, sir; there is no producer of ingots in America except the Aluminum Co. of America.

The CHAIRMAN. Do any of these 39 use domestic aluminum, or do they use the imported article?

Mr. BRILE. They use both.

The CHAIRMAN. Which do they use the most?

Mr. BRILE. Of the American article?

The CHAIRMAN. They use mostly the American article, you say?

Mr. BRILE. They have used only the American article.

The CHAIRMAN. Then it has not been very destructive to them?

Mr. BRILE. During the first part of 1920 the independent aluminum cooking utensil concerns—these 39 I speak of—were able to get only 10 to 16 per cent of the amount of aluminum sheet they ordered and were forced to go abroad and buy what they could get or buy surplus sheets in the open market at destructive prices, because the Aluminum Co. of America could not or would not furnish them sheets during that period.

Senator WALSH. If this bill amounts to an embargo, as you claim, it would be possible for the Aluminum Co. of America to practically close up those 39 establishments by restricting their own output?

Mr. BRILE. Exactly.

Senator WALSH. And by putting the price so high they could not afford to purchase?

Mr. BRILE. Yes; and, furthermore, we do not believe that the American Co. want, desire, or ask for 9 cents per pound duty on sheets, which is 40 per cent higher than ingot price, although the difference between the manufacturing cost of ingots is only 23 per cent, as we shall show.

In other words, even if you establish a rate of duty of 5 cents on crude aluminum, the rate on sheets should not be more than 1½ cent in advance. At the time the Underwood bill was passed we understand that the Finance Committee of the Senate made an extensive investigation as to just what the average above the crude aluminum rate should be on sheets, or, regardless of what rate was established for crude aluminum—what the difference in cost of manufacture was. In other words, the Aluminum Co. of America on March 30 produced a coil to sell at a profit of 7.6 cents per pound, and yet they ask the committee for a rate of duty of 9 cents—1.4 cents more than the admitted cost of making the coil. So it can not possibly be a fair rate on sheets.

Senator WALSH. Can you give us some idea of the American cooking-utensil industry—the valuation of their product in this country in a given year?

Mr. BRILE. I have not the figures available.

Senator WALSH. Then never mind; I will get it elsewhere. It is a very large sum, I suppose?

Mr. BRILE. It is a very large sum.

The same thing I have said with reference to the cooking-utensil industry applies to the aluminum-casting industry. The Aluminum Co. of America owns, through stock ownership or control, the largest aluminum foundry in the United States—the largest aluminum foundry making aluminum castings for automobile purposes.

Senator WALSH. How many competitors has that company—small competitors?

Mr. BRILE. I do not know. But I should say there are possibly 30 or 40 small aluminum foundries. There is only one in the country that anywhere near equals the size of the Aluminum Co. of America's plant, yet all of these smaller aluminum foundries would be at the mercy of the Aluminum Co. of America, if they choose.

Senator WALSH. Providing this tariff rate of 5 cents per pound amounts to an embargo?

Mr. BRILE. Yes.

The CHAIRMAN. Yes, sir; if they shut up, the American consumer would be at the mercy of the foreigner?

Mr. BRILE. If who shut up?

The CHAIRMAN. If the American Aluminum Co. closes down.

Mr. BRILE. Yes. But the difference, Mr. Chairman, between here and abroad—you have any number of producers of aluminum imports abroad. You have several of them in Switzerland, you have several of them in Great Britain, you have several of them in France, and you have several of them in Norway. They are all competing companies over there. So that the American consumer would not possibly be at the mercy of anyone. You have no monopoly anywhere except in America.

Senator WATSON. Has the American Aluminum Co. a monopoly on bauxite?

Mr. BRILE. So far as the American supply is concerned, we claim they have. The American Bauxite Co., which is a subsidiary, owns practically all of the American bauxite that could be reduced into aluminum. The foreigners, with one or two exceptions, must all buy from mines controlled by the American interests.

Senator WATSON. Is bauxite produced in more than one State; what is, Arkansas?

Mr. BRILE. Arkansas is practically the only State that produces appreciable quantities of bauxite.

The CHAIRMAN. These ridiculous assertions, you know, do not hold water. Here our book on General Information states, "Three large financial groups, involving French, British, and German capital, control some 14 producing companies in Europe, producing the greatest bulk of aluminum product," that you want brought into this country, to the possible destruction of the American industry.

Mr. BRILE. That is absolutely not true at the present time.

The CHAIRMAN. You will have to do a lot of proving to prove that this document prepared for the use of the Ways and Means Committee of the House of Representatives is erroneous.

Senator WATSON. By the Tariff Commission?

The CHAIRMAN. By the Tariff Commission.

Senator WALSH. Supposing that we may get information that modifies that?

The CHAIRMAN. I can not tell whether this information has been modified by any events occurring during the last 10 days; but that was a fact within a very recent period.

Mr. BRILE. Mr. Chairman, did you say it was a fact simply because the Tariff Commission says it is?

The CHAIRMAN. No; because we have our authoritative statement here from the highest official sources.

Mr. BRILE. Just a few producers, and they have no ownership. In Great Britain we have two competing companies—the British Aluminum Co. and a small company in Wales, I think it is, the Dalgeroff Co.

Senator WATSON. You imported 35,000,000 pounds last year?

Mr. BRILE. In 1920.

Senator JOHNSON. At 2 cents a pound crude, in crude form, scrap, and alloys of any kind, 35,000,000 pounds?

Mr. BRILE. You must remember a large part of that importation will be found to come from Canada and is imported by the Aluminum Co. of America and is not representative of the imports that come into this country from Europe. Every pound that the Aluminum Co. of America gets from Canada comes in from their Northern Aluminum Co.

Senator WATSON. You mean the Aluminum Co. of America owns a Canadian plant?

Mr. BRILE. Yes.

Senator WATSON. And that these imports set down here come from Canada instead of Europe?

Mr. BRILE. Not all of them. I say that included in those figures are the importations from the Canadian plant of the Aluminum Co. of America, the Northern Aluminum Co.

Senator WALSH. Does the Aluminum Co. of America export any of their product?

Mr. BRILE. The Aluminum Co. of America have special sales department devoted to export sales, as I understand it, and they export. Furthermore, I understand that the Canadian plant exports practically five-sixths of their production of the Northern Aluminum Co.; Mr. Davis made that statement before the Federal Trade Commission at the time the American Aluminum was ordered to divest themselves of stock ownership in a sheet mill that they had taken over in this country—the Cleveland Metal Products Co. Five-sixths of the product of the Canadian mill of the Aluminum Co. of America is exported.

Senator WALSH. Do they manufacture in Canada some of the product that they sell in the United States?

Mr. BRILE. Absolutely they do.

Senator SUTHERLAND. A part of their product is shipped to the United States from Canada? What part of the product of the

Northern Aluminum Co. is shipped—which I understand is a branch or subsidiary of the Aluminum Co. of America—to the United States?

Mr. BRILE. That is available. Mr. Davis stated that five-sixths was exported, and I assume that he meant the United States was included as one of the importing companies.

Senator WATSON. Do you know what the imports are for 1921?

Mr. BRILE. For 1921 I have not the figures; for 1920 I have the figures.

Senator WATSON. In the latter—1920—35,000,000 pounds of crude and scrap were imported; thus far in 1921, 38,175,000 pounds.

Mr. BRILE. Does that include the importation from Canada?

Senator WATSON. It is all importations.

Senator WALSH. It must include it.

Senator WATSON. Yes. But is it true that the Europeans accumulated a great deal of aluminum for all purposes, and that since the war they have been sending that over here in great quantities, in a sense dumping? Are not prices lower, and would not that fact have something to do with lowering prices?

Mr. BRILE. They are higher to-day. The Aluminum Co. of America price is 24 cents, against the price I have told you.

Senator WATSON. Is that on the finished product?

Mr. BRILE. That is on crude aluminum. The price to-day is 24½ cents per pound, against 18½ cents in 1914 and against an average price of 21.61 for five years previous to 1914. The price is higher to-day than the average price for the past 10 years.

Senator WATSON. What was it during the war?

Mr. BRILE. Thirty-three cents.

Senator WALSH. Do they control the aluminum market in Canada?

Mr. BRILE. The Northern Aluminum Co. does.

Senator WALSH. So that if this tariff rate is fixed so very high, it is possible for the aluminum company—I do not say they will do it—if they can produce or manufacture cheaper in Canada, to shut down those parts of their factories here where they can produce the same goods cheaper in Canada and ship them over here at an excessive profit?

Mr. BRILE. It is absolutely possible. I submit that the overhead and interest charges are 12 cents per pound to-day, and yet they sold aluminum at 18.59 cents in 1914, considerably less than they are to-day, and only a difference of about 6 cents a pound or 5½ cents per pound, and they claim their overhead and administrative costs are to-day. We claim that 12 cents per pound is not a correct statement of the selling and financing costs of the Aluminum Co.; if it is, the foreigner has those same costs.

DEED OF LAWRENCE M. BRILE, PRESIDENT BRILE & RATNER (INC.), NEW YORK CITY.

The fact that the 2-cent Underwood tariff rate in 1914 brought the price of aluminum down to 18.59½ cents per pound from 22.63 per pound proves conclusively that had this price of 18.59½ cents been established by the Aluminum Co. of America in any year of the Payne-Aldrich tariff there would have been no importations whatever. Importations were less under the Underwood bill, with a 2-cent rate, because the price in America was reduced 5.14 cents per pound as soon as the reduced tariff went into effect.

If you establish a rate of 5 cents per pound on aluminum ingots, the situation will be—

1. With a normal rate of exchange no country can compete with the United States in aluminum.

2. There will be no importation of aluminum, or there will be an artificial rise in the price of aluminum. The only possibility for importation will be in the established price in America—a low price for aluminum and a high tariff means no imports. A high price and a high tariff means imports in the measure that the price is inflated; but a low tariff guarantees a low price and a healthy demand and normal importation.

The cost of raw material to the foreign manufacturer is at least equal to the cost of the American producer. Some of the raw materials used in the manufacture of aluminum are bauxite, coal, limestone, and soda ash. With reference to bauxite, practically the entire American supply is controlled by the American Bauxite Co., a subsidiary of the American Producers. Most of the foreign producers purchase their bauxite from mining interests. With reference to coal, practically all of the foreign producers purchase their coal in the open market, whereas the American producers own their own coal mines, situated conveniently to their plants, in Pennsylvania. The foreign cost of coal is many times the American cost. The cost to the foreigner for limestone and soda ash is at least equal to the cost to the American producer.

We submit that even if the proposed rate of 5 cents per pound on crude aluminum were fair, equitable, and just, representing the approximate difference in cost between foreign and American crude aluminum, which is, of course, not true and denied, the rate provided of 9 cents per pound for aluminum in plates, sheets, bars, rods, circles, disks, blanks, strips, rectangles, and squares is entirely inconsistent with the said rate of 5 cents per pound on crude aluminum and is relatively much higher than the 5 cents per pound rate on crude aluminum.

We submit further than the rate of 9 cents per pound on plates, sheets, bars, circles, etc., will create an absolute embargo against the importation of any of these products into the United States; and further submit that the Government, by reason of the said embargo, will receive no revenue from the importation of these said products.

In support of our contention that the rate of 9 cents per pound on aluminum sheets, bars, rods, circles, disks, blanks, strips, rectangles, squares is entirely disproportionate to and inconsistent with a rate of 5 cents per pound on crude aluminum, we wish to call attention to the differential or overages above the selling price on crude aluminum ingots, charged by the American manufacturers on certain of the fabricated items mentioned above, such as strip or coils, sheet aluminum, sheet aluminum, circles, etc.

On March 30, 1920, the sole producer of aluminum in this country issued a condensed data sheet, No. 6697422, of which the following is a copy:

Gauge.	Size.	1-ton lots.	15-ton lots.	50-ton lots.
	Inches.	Cents per pound.	Cents per pound.	Cents per pound.
12-17.....	3-18			
18-20.....	3-16			
21-22.....	3-15	8.00	7.80	
23-24.....	3-14			
25.....	3-13			
26.....	3-13	9.20	9.00	
27-28.....	3-12	10.30	10.10	
29-30.....	3-12	12.50	12.30	
31-32.....	3-12	14.80	14.60	
33.....	3-12	17.00	16.80	
34.....	3-12	20.00	19.80	
35.....	3-12	24.00	23.80	

It will be noted from the above that aluminum coiled sheets in 50-ton lots were sold by the Aluminum Co. of America at 7.6 cents per pound more than crude aluminum ingots. In other words, 7.6 cents per pound represented the cost of manufacture of aluminum coiled sheets in 50-ton lots, plus profit, plus overhead and all interest charges. The proposed rate of duty of 9 cents per pound on sheet aluminum is 1.3 cents per pound more than the cost of manufacture by the chief producers on March 30, 1920, of coiled sheets, including all charges.

other words, the foreigner is asked to pay a duty of 1.3 cents per pound on aluminum coiled sheets over the chief producer's admitted cost of manufacturing. On March 30, 1920, the sole producers of aluminum in the United States issued condensed data sheet, No. 6697422, covering coiled sheet circle differentials, of which the following is a copy:

Gauge.	Size.	1-ton lots.	15-ton lots.	50-ton lots.
	Inches.	Cents per pound.	Cents per pound.	Cents per pound.
7.....	3-18			
10.....	3-16			
12.....	3-15	12.30	12.10	11.90
14.....	3-14			
	3-13			
	3-13	14.40	14.20	14.00
18.....	3-12	15.50	15.30	15.10
20.....	3-12	17.80	17.60	17.40
22.....	3-12	20.00	19.80	19.60
	3-12	22.30	22.10	21.90
	3-12	25.50	25.30	25.10
	3-12	30.00	29.80	29.60

It will be noted from the above differential or extras above crude aluminum charged by the Aluminum Co. of America for coiled sheet circles in 50-ton lots is 11.9 cents per pound. The proposed duty of 9 cents per pound on aluminum circles is but 2.9 cents per pound less than the admitted cost of production plus profit, plus overhead, of the sole producer of aluminum circles. These illustrations will tend to show how unreasonable a duty of 9 cents per pound on aluminum sheets is, especially when considered in connection with the rate of 5 cents per pound on crude aluminum. On March 30, 1920, the date on which the said above condensed data sheets were issued, the selling price for crude aluminum ingots was 33 cents per pound. The selling price, therefore, of coiled sheets in 50-ton lots was 40.6 cents per pound, or an increase of 23 per cent. The coiled sheet circle price in 50-ton lots was 44.90 cents, an increase above the price of ingots of 36 per cent. The increase, however, on the proposed rate of duty between crude aluminum of 5 cents per pound, and sheet aluminum of 9 cents per pound, is 80 per cent, showing how disproportionate the differential between the ingot and sheet duty really is. The attention of your committee is respectfully called to the fact that the Finance Committee made an extended investigation of the differential or difference that should apply between the rate of duty established for crude or ingot aluminum and aluminum sheets at the time the Underwood tariff rate was established, and they fixed this differential at 1½ cents per pound, which, in our opinion, is just, fair, and equitable. In other words, regardless of what rate of duty it is decided upon for crude aluminum or ingots, the rate on sheets and other fabricated products, in order to be consistent, should not be more than 1½ cents per pound in advance. There is a far greater interest, from the standpoint of independent consumers of aluminum, that a just rate of duty be established for aluminum sheets than there is for crude aluminum, because the fabricating capacity of the producers in America in normal times has not been sufficient to enable them to make prompt deliveries and to keep the consuming trade supplied with fabricated aluminum such as sheets, circles, coils, etc., and in order to be assured of a source of supply at such times as the American producer is unable to supply the demand for sheets, etc., there should be an opportunity to the independent consumers to secure their much-needed supplies abroad, and those supplies can only be secured in competition with the American supply, if such supplies can be imported under a rate of duty that is not prohibitive. We, therefore, respectfully suggest that no matter what action is taken with reference to the duty on crude aluminum in ingot form, that the rate of duty on fabricated aluminum such as aluminum sheets, rods, etc., shall carry a rate not in excess of 1½ cents per pound higher than whatever rate is found equitable, just, and fair for aluminum ingots or crude aluminum.

**STATEMENT OF HARRIS E. GALPIN, REPRESENTING THE
NATIONAL ALUMINUM FOUNDRIES' ASSOCIATION.**

Mr. GALPIN. I represent the National Aluminum Foundries' Association, which is a trade organization composed of independently owned aluminum foundries scattered throughout the United States. We have, I think, in the membership of our association approximately 35 to 40 per cent of the foundry production business in the United States. Of the remaining business of the United States, I think it is safe to say that 30 per cent is controlled by the subsidiary companies of the only producers in this country—the Aluminum Co. of America.

We filed a brief before the Ways and Means Committee of the House on this matter and were heard at their hearings; and our position to-day is the same as it was at that time. We protest against an increase in the duty over that of the Underwood bill. The Underwood bill provided for 2 cents on ingots and 3.5 cents on sheet. The Fordney provides 5 cents on ingots and 9 cents on sheet.

Senator SMOOT. You want the Underwood rate?

Mr. GALPIN. We want the Underwood rate; yes.

I wish to file the same brief that was filed before the Committee on Ways and Means of the House.

Senator SMOOT. There is no need to put it in. We can get that brief. We will have it before us.

Mr. GALPIN. If it will be considered as part of my statement, I need not file it.

I would also like to have permission to file, within the next 10 days, a brief on this subject.

Senator SMOOT. You may have that privilege.

Mr. GALPIN. In addition to that, there are one or two observations that I should like to make.

The Aluminum Co. of America is the sole producer of the metal in this country. It is, at the present time, the sole producer of aluminum sheets in the country. While it has not a monopoly in a strict legal sense, in effect it has to-day a monopoly, and through its subsidiary corporation already mentioned, we, the independent aluminum foundries, meet them not only as our sole local source of supply but also as our principal competitor in the sale of our product, which is aluminum castings.

Something has been said with reference to aluminum in connection with present market conditions. I think it has been said during the hearing that foreign aluminum is being offered in this country to-day at low prices. I think that undoubtedly that is true, but I believe that the situation that has arisen is the result not so much of the importations of aluminum as it is of general business depression.

I understand that the Aluminum Co. of America has on hand to-day a large stock of metal which it can not sell because of the lack of demand.

When the automotive industry shut down last summer a number of foundries had large stocks on hand. As a result a large number of stocks have been placed upon the market for resale. Aluminum runs into large sums of money and resale is necessary to carry along financial obligations.

I think the market to-day is demoralized as the result of depression, but not as the result of importations into this country.

There has been considerable said about the fear that the German producers would flood the market. I think that an investigation of the subject and perusal of the Tariff Commission's reports will indicate that the German competition is not to be feared to any extent.

The Aluminum Co. of America, through mills here and in Canada, controls over one-half of the product supplied to the world, and of the 14 companies engaged abroad the Germans produce only about one-sixth of what is produced in foreign countries, so that competition does not mean as much as it has been said to mean by a number of witnesses who fear that the German product will flood the market. I might also add that while the Aluminum Co. of America, through the Northern Aluminum Co., which it owns, in Canada, exports to the United States considerable aluminum, yet, according to the testimony before the Federal Trade Commission of Mr. Davis, of the Aluminum Co., five-sixths of that company's output from its large plant is sold abroad in England and France and other countries in competition with other producers against whom protection is asked here.

We have very large foundries and we have large sums of money invested. We normally employ between 9,000 and 10,000 men and have invested approximately \$9,000,000 or \$10,000,000 in the foundries.

Senator WALSH. How many foundries are there?

Mr. GALPIN. I am talking about our foundries now. There are about 14 or 15 of them. There are between 40 and 50 in the United States. Perhaps there are 200 or 300, but they would be one-man foundries.

Senator WALSH. There is a large number of small foundries, is there not?

Mr. GALPIN. Yes; there is a large number of small ones. I am talking of the larger foundries at this time.

Senator WALSH. Just what kind of aluminum has the American Aluminum Co. a monopoly on in America?

Mr. GALPIN. That is the raw metal. They are not only the sole producers of the metal, but also the sole producers of the sheet at the present time.

Senator WALSH. Is there any other kind besides the sheet?

Mr. GALPIN. Ingots. There are also the aluminum rod and coil. Those are fabrications of the raw material.

Senator WALSH. They would be classified under crude aluminum?

Mr. GALPIN. Crude aluminum; yes, excepting, of course, that sheet is rolled.

Senator WALSH. And it is manufactured into these different things?

Mr. GALPIN. Yes.

In view of the situation as it exists to-day we do not feel that we should be limited by a prohibitive tariff to one source of supply. We believe that if we call the attention of the committee to the subject, it will make an investigation that will show that the measure of protection afforded by the Fordney bill would undoubtedly be prohibitive and would shut out foreign aluminum and give the Aluminum Co.

of America a more substantial hold upon the market and upon the prices charged for the metal in this country.

It is not as if we had producers of metals in the United States. The Aluminum Co. of America is the sole producer. It has made enormous profits. It is undoubtedly deserving of a great share of its success because it pioneered the industry in this country. It was protected by patents for a number of years. To-day the field is open in a way. However, the industry is so well controlled that there is no chance of competition.

Our point is that if we can buy the raw material at somewhere near the proper price, taking into consideration some factor of protection for the American industries, we will not be limited to this one source of supply; and I think there will be quite a tonnage of aluminum used in the United States.

Senator McLEAN. Do you know what profits the American combination makes?

Mr. GALPIN. It is not a combination. It is one company, with subsidiary corporations.

In 1913 Mr. Davis testified before the Underwood committee that at that time the invested capital—that is, the capital and surplus of the corporation—was \$30,000,000. In last January, I think they sold \$10,000,000 notes on the market, and in a letter signed by Mr. Davis they stated their assets, exclusive of patents and good will, were in excess of \$110,000,000. They made a profit, part of which they left in the business, during the period 1913 to 1920 of between \$80,000,000 and \$90,000,000. In other words, there was an increase of invested capital of about 300 per cent. Their capital remained the same but their surplus increased. That is the investment as disclosed by the circular which is in the record of the Ways and Means Committee of the House. There was an increase of between \$80,000,000 and \$90,000,000.

Senator WALSH. Could you give figures as to the value of the aluminum kitchen utensil output in this country?

Mr. GALPIN. I could not. The Tariff Commission reports say that the Aluminum Co. of America's subsidiaries use 22 per cent of the metal produced by the Aluminum Co. It is a large industry, but in tonnage it does not compare with the foundries. The kitchen utensil products are made from sheet.

Senator WALSH. There is more tonnage in the foundry business?

Mr. GALPIN. Yes; more tonnage. The Aluminum Co of America sells, of course, to independent competitors.

Senator SMOOT. Do you desire to file a supplemental brief?

Mr. GALPIN. Yes; I do.

Senator SMOOT. You may have that privilege.

BRASS AND COPPER.

[Paragraph 378.]

STATEMENT OF FRANK H. HOFFMAN, ASSISTANT GENERAL MANAGER OF THE DETROIT COPPER AND BRASS ROLLING MILLS, REPRESENTING THE AMERICAN BRASS AND COPPER STATISTICAL EXCHANGE.

Mr. HOFFMAN. Mr. Chairman and members of the committee, the American Brass and Copper Statistical Exchange is an organization made up of 15 manufacturers of brass and copper material in various forms, and through its taxation and tariff committees they have endeavored to aid the Ways and Means Committee and the Finance Committee in arriving at a schedule that would be appropriate for the industry.

All prior bills have covered the brass and copper industry with not over a dozen lines, and in taking the matter up with the Ways and Means Committee an effort was made to cover the industry in all its details and technicalities. That resulted in a very voluminous proposition, too great and too elaborate, apparently, for consideration.

We have taken the various lists which we use and which are standard lists in the industry and boiled them down to as small a scope or as few groups as we possibly could, and in order to make clear to you what we are endeavoring to do, I shall take as an illustration sheet copper.

All sheet copper is made from a cake of copper as it comes from the copper refineries. It has to be rolled and trimmed to size by us. The lowest price sheet, which is known as a base size, is priced at, say, 12 cents per pound. It is between 19 and 20 cents to-day, with copper at 12 to 13 cents. As that base sheet is altered by labor, rolling it to wider widths or longer lengths or lighter gauges or the temper is regulated or changed by extra rollings, or the finish is changed by extra polishing operations, the price advances, and we have a list to cover that, which I find embraces 97 different items. An effort was made to introduce that list into the schedule when it was under consideration by the Ways and Means Committee.

We have reduced those 97 items into groups, six or seven in number, grouping the sizes as nearly as we could to secure a fair and equitable spread. We have taken the position that it is not consistent nor equitable to put the same duty on a sheet on which the value is 20 cents as we would on a sheet on which the value is 50 cents, when the difference between the 20 and 50 cents is made up fully 90 per cent in the shape of labor.

The same conditions apply to all items of the brass and copper industry. The brass rod is cast to a size and then by drawing operations reduced to smaller sizes; the same with wire; and the difference in the selling price is the difference which is occasioned by the extra labor which is put on the base or minimum size of whatever form it may be.

Senator SMOOT. The wording of the paragraph, we will find, then, your brief?

Mr. HOFFMAN. Yes, sir.

Senator SMOOT. You may file that as a part of your remarks.

Senator McLEAN. I notice here there is a rate of 2½ cents a pound on copper in rolls.

Mr. HOFFMAN. That is a different product. I used sheet copper as an illustration, and then I made the statement that with all other items the conditions were precisely the same. What we term sheet copper is a flat sheet.

Senator McLEAN. That has come in free in the past, has it not?

Mr. HOFFMAN. No, sir; there has been a duty on it.

Senator SMOOT. Copper itself is free.

Mr. HOFFMAN. The raw ingot is free. The roll copper, Senator McLean, to which you called attention, is copper that instead of being furnished in a certain width and certain length is rolled out in a continuous length. It is coiled up, probably some of it 200, 300, or 400 feet long.

We have endeavored in the consideration of a proper rate to secure a line as near as we possibly could on foreign costs. The last comparison that we were able to secure was in the latter part of 1919 or early in 1920, and the labor rate prevailing in English mills similar to the mills which make up our organization showed that our rate ran from 90 to 120 per cent higher than their rate.

I was in close communication with three very large English manufacturers last week. I was unable to secure any figures from them that would enable me to give your committee an intelligent comparison, for the reason that they are running under such absolutely chaotic conditions that they do not know where they are themselves, due to the domination of trade unionism, and so forth.

Within the past sixty days I spent quite some time with the representative of the largest manufacturer of these items in Germany. Their minimum rate that they were then paying was 60 marks per day; their maximum rate was 80 marks per day; which, based on the present rate of exchange, would be from 70 to 90 cents per day. Of course, that is based on the American valuation and the rate of exchange, and it does not necessarily follow that the mark when spent in Germany has not a greater value than when spent in America.

I wish to impress upon the committee the fact that European manufacturers in the past year have sent their best experts, in the shape of engineers, with a view of familiarizing themselves with every possible improvement. They have had a very material advantage from a labor standpoint. We have had some advantages over them from the basis of efficiency and modern machinery. They have contracted for large quantities of machinery in this country and are continuing to do so, undoubtedly with a view of offsetting that advantage, if any, that we did have. We enjoy no advantages in the way of our raw material, notwithstanding the fact that perhaps 75 per cent of the raw copper which Germany and France and England use is American copper.

Prior to the war they were able to buy that American copper laid down in London for less than we were able to buy it for laid down in Detroit. To-day there is very little difference between the cost of the copper laid down in English points against copper laid down in Detroit. So that we have no advantages in the way of raw materials.

The rates which we ask for are totally different from what have prevailed in all previous bills, by reason of the fact that we are asking for classified duties instead of a fixed duty.

The condition of the brass and copper industry to-day is probably as low an ebb as it has ever been in the history of the industry, due to an enormous producing capacity and a slowing down of the demand, which is perhaps no different in that particular from that existing in most all other industries. But to-day I think I can say with safety that we have facilities in the brass and copper industry producing in from three to four months all the material that will normally be consumed in 12 months.

Senator WATSON. That is, you can produce in the United States that can be consumed in the United States?

Mr. HOFFMAN. Yes, sir.

Senator WATSON. And export it, too?

Mr. HOFFMAN. The export business is practically an unknown quantity. The Underwood bill reduced the tariff on many items.

Senator WATSON. There is not much import now, is there, of copper?

Mr. HOFFMAN. No. I simply wish to mention the fact that the Underwood tariff reduced the duty and it became operative in 1913. In the spring of 1914 the foreign manufacturers began to operate in the American market, not by making sales, but they had their people here familiarizing themselves with the market and the conditions and the requirements. The war broke out in 1914, and instead of the United States becoming a buying factor it became an enormous selling factor by reason of the fact that foreign manufacturers were unable to meet the great demand, and all during the war we were large exporters.

Senator WATSON. Of course, there are enormous possibilities for the production of copper in the United States, are there not?

Mr. HOFFMAN. Yes, sir. You refer to the raw copper?

Senator WATSON. Yes.

Mr. HOFFMAN. There are possibilities in both. They reached the peak during the war. Our end of the industry was affected by the war, due to the absolute necessity of our product for war purposes.

Senator SMOOT. Your 15 minutes are up, Mr. Hoffman.

Mr. HOFFMAN. May I make one point more? It will take me but a moment. This point may have no direct bearing on this subject at this time, but it was manifestly evident in the past six years. Basic copper products are perhaps the most essential to the conduct of war. Without copper and brass in various forms the manufacture of munitions and many other items would be impossible. While it is hoped that the United States will never again be drawn into another war, still the policy of preparedness and readiness should never be overlooked. Consequently, if this deduction is correct, it must appear how essential it must be that an industry so vital and so absolutely indispensable should be encouraged and developed to its full strength as one great factor in the protection of the Nation.

BRIEF OF THE AMERICAN BRASS AND COPPER STATISTICAL EXCHANGE. NEW YORK CITY.

I. This statement is made on behalf of the American Brass and Copper Statistical Exchange, whose membership is made up of 15 concerns engaged in the manufacture of copper and brass in various shapes and forms. The membership is as follows: Bridgeport Brass Co., Bridgeport, Conn.; Rome Brass & Copper Co., Rome, N. Y.; Detroit Copper & Brass Rolling Mills, Detroit, Mich.; Chase Rolling Mills, Waterbury, Conn.; Scovill Manufacturing Co., Waterbury, Conn.; Michigan Copper & Brass Co., Detroit, Mich.; Bristol Brass Co., Bristol, Conn.; National Brass & Copper Co., Lisbon, Ohio; Taunton-New Bedford Copper Co., Taunton, Mass.; Cleveland Brass & Copper Mills, Cleveland, Ohio; C. G. Hussey & Co., Pittsburgh, Pa.; Mueller Metals Co., Port Huron, Mich.; Baltimore Copper Smelting & Rolling Co., Baltimore, Md.; American Copper Products Corporation, New York City; Seymour Manufacturing Co., Seymour, Conn.

II. Our interest is in paragraph 378 of the tariff bill as it passed the House. This reads as follows:

"Copper in rolls, rods, or sheets, 2½ cents per pound; copper engravers' plates, not ground, and seamless copper tubes and tubing, 7 cents per pound; copper engravers' plates, ground, and brazed copper tubes, 11 cents per pound; brass rods, sheet brass, brass plates, bars, and strips, Muntz or yellow metal sheets, sheathing, bolts, piston rods, and shafting, 4 cents per pound; seamless brass tubes and tubing, 8 cents per pound; brazed brass tubes, brass angles and channels, 12 cents per pound; bronze rods and sheets, 4 cents per pound; bronze tubes, 8 cents per pound."

III. This paragraph does not at all meet the needs of the copper and brass industry. It does not take care of the different grades of copper and brass products, which vary greatly in value as regards gauge and other elements of manufacture. A flat specific rate is put upon all of the copper and brass products. It does not take into consideration the higher grades and those in which the additional labor makes a larger production cost, which is mirrored in the selling price.

Copper in sheets, American made, has a selling price of from 19½ to 50 cents per pound, depending upon grade, yet a flat rate of 2½ cents per pound is put upon all such products. Seamless copper tubes or pipes vary in selling price from 19 to 65 cents per pound and copper tubing from 29 cents to \$4.70 per pound, yet this paragraph gives a flat rate of 7 cents per pound on such tubes and tubing. Brazed copper tubes, given a duty of 11 cents per pound, vary in American value from 30 cents to \$1.40 per pound.

Sheet brass, American made, has a wholesale selling price in the American market of from 15½ to 55½ cents per pound, but is given a flat rate of 4 cents per pound. Seamless brass tubes or pipes vary in wholesale selling price from 18 to 64 cents per pound, and seamless brass tubing from 28 cents to \$4.60 per pound; but in this paragraph a flat rate of 4 cents per pound is given. Brazed brass tubes, given a rate of 12 cents per pound, vary in value as is gauged by price, from 27 cents to \$1.37 per pound.

Bronze rods and sheets, given a flat rate of 4 cents per pound, go from 22 to 55 cents per pound in selling price. Seamless bronze tubes, given a rate of 8 cents per pound, go from 22 to 68 cents per pound in value.

The paragraph as it now stands fixes a flat or similar duty on each of the various shapes in which brass and copper are produced, regardless of the values of the various dimensions, tempers, and finishes. It pays no attention to the different grades and values of copper and brass products. These grades and their consequent values are the result of extra labor, and therefore create a larger production cost. An illustration of this is in regard to sheet copper. Take the lowest price sheet, which carries a price of 20 cents per pound. This price is based on raw copper at 13 cents per pound and represents a spread of 7 cents per pound. A large proportion of sheet copper is sold through agents or jobbers who receive a commission of at least 5 per cent; consequently, 6 of the 7 cents must come labor, fuel, supplies, overhead, taxes, freight, handling, commissions, cash discounts, and profit. This is for the lowest priced sheet or what is known in the trade as a "base size."

As a sheet is increased in width or length, or is reduced in thickness, or there is added a special temper by rolling or a special finish by polishing, the price advances until it reaches a maximum of, say, 50 cents per pound, or a spread of 37 cents per pound—a difference of 30 cents per pound in the spread.

tween the minimum and the maximum sheet, and practically all this difference is made up of labor. It is contended, therefore, that it is erroneous to a flat rate of duty on sheets of every conceivable dimension and finish, even though such flat rate be arrived at by average, which would simply result in a rate too high for the minimum sheet and too low for the maximum sheet. While sheet copper has been used in this illustration, the same conditions prevail on all other items, such as tubes and tubing, angles, rods, and the other brass and copper products.

IV. The copper and brass industry in the United States is a large one. It counts its products by the hundreds of millions of dollars. It is an industry essential to the national welfare. Such an industry, well equipped and efficient, is absolutely necessary for military preparedness. Production units are expensive, requiring heavy machinery and large labor organizations. They cannot be assembled on short notice and expansion is necessarily slow. The products of this industry enter into ordnance material and munitions, making it second only to iron and steel manufacturing in military importance. They are used for the manufacture of small-arms ammunition and in the manufacture of projectiles. They enter into marine construction in many different forms. They are so important components of automobiles and other machinery. An industry so essential to the Nation and its welfare should receive from its legislators adequate tariff protection.

V. In spite of the fact of the copper production of the United States, the American manufacturer and his European competitor are practically on a par as to the cost of their raw material. As to Japan, she has not only her own copper supply, but a surplus for export. The American industry is at a disadvantage in the making of its copper alloys in comparison with its European rivals because of the lower price of zinc abroad, due to cheaper coal and labor. The expense of putting up a plant in this country is much greater than in foreign countries. And the large and expensive installations of powerful machinery needed in the production of brass and copper products make a heavy capital outlay for the American manufacturer that must be taken into consideration.

In the matter of wages the American manufacturer is at a great disadvantage, and the labor cost in the production of brass and copper articles is an enormous element in the total production cost. According to an official report of the Tariff Commission, British wages in the brass rolling-mill industry are only a little more than one-half those paid in the United States. Common labor in British plants receives a minimum of 63s. 7d. per week of 48 hours, which at the present rate of exchange, \$3.50, is equivalent to only 23 cents per hour as compared with 45 cents or more paid to similar workers in the United States. The wage of rollers ranges in England about 80s. per week, or less than 30 cents per hour, as compared with from 60 to 80 cents in American mills. The French scale, with the present depreciation of the franc, is about one-third that being paid in American plants. These are the figures of the Tariff Commission itself.

VI. The foreigner has been busy for some time in copying American methods of brass and copper manufacture. Shortly after the Underwood Act became effective, foreign manufacturers began to operate in the United States. It was a new field for them, and considerable time was required until they could familiarize themselves with American market conditions and requirements. Before anything was really accomplished in this direction came the beginning of the war of 1914 and an entire change occurred. The demand for copper and brass products for war work grew to proportions beyond the facilities of foreign manufacturers, and instead of the United States being a buying factor it became a selling factor and continued as such during the entire period of the war.

For all time foreign manufacturers have enjoyed labor costs so greatly below those prevailing in the United States that this alone gave them an insurmountable advantage. The only possible advantages possessed by American manufacturers have been a somewhat higher efficiency on the part of labor, also a somewhat higher efficiency in general mill practice and equipment. Foreign manufacturers are fully aware of these features, and efforts are being made by them to overcome them, which is evidenced by the fact that representatives of prominent English manufacturers have spent considerable time in this country during the past year to familiarize themselves with American practices and equipment. The representative of one of the

largest German manufacturers returned to Germany last week after a two months' visit, all of his time practically being devoted to the study of American shop practices and improved and modern machinery. These are indications everywhere that foreign manufacturers are making every effort to add to the advantage they already have in the cost of labor, such as will accrue to them through better mill practices and efficiency and improved and modern machinery.

VII. It is, of course, to the future that tariff legislation looks. This committee is making a law not for to-day but to stand the test of to-morrow in industry. Outside of the United States, the chief makers of brass and copper products are Germany, Great Britain, Japan, and France. All of these nations are making great preparations for the American market. The German is laying out his plan by organizing large production units and concentrating on a relatively small number of products. In this way he is obtaining the advantage of low labor costs and putting himself in a position to compete vigorously with the American manufacturer at home. The Briton is following his example and is eliminating minor lines of production and concentrating on the few.

It must be remembered, too, that while the war temporarily eliminated the German industry, it stimulated production in France and England. In both of these countries the productive capacity was greatly increased, and there is to-day a large surplus over domestic requirements. This means exportation and exportation to the United States as the best market place of the world. The fact that foreign competition has not assumed large proportions as yet since the war is due to the fact that the world markets were starved during the war, and that following the cessation of hostilities English and French brass manufacturers have had more orders than they could fill. Both of these nations, however, have now caught up on their orders and from now on will have a surplus to sell abroad.

VIII. We ask that this committee fix the following schedule of tariff rates for the products manufactured by this association:

"Sheet copper, both hot and cold rolled, in the form of sheets, plates, etc., all lengths, but not over 36 inches wide: Heavier than 24 ounces per square foot, 4 cents per pound; more than 14 and not more than 24 ounces per square foot, 5 cents per pound; more than 12 and not more than 14 ounces per square foot, 6 cents per pound; 12 ounces or less per square foot, 11 cents per pound; in addition to above duties, 1 cent per pound for widths between 36 and 72 inches, and 2 cents additional for widths over 72 inches; sheet copper not included in above and sheet copper coated with tin, and polished, 12 cents per pound; copper engravers' plates, not ground, 8 cents per pound; copper engravers' plates, ground and polished, 16 cents per pound.

"Copper in rolls or coils: All widths over 2 inches, No. 23 Brown & Sharpe gauge and heavier, 4 cents per pound; less than No. 23 but not less than No. 26 Brown & Sharpe gauge 5 cents per pound; less than No. 26 but not less than No. 31 Brown & Sharpe gauge, 6 cents per pound; less than No. 31 but not less than No. 34 Brown & Sharpe gauge, 7 cents per pound; less than No. 34 Brown & Sharpe gauge, 10 cents per pound; in widths 2 inches and under, also specified above, 12 cents per pound.

"Sheet brass and sheet bronze, brass and bronze plates, Muntz and yellow metal sheets and sheathing, widths over 2 to 16 inches: No. 24 Brown & Sharpe gauge and heavier, 4 cents per pound; less than No. 24 but not less than No. 26 Brown & Sharpe gauge, 5 cents per pound; less than No. 26 but not less than No. 30 Brown & Sharpe gauge, 6 cents per pound; less than No. 30 but not less than No. 33 Brown & Sharpe gauge, 9 cents per pound; all other widths and gauges not specified above, 11 cents per pound.

"Brass, bronze, and copper rods, bars, and strips, bolts, piston rods, shafting, and brass wire, over five-eighths inch in diameter or equal cross section, 2½ cents per pound; three-sixteenths to five-eighths inch in diameter or equal cross section, 3½ cents per pound; one-eighth to three-sixteenths inch in diameter or equal cross section, 4 cents per pound; No. 11 Brown & Sharpe gauge to one-eighth inch in diameter or equal cross section, if rectangular, 5 cents per pound; not specified above, 8 cents per pound.

"Seamless, brazed, and lockseam or lapped tubes and pipes in copper, brass and bronze: Larger than 1½ to 4½ inches, inclusive, outside diameter, and No. 14 Stubbs gauge and heavier, 5 cents per pound; larger than 4½ inches in diameter and heavier than No. 14 Stubbs gauge, 9 cents per pound; ½ to 1½ inches,

sive, outside diameter, and No. 14 Stubbs gauge and heavier, 10 cents per pound; larger than 1 to 4 inches, inclusive, outside diameter, and lighter than No. 14 but not lighter than No. 24 Stubbs gauge, 15 cents per pound; $\frac{3}{4}$ to 1 inch, both inclusive, outside diameter, and lighter than No. 14 but not lighter than No. 24 Stubbs gauge, 16 cents per pound; larger than 4 inches outside diameter, and lighter than No. 14 but not lighter than No. 24 Stubbs gauge, 20 cents per pound; including $\frac{3}{4}$ to $\frac{1}{2}$ of 1 inch outside diameter, No. 24 Stubbs gauge and heavier, and $\frac{3}{4}$ to 1 inch, both inclusive, when lighter than No. 24 but not lighter than No. 29 Stubbs gauge, 20 cents per pound; $\frac{3}{4}$ to 1 inch, both inclusive, outside diameter, and lighter than No. 29 Stubbs gauge, 40 cents per pound; tubes smaller than $\frac{3}{4}$ of 1 inch outside diameter, and tubes larger than 1 inch outside diameter and lighter than No. 24 Stubbs gauge, 60 cents per pound.

"All copper and copper alloys wherein copper is the principal component not otherwise specified in the above schedules, 12 cents per pound."

[X. These duties for which we ask have been carefully figured out in accordance with our production costs and the difference in labor cost here and abroad. These specific duties for which we ask in no case amount to more than 40 per cent ad valorem on American valuation. The duties on sheet copper run from 10 per cent to 30 per cent ad valorem, with an average of 24 per cent. The duties on copper in rolls and coils run from 20 per cent to 32 per cent, with an average of 26 per cent. The duties on sheet brass and plates and bronze sheets and plates run from 24 to 30 per cent, with an average of 28 per cent. The duties on brass rods and brass and brass wire run from 18 to 32 per cent, with an average of 25 per cent. The duties on tubes and pipes run from 24 to 40 per cent, with an average of 30 per cent. The duties that we ask on products of copper and alloys of copper not otherwise specified amount to 25 per cent.

There is no foundation for any belief that American manufacturers of brass and copper are endeavoring to secure rates of duty that will shut out imports and that will therefore result in abnormal high profits for the industry in this country. To offset any ideas in this direction it should be thoroughly understood that due to the demands of the United States Government and the allied Governments for copper and brass products absolutely essential for the conduct of the war the American producing facilities were increased enormously. With a disappearance of the war demand manufacturers were left with producing facilities sufficient to produce in 3 or 4 months the normal requirements for 12 months. An attempt to secure tonnage to run 75 per cent or even 50 per cent of normal has led to ruinously low prices, and it is believed that it is safe to say that the manufacturing profit in the industry is averaged below 5 per cent. It has been stated and not seriously contradicted that every mill in the United States has been running at a loss, not on account of foreign competition but solely on account of domestic competition. It is difficult to picture the condition that would prevail were foreign competition to be added to the demoralization that already prevails. The rates of duty that are asked will not make excessive profits for American manufacturers. The domestic competition will keep down prices of brass and copper products.

XI. The copper and brass industry is an old one and a firmly established one, and in which some of the older units have grown from very small to large concerns. It has enjoyed no particular benefits. Its raw materials, excepting during the war period, have been and are sold to their foreign competitors at practically the same prices as they pay. They have at all time paid labor as high a rate as has prevailed in similar industries, and under normal conditions could compete with the world were it not for the great difference in the cost of labor and perhaps some few supplies. American manufacturers are convinced that at no time can they expect to enjoy the cheap or lower labor costs of England, France, and Germany, to make no mention of Japan, and in their recommendation for a tariff schedule they ask only for such protection that will enable them to continue to pay liberal wages to their employees, secure a fair return on the capital invested, and retain the American market for American institutions.

GOLD LEAF.

[Paragraph 380.]

STATEMENT OF F. W. RAUSKOLB, REPRESENTING THE UNITED STATES GOLD LEAF MANUFACTUTERS' ASSOCIATION.

Senator WALSH. Will you state your interest?

Mr. RAUSKOLB. I will read from this brief. We earnestly recommend that paragraph 380, H. R. 7456, be amended to read as follows:

PAR. 380. Gold leaf, \$1 per 100 leaves. The foregoing rate applies to leaf not exceeding in size the equivalent of 3½ by 3½ inches; additional duties in the same proportion shall be assessed on leaf exceeding in size said equivalent.

You will notice that we ask for \$1 per 100 leaves instead of 35 cents per 100 leaves, as provided by House bill 7456. The Ways and Means Committee was evidently guided by the rates asked in the Payne-Aldrich bill of 1909. At the present time conditions have materially changed and our skilled labor will not go back to the impoverished conditions which they have suffered in past years.

Taking into consideration purely the question of wages, we believe a higher rate than we ask for should be granted, as the net foreign labor cost is \$1.04 per hundred leaves less than in this country. The comparative labor cost in a hundred leaves of gold leaf is as follows:

Wages: United States, \$44 per week per man; Germany, 300 marks at \$0.015=\$4.50
Product: 5,000 leaves of gold 3½ by 3½ inches.
Raw material: Gold. (Gold is gold the world over.)

Labor cost per 100 leaves, 3½ by 3½ inches.

United States:		
Man.....	\$0.85	
Booking girl.....	.28	
Total.....	\$1.13	
Germany:		
Man.....	.09	
Booking girl.....	.024	
Total.....	.114	
Difference.....		1.016

We believe that no other industry in the United States asks for tariff less than the actual difference in labor costs, which is the fact in our case. Understand, please, we do not include any overhead charges and only ask you to equalize actual labor cost.

I would like to read the committee a paragraph appearing in the Literary Digest of July 16, 1921:

Chairman Fordney's belief that "the rates prescribed in the new tariff bill stimulate American industries and cause a revival of business in general," as he says, based on the fact that "under existing rates many products from Germany, Japan and other countries are coming upon the American market at far less than the American cost of production. The displacement of American labor is the inevitable result: the purpose of the new bill is to enable American industries to meet the severe competition to which they are now subjected. If time would permit, a long list of industries now seriously affected by the importation of articles at prices with which they can not compete and maintain the American standard of wages could be cited."

Senator SMOOT. The Payne-Aldrich bill gave you 35 cents!

Mr. RAUSKOLB. The Payne-Aldrich bill gives 35 cents.

Senator SMOOT. And you want \$1?

Mr. RAUSKOLB. We want \$1 now. At that time we were paying from \$12 to \$15 per week. It takes from three to six years to run the gold-leaf trade. It is highly skilled labor.

Senator SMOOT. It took them just as long as that in 1909, didn't it?

Mr. RAUSKOLB. Yes; but they were not getting living wages. Conditions are different now. The present tariff bill gives us only 50 cents. The German and Japanese standard price, retail, is \$8.25 at the present time. That gives 58 cents. In spite of the fact that the object of this bill is to stimulate industry, the present bill, as it is, gives us only 50 cents. If that goes through, there will have to be a cut of at least \$20 per man as well as for the girls in the industry. I thank you very much for your courtesy in allowing me to appear before you at this time. It would have been a serious matter for me had it been necessary for me to stay over.

TINSEL.

[Paragraph 382.]

STATEMENT OF B. WILMSEN, PHILADELPHIA, PA.

The CHAIRMAN. On what item do you appear?

Mr. WILMSEN. In reference to the duty on tinsels.

The CHAIRMAN. As I understand it, you are satisfied with Payne-Aldrich rates?

Mr. WILMSEN. I am satisfied with the Payne-Aldrich rates, and I beg to submit a brief to the committee.

The CHAIRMAN. We will take it and have it printed as a part of our statement.

BRIEF OF B. WILMSEN, PHILADELPHIA, PA.

May I submit the following information and data for your consideration when you review the matter of providing the rate of duty on the commodity known as tinsel, lahn, or lame, which has been specifically provided for under paragraph 382, H. R. 7456, known as the Fordney bill, at 10 cents a pound and 30 per cent ad valorem.

Let me first state that tinsel wire is essentially a raw material, this in view of the fact that it must be made up into some article, such as Christmas-tree ornaments, fabrics, etc. Under the act of 1897, paragraph 179, it carried a duty rate of 5 cents a pound. Under the act of 1909, paragraph 179, the same rate of 5 cents a pound applied. In the act of 1913 it was rated at 6 per cent ad valorem under paragraph 150, which rate, figured out in normal times, that is, before war conditions prevailed, at something less than the previous rate of 5 cents per pound. Under the proposed Fordney Act, H. R. 7456, paragraph 382, it is listed at 10 cents per pound and 30 per cent ad valorem.

I am principally engaged in producing various kinds of toys, my plant being located in Philadelphia, where I employ some 200 men and women. One of the principal products that I produce is an extensive line of Christmas-tree ornaments, in the fabrication of which I use a great deal of tinsel wire, lahn, or lame, which up to date hereof I have been compelled to purchase principally in the foreign market, due to the poor quality produced by the single manufacturer in the United States. The trade to whom I offer my Christmas-tree ornaments made of tinsel wire refuse to accept such ornaments when made from the inferior tinsel wire produced in the United States, and they generally stipulate in the orders that they place with me that imported, rather than domestic, tinsel must be used, as they know from experience that the ornaments made from domestic tinsel quickly lose their luster, changing color much more quickly when they display them than do the articles made of imported material.

At the present time the import price of tinsel is about \$190 per case of 100 kilos. Applying the duty rate of 6 per cent, as specified in the Underwood Act,

which is equal to \$11.40, together with a charge of \$1 per case for hauling and freight, will make the landed price \$202.40. If you compare this rate with that proposed in the Fordney Act you will find that the amount of duty will be \$79 per case of 100 kilos, or nearly seven times the duty assessed under the present (Underwood) act, this without taking into consideration the American valuation plan, which, if adopted, would force all manufacturers of Christmas-tree ornaments using tinsel wire in the manufacture of such ornaments out of business or compel them to pay an arbitrary price which would be demanded by the sole American manufacturer, tending thereby to establish for him what would amount to a virtual monopoly in this country. In this connection I relate as follows: From January to May last year there was a strike of dock laborers in Rotterdam and it was impossible during that period to bring into the United States any of the tinsel wire that I had contracted for in the foreign markets. Thus my supply was shut off, and I was forced thereby to turn to the American manufacturer, who charged me \$425 per case of 100 kilos for tinsel much inferior in quality to that which was held up by the strike in Rotterdam and which cost me, landed, something slightly below \$200 per case of 100 kilos.

At present there are two other factories in the United States—one located in Baltimore and the other in Manitowoc, Wis.—which, including my own, employ about 500 people, and if the rate of duty as proposed in the Fordney bill is enacted it will stop the industry as far as these factories are concerned or force them under the absolute control of the only manufacturer of tinsel wire in the United States, thereby automatically monopolizing not only the trade in tinsel wire but also that of producing Christmas-tree ornaments from that commodity.

In view of the fact that tinsel, lahn, or lame is made principally of copper, and as the price of copper is constantly fluctuating, I respectfully petition you to restore the rate of 5 cents per pound as provided in the acts of 1897 and 1909 and submit that the adoption of a specific rate would permit importers to readily determine in advance the amount of duty due on any consignment and would obviate the necessity of constantly investigating its value in the foreign markets, following the ups and down of the price of copper, the principal ingredients entering into it. In addition to this, it would relieve the United States appraising officers of considerable difficulty in determining the value of each individual importation.

STATEMENT OF GEORGE M. MONTGOMERY, REPRESENTING J. B. MONTGOMERY CO., OF WINDSOR LOCKS, CONN.

Mr. MONTGOMERY. I am appearing simply to correct an error that has crept into paragraph 382 in the printing, and I have explained all the error and will file this with the clerk, if you will permit.

The CHAIRMAN. It will be filed and attention called to it.

Mr. MONTGOMERY. Beyond this I find that the quality of our goods has been attacked before this committee in a brief filed by one of our users, in which he states that they are not of a quality equal to those made in Germany. In reply I will say—

Senator WATSON. What is it you are making?

Mr. MONTGOMERY. Tinsel, under paragraph 382. During the war we manufactured all the silver tinsel used in this country for Christmas tree ornaments, and since the war about one-third of it. The quality has not been questioned in any particular, and our silver tinsel, I wish to maintain, is just as good as that made by the Germans. We want to continue to manufacture it, and under the operations of paragraph 382, as corrected, we can do so. Thank you very much.

BRIEF OF GEORGE M. MONTGOMERY, WINDSOR LOCKS, CONN.

In compliance with our request for a correction in paragraph 382 as it appears in H. R. 7456, would say that we based our original suggestion in our brief on our appearance before the Ways and Means Committee of the House upon the wording of the tariff act of 1913 (Underwood), Schedule C, paragraph 150:

Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, 6 per cent ad valorem; bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn, 25 per cent ad valorem; fringes, ribbons, beltings, toys, or other articles, made wholly or in chief value of tinsel wire, lame or lahn, or of tinsel wire, lame or lahn, and india rubber, bullions, or metal threads, not specially provided for in this section, 40 per cent ad valorem.

Our suggestions for the new Fordney tariff bill were as follows:

Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, 10 cents per pound and 25 per cent ad valorem; bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn, 10 cents per pound and 35 per cent ad valorem; ribbons, beltings, toys, or other articles made wholly or in chief value of tinsel wire, lame or lahn, or of tinsel wire, lame or lahn, and india rubber, bullions, or metal threads, not specially provided for in this section 60 per cent ad valorem; woven fabrics, fringes, and tassels, 70 per cent ad valorem.

The new Fordney bill, paragraph 382, H. R. 7456, as passed by the House of Representatives, reads as follows:

Tinsel wire, lame, or lahn, made wholly or in chief value of gold, silver, or other metal, 10 cents per pound and 30 per cent ad valorem; bullions and metal threads made wholly or in chief value of tinsel wire, lame, or lahn, 10 cents per pound and 35 per cent ad valorem; ribbons, beltings, toys, and other articles made wholly or in chief value of tinsel wire, lame or lahn, and india rubber, bullions, or metal threads, not specially provided for, 45 per cent ad valorem; woven fabrics, fringes, and tassels, made of any of the foregoing, 55 per cent ad valorem.

The error which we wish to point out is an omission on page 82 of this bill, under paragraph 382, on line 18. After the word "lahn" should be inserted **or of tinsel wire, lame, or lahn.**

In our opinion the bill could be administered better if there was also written in, on line 21, page 82, after the word "made," the sentence "wholly or in chief value."

This would make paragraph 382 of H. R. 7456 read as follows, our suggestions being written in italics:

Tinsel wire, lame, or lahn made wholly or in chief value of gold, silver, or other metal, 10 cents per pound and 30 per cent ad valorem; bullions and metal threads made wholly or in chief value of tinsel wire, lame, or lahn, 10 cents per pound and 35 per cent ad valorem; ribbons, beltings, toys, and other articles made wholly or in chief value of tinsel wire, lame or lahn, *or of tinsel wire, lame, or lahn*, and india rubber, bullions, or metal threads not specially provided for, 45 per cent ad valorem; woven fabrics, fringes, and tassels made *wholly or in chief value* of any of the foregoing, 55 per cent ad valorem.

LEAD, TIN, AND TIN FOIL.

[Paragraphs 386, 387, 389, 393, and 1670.]

STATEMENT OF EGBERT MOXHAM, REPRESENTING THE TIN FOIL MANUFACTURERS OF THE UNITED STATES.

Mr. MOXHAM. Gentlemen, I am a tin-foil manufacturer, being vice president of the Conley Foil Co., of New York, but in appearing before you do so not as a representative of this firm only but of the tin-foil industry of the United States. Mr. B. N. Schwartz, president of Lehmaier-Schwartz & Co., who are also large manufacturers of foil, is here with me and at your service in case any questions arise which I am unable to answer. I appear before you in connection with paragraphs 386, 389, 393, and 1670.

Paragraph 393 is the basket clause in the metal schedule in which tin foil lies.

Briefly, our position is one of opposition to the present schedule on tin and lead as compared with the protection afforded tin foil.

Lead, under the Fordney bill, carries approximately 50 per cent ad valorem protection on the American valuation. If taken on the cost abroad, it is anywhere from 50 per cent to 100 per cent.

Briefly, we feel that this protection is not needed for the lead industry, but passing over that, if that protection is to be, we must have more on foil.

I would like to say a word on tin, if I may. We approach the question of tin more as a matter of dread than as a matter of equity. At the present time this country is absolutely dependent upon foreign sources for tin. We do smelt about 20 per cent of our tin in this country, but that is dependent upon foreign sources for ore.

Senator SMOOT. What do you want on tin?

Mr. MOXHAM. We feel a duty of 2 cents is too high.

Senator SMOOT. Well, what do you ask for?

Mr. MOXHAM. We ask that it remain on the free list, where it has been all this time.

Passing over those features, if tin and lead are to remain as they are, we should have more adequate protection on tin foil. Tin foil is a highly fabricated product.

Senator SMOOT. That comes under the basket clause.

Mr. MOXHAM. Yes.

I have a brief that I would like to leave with you. In it is a suggested amendment of paragraph 393, the basket clause. It reads as follows, following the words "35 per cent ad valorem":

Provided, That any manufactured product covered herein, composed in whole or in part of metals upon which there has been imposed by this act specific duties, shall carry, in addition to the ad valorem duty herein enacted, a specific duty of the same rate as is enacted for the metal components by other provisions of this act.

Senator SMOOT. Would you have that same duty apply to all component parts of the manufactured article?

Mr. MOXHAM. Well, Senator, in tin foil we have only the two materials—tin and lead.

Senator SMOOT. That would apply to all in this basket clause. would it not?

Mr. MOXHAM. I would say that that would be equitable. In our own case it is equitable.

Senator SMOOT. Then, if you should have 1 pound of lead and 9 pounds of zinc, you would want the same duty on the other 9 pounds as on the lead?

Mr. MOXHAM. No, sir; only on the 1 pound of lead.

Senator SMOOT. Then you did not understand my question.

Mr. MOXHAM. I suppose I did not understand your question.

I would like also to bring up the question of bottle caps, paragraph 387.

Bottle caps, again, are composed of tin and lead. I can cover that briefly by stating that originally we had a number of bottle-cap plants in this country, but that due to foreign competition they have eliminated themselves one by one until to-day we are the only manufacturers left in the business. We receive under the Fordney bill 40 per cent ad valorem on bottle caps, if they are colored, and 25 per cent ad valorem when uncolored. I have covered this point in the brief.

Senator Smoot. You may file that brief. Just what does the brief propose?

Mr. Moxham. The brief proposes 60 per cent ad valorem.

Senator Smoot. On colored bottle caps?

Mr. Moxham. Our recommendation is:

Bottle caps of metal, collapsible tubes, and sprinkler tops, if not decorated, red, lacquered, waxed, enameled, lithographed, electroplated, or embossed colors, 60 per cent ad valorem;—

Senator Smoot. Instead of 25?

Mr. Moxham. Yes.

Decorated, colored, waxed, lacquered, enameled, lithographed, electroplated, embossed in colors 10 per cent extra ad valorem for every color or lacquer, enamel, lithographing (electroplating or embossing bronze be counted as two colors), plus a specific duty of $2\frac{1}{2}$ cents a pound.

As bearing that out, I have attached to my brief some recent quotations on German caps as compared with American caps. Briefly, they range from 54 cents on the German caps to \$3.65 on American caps, and from \$1.45, German price, as compared with our price of .59.

I would like to point out once again, if I may, the unequitable position in which tin foil is placed under the Fordney bill.

The tin-foil business may be divided into two main categories—the first, pure tin foil, in which tin is used entirely as a raw material; and, second, composition foil, which is made up of varying amounts of tin and lead as a raw material. By far the largest proportion of the foil business lies in the composition foil.

The Fordney bill gives foil, a highly fabricated product, only a 5 per cent protection, and the advocates of the bill point out inasmuch as this is based on American valuations it gives a very ample protection.

As compared with this the principal raw material entering into the manufacture of foil—lead, a comparatively crude product—is given on the basis of a normal American valuation a 50 per cent protection (this on the fair assumption that $4\frac{1}{2}$ cents may be considered as a normal valuation for lead figured on the $2\frac{1}{2}$ cents duty granted).

I feel sure it will need no extended brief on our part to convince your committee that a highly fabricated product such as tin foil, on which the greatest care and skill must be exercised in the manufacture, is certainly entitled to an equal, if not greater, protection than a comparatively crude material such as pig lead.

BRIEF OF EGBERT MOXHAM, REPRESENTING THE CONLEY FOIL CO.

BOTTLE CAPS.

Metal bottle caps are included in the present and past tariff measures under paragraph with collapsible tubes. Under the Payne-Aldrich act they carried an ad valorem duty of 45 per cent colored and 45 per cent plus a specific duty of $\frac{1}{2}$ cent uncolored. Under the Underwood bill 30 per cent uncolored and 40 per cent colored. Under the Fordney bill 40 per cent colored and 25 per cent uncolored.

We earnestly ask that this schedule receive attention and that bottle caps be given adequate protection, which is entirely lacking under the existing conditions.

The history of the bottle-cap business in this country has been a lamentable one. Originally a number of manufacturers existed, but due to the severe

foreign competition one company after another has given up the manufacture until to-day, so far as we know, we, the Conley Foil Co., are the only manufacturer remaining in the business in the country. Our methods, so far as we can determine, are the most advanced in use, employing to the full, automatic methods, but despite this fact the prices we are able to quote on bottle caps are materially higher than those of foreign competitors. Foreign prices are lower by reason of lower values of materials (lead and tin) and labor, and inasmuch as the present tariff measure is substantially increasing the protection of both tin and lead, unless something is done to yield corresponding protection to the bottle cap industry, its future in this country is virtually predetermined as a failure.

Exhibit A attached hereto, a letter from one of our customers, is entirely self-explanatory and illustrative of the condition we are facing.

The normal condition of a relatively high material labor cost in this country is greatly intensified at the present time by the depreciated value of European exchange.

Exhibit B attached hereto sets forth this condition very plainly.

We urge very strongly, therefore, that paragraph 387 of the Fordney bill, as introduced, be stricken from the tariff and in its place the following provision be enacted:

“Bottle caps of metal, collapsible tubes, and sprinkler tops, if not decorated, colored, lacquered, waxed, enameled, lithographed, electroplated or embossed in colors, 60 per cent ad valorem; if decorated, colored, waxed, lacquered, enameled, lithographed, electroplated or embossed in colors, 10 per cent extra ad valorem for every color or lacquer, enamel, lithographing (electroplating or embossing bronze to be counted as two colors), plus a specific duty of 2½ cents per pound.”

EXHIBIT A.

AUGUST 12, 1921.

THE CONLEY FOIL CO.,
New York City.

GENTLEMEN: Answering your quotation of August 5, beg to advise your prices are out of reason, as same can be imported at almost half the price quoted by you.

Thanking you for your quotation, we are,
Yours, very truly,

PARK & TILFORD.

EXHIBIT B.

Comparison of prices on bottle caps as quoted by a large German manufacturer with domestic prices in the United States.

[Prices quoted in American currency with allowance for effect of the German mark at \$0.0125.]

Approximate size of cap.	German prices.	American prices.	Approximate size of cap.	German prices.	American prices.
PLAIN.			COLORED.		
1.4 by 0.10.....	\$0.54	\$3.65	1.4 by 0.10.....	\$0.79	\$4.65
1.4 by 0.12.....	.61	3.69	1.4 by 0.12.....	.87	4.65
1.4 by 1.4.....	.90	4.44	1.4 by 1.4.....	1.15	4.65
1.4 by 1.6.....	.97	4.55	1.4 by 1.6.....	1.23	4.65
1.4 by 1.10.....	1.08	4.67	1.4 by 1.10.....	1.35	4.65
1.4 by 1.12.....	1.18	4.75	1.4 by 1.12.....	1.45	4.65

NOTE.—To land caps in this country carrying charges would have to be added to the German prices, but however liberal the allowance for this may be, the great diversity of values is still apparent and points out most strongly the necessity of protection.

LEAD, TIN, AND TIN FOIL.

The Fordney bill as passed by the House removes metallic tin from the free list and places on it a 2-cent duty. It advances the duty on lead from 25 per cent ad valorem to a specific duty of 2½ cents per pound. At normal prices on lead this is equivalent to 100 per cent increase. Tin foil is in the unenumerated class.

It therefore falls in the basket clause of the metal schedule. Under this it receives 35 per cent protection ad valorem, as compared with 20 per cent in the Underwood bill and 45 per cent in the Payne-Aldrich bill. It is the urgent contention of the tin-foil manufacturers of the United States that they are subject to unjust discrimination by the Fordney bill.

Such disruption of the world's commerce was caused by the war that no adequate measure is possible of the protection afforded by the Underwood bill to the tin-foil industry. The Payne-Aldrich Act, under which tin was free, lead received 2½ cents, and tin foil 45 per cent, seemed to offer, as judged by the statistics on imports during the period of its existence, reasonably adequate protection to the tin-foil industry.

Paralleling therefrom and allowing for the present conditions in Europe and Japan, it would seem that tin foil, a highly fabricated product, should receive better protection than it did under the Payne-Aldrich Act; that is, if the duty on tin and lead is to be left as at present enumerated, tin foil for adequate and commensurate protection should receive an ad valorem duty of 45 per cent plus specific duty on the metal contents at an equal rate to that assessed on lead and tin in other parts of the metal schedule. (See Exhibit A, attached hereto, offering an amendment to par. 393 of the Fordney bill.)

In this connection it has been pointed out by the framers of the Fordney bill that the 35 per cent granted therein is equivalent to and better than previous protection by reason of the American valuation clause embodied in this bill.

The tin-foil manufacturers do not feel that they can accept this position, in that they can not seriously believe the American valuation feature will be maintained in the ultimate passage of the tariff bill, and it is essential that it be thoroughly recognized by Congress that if this provision is stricken out or modified, as it undoubtedly will be, that greater protection must be given tin foil if present raw-material provisions on tin and lead are maintained.

Bearing on these:

Tin.—Reference is made to copy of brief submitted by the tin-foil manufacturers to the House subcommittee on metals, which is attached hereto—Exhibit . In this has been set forth, as clearly as available data will permit, the belief of the tin-foil manufacturers that the tin industry is not entitled to the protection it seeks. The dependence of the United States on the outside world for tin is so absolute that it is almost self-evident that any import duty imposed by the United States on this material will be followed by retaliatory duties on the part of the producing countries, the whole serving to build upon domestic prices, not only the import duty proposed but the retaliatory export duties occasioned thereby. On commodities into which tin enters largely, such as tin oil, this will work not only a decided hardship to the producer, but also to a very large percentage of the consuming public in the advance prices created. We strongly urge, therefore, that the levying of a duty on tin will react most unfavorably on the consuming public and that it should not be considered.

Lead.—It is believed that 4½ cents may be considered as a normal price for lead, on which basis the 2½ cents duty is equivalent to a 50 per cent ad valorem. Statistics indicate that this country is producing its full requirement of lead and is exporting large quantities of this material, which facts would indicate that the industry is in a position to successfully compete with foreign producers, and it is therefore urged that a protection of approximately 50 per cent ad valorem is unnecessarily high.

EXHIBIT A.

Outline of amendment to paragraph 393 to put tin foil in balance with raw materials.

That paragraph 393 be amended by the addition, following the words "35 per cent ad valorem" at the end of the paragraph, of the following:

"*Provided*, That any manufactured product covered herein, composed in whole or in part of metals upon which there has been imposed by this act specific duties, shall carry in addition to the ad valorem duty herein enacted a specific duty of the same rate as is enacted for the metal components by other provisions of this act."

EXHIBIT B.

Hon. G. Q. TILSON,
Committee on Ways and Means,
House of Representatives, Washington, D. C.

GENTLEMEN: We come before you representing the tin-foil manufacturers of the United States, in connection with the proposals recently made for removal of tin from the free list and the imposition of certain duties thereon.

The tin-foil business is a long-established American industry, in which a number of firms with plants established in various parts of the country participate, using, according to Government figures, approximately 4,000 tons per year, or approximately 6 per cent of the total consumption of the country. Its product is used to a very considerable extent throughout the entire country and serves, as, perhaps, no other material can, a most useful part in the merchandising of food and other perishable products.

The tin-foil manufacturing industry of this country in appearing before you do not wish to oppose any legitimate protective measure that is for the benefit of the American consumer as a whole, or for American industry in the same sense, nor do they wish to oppose measures necessary for revenue purposes. They do, however, feel very strongly that if tariff is to be imposed for revenue purposes that it should be apportioned uniformly over general imports, and that an individual commodity should not be singled out to bear undue burden. The result will result from such measure as that which we now understand is under consideration by your committee.

In that it has a distinct bearing on this measure, it should be further stated that the tin-foil business encounters formidable competition from aluminum and specially prepared papers arising not to merit for the particular quality of the competing material, but more particularly through their lighter weight per unit of area and any tariff measure that tends to advance prices of principal raw materials entering into the tin-foil industry, namely, tin and copper, will react not only on the industry itself but also on a very large percentage of the American people seriously, in that tin foil in its application to the business reaches very largely into the every-day life of the average American consumer.

It is our understanding that the proponents of the removal of tin foil from the free list have laid their proposals before you on three main counts. These are taken up and answered herewith.

First. They propose that tin in ore or concentrates shall be removed from the free list, and that an import duty of 6 cents per pound be levied thereon.

According to the facts brought out by the proponents of this measure, the proposed tax of 6 cents per pound on tin in ore can not be considered as it is advanced as a protective measure, in that there exists to-day in this country no mining of tin. We would urge very strongly upon you that the present tariff, with its provision for the levying of a 4 cents per pound duty on tin in ore upon presidential proclamation when 1,500 tons or more of tin was mined in the United States, amply protects any potentiality of mining that may exist. This provision in the present law not only affords protection should a mining industry developed but also offers substantial encouragement and reward for such development. The fact that the measure has been so long on the statute books, particularly when coupled with the high demand and consequent return available existing during the last few years through the extraordinary high prices existing, would indicate the utter futility of greater incentive in this regard. On the other hand, the assessment of a duty of 6 cents per pound on imports of tin in ore, while protecting the American industry, can not fail to increase materially to the consumers in the United States the cost of all products into which tin enters or which are most unfavorably to those manufacturers who are dependent upon tin for a considerable part of their raw material.

It is clearly evident, not only from the brief of the proponents of increased duty on tin but also from the statistics of the Government, that the United States is to-day and will in all probability for some time to come be entirely dependent on importation for its basic supply of tin, and it is fully urged that a measure of heavy duty on such a commodity will have a tendency to create retaliatory export duties from the producing countries which will still further advance the cost of tin-bearing products to the consumer and still further embarrass the tin-consuming manufacturers of the United States.

It is admitted by the proponents of the measure that the United States is to-day virtually dependent on Bolivia for its ore supply, though it is further admitted by them that the available ore in Bolivia constitutes but 25 per cent of the world supply. Mention is made of the possible augmenting of this supply by Chinese ore, but according to the figures of the Geological Survey the average Bolivia and Chinese output for years 1913 to 1918 would constitute but 33,934 metric tons, only a little over 50 per cent of the United States consumption for the same period. These figures would seem to indicate clearly a dependence for so large a portion of our supply on sources other than those named and interested in the smelting of tin that we can not but view with alarm the effect on these other sources of an import duty into the United States on ore. Further, we are informed that Bolivia is the only tin-producing country that does not to-day protect its own smelting business by a differential import duty on tin ores and that they are seriously considering such a step. It is believed that an import duty on ore entering the United States would hasten such action by Bolivia and so react unfavorably on the United States consumer.

In this connection the Federated Malay States now virtually prohibit the exportation of tin in ore by means of differential export duties on tin in the form of ore over that in the finished form, so that this all-important supply is virtually eliminated as a source for our own smelting industry.

It is intimated in the brief of the proponents of the higher duty on tin that protection is needed by the smelters of the United States not only to cover the higher smelting costs but also to equalize the freight differential on the tin in the ore as compared with the finished material.

We would urge strongly that such an argument should not be considered in the present consideration. The facts seem to substantiate the statement that it costs more to lay down in this country a pound of tin in the form of ore than it does a pound of smelted tin freed of the carrying charge on the non-bearing tin material, but it is not our understanding that duties are to be imposed to protect at the expense of the American public the inequalities suffered by any small group of American manufacturers by reason of their uneconomic location.

It is strongly urged, therefore, that your committee do not favorably consider the levying of an import duty on tin in ore on the broad general ground that it is not a protective measure and that it is unjust to impose on one commodity so abnormal a levy for revenue purposes only.

Second. The proponents of this measure propose further a duty of 10 cents per pound on tin in bars, blocks, pigs, or grain or granulation or any other metallic form, or a differential of 4 cents over ore, which they claim is necessary as a protective measure in order that the smelters established in this country within the last few years and now producing, according to their statements, some 19 per cent of the country's consumption of tin, shall be able to compete with foreign producers. (Exhibit A attached would seem to indicate a higher ratio of domestic production.)

They state that a duty of 4 cents "would probably suffice" to equalize the difference between the cost of domestic and foreign smelting, and specifically ask for such a duty. They point out that some four or more smelters have been started in this country within the last few years and indicate that in at least two cases these smelters have lost money since starting. They speak in general terms of the inability of these smelters to compete with foreign producers, but in so far as we are informed no specific concrete facts have been presented that would indicate what the actual margin of cost inefficiency in American smelters is as compared with the foreign.

In consideration of this matter, it would seem to be just to consider the conditions under which these smelters were built in the United States. In 1916, the time the first smelter was put into operation, the country was under the direction of a low-tariff administration. In the face of this condition four or more smelters were built and in at least two cases the parties engaged were large influential firms, well versed in the knowledge of smelting business generally and well provided with the technical and research talent to measure the possibilities of their investment in the locations chosen. In one case at least the direct knowledge of foreign smelting conditions was in the hands of the builders by reason of their smelting operations in England.

In view of these facts, it seems incumbent upon the proponents of the measure to lay before the American people conclusive and concrete evidence of the neces-

sity for the protection they crave. This from such facts as are available to us they have not done.

Furthermore it is a grave question whether the smelters which, as pointed out by the proponents of the higher duty, have lost substantial sums on an operation of some magnitude in the years immediately succeeding 1916 can hope to be put upon a profitable basis by any measure that would not be discriminatory to the tin-consuming public. In this connection we would point out that the official prices of tin over the years 1916 to 1920 (omitting 1918, the data for which is not available) average 61.6 cents per pound, with a high of \$1.10 per pound and a low of 32½ cents per pound. This average is more than 20 cents per pound over the five years preceding 1916 and is over 33 cents per pound over the average of the 25 years preceding 1916. It is admitted that these were years of high productive costs generally, but after due allowance for this fact, the conditions of supply and demand during the period in question were such as to indicate a very much more substantial margin of profit to the production of a material so much in demand and so restricted in supply as tin than can be achieved by any measure of tariff protection compatible with the public interest, and if the smelters in question could not prosper under the conditions existing during their operation to date, no conceivable duty would seem adequate for their protection.

Bearing on the point raised under "ore" as to retaliatory duties from foreign producers, it is a fact that virtually all the tin-producing countries to-day protect their tin by a differential in export duty between tin in the finished form and tin in the form of ore. Any danger that may exist of the stirring up of retaliatory duties on the part of the tin-producing countries by the imposition of an import duty on tin in ore is still further intensified by the consideration of an additional duty on tin in the pig form. It is, we believe, axiomatic that an import differential imposed on entry into this country on tin in the metallic form over tin in the form of ore calls for an increased differential on the part of an exporter to maintain his present equilibrium. Such a cycle once started will still further increase the burden to the tin consumers of the United States.

Bearing on the proponents' reference to foreign competition, and particularly with reference to Cornwall, England, it is of interest to note that during the years 1916, 1917, 1919, and 1920 (1918 not available) that the production of tin in Cornwall was 15,401 tons as against a production in the United States of 37,454 tons, and it is to be particularly noted in these figures that the margin of surplus production in the United States shows an increasing ratio over Cornwall in the latter years. These figures raise a very serious doubt in the minds of the tin consumer of the relative weakness and need of the new American industry for protection at least so far as the Cornwall competition is concerned.

We would urge therefore that sufficient facts have not been presented to justify the consideration of a duty on tin, and that a duty will react unfavorably to the American public.

Third. The proponents of the measure state that the effect of such a duty on the consuming trade of the United States, assuming that the entire duty could be covered in the domestic price, would be unimportant, if not entirely negligible, basing their statement on the ground that tin is used almost wholly as an alloy or in small proportions of the various finished products in which it is marketed.

In general, it may be pointed out that the actual facts are not in accord with this presentation. It is true that tin is used in large part in alloy, and so enters into the final cost in only proportionate amounts. However, in the case of tin foil, and we are informed in other industries, the proportions of tin in the alloy are sometimes quite marked. In fact, in the case of tin foil a very considerable portion of the business—for food products—is made up entirely of tin, and is particularly on this portion of the business that competition is to-day, and has been over a long period particularly strong from aluminum and the specially prepared papers. It may be stated without fear of contradiction that a duty of 10 cents per pound on tin, if covered in large part in the domestic price would, unless absolute unforeseen changes in the cost of aluminum and specially prepared papers came about be absolutely prohibitive to such portion of the tin business as is open to competition with these materials. It is an open question just what proportion of the tin-foil business would be open to this competition but it may be stated that it would be a very broad percentage.

Aside from the very grave aspect that such a condition presents to the tin manufacturer, we ask, and perhaps with better grace, your consideration of the serious effect that such a measure would have on a considerable portion of the

suming public. Through its very perfect sanitary, hygenic, and protective
tures, tin foil, and particularly those grades made entirely of tin, plays a
y important part in the protection and delivery of edible products to the
merican consumer, and a very considerable proportion of the American public
not fail to be materially affected by your decision in the matter.
In summarizing our position therefore, we wish to again emphasize the fact
at the tin-foil industry as such does not seek to embarrass the consideration
adequate protective measures of which the industries of this country have a
rical need. We do not feel very strongly, however, and have endeavored to
int out by the facts presented herein that the tin-consuming industries and the
n-consuming public in the United States would be most seriously effected by
e removal of tin from the free list, and that such action would result in mate-
al hardship to a very considerable proportion of the citizens of the United
ates. In fact, it is believed such a measure would react unfavorably even to
at portion of American industry proposing the measure at present under con-
deration, in that it is believed that the restrictions of tin consumption that
ould follow the passage of such a measure would more than offset the price
atterment that would be created.
For such weight as it may have on the general economic situation, there is
so pointed out the belief that such a duty on tin either in the form of ore or in
e final metallic form stocks in this and foreign countries, thus delaying fur-
er the orderly progress of liquidation, which, if allowed to proceed normally,
ill tend to establish a sound and stable market necessary for normal business.
The tin-foil manufacturers do feel very strongly, however, that if the existing
chedules on tin are changed that tin foil should carry in addition to such ad
alorem as it may enjoy, a specific duty based on the metal contents of the
oil to the extent of the specific assessments on tin over the present schedules.
We wish, however, very strongly to point out to your committee that it is not
elieved that such a provision would protect or in any way adequately compen-
ate the tin-foil industry for the harm that would be done it by the proposed
duty on tin, and that such a measure is merely asked to keep tin foil in balance
with its raw materials, if such a measure on the raw materials referred to must
be enacted.
In support of the various figures presented herewith there are attached in the
orm of exhibit certain basic figures which may be of interest to your committee.
These are all available in Government or general publications and are merely
attached for the convenience of your committee.
Respectfully submitted.

TIN FOIL MANUFACTURERS OF THE UNITED STATES.

ZINC ORE AND PRODUCTS OF ZINC.

[Paragraphs 390 and 391.]

STATEMENT OF E. H. WOLFF, REPRESENTING THE AMERICAN ZINC INSTITUTE, NEW YORK CITY.

Senator SMOOT. Please give your name for the record.

Mr. WOLFF. My name is E. H. Wolff. I am the operating head of smelting plant and rolling mill. However, I am here as president of the American Zinc Institute. I have with me representatives of about 15 producing companies.

Senator SMOOT. Do I understand, Mr. Wolff, that you are going to speak for all the companies.

Mr. WOLFF. All of the zinc companies from the mining to the finished product. I have a brief that I wish to present, and ask your permission to file it.

Senator SMOOT. You may proceed. Your brief will be printed as part of your remarks.

Mr. WOLFF. I thank you. In the individual membership of the institute are represented substantially all of the people of the United States who are engaged in the mining, milling, smelting, and manufacturing of zinc and the products of zinc. We are interested in paragraphs Nos. 74, 88, 390, and 391 of the pending tariff bill.

On behalf of the United States zinc industry, the president of the institute, being thereunto duly authorized by its board of directors, last January presented to and filed with the Ways and Means Committee a brief explaining the absolute necessity for an adequate tariff on zinc ore and the products of zinc. Briefs were simultaneously presented and filed by Mr. William A. Ogg, president of the American Zinc, Lead & Smelting Co., and Mr. Otto Ruhl, mining engineer, Joplin, Mo. These correlated briefs, to which your attention is respectfully invited, will be found in the attached tariff reprint of the bulletin of the institute of that period. It is, however, natural that in more than seven months some changes in the situation should have taken place. On behalf of the zinc-mining

section of the institute, with headquarters at Joplin, Mo., Mr. R. has filed or will file with this committee a supplemental statement dealing primarily with zinc ore.

Viewing the industry as a whole, however, I wish at this time to present a brief statement of facts for your consideration.

In January, when the brief of our industry was presented to the Ways and Means Committee, testimony was given showing that foreign metal was being offered in this country at a price lower than the American market, and we laid stress upon this menace. Our prediction was verified, as is shown by the Government reports of importations during March and April of this year.

The condition of the industry has become worse instead of better. Zinc mines have continued to shut down until to-day a very large percentage of the zinc mining, smelting, and rolling mill capacity of the United States is idle.

Senator Smoot. If this is the brief you intend to file, I suggest that you spend no time reading it. Of course, we are quite familiar with general business conditions. You had better address yourself to those things which are not in your brief.

Mr. Wolff. Perhaps I should.

Senator Smoot. The committee will have every word of that before it.

Mr. Wolff. However, there are one or two points in this brief that I should like to emphasize.

Senator Smoot. If there is anything special, we would like to hear that.

Mr. Wolff. One of those points is that the bill, as written in the House of Representatives, is not satisfactory to us; that is, it is not satisfactory to the zinc industry. They put a duty on zinc ore, which is the raw material, and they gave that raw material protection for the life of the bill, but for the products of that raw material they give a two-year protection.

Senator Smoot. And you object to the two-year protection?

Mr. Wolff. We object to that phase of it; yes. It is a very logical conclusion as to what the result at the end of two years will be.

Senator Dillingham. Are you interested in the higher grades like oxide and chlorate, etc.?

Mr. Wolff. I represent all the zinc production of the country. This association of ours was not in existence when the former tariff bills were written. At that time the representatives of the various products appeared before the committees in person representing their own individual companies. We now are together in an association, and that association has prepared this presentation for the industry. In other words, our house is not divided; we are absolutely together.

Senator Dillingham. Under this bill I see there is no difference provided as between zinc ore and the other forms of manufacture of zinc. With lead it is quite different. We place a higher rate upon white lead than upon lead ore, for instance.

Mr. Wolff. I think that has been taken care of, Senator. If you refer to oxide, that has been taken care of by a brief of the secretary of our association, who appeared here several days ago.

Senator DILLINGHAM. Oh, I did not know that he had appeared here.

Senator SMOOT. We give you the same rates as in the Payne-Aldrich bill; that is, on zinc block, zinc dust, and so on.

Mr. WOLFF. Do you mean that the Fordney rates are the same?

Senator SMOOT. As in the Payne-Aldrich bill.

Mr. WOLFF. They are slightly higher, Senator.

Senator SMOOT. The Payne-Aldrich bill gave you on zinc blocks, or pigs and zinc dust, 1½ cents per pound.

Mr. WOLFF. That was for the life of the bill, but we have higher rates for the two-year period.

Senator SMOOT. I want to know which one you want?

Mr. WOLFF. We want the higher rates. Our rates are set out in the brief. You will find them when you get to it.

Senator SMOOT. Yes. That will be the best place to find them.

Mr. WOLFF. Another point that I would like to refer to is that our operating costs are getting up higher than they were in prewar years. One of the important facts to be considered is that the zinc industry as a whole operated on a 12-hour basis. To-day it is on the 8-hour basis, which is the American day, and no one expects that we will go back to the 12-hour basis. That in itself is going to increase the labor costs permanently about 30 or 35 per cent.

Then there is the further fact that freight rates have a very large bearing on our business. This is all heavy tonnage, and the amount of money involved in the payment of freight is very large indeed. While it is true that the rates are somewhat higher to-day than we are to see them, and we expect them to come back to a somewhat more normal basis, yet we do not expect them to go back to what they were in 1910, 1912, or 1913.

Senator SMOOT. I think that is right.

Mr. WOLFF. Another matter to be taken into consideration is fuel. Fuel is high to-day compared with prewar days, and we do not expect to see fuel come back to that point. I might say that the zinc industry has had protection for many years. It has been understood that zinc had protection. It has never been coming into this country in any large volume, and I do not think anyone expects it to come in from foreign countries. It is a domestic proposition. We should like to have it remain so. That is all I have to say, gentlemen, unless you have some questions that you wish to ask.

BRIEF OF E. H. WOLFF, REPRESENTING AMERICAN ZINC INSTITUTE (INC.).

In the individual membership of the institute are represented substantially all of the people of the United States who are engaged in the mining, milling, smelting, and manufacturing of zinc and the products of zinc.

We are interested in paragraphs Nos. 74, 88, 390, and 391 of the pending tariff bill.

On behalf of the United States zinc industry the president of the institute, being thereunto duly authorized by its board of directors, last January presented to and filed with the Ways and Means Committee a brief explaining the absolute necessity for an adequate tariff on zinc ore and the products of zinc.

Briefs were simultaneously presented and filed by Mr. William A. Ogg, president of the American Zinc, Lead & Smelting Co., and Mr. Otto Ruhl, mining engineer, Joplin, Mo.

These correlated briefs, to which your attention is respectfully invited, will be found in the attached tariff reprint of the bulletin of the institute of that period.

It is, however, natural that in more than seven months some changes in the situation should have taken place.

On behalf of the zinc mining section of the institute, with headquarters at Joplin, Mo., Mr. Ruhl has filed or will file with this committee a supplemental statement dealing primarily with zinc ore.

Viewing the industry as a whole, however, I wish at this time to present a brief statement of facts for your consideration.

In January, when the brief of our industry was presented to the Ways and Means Committee, testimony was given showing that foreign metal was being offered in this country at price lower than the American market, and we laid stress upon this menace. Our prediction was verified, as is shown by the Government reports of importations during March and April of this year.

The condition of the industry has become worse instead of better.

Zinc plants have continued to shut down, until to-day a very large percentage of the zinc mining, smelting, and rolling mill capacity of the United States is idle.

The estimated slab zinc capacity of the United States is approximately 650,000 tons. We produced in July at the rate of only 186,000 tons per annum, or approximately 30 per cent of capacity. While the stated capacity may be in excess of the normal consumption during normal years, yet the present rate of production in any plant now in operation is below the point at which it can operate successfully even with a fair metal market.

Our stock of primary slab zinc on hand at smelters' plants on August 1 was 94,524 tons, or between six and seven months' output at the estimated August production rate of 15,000 tons. To this should be added warehouse stock owned by others than smelters, of approximately 5,000 tons. This makes a total of stock on hand in this country of practically 100,000 tons of slab zinc.

This is confirmed by a recent report made by Mr. C. E. Siebenthal, of the United States Geological Survey, covering the first half of the year 1921, from which we quote as follows:

"Reports submitted by all zinc smelters which operated during the first six months of 1921 show that the production of zinc from domestic ore in that period was 100,781 short tons and from foreign ore 1,744 tons, a total of 102,525 tons, as compared with 205,269 tons in the last half of 1920 and 258,108 tons in the first half. The stock of zinc held at smelters and in warehouse June 30 was 94,747 tons, having increased from 71,037 tons at the end of 1920 and 29,892 tons at the middle of that year.

"The demoralization of the zinc industry during the half year with imports of 7,405 tons, exports of 2,255 tons, and apparent consumption of 83,865 tons, is strikingly shown by comparison with the two periods of 1919 and the first half of 1920, when imports were nothing, exports from 70,000 to 90,000 tons, and consumption from 160,000 to 175,000 tons.

"World zinc stocks have been recently stated as about 160,000 short tons exclusive of the stocks of sheet zinc, of which Belgium is reported to hold 45,000 tons."

Until political disturbances in Europe disorganized industry in one of the principal zinc-producing centers of the world, importations of slab zinc into this country were, according to Government figures, growing, reaching in April 6,300,000 pounds, with a total for the 10 months ending April of over 13,000,000 pounds.

In spite of any testimony to the contrary which may be presented to this committee, we who are in close touch with world conditions as they affect the businesses which we ourselves have reared have every reason to believe that as soon as order is restored in the affected district we shall again be confronted with price offerings which will further discourage our domestic zinc producers or with actual zinc importations on a large scale.

Excepting zinc oxide, the bill as reported to the House of Representatives provided a certain schedule of duties for two years only and a certain lower schedule thereafter. (See appended table of zinc tariff rates.) This lower schedule is in fact, the rates appearing in the tariff act of 1909. (It should be borne in mind that these 1909 tariff rates were originally fixed when our zinc plants were operating on a 10 or 12 hour instead of an 8-hour basis and paying freight charges one-half the present freight schedule.)

Just before the passage of the bill in the House the Ways and Means committee awakened to the fact that the zinc-mining industry of this country was threatened almost with extinction. They, therefore, voted to make the two-year rates on zinc ore only the rates for the life of the bill.

But in the stress of their work the members of the Ways and Means Committee overlooked the fact that after two years, if the rates on the products of zinc ore are not similarly advanced, these higher ore rates will be practically valueless to the zinc miners of this country.

In this connection the question naturally presents itself as to where, after two years of the higher ore rates, are the zinc miners of the United States to find a market for their ores? That market is wholly a domestic one. It must, therefore, be obvious to all that, unless the rates on the products of zinc are advanced in keeping with the rates on zinc ore which were at the last minute added upon the Ways and Means Committee as necessary to the salvation of our zinc miners, there will be no market for domestic zinc ore after two years.

Here, too, the principle elucidated in Mr. Tuthill's brief on zinc oxide applies, namely, the propriety of a higher duty on the manufactured products of ore than on the ore itself, this on the theory that the labor and capital involved in their processing are entitled to their share of protection.

Furthermore, the position of our manufacturers of the products of zinc, the buyers of our zinc ore, is as serious as that of the miners of zinc ore.

The schedule of rates submitted by our institute is based upon the indisputable fact that adequate tariff duties must be extended to all branches of the zinc industry if that industry is not to suffer as a whole. This is not only the view of the American Zinc Institute, representing the zinc industry of this country, but it is also, we are privileged to say, the view of the members of Congress who represent our zinc ore producing districts.

On August 16 the institute, through its secretary, presented to and filed with this committee a separate brief on zinc oxide, a strictly zinc product, now inappropriately appearing in the chemicals, paints, and oils schedule of the bill. We renew our request for the transferring of zinc oxide to the zinc section of the bill.

We also request that, whatever rate of duty this committee shall see fit to impose upon zinc-bearing ores, the products of such ore shall be favored with appropriate duties somewhat higher than the duty imposed on the ore from which slab zinc, rolled zinc, zinc oxide, and other zinc products are manufactured. This elemental principle was faithfully observed by the Ways and Means Committee in making the lead rates, but it was ignored by that committee in making the zinc rates, as is shown by the following table:

	Cents.		Cents.
Lead ore-----	1½	Zinc oxide-----	1½
Sp. lead-----	2½	Zinc chloride-----	1.3
White lead-----	2½	Zinc sulphate-----	¾
And other lead items in chemicals and metals sections.		Zinc sulphide-----	1½
Zinc ore-----	1½	Lithopone-----	1½
Slab zinc-----	1½	And other zinc items in chemicals and metals sections.	
For two years only-----	2		

Zinc oxide, therefore, should be treated on a parity with slab zinc in view of the similarity prevailing in the matter of process and, therefore, of cost to make. The schedule of rates requested in the general brief of the institute last January was agreed upon only after several conferences participated in by practically all of the leading men of the zinc industry. They are as follows:

	Cents.		Cents.
Rate up to:		Slab zinc-----	2½
10 per cent-----	Free.	Sheets-----	3½
10 to 20 per cent-----	1½	Sheets, coated-----	8½
20 to 25 per cent-----	1½	Old and wornout-----	2½
Over 25 per cent-----	2	Zinc oxide, dry (not containing more than 25 per cent lead)---	2½
Zinc dust-----	8½		

A recent canvass of these men showed that they still favor the adoption by Congress of the schedule of rates proposed by our institute in its first brief as rational aid to the restoration of their industry to its normal proportions.

It is their unanimous belief that, having had an opportunity to present their case to your committee, you gentlemen and the other Members of Congress will fully appreciate the exigencies of their industry and finally agree upon such

mely, Messrs. O. W. Sparks, Otto Ruhl, and Richard Jenkins. Mr. Wolff said that as many members of the institute as could make the trip should accompany him to Washington.

Mr. Ogg, at the request of the board, agreed to present at that hearing a comprehensive brief on the tariff question which he had prepared on behalf of the company. (See Mr. Ogg's brief.)

A conference in Washington on the morning of January 12 resulted in a prompt meeting of the minds of the tariff delegations of the institute and the Interstate district, and the institute brief was then ordered printed for use at the hearing and for general distribution. This conference was attended by Messrs. Brennemann (president Matthiessen & Hegeler Zinc Co.), Gaines (general manager Premier Mining Co.), Grasselli (treasurer the Grasselli Chemical Co.), Hegeler (president the Hegeler Zinc Co.), Jenkins (secretary-treasurer Interstate section, American Zinc Institute), Ogg (president American Zinc, Lead & Smelting Co.), Palmer (president the New Jersey Zinc Co.), Ruhl, Sparks, George C. Stone, Henry S. Wardner, Wolff (secretary and general manager Illinois Zinc Co.), and Young (manager of mines, American Zinc, Lead & Smelting Co.).

The gentlemen attending the conference then adjourned to the Capitol, where the conditions of the zinc industry were explained to Congressmen Campbell (Kansas) and Cannon (Illinois) and to Senator Curtis (Kansas) and others.

That afternoon Messrs. Wolff and Ogg drew a proposed substitute for the amendment of Senator Spencer (Missouri) to the House emergency zinc tariff bill, incorporating in the proposed substitute amendment the rates set forth in the brief of the institute. This proposed amendment was thereupon substituted by Senator Spencer for his amendment to the House emergency zinc tariff bill.

On the morning of the 13th the president of the institute, accompanied by the gentlemen who had come to Washington with him, appeared before the House Ways and Means Committee.

Congressman Campbell in a short but strong address opened the hearing on behalf of the zinc industry. He was followed by Messrs. Sparks, Ruhl, Wolff, and Ogg. Each of these gentlemen presented as fully as time permitted the claims of the zinc industry for an adequate tariff on zinc ore and the products of zinc.

Through the courtesy of Senator Spencer a hearing was also had before the Senate Finance Committee, Mr. Ogg presenting the claims of the zinc industry to that committee.

It is the bounden duty of every American directly or indirectly interested in the production of zinc ore and the products of zinc widely to circulate the tariff brief of the institute and also to impress without ceasing upon his Representatives in Congress the fact that in order for the United States zinc industry to live and to serve the Nation this "key industry" must adequately produce, that in order to continue adequate production it must sell, and that in order that it may sell this domestic production the Congress of the United States must by safeguarding legislation forthwith put an end to foreign competition, which is closing plants and throwing out of employment thousands of skilled American workers and imperiling capital investments aggregating hundreds of millions of dollars.

Unless adequately protected, how can this "key industry" exist in the face of frequent foreign bona fide offerings like the following, recently made by a responsible Paris house to an equally responsible New York house:

"A firm offer of 890 tons of high-grade slab zinc at the equivalent of 5.77 cents per pound, New York, duty paid; also 1,000 tons of ordinary slab zinc at the equivalent of 5.36 cents per pound, New York, duty paid."

These prices, in each instance below the cost of production in the United States, demonstrate the absolute necessity of immediate action by Congress on the subject of adequate protection to one of the Nation's "key industries."

Although the tariff brief submitted to the Committee on Ways and Means of the House of Representatives and also filed with the Senate Finance Committee by the institute at the zinc tariff hearings on January 13, 1921, was printed in full in the records of the hearings, and although a copy of this brief was subsequently mailed to each of the members of the institute and to each of the members of the said congressional committees, it is, with the names of the active members of the institute omitted, reprinted below in the hope that through its still wider distribution we shall be able to impress more deeply upon our national legislators the critical position of the zinc industry in the

face of a foreign competition that can only be met by the enactment of a law embracing the schedules suggested by the institute.

For the same reason the briefs of Mr. William A. Ogg, president of the American Zinc, Lead & Smelting Co., and Mr. Otto Ruhl, of Joplin, are likewise presented.

BRIEF OF THE AMERICAN ZINC INSTITUTE (INC.).¹

NEW YORK, January 11, 1921.

COMMITTEE ON WAYS AND MEANS,

House of Representatives, Washington, D. C.

GENTLEMEN: The American Zinc Institute, composed of substantially those engaged in the mining, smelting, and manufacture of zinc and its products (representing more than 95 per cent of the industry), in accordance with instructions of the board of directors submits the following brief:

This institute is vitally interested in paragraphs 162 and 163 of schedule B and in paragraph 61 of Schedule A, as shown in "Summary of Tariff Legislation, 1920."

Present paragraph 162: Zinc bearing ores of all kinds, 10 per cent ad valorem.

Present paragraph 163. Zinc in blocks, pigs, or sheets, and zinc dust; and worn out zinc fit only to be remanufactured, 15 per cent ad valorem.

We recommend these be changed to:

Paragraph 162: Zinc-bearing ores, containing less than 10 per cent metallic zinc, free.

On all zinc-bearing ores containing more than 10 per cent and less than 25 per cent metallic zinc, 1½ cents per pound on metallic zinc contained therein.

On all zinc-bearing ores and zinc drosses containing more than 25 per cent metallic zinc, 2 cents per pound on metallic zinc contained therein.

Paragraph 163: On zinc in blocks, pigs or slabs, and on old and worn zinc fit only to be remanufactured, 2½ cents per pound.

Zinc, oxide of, and white pigment containing zinc, but not containing lead, dry, 2½ cents per pound.

(Previously classified under Schedule A, but now appropriately classified under Schedule C, as being entirely a zinc product.)

On zinc in sheets, plates, strips, coils or plated with nickel or other metal; and any of these rolled zinc products in fabricated form, and zinc dust, 3½ cents per pound.

The reasons for these recommendations follow:

The zinc industry of America at present is in the worst period of depression it has ever experienced. A continuation of present conditions for any length of time will bring disaster, in many cases irreparable, to the industry. This is due mainly to the conditions in Europe, where slab zinc is now being produced at a much lower cost than here, and this is exaggerated by the present rate of exchange. The stocks of slab zinc and sheet zinc now on hand here are 70,000 tons, and it is believed there are 100,000 tons on hand in Europe, equal to nearly six months' normal consumption of this country before the war. The European smelters have now largely recovered from the effects of the war, and ore, slab zinc and other zinc products are being imported into the United States.

In consequence, a large proportion of the zinc mines and smelting works in this country are shut down and those that are operating are doing so at a heavy loss, with greatly reduced output, merely to hold together the numbers of their organizations.

Zinc is the third most important base metal of the world and during the war it proved to be essential for the production of cartridge metal. If it had not been for the response of the zinc industry in the United States to the war, made upon it the Allies could not have continued to wage war successfully.

Over the past five years a greatly increased production of zinc ore has been developed and many new smelting works have been established throughout the country. There are 47 smelting works established in nine States, distributed from New Jersey to Colorado and from Wisconsin to Texas. Between 1914 and 1916 the zinc smelting capacity of the country was doubled, and in addition a large electrolytic zinc plant was established in Montana. During the same period the Missouri-Oklahoma-Kansas field was also developed, and has proved to be the richest and largest zinc ore district the world has.

¹ This report was mailed to the members as advance bulletin copy under date of February 1, 1921.

own. The number of workers normally employed in all branches of the industry is estimated to be over 50,000, mostly skilled workmen. With its raw material assured, the zinc industry needs only adequate protection to assure continuous employment to its workers and a reasonable return on the capital invested.

Zinc during the late war was recognized by all governments as a key industry, and some of these governments have already formulated plans to protect its position in regard to zinc for the future. We feel that proper recognition of its importance should be accorded by our own Government.

To-day the American cost of production is higher than the market price of metal. The wages paid are fully as high as those paid in other comparable industries and from three to six times what is paid for the same kind of work in the principal zinc producing countries of Europe.

While the sale of slab zinc by European producers for export to the United States may not be classed as "dumping" in the legal sense of its being sold at a lower price than it brings in their own countries, nevertheless, it is dumped in the sense that they have not sufficient market to absorb their own production and must realize upon their slab zinc by selling it for export to the United States.

We are informed and believe that Germany is in a position to produce slab zinc from her own ores at a cost not much, if any, over 2 cents per pound; Belgium, with a somewhat higher wage scale, and obliged to purchase all of her ores, has a higher cost than Germany, although still below that in the United States. Tasmania, treating either Broken Hill or Tasmanian ores, in two years will be producing 100 gross tons daily at a cost of approximately 3 cents per pound, f. o. b. New York, duty unpaid, with exchange at \$3½, and 4 cents with exchange at par.

It is believed that no important quantity of slab zinc can be produced in the United States under present conditions for less than 6.50 cents per pound, f. o. b. New York, not including depletion and depreciation; and to cover these, by the selling expense and allow a reasonable profit would require an addition of 1½ to 2½ cents per pound to this figure.

It is rather difficult to say from what country slab zinc imported to the United States is coming, as although generally bought in London it may not originate in England. Slab zinc sold in London toward the latter part of December, 1920, at £22 10s per long ton, with exchange at around \$3.50. This gives a cost, f. o. b. New York, with 45 cents freight and 15 per cent ad valorem duty paid, of 4½ cents per pound. With slab zinc selling at 8 cents per pound New York, which would cover only a moderate profit to the miners and smelters, a duty of about 2½ cents per pound would be required to protect the industry against foreign slab zinc, which can be produced at much lower cost.

In establishing a schedule of duties on zinc products it should be remembered that the basis of all these products is zinc ore. Therefore, if it be the policy of Congress to place a duty on zinc ore, that fact must be recognized when it comes to imposing duties on the products of the ore. If there is to be a certain duty on the zinc ore, there should be a proportionately higher duty on all the manufactures of the ore; otherwise, the ore itself is not protected.

We ask that the duty be changed from ad valorem to specific, believing the latter to be fairer and better for both the Government and the zinc producers. It is simpler and more easy to calculate and collect and with less chance of error. With an ad valorem duty the receipts are least in times of depression and low prices, when the Government most needs income and the producers most need protection.

Respectfully submitted.

AMERICAN ZINC INSTITUTE (INC.),
By E. H. WOLFF, *President*.

BRIEF OF WILLIAM A. OGG, PRESIDENT OF THE AMERICAN ZINC, LEAD & SMELTING Co., BOSTON, MASS.

JANUARY 11, 1921.

COMMITTEE ON WAYS AND MEANS,

House of Representatives, Washington, D. C.

GENTLEMEN: Consideration of this subject can best be crystallized by a few questions, the answers to which should, to a considerable measure, be the basis for deciding what tariff on slab zinc is required, viz:

1. Have conditions bearing on the tariff problem of this country, as applied to slab zinc (spelter) changed since the Underwood bill was enacted in October, 1913?

2. Are these changes, if any, permanent or temporary?
 3. If a modification of the tariff is advisable, on what premises should the tariff be based?
 4. What should the amount of that tariff be on slab zinc imported in country, and should the present method of computing the duty by an ad valorem basis be retained, or should it be changed to a specific basis, as in the Aldrich bill?
1. The answer to question 1 requires a careful consideration of the production situation of the entire world, and for the purposes of this tariff we should confine our answers to those factors which now exist or which will become effective within the next five or six years.

DOMESTIC CHANGES.

(a) *Freight rates increased.*—The United States is a big country and from points of production to points of consumption play an important part in the total cost of zinc to the consumer. Since 1913 freight rates have, generally speaking, more than doubled on both zinc ore and slab zinc. To give an illustration, the freight on slab zinc from the usual price-basing point, St. Louis, to New York, where it comes into competition with imported spelter, has increased from 0.15½ cent per pound to 0.49 cent per pound, plus 3 per cent war tax, a total of 0.50½ cent per pound, being an increase of 0.35 cent per pound, or 225 per cent. Freight on zinc ore from the Joplin field (one of the principal shipping points in the United States) to St. Louis in 1913 was \$2.30 per ton; to-day it is \$4.20, and with 3 per cent war tax, \$4.33; an increase of 88 per cent.

Estimating 1,000 pounds of slab zinc recovered from 1 ton of ordinary Oklahoma zinc ore, it is seen, as a fair example of what increased freight rates mean in added costs, that the increase in freights on ore and slab zinc to New York have added 0.55 cent per pound to the cost of slab zinc delivered at that point. Western zinc-ore producers are even more seriously affected by the freight increases.

So far as one can see at present, these freight rates are permanent for the period under consideration.

(b) *Missouri-Oklahoma-Kansas field developed.*—Since the Underwood Act was passed a large and entirely new ore-producing district, known as the State or Missouri-Oklahoma-Kansas district, has come into prominence. This is the most important ore-producing district in the country, employs more labor (all American) than any other zinc section, and with reasonable production gives promise of retaining this position for many years to come.

(c) *Slab-zinc producing capacity increased.*—In addition to a large extension of the capacity of the natural gas field zinc smelters, there has been an extensive investment in permanent coal-fired zinc smelters of a very expensive character. The following new plants having been completed since 1913, viz:

Name of plant.	Owned by—
Langeloth.....	American Metal Co.....
Terre Haute.....	Grasselli Chemical Co.....
Moundville.....	United Zinc Smelting Corporation.....
Donora.....	United States Steel Corporation.....
East St. Louis.....	American Zinc, Lead & Smelting Co.....
Total.....

The approximate annual productive capacity of the above plants at 1½ per retort is 126,000 tons of slab zinc, and they represent new investment including the associated acid plants, of perhaps \$15,000,000.

Also a very large electrolytic zinc plant, with an annual slab zinc capacity of 50,000 to 60,000 tons, has been constructed by the Anaconda Copper Mining Co. at large expense, and other smaller electrolytic plants have been constructed throughout the country. These large investments entitle the industry to a tariff sufficient to give them and their workmen proper protection.

(d) *Western supplies of zinc ore increased.*—Since 1913 large investments have been made to open up and develop mining properties throughout the far West have been made, and these mining properties and their workers are entitled to proper consideration.

(e) *Costs of mining and smelting increased.*—Since 1913 costs of producing zinc ore have increased from 50 to nearly 100 per cent, and those of smelting

c ore at American smelters have more than doubled. Present costs are somewhat higher than they probably will be within the reasonably near future, but one can not expect a return to prewar costs either in mining or smelting. In zinc smelting, as a relatively large share of the cost consists of hand labor and coal, one can not expect the same degree of return toward prewar conditions as in the smelting of the other base metals.

FOREIGN CHANGES.

(a) *Effect of metallurgical improvements.*—Since 1913 there has been a great advance in the metallurgy of zinc, both as regards improved mill recovery of zinc from crude complex ores for subsequent treatment to produce slab zinc, and also in the development of the electrolytic process of producing slab zinc (which is usually applicable to the ores at or near the point of their production, thus materially reducing the freight factor), and this method has already been introduced on a large scale basis in Tasmania and is to be used there on a very much larger scale in the near future.

The cost of producing slab zinc by this electrolytic method depends to a large extent upon the cost of the electric power consumed, and as the electricity used in electrolytic zinc production has thus far invariably been developed from water power, the costs of producing zinc by this method have not gone up comparably with those of the fire smelters.

By these metallurgical improvements the situation relative to some very large deposits of zinc ore in different parts of the world has been changed so that whereas in 1913 they were not factors seriously to be reckoned with, now it is possible for slab zinc to be produced from such sources at a cost considerably below what can be done in this country on any large known body of ore devoted to such production.

(b) *Additions to zinc-producing capacity in Europe.*—As in this country, the pressure of war forced an increase in the zinc-smelting capacity of Great Britain by extensions to various smelters already in existence, and by the construction of one very large plant, which is almost completed. With the increased slab-zinc producing capacity of Great Britain, and of the British Empire elsewhere, it would appear that the British, heretofore the principal importers of slab zinc, are likely in the future to be more nearly able to produce their own requirements, and will not have to rely upon the production of the continental zinc smelters, thus making it necessary, if the latter operate, to find new outlets for their production.

(c) *Mexican possibilities.*—The ability of Mexico to produce zinc ores on a large scale has never really been put to the test, but well-informed mining men know that large supplies of zinc ore are available in Mexico, when matters are quiet there, for export either to this country or to Europe.

With the Broken Hill Australian output under contract to them, the principal European smelters never felt the necessity of using Mexican zinc ores to any large extent, but as these Australian ores are not now likely to be available again to Germany and Belgium on the same scale as hitherto, it is probable that these countries will find the ores they need to take the place of the Australian ores, in these Mexican ores; so it should not be reckoned that taking away the Australian ores will shut down the continental fire smelters for any considerable time. In addition there is likely, on account of the increased freight rates on zinc ores from Mexico to the United States, to be substantial development in Mexico of fire smelting based on oil as fuel. One zinc smelter using oil for fuel has already been established at Saltillo, and under stable conditions in Mexico it very likely will be extended. Before 1913 Mexico was not rich in cheap fuel, but since 1913 the fuel-oil resources of Mexico have been exploited on a large scale, and it is now reported that oil has been discovered in the immediate zinc-producing area of that country.

With protection of investments in Mexico assured; with its cheap labor; its cheap zinc ores; and its now enormous quantity of cheap fuel, Mexico becomes a potential producer of slab zinc comparable at least to, and possibly greater than, Australia and Burma.

(d) *Effect of the termination of the Cartel agreement.*—Prior to the war there existed an agreement amongst the European slab zinc producers to maintain production only on a basis which would insure at all times a reasonable return on the capital invested. This agreement, now terminated, had the effect of maintaining prices in London, the price-basing point, at probably a higher level than otherwise would have been the case. Unless some such new agreement is effected (and one can not see any signs of this at the present time nor would one expect it under the changed conditions) the London market, on

the average, is likely to rule at a lower level than it did under the C. I. arrangement.

(e) *Foreign exchange.*—In one of the preceding paragraphs brief mention was made of foreign exchange. Never before has it been necessary to bring the question of exchange into consideration in framing a tariff, but conditions have been so completely upset by the war that one can not afford to overlook the state of affairs existing in regard to foreign exchanges. Where the pound sterling worth not much over 70 per cent of its normal par; the franc at not much over 30 per cent of par; and the mark at not much over 5 per cent of par. If the foreign exchanges of these countries are to remain permanently at a discount, recognition of this must be taken into account in framing a tariff.

2. Answering question 2, we do not see any reason for doubting that the changes above mentioned will be permanent, except that the costs of mining and smelting zinc ore may be reduced somewhat. In view of the national budgets which are a necessity for many years to come, it is impossible to expect a permanent return to a general prewar cost basis during the period under consideration.

Possibly some arrangements may be made to rectify the foreign exchange situation.

3. The policy of the Republican Party in regard to tariff has always been to provide such tariffs as will protect industries of the United States, but not to their wage earners and investors.

This country can produce all the slab zinc from its own ores that the country needs, but to do so requires adequate protection, as shown herein.

4. The amount of tariff required should, of course, be based on the difference in production cost as between the United States and foreign countries and under normal circumstances a reasonably accurate statement of the costs of America's principal competitors could be prepared for the use of the committee, but authoritative statistics of the costs in some of the chief competitor countries are not readily obtainable under present conditions.

In Europe before the war the two principal slab-zinc producing countries were Germany and Belgium, Germany being the larger. Before the war, and since, both the United States and Germany produced practically their entire output of slab zinc from their own raw materials and with their own labor. German wage rates before the war in a general way were approximately one-half the wage rates of American labor. The cost of slab zinc produced in Germany before the war was approximately 80 per cent of that in America. The relative wage rate in Germany expressed in dollars and cents at current rates of exchange, is now about one-fifth of the American rate. This works a relative cost in Germany to-day of about one-third of that in America. Based on an American cost of 6.6 cents, the difference between this and the German estimated cost of 2.2 cents would be 4.4 cents per pound. This extreme difference is not likely to be permanent.

Belgium, the next largest producer in prewar times, having no zinc ores, is under the necessity of purchasing them from countries with exchange rates probably against her so that her situation from the standpoint of cost is not so favorable as that of Germany.

Within the past two weeks slab zinc originating somewhere in Europe was selling in London, and was probably bought for import into this country at a price at least 2 cents per pound f. o. b. New York, plus 15 per cent duty is below the estimated bare operating cost of producing slab zinc from Oklahoma ores plus the freight to New York.

On the cost of producing slab zinc in other parts of the world than Europe we have an authoritative estimate by the company operating the electrolytic zinc plant in Tasmania, of what it expects to do, commencing January 1, 1923. In a circular recently put out by this company, which has powerful financial backing, a skilled and experienced organization, and has been operating an electrolytic zinc plant in Tasmania for two years, it is stated that with zinc selling in London for £30 the net profits of the company, after making necessary provisions for depreciation and amortization, will be at the rate of £413,000 per annum from the beginning of 1923. Based on an output of 10,000 tons per day, the capacity this plant is expected to reach in two years it would mean a cost, including all depreciation and amortization, of 2.92 cents per pound (American basis) for slab zinc f. o. b. London when the exchange is \$3.50 or 4.06 cents when the exchange is \$4.86. As the ocean freight from Tasmania to New York will not differ materially from the ocean freight from London, the above costs would represent about what the slab zinc could be sold down for in New York, duty unpaid.

to get some idea of how this cost compares with United States costs, based on Oklahoma ores and fire smelting, we have made the following tabulation which it should be distinctly observed does not include depletion, depreciation, interest in the costs of either mining or smelting.

	Present.	Prob- able.	Mini- mum.
Port ton of 60 per cent Oklahoma zinc ore, f. o. b. mines price.....	\$30.00	\$30.00	\$30.00
Weight and hauling thereon to St. Louis territory, including moisture..	6.00	6.00	6.00
Smelting.....	25.00	20.00	15.00
Total.....	61.00	56.00	51.00
Cost per pound of spelter.....	.061	.056	.051
Weight to New York.....	.005	.005	.005
Cost f. o. b. New York.....	.066	.061	.056

In regard to 60 per cent Oklahoma ore, we have used \$30, which is about the current price level, but admittedly very few mines can pay even operating expenses on this basis and many of them have had to shut down. Information on the question of the cost per ton of 60 per cent zinc ore undoubtedly will be forthcoming from the Oklahoma producers so that substitution of the proper amount for the figure used here can be made, and the cost of slab zinc adjusted accordingly.

To cover depletion, depreciation, selling expenses and allow a fair return on mining and smelting investments would require an addition to the cost of slab zinc in this country of 2 to 2½ cents per pound depending upon conditions.

As regards whether the tariff should be on an ad valorem or specific basis, we prefer the specific basis because we have already seen that the question of exchange, over which we can exercise very little control, may have the effect of reducing the duty when perhaps protection is most needed.

Comparing American costs on Oklahoma ore with the Tasmanian costs, which include depletion and amortization, it is seen that a tariff of at least 3 cents per pound is necessary for the preservation of the American slab-zinc industry on a reasonably prosperous basis.

BRIEF OF OTTO RUHL, MINING ENGINEER, JOPLIN, MO.

HOUSE WAYS AND MEANS COMMITTEE,
Washington, D. C.

GENTLEMEN: My name is Otto Ruhl, a mining engineer, 304 Miners' Bank Building, Joplin, Mo. My temporary address is the Willard Hotel, Washington, D. C. I represent the Joplin and Webb City Chambers of Commerce and the Southwest Missouri Zinc Mine Operators' Association in the zinc mining district, popularly known as the Joplin Missouri-Oklahoma-Kansas zinc mining district, a district which supplies approximately 40 per cent of the zinc ore production of the United States. This production has dependent upon it, directly and indirectly, in the immediate vicinity of the mining district, a population of approximately 150,000 to 200,000 people. Like all other industries, it has been greatly depressed, and its depression began a year earlier than that of other industries following the war.

The subject to which we wish to address our remarks is the schedule relating to zinc ores specifically. The zinc ore producers of the United States on several occasions have had the privilege of appearing before this committee and submitting evidence on the condition of their industry, their cost production, and pointing out the tariff rates which they consider just and necessary for maintenance of the zinc mining industry in the face of foreign competition. The evidence filed in previous briefs, and most notably that filed in June of 1919, when an emergency tariff was desired by the zinc ore producers, is applicable to-day. The summary on zinc ores supplied this committee by the United States Tariff Commission under the title "Information Concerning Zinc Ore," we consider a good general presentation of the facts. It is not our intention, therefore, to burden this committee with data or consume its time needlessly. We wish only to call attention to the main facts which have forced our industry to appeal for tariff protection ever since 1908.

The essential factor in the whole question is the difference in the cost of production in the United States and Mexico, our chief foreign competitor in

the production of zinc ores. This committee, regardless of all other things, must have reliable detailed data on cost at home and abroad to enable it to frame a just and intelligent schedule of duties. That data our committee has undertaken to supply from the books of our industry's operators and present here in detail for your later consideration. We found it impossible to copy the costs from all of the 212 concerns having properties in our district, largely on account of the different methods of keeping costs. We have, therefore, presented the costs of 11 representative plants, handling 1,305,000 tons of ore in 1919 and making approximately 97,000 tons of zinc concentrates. The actual cost of each ton of concentrates was \$47.78. Those producers represented were having ore recoveries ranking from 4.73 per cent to 12.7 per cent.

During 1920 there was very slight lowering of costs until the later months of the year. On the present level of supply costs a schedule of which we are submitting in addenda to this brief, there was a further reduction in costs of 10 cents per ton of zinc ore concentrates. We note on page 38 of the Tariff Commission report, to which allusion has already been made, that F. B. Hyder, of the Bureau of Mines, is quoted as giving an operating cost for the production of zinc ores in the Joplin district of \$28 to \$30 per ton with an addition of 10 cents for depletion and depreciation and an average royalty charge of 17 per cent. These figures are given as of May, 1919, after a thorough investigation of conditions in the field. As the royalty on a \$45 market would be \$7.65 per ton, this would give a total cost of \$47.65 to \$49.65, which is in close agreement with the actual cost of 11 mines, whose data we are submitting. In addition to that we have a cost of at least \$2 to cover buying and handling charges and an average freight rate of approximately \$4 per ton to the smelters' bins, which should be added to any basic cost figure for delivering the ore ready for smelting. The basic figure, therefore, would be at the very minimum not less than \$45 per ton and running up to better than \$50 per ton.

For the purposes of comparison, however, we will assume a basic charge of \$45 per ton for the production of Joplin zinc ore concentrates.

COMPARISON WITH IMPORTS.

An attached table showing the imports by calendar years, taken from the reports of the Bureau of Commerce, supplies the data for a comparison. Taking the last two years' imports and their basic values, so as to have a fair comparison with the same conditions in our own industry, we find an average declared value of all zinc ore laid down in the smelters' bins of \$12 per ton of 34 per cent zinc ore concentrates. These concentrates carry 680 tons of metal. The standard grade of Joplin zinc ore concentrates carry 60 per cent zinc, or 1,200 pounds of metal to the ton, and, according to our basic costs, could be produced for \$45 at the smelters' bins. To get the same amount of metal from the imported ore one would require 1½ tons of imported ore and at the average cost of \$12 per ton the value would be \$21. In other words, for \$21 the importer during the past two years could obtain 1½ tons of zinc ore containing 1,200 pounds of metallic zinc, while it costs the Joplin mine operator \$45 to produce ore containing 1,200 pounds of metallic zinc. The difference in the cost of producing this 1,200 pounds of metal is, therefore, \$24, or approximately 2 cents per pound.

It is the difference, therefore, that we are asking you gentlemen to adopt in the schedule of duties for zinc ore as the basic rate. We realize, however, that there are various grades of ore being imported, and in order to provide a differential to cover the variation in values of these grades we would suggest a graduated scale permitting ores under 10 per cent to enter free, which would cover those lead-silver ores or other mixed ores containing that percentage of zinc as a by-product and which could not be recovered in smelting; on ores containing zinc from 10 to 25 per cent a duty of 1½ cents per pound; and on those above 25 per cent a duty of 2 cents per pound.

We would respectfully ask, therefore, that in lieu of the present Schedule paragraphs Nos. 162 and 163, we suggest the following:

Paragraph 162. Zinc-bearing ores containing less than 10 per cent metallic zinc, free.

On all zinc-bearing ores containing more than 10 per cent and less than 25 per cent metallic zinc, 1½ cents per pound on metallic zinc contained therein.

On all zinc-bearing ores and zinc drosses containing more than 25 per cent metallic zinc, 2 cents per pound on metallic zinc contained therein.

Paragraph 163. On zinc in blocks, pig, or slabs, and on old and worn-out zinc fit only to be remanufactured, 2½ cents per pound.

inc, oxide of, and white pigment containing zinc, but not containing lead, 2½ cents per pound.

Previously classified under Schedule A, but now appropriately classified under Schedule C as being entirely a zinc product.)

n zinc in sheets, plates, strips, coils, or plated with nickel or other metals, any of these rolled zinc products in fabricated form, and zinc dust, 3½ cents per pound.

n addition we realize that the ores that are produced in the United States must be smelted by American smelters, and that to provide a market for this ore after it is produced the smelter and manufacturer of zinc-ore products must have a compensatory duty, and that the schedule prepared by the American Zinc Institute and submitted to this committee is just and earnestly desired by the ore producers to be included as a protective measure for zinc industry.

Cost of mine supplies, by years.

STATEMENT OF OTTO RUHL, JOPLIN, MO., REPRESENTING ZINC ORE PRODUCERS OF MISSOURI, KANSAS, AND OKLAHOMA.

Mr. RUHL. At various times during the past several years ore producers have come before this committee and the Ways and Means committee of the House asking protection on zinc ores. As part of the files of this committee and as part of the files of the Ways and Means Committee, we have filed, of course, a great deal of evidence, which will be at your command.

We wish only to supplement that evidence in a few instances where we know it has been changed or has been altered more recently.

The thing which should be brought out in addition to those matters brought out in the briefs which will be filed is perhaps the fact that during the war so large a tonnage of zinc ores came in from Mexico, our chief competitor. That was alarming to us, especially in view of the disorganized condition of Mexico. That huge tonnage of ores which came in at that time was carried over and created a surplus stock of ore and metal, even to the present time, a danger which has become extremely manifest during the past year and a half to two years.

Even before the war was ended we had begun to slide down the ladder of prices and our labor had begun to suffer, until to-day our plants are idle up to about 65 or 70 per cent; and from 12,000 miners operating we are now down to about 2,000 or 2,500. Those features should, perhaps, be called particularly to your attention. Those are the things that we have been calling attention to and in regard to which we desired, during the past session of Congress, emergency legislation, but which we did not get.

Senator DILLINGHAM. To what do you attribute this condition? To what causes do you think this depression in your business is due?

Mr. RUHL. Of course we are suffering, as everybody else is suffering, from the business depression of the whole country.

Senator DILLINGHAM. Is it a buyers' strike?

Mr. RUHL. Perhaps to a certain extent, but what I really meant was that the thing that we have had to fear and have really suffered from is the tremendous accumulation of zinc ore that came in during the war period, which cut off our own production and resulted in the extremely depressed condition we find at the present time. That importation comes about through the fact that the production cost is exceedingly low in Mexico.

Take as an example the years 1919 and 1920 as indicative of what the import value was on the border. It averages approximately \$12 laid down at the border ports along the Rio Grande. That ore approximates 35 per cent metallic content, or 700 pounds of metal to the ton. Comparing that with our own ore, which carries approximately 60 per cent, we would require 1.7 tons of this Mexican ore to get the equivalent of our ton in metal content. That would result in a value of \$20.40. The freight on that same ore from the Mexican border to the Oklahoma smelters, which would be the logical point for smelting, would be \$11.72, the rate being \$6.90, which makes a total cost of \$32.13. Comparing that with our own cost for 1919 for something like 11 groups of properties, producing perhaps something like

92,000 tons of concentrates, gives us an average cost of \$47.50. These figures will be put in our brief to show the cost in detail.

We also desire to call your attention to the facts shown in the report to the Tariff Commission by F. B. Hyder, in which report his figures substantially agree with ours. They are a trifle higher—\$47.50 to \$50 his figures were. Allowing for a profit of 15 per cent and a freight rate of \$2.55 to the smelter, there would be a total cost of the Joplin ore of \$57.17, or a difference between the two products on exactly the same metallic content of \$25, or approximately 2 cents per pound. That is, of course, an essential point to which we wish to direct your attention in our brief.

Senator McLEAN. The importations of zinc diminished very much in 1921 as compared with the imports of 1920?

Mr. RUHL. Yes. The imports have decreased the same as our production has decreased. You will notice that during the last six months of this year, or up to, say, June 1, that instead of coming in in the form of ore zinc has been coming in in the form of metal.

Senator McLEAN. You mean as pig?

Mr. RUHL. Yes. It has just started.

Senator SMOOT. There was \$564,000 worth of blocks or pigs imported during the year 1921; that is, the calendar year.

Mr. RUHL. That must be the first six months' figures.

Senator SMOOT. But the ore fell down nearly \$700,000.

Mr. RUHL. Yes. The ore naturally would decrease as prices decrease. We are offered at present only 50 per cent of what it cost to produce in 1919 and 1920. On that particular point I will file my brief with Mr. Wolff's brief as part of the agreed schedule.

STATEMENT OF F. C. WALLOWER, VICE PRESIDENT AND GENERAL MANAGER OF GOLDEN ROD M. & S. CORPORATION, JOPLIN, MO.

Senator SMOOT. Give your name for the record.

Mr. WALLOWER. F. C. Wallower, of Joplin, Mo.

I would like to speak briefly in regard to our local situation, supplementing, to some extent, the remarks which Mr. Ruhl has just made.

I have been operating in the Joplin district for the past 15 years—the first operations being in the Webb City field, which is approximately 8 miles from Joplin. At one time there were 87 mills in operation.

During the period from 1906 to 1920 Mexican ores have come into this country and have so affected our mining business that to-day the Webb City field is extinct, the 87 mills having been moved, many now being located in the Oklahoma fields.

Several years ago there were as many as 200 mills operating in the Oklahoma fields, due to the unusual demands of the war. To-day there are approximately 25 mills in operation.

At one time we employed 12,000 men; to-day we are employing approximately 2,000. Last winter we had the problem of unemployment on our hands, so were forced to develop a means by which actual want was avoided. By subscriptions of the men at work, totaling approximately \$3,000; subscriptions from the operating companies of so much per ton, approximately \$3,000; and \$1,500 from supply houses, we were able to put the unemployed to work on the roads.

.50 and \$2 a day and paid them in tickets which they were able to cash at the supply house.

Senator Smoor. I think we know the conditions as they exist to-day, without going into detail, as affecting the employment of men in the United States.

Mr. Wallower. It is the situation in our district that I am anxious to present to you.

The rate which we ask for is 2 cents a pound; that Mr. Ruhl has suggested. This will place us on a parity with the Mexican ore which is produced at a lower cost than ours, and avoid, for the future, the distressing conditions which exist at present.

Senator Smoor. Did you say that you want to file a brief?

Mr. Wallower. With these few remarks in addition to the briefs already submitted, I will leave the matter in your hands.

STATEMENT OF CHARLES T. ORR, GENERAL MANAGER ATHLETIC MINING & SMELTING CO., WEBB CITY, MO.

Mr. Orr. I wish to make a few remarks supplementing what has already been said.

First, we wish to stand for what our original brief asked for; secondly, we would like to have that made permanent instead of for a two-year period. Those are the two points that I wish particularly to emphasize. The necessity for this will be shown in our brief.

I am more particularly interested in the smelting end of the business, although I am also interested in the mining; our mines are now closed down.

I want to say further that one reason why the big mines are still running is that we find the zinc mined with lead, the lead being mined and the zinc produced with it. The zinc mines alone are almost out of business. I have been mining for 22 years, and I can tell you that the prices to-day are less than they were 22 years ago. Our labor prices are about twice as high. That is, briefly, our situation. We would simply like to have you give it your consideration.

Senator Dillingham. How much do you ask in your brief?

Mr. Orr. Two cents on the ore. We ask that and we also ask that it be made permanent. Those are the two things we wish to emphasize.

STATEMENT OF HON. HENRY L. MYERS, UNITED STATES SENATOR FROM MONTANA.

Senator Myers. Mr. Chairman, I shall be very brief.

The Chairman. Take your time, Senator.

Senator Myers. I appear in behalf of the zinc producers of Montana. I have a letter from one of the leading zinc producers of Montana, stating that at the time he wrote the letter the House had fixed a duty of 2 cents per pound on zinc. Did the House leave it at that rate?

Senator Smoot. It left it at that rate for two years.

Senator Myers. He claims that in view of foreign competition and cheap foreign labor they can not possibly produce zinc in the West for less than 2½ cents a pound. He wrote a very urgent letter. I suppose others will appear in connection with this matter, but I hope

that a duty of at least 2½ cents a pound will be put on, because mines in the West are in a very bad condition. Practically all mines in Montana are closed down. I just wanted to bring the matter to the attention of the committee.

Senator SMOOT. I will say to the Senator from Montana that zinc interests have been here and testified, and they wanted 2 cents per pound.

Senator MYERS. Wanted it left at 2 cents per pound?

Senator SMOOT. Yes, sir.

Senator MYERS. I will say no more about that, then. I will simply add that the producers in Montana of manganese, chrome and graphite all claim that they ought to have a fair duty on three of those articles, and I promised to convey that information to this committee.

STEEL WINDOW SASH.

[Paragraph 393.]

STATEMENT OF AARON C. THAYER, REPRESENTING HENRY HOPE & SONS, NEW YORK, N. Y.

Mr. THAYER. My name is Aaron C. Thayer, lawyer, and secretary and treasurer of Henry Hope & Sons, a New York corporation.

If the committee please, I represent Henry Hope & Sons (Ltd.), an English corporation, and its subsidiary and selling agent, Henry Hope & Sons, a New York corporation. The question is on metal sash and window frames, which bear an ad valorem duty of 10 per cent under present section 104. We ask that the duty be retained at the present amount.

Under the new act as passed by the House the words "sash and frames" are stricken out of section 312, which, as we understand, throws us into section 393 and makes us subject to an ad valorem duty of 35 per cent, three and a half times what we have been under for the last eight years.

Our reasons for thinking that the present duty is ample are, briefly, these:

We have been under this duty of 10 per cent since 1913. Our business has remained substantially the same. Our competitive business has prospered and increased.

Secondly, of our competitors only two appeared asking for an increase of duty, and those are both offshoots of our competitor in England.

Furthermore, at the hearing before the Ways and Means Committee, at pages 759 to 766 of the record, in which briefs were submitted, we showed that, taking their own figures for their wages and material cost as compared with the figures which we submitted in our supplemental brief, 10 per cent more than compensated for the difference in cost of labor and material, even taking exchange at \$3.76. Of course, if you took it at \$4.80 our labor cost and material cost would be very much larger.

This business is a relatively new business in this country. Henry Hope & Sons (Ltd.), an English corporation, and George Ragg Ltd., another English corporation, introduced it into this country, or introduced the sash in about 1907 and 1908. There was none manufactured

red in this country at that time. We were advised that we would be subject to a duty of one-half cent a pound; but as sash and frames are not included in the then section of the law, reading otherwise practically as it does to-day, we were put under the "catch-all" clause and subject to a duty of 45 per cent.

There being no competition we went on doing business and introduced our sash and were quite successful.

There are two classes of sash. There is factory or industrial sash, which is made in large quantities and appears in large factories; and there is more expensive sash called also casements, which go into libraries and asylums and office buildings and residences.

Up to 1913 the competition had become so strong that we could not possibly go on under 45 per cent, and it was changed to 10 per cent. We have had no orders but one for industrial sash in five years, and that was from an old customer.

Senator SMOOT. What rate are you asking for?

Mr. THAYER. The existing rate, 10 per cent. We ask that it be maintained as it is under the Underwood law.

Senator SMOOT. Have you a brief that you want to file?

Mr. THAYER. I have a brief here to file.

Senator SMOOT. You may have the privilege of filing it, then.

Mr. THAYER. I just want to say one more thing, that our larger American competitors do not ask for any increase. It is only these two companies which I have described which have prospered so much since 1912. They have done practically all their business under the 10 per cent duty and are really offshoots of our English competitors.

BRIEF OF AARON C. THAYER, REPRESENTING HENRY HOPE & SONS (LTD.), OF BIRMINGHAM, ENGLAND, AND HENRY HOPE & SONS, OF NEW YORK CITY.

Under section 104 of the existing law the duty on steel sash and casements is 10 per cent ad valorem, and the section reads as follows:

"Sec. 104. Beams, girders, joists, channels, car-truck channels, T's, columns and posts and parts or sections of columns and posts, deck and bulb beams, sashes, frames and building forms, together with all other structural shapes of iron or steel, whether plain, punched, or fitted for use, or whether assembled or manufactured, 10 per cent ad valorem."

The English company manufactures this product in England. It owns the stock of the New York corporation which obtains orders in this country, attends to the importation, pays the duties, and installs the sash when received.

The proposed act (H. R. 7456) strikes out from paragraph 312, which is obviously to take the place of present section 104, the words "sashes, frames," and as we understand it, steel sashes and casements would be dutiable under proposed paragraph 393 of the new act at 35 per cent ad valorem. The proposed new duty, therefore, is three and one-half times as large as the existing duty, and it will also be reckoned on the market value in this country of our competitor's product, not on the market value in England.

We respectfully submit that the present duty of 10 per cent ad valorem is ample, as shown by the following facts:

(1) The present 10 per cent duty dates from 1913, and under it our competitors in this country have prospered and largely increased their business, while ours has remained practically stationary.

(2) Only two of our competitors in this country appeared before the Ways and Means Committee to urge any increase in the duty, and these two competitors, viz, the International Casement Co., of Jamestown, N. Y., and the Crittal Casement Window Co., of Detroit, Mich., are offshoots of our English competitors. The present duty of 10 per cent fully covers the difference, if any, between labor and material cost in England and labor and material cost in the United States, and increasing the duty to 35 per cent will drive us out of the American market and to that extent reduce the revenue.

It will also probably result in an unnecessarily large profit to the two competitors who appeared before the Ways and Means Committee and asked for the increase.

Steel sash and casements were first introduced into this country in 1907 by George Ragge (Ltd.), of Manchester, England, and ourselves. We were advised at that time that the duty would be one-half of 1 per cent a pound, but we were classified under the basket clause and a duty of 45 per cent ad valorem imposed. There was no American competition, we were able to do business in this country under the 45 per cent duty, but as competition grew it became more and more difficult to do so, and in 1913 the duty was reduced to 10 per cent ad valorem.

The International Casement Co. has as president Thomas H. Ringrose, and as vice-president Walter G. Lawrence, both of whom came to this country as representatives of George Ragge (Ltd.), of Manchester, England, who were our competitors in England in the manufacture of steel sash and casements. The Crittall Casement Window Co., as we are advised, holds and controls the patent on a metal window casement in this country and in Canada, the patent being owned by the Crittall Manufacturing Co. of England, which is another of our competitors.

Both of these American corporations were formed in 1912, and the American International Casement Co. began business in the early part of 1913. Practically all of their business, therefore, has been done under a protective duty of 10 per cent ad valorem and they have prospered exceedingly. Thus, the International Casement Co. was incorporated with a capital of \$50,000. We are advised that as a result of six years of business under the present duty it now has capital stock paid in of \$75,000 and surplus and undivided profits of \$102,000. The Crittall Casement Window Co., as we are advised, has a capital stock of \$122,000, of which \$97,000 was paid in cash and \$25,000 represents contracts with the Crittall Manufacturing Co., of England. It also, as we are advised, has surplus in use as capital and undivided profits of \$90,000. No further comment would seem to be necessary as to the success of these companies and the adequacy of the protection which they have heretofore received.

It further appeared from Mr. Ringrose's testimony at the hearing on January 19, 1921, before the Committee on Ways and Means, that the International Casement Co. had a plant in England until about a year ago, when the lease expired, and instead of building a new plant in England they have made arrangements with an English firm with which they used to be connected to manufacture the product in England if that can be done at a greater profit than by manufacturing in this country.

The Crittall Casement Window Co., as above stated, is engaged in exploiting the British patent, and apparently one-fifth of the profits go to its English parent.

In other words, the request for an increase in duty comes not from real American manufacturers, but from our English competitors who would like to see our product excluded from this market, having first made arrangements to manufacture the product here if it can be done at a greater profit than in England.

At the hearing before the Ways and Means Committee it was stated by our competitors that we could undercut them by about 15 per cent. This is not our experience, and in proof of the actual state of competition we respectfully refer to the following recent bids submitted by us and the results:

Scottish Rite Cathedral, Guthrie, Okla.:

Estimate submitted by H. Hope & Sons, Dec. 16, 1920, amounting to \$10,000.
Secured by Crittall Co. for \$10,000.

Princeton University, Princeton, N. J.:

Estimate submitted by H. Hope & Sons, Feb. 26, 1921, amounting to \$10,000.
Secured by International Casement Co. at about \$10,000.

Federal Reserve Bank, Richmond, Va.:

Estimate submitted by H. Hope & Sons, Mar. 26, 1921, amounting to \$10,000.
Secured by Crittall Co. at about \$10,000.

Cleveland Public Hall, Cleveland, Ohio:

Estimate submitted by H. Hope & Sons, Feb. 9, 1921, amounting to \$10,000.
Crittall Co. \$10,000.
International Casement Co. \$10,000.

Educational Hall, Washington University:

Estimate submitted by H. Hope & Sons, July 6, 1921, amounting to \$10,000.
Secured by Crittall Co. for \$10,000.

In addition, we have recently bid for the windows to be furnished to the Asylum in Manitoba, in which our English corporation had the advantage of a 15 per cent differential Canadian duty. Our estimate submitted July 6, 1921, was \$57,500 and the contract was secured by the International Casement Co. for \$57,500.

There are two general classes of steel sash and casements, one which is for industrial or factory sash made in quantity and not finely finished. We have been able to compete for this sash even under the 10 per cent duty and have

ly one order within five years although we make large quantities of it at the English factory. The other class is a more finely finished sash or casement for office buildings, libraries and similar expensive structures. As our bids quoted above show, we can not compete for this work on the basis of doing it cheaper than our American competitors. We are, however, one of the oldest manufacturers in this line of work. Our product is well known and has an established reputation and it is on this basis that we can continue to do business in this country.

We shall not attempt to give actual figures for the difference in labor and material cost between the two countries as those figures vary from time to time and, as is well known, the labor costs in general in the United States have been going down for some time. Our best information, however, is from our English company, that the costs of material and of labor are substantially the same in the two countries and that the duty of 10 per cent more than makes up the difference without taking into consideration our additional cost for freight and insurance, and our additional cost in maintaining here a corporation to solicit business and to attend to the installing of the sash when received. The best proof of the actual state of competition it seems to us are the facts in regard to the success of our competitors quoted above, and these further facts as to the business of our New York corporation since 1913 when the 10 per cent duty went into effect.

Our fiscal year ends March 31, and the last fiscal year in which we did business under the Payne-Aldrich law ended March 31, 1914. The gross sales of our New York corporation for that year were just a little short of \$200,000. These gross sales included not only sash and casements but also window glass, charges for installing the sash, and profit and various other items. We have never done as well since, our largest gross sales for any year being a little short of \$133,000 for the year ending March 31, 1921. Our average gross sales for the fiscal years 1915-1921 have been \$90,000, and the business of the New York corporation for the period has resulted in a new loss.

We do not wish to abandon this business because we believe it has a future in this country and that it is worth trying to develop, although we are positive, and our past experience has shown, that any increase that we can bring about for ourselves will be but a small percentage of the general increase, in the use of this sash and casements, which will be produced by and the profit on which will be made by the American manufacturers. We are quite sure that our business does not amount to more than 1 per cent of the entire business in this country.

We recognize that our industry is small and the duties which we have paid have varied between \$5,000 and \$10,000 per year under the existing law.

We respectfully submit, however, that there is no sufficient reason why the Government should lose money by abandoning an actual source of revenue, although small in itself, to our detriment and for the benefit of our English competitors, and this is particularly true in view of the evident willingness of our American competitors to continue on the present basis.

We ask, therefore, that window sash and casements composed principally of steel shall be subject to a duty in the new act of 10 per cent ad valorem, and that a paragraph to that effect shall be inserted in the bill instead of leaving this product to be taxed as in present paragraph 393. This will give the American manufacturers a 10 per cent protection on their own wholesale cost and it will give the American consumer a chance to obtain our product, which we do not think even our competitors will claim is in any respect inferior to theirs.

STATEMENT OF T. H. RINGROSE, JAMESTOWN, N. Y.

Mr. RINGROSE. Mr. Chairman and gentlemen, my name is T. H. Ringrose, president and general manager of the International Casement Co., of Jamestown, N. Y. My address is Jamestown, N. Y. I also represent the Crittall Casement Co. (Inc.), of Detroit, Mich. We are the only two manufacturers of steel casement sash. I brought a little model here. I don't suppose many of you have seen the casement sash. It is a high-grade article used in residences, colleges, schools, libraries, etc. It is a sash that swings on hinges, differing from a sliding window. Any remarks that I make about my own company will apply to the Detroit company as well, because we both started at about the same time and under somewhat similar conditions.

I am interested particularly in paragraphs 312 and 393.

Senator SMOOT. Paragraph 393 is the basket clause and 312 structural shapes.

Mr. RINGROSE. Paragraph 393 is the basket clause, and 312 is structural shapes. It will be up to the Treasury Department to determine whether that will come under structural shapes fabricated for use or the basket clause.

I am very well satisfied with the duty imposed by the Fordney bill but on Tuesday last you had before your committee our British competitor, the only one left. He was asking the duty be the same as under the present Underwood law—10 per cent ad valorem.

Senator SIMMONS. What do you mean by saying we had before your British competitor? I did not know we had any of the British representatives before the committee.

Mr. RINGROSE. Yes, sir; you had Mr. Thayer, representing Hope & Sons, of Birmingham, England.

Senator SIMMONS. Their American agent?

Mr. RINGROSE. Yes, sir; their American agent, a selling company here, owned and controlled by the parent organization in England.

I have read a copy of his remarks. His main reason for asking that this duty be lowered to 10 per cent was that we had prospered while they had remained stationary. I will not take very much of your time, gentlemen, but I want to bring this one point home. Prior to 1913 I was engaged in importing windows, and, seeing an opportunity to manufacture in America, we put a plant in Jamestown, N. Y. The Detroit company started at about the same time. In January, 1913, we started to manufacture. The Underwood law came into effect about October or November. The duty prior to that was 45 per cent ad valorem. We could not stay in business and manufacture in America with three very large British concerns in competition with us, so we sent back to England our vice president, and he rented a factory as near to the American line of steamships in Liverpool as he could get, to manufacture for this market special casement window. It is for that reason we prospered. Because we had a factory in America, and if an architect wanted special windows delivered quickly we could deliver it, and we had a plant in England which he could use if he had time to wait and wanted the lower price.

Then came on the war. That meant that after a little while British manufacturers could not ship any materials. That, we threw onto us and our contemporary company in Detroit the burden of taking care of the whole market, which we did. We extended our plant. We built a new building, and have now plenty of room for extension.

I don't know of anything else I want to say.

Senator SMOOT. You are satisfied with the House proposition to the basket clause and also paragraph 312?

Mr. RINGROSE. Quite satisfied.

Senator CALDER. How many men do you employ?

Mr. RINGROSE. One hundred, normally.

Senator CALDER. At Jamestown?

Mr. RINGROSE. Yes; and about 120 at Detroit.

Senator SUTHERLAND. Do you still conduct the English plan?

Mr. RINGROSE. No. We closed it a year ago, because we felt that wages were up very high in England and we would have a better chance to compete. But that is another point that we overlooked the time. Wages in England have increased three times over prewar times, while ours have increased only twice. So the result is that theirs are liable to come down greater than ours possibly can.

Senator CALDER. Have wages come down in England in that line?

Mr. RINGROSE. They must have, these last two weeks, because prices now are very much lower, but I have not been able to get accurate advices on that.

Senator SUTHERLAND. You do not know what wages over there are at this time as measured in dollars and cents?

Mr. RINGROSE. No. I would like to file a brief in about three days, if I may be granted that permission, and I can get that information by that time from our British associates.

When we did close the plant in England, we arranged with our old associates there, the firm with whom our vice president and myself were trained, to manufacture our product, and last year they did manufacture \$70,000 worth of casement windows, and we brought them in and made more profit on them than we did on our own product manufactured here. We want to keep this plant going in America. We have a big plant, and we would like to see it grow and develop.

Senator CALDER. What was the value of the output of your plant in this country last year?

Mr. RINGROSE. \$440,000.

Senator CALDER. In Detroit?

Mr. RINGROSE. Jamestown, including \$70,000 worth we imported from England.

Senator SUTHERLAND. If conditions warrant it, do you expect to start your English plant up again?

Mr. RINGROSE. No; we have closed it up for good.

Senator SIMMONS. Let me understand you in regard to the statement you made about the cost of labor. You say the cost of British labor is higher than the cost of labor here?

Mr. RINGROSE. No; it was not higher, but it was nearer, when we closed our plant up.

Senator SIMMONS. What did you mean by what you said a while ago? Did you mean the English price of labor had gone up three times as much compared with prewar prices as the American price of labor?

Mr. RINGROSE. No, sir. The American price went up twice, and English three times.

Senator SIMMONS. You really closed your plant in England because there was practically no difference in the labor cost there and here?

Mr. RINGROSE. No; there was just a little difference.

Senator SIMMONS. Was it in favor of America or England?

Mr. RINGROSE. The difference was in favor of Great Britain.

Senator SIMMONS. Great Britain labor prices were higher?

Mr. RINGROSE. No; lower.

Senator LA FOLLETTE. But when you added ocean freight rates there was no advantage in operating the English plant?

Mr. RINGROSE. None whatever at that time, but the reductions were much greater in England.

Senator LA FOLLETTE. Do you know what the reductions have been in the last two weeks.

Mr. RINGROSE. No, sir; I could find that out and put it in the brief which I will file in about three days.

Senator SIMMONS. If that is true, what do you need this protection for? We should not pass a tariff law upon conjecture as to prices coming down, but it ought to be based upon the price of labor here and the price of labor there at the same time. They may go down here. I hope they will. They ought to in some industries. They may go down in Europe. But in framing this tariff law we should not assume that American wages are going to remain stationary, while English wages will continue to go down.

Mr. RINGROSE. No. However they go down, English wages will go down greater than ours.

Senator SMOOT. How do you know that? They have not done it so far. They went up faster than American wages, according to your own statement.

Mr. RINGROSE. I can find that out for you.

Senator SIMMONS. You do not know it?

Mr. RINGROSE. I do not know it.

Senator SIMMONS. You are simply guessing at it, and I think there is a good deal of guesswork about these tariff statements.

Mr. RINGROSE. Well, judging by the prices they are quoting the last two or three weeks they must have come down considerably.

Senator SIMMONS. During the last two or three weeks?

Mr. RINGROSE. Yes, sir.

Senator SIMMONS. Up to that time you thought it was cheaper for you to operate a factory there as well as in America?

Mr. RINGROSE. No; that was a year ago.

Senator SIMMONS. I thought it was just a little while ago.

Mr. RINGROSE. No; we closed our factory over there about a year ago, but it is in the past two or three weeks that the prices have been very much lower than they were.

Senator SIMMONS. And you are bringing your prices down lower?

Mr. RINGROSE. Yes; our prices are lower.

Senator SIMMONS. And you are going down lower still?

Mr. RINGROSE. Yes, sir.

Senator SIMMONS. And they are still ahead of you?

Mr. RINGROSE. We can not possibly go as low as they are going now. That is impossible, even if we come to prewar prices.

Senator SMOOT. Suppose you take American gold over there and buy English money and pay the labor over in Europe with English money, could you not run your plant then?

Mr. RINGROSE. Yes; we could run the plant to a big advantage.

Senator SIMMONS. And you contemplate opening this plant over there again, do you?

Mr. RINGROSE. No. We have arranged with a large manufacturer in England to manufacture our product.

Senator SIMMONS. You mean he is going to manufacture it for you?

Mr. RINGROSE. For us.

Senator CALDER. If it is profitable?

Mr. RINGROSE. Surely, if it is profitable.

Senator LA FOLLETTE. That is a contingent contract?

Mr. RINGROSE. Surely, that is a contingent contract.

Senator LA FOLLETTE. What rate are you paying now for common labor in your factory?

Mr. RINGROSE. Per hour?

Senator LA FOLLETTE. Yes.

Mr. RINGROSE. Thirty cents.

Senator LA FOLLETTE. What did you pay at the highest point prior to the present time?

Mr. RINGROSE. Forty-five cents.

Senator LA FOLLETTE. How long ago was your factory established in this country?

Mr. RINGROSE. January, 1913.

Senator LA FOLLETTE. What were you paying then for common labor?

Mr. RINGROSE. Seventeen and one half cents.

Senator McCUMBER. Is that all?

Mr. RINGROSE. Yes; thank you.

BRIEF OF THOMAS H. RINGROSE, REPRESENTING THE INTERNATIONAL CASEMENT CO. (INC.) AND CRITTALL CASEMENT WINDOW CO. (INC.).

It should be noted that the words "sashes and frames" in paragraph 104 in the present Underwood tariff are included along with beams, girders, joists, angles, etc. Sashes and frames are a highly finished article mostly fitted with expensive bronze hardware and used in the homes of the wealthy, in libraries, colleges, and public buildings. The product is mostly handmade. The other articles in the paragraph are bars of steel or iron not advanced in manufacture further than the rolling.

The words "sashes and frames" were not in the Payne-Aldrich law, but were added in the Underwood law on the recommendation of Henry Hope & Sons (Ltd.) and George Wragge (Ltd.), both British corporations. We did not testify at these hearings. Under the Payne-Aldrich law they carried a duty of 45 per cent ad valorem.

In the brief filed by Mr. Thayer, Senate Finance Committee tariff hearings, item (1), Mr. Thayer states, in arguing for 10 per cent duty, that since 1913 we have prospered and their business has practically remained stationary. In considering this we respectfully call your attention to the fact that in December, 1913, soon after the Underwood bill became law, in order to stay in the business the International Casement Co. were compelled to open a factory in Liverpool, England. The Crittall Casement Window Co.'s parent organization is in England. We could not possibly have prospered had we not had these factories in England to manufacture for us. It should also be noted that during the war and for sometime afterwards our British competitors were not in position to manufacture for this market. Our capital and plants were enlarged in the United States to meet this condition, and we are anxious to manufacture all our product here.

In regard to our profits for the years 1913 to 1920, inclusive, these show an average of 8.27 per cent on the sales.

Mr. Thayer gives a list of contracts in which lower prices were quoted in the United States. We could give a list reading the opposite way, but it would not be of much service because of the special nature of each contract and the fact that in the majority of the jobs quoted by Mr. Thayer about 50 per cent of the cost is for material purchased or for labor done in this country.

In connection with the Brandon Asylum, Manitoba, Canada, the price referred to was quoted by the International Casement Co.'s Canadian associates (Canadian Allis-Chalmers Co.) and was for work made in Canada. We could not possibly compete with British firms in Canada, and for over a year the above-mentioned Canadian firm has been manufacturing international casements in Canada.

For actual figures we respectfully refer you to pages 759 to 766, Hearings on General Tariff Revision before the Committee on Ways and Means, part 2, 1921. In the supplemental brief of Henry Hope & Sons, pages 764 and 765, please note, line 12, page 765, they state the International Casement Co.'s cost is \$23.45. This is correct and in accordance with our testimony given before the Ways and Means Committee. In line 18, page 765, they state we can sell at \$23.45. To their figures they add selling expenses and profit. We, too, have representatives in various cities, and to our cost of \$23.45 must be added 20 per cent to cover these expenses and profit, also the freight from Jamestown to the seaboard.

Details of comparative costs and selling prices in Great Britain and the United States, taken from figures furnished by Henry Hope & Sons (Ltd.), page 765, are as follows:

Cost of casement 24 by 54 inches in England packed ready for shipment to New York (£3 16s. 9d.), present rate of exchange \$3.70 per pound.....	\$14.50
Ocean freight, insurance, cartage, dock dues, and customs tax.....	1.20
	15.70
Duty 10 per cent.....	1.57
Cost with duty landed in New York.....	17.27
Selling expenses and profit 20 per cent.....	3.29
Selling price in New York City.....	20.56
Cost of casement 24 by 59 inches, made in United States, packed ready for shipment.....	23.00
Freight to New York.....	0.50
Cost landed in New York.....	23.50
Selling expenses and profit, 20 per cent.....	4.69
Selling price in New York.....	28.19

In other words, the selling price of American manufacturer on this particular casement is \$8.73, or 43 $\frac{2}{3}$ per cent, above the selling price of the British manufacturer based on to-day's rate of exchange (\$3.70=£1).

It will be seen, therefore, that the proposed rate of duty in House bill H. R. 7400 is fair, providing casement sashes come under the basket clause of paragraph 393 and 35 per cent ad valorem taken on American valuation.

In response to your request for information regarding reduction in wages in Great Britain, we cabled to the Crittall Casement Co., of Braintree, England, and to-day received reply giving the following information:

Skilled casement mechanics reduced 21 $\frac{1}{2}$ per cent, common labor 21 per cent, from the high peak of war period to present day.

LETTER OF DIRECTOR OF GEOLOGICAL SURVEY IN REPLY TO STATEMENT OF CHARLES W. POTTS, DEERWOOD, MINN.¹

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
Washington, October 6, 1919.

DR. THOMAS WALKER PAGE,
Chairman United States Tariff Commission.

DEAR DR. PAGE: I have received your letter of September 30 with reference to the statements of Mr. C. W. Potts before the Committee on Finance of the United States Senate.

Mr. Potts's charges are of such a character and of such wide range that they demand rather detailed consideration. It has seemed best, therefore, to prepare rather full answers to each type of charge. I give below a summary of my reply. Considering the reception given to the charges by the Senate committee, I suggest that Mr. Potts be given an opportunity to retract the charges and, if possible, to reappear before the committee under circumstances that permit cross-examination. I need scarcely assure you that you are at liberty to use both this letter and the attached statement as you wish.

Mr. Potts's charges that the survey's estimates of manganese-ore reserves are based upon superficial examinations and obsolete reports and that the examinations were undertaken with pessimism are untrue. His further charges that the reports of reserves in the Butte district are not consistent with reports of production and that the World Atlas of Commercial Geology was based upon material available in 1913 are not only untrue but arise out of his very superficial examination of and careless reference to the publications. On the other hand, he has refused, for the present at least, to give the survey access to the data and methods by which his estimate of 10,000,000 tons was arrived at.

¹ See p. 1675.

s of 42 per cent ore was reached. Further, by partial statements and by the incorrect use of data submitted to him, he has reached conclusions which are obviously sound.

The foregoing discussion of the charges and claims of Mr. Potts should not becloud the fundamental question of the amount of manganese-bearing materials remaining mined in the United States, for that is the information which Congress needs. It is out of the question for the survey at the present time to attempt an exhaustive examination of all or even most of the principal deposits. In considering the present situation I do not think this is necessary. The estimates, even of qualified individuals, concerning the domestic resources of a number of minerals seem bound to differ widely. The estimates of mineral reserves by conservative persons, particularly those conscious of responsibility, will always seem ridiculously low to persons of different temperament and to those seeking to promote selfish ends. After considering the estimates of our domestic manganese reserves made by the Survey during 1917 and 1918, the statements of production that have been filed by the producers with the Survey, and other sources of information published or furnished informally since that time, I give herewith the Survey's present impression of domestic manganese-ore reserves. There is fair assurance of the existence in domestic deposits of about 1,800,000 tons of material containing more than 35 per cent manganese, which are sufficient to make out 75,000,000 tons of steel by present practices. If the large reserves of lower grade material be considered, making proper allowances for necessary adjustments in steel plants and processes, the combined reserves are probably sufficient to make out twice as much steel, or 150,000,000 tons.

Very truly, yours,

GEO. OTIS SMITH, *Director*.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
Washington, October 7, 1921.

DR. THOMAS WALKER PAGE,
Chairman United States Tariff Commission.

MY DEAR DR. PAGE: Supplementing my letter of yesterday, I wish to call your attention to an article on manganese by Mr. Potts, which appears in the current number of the Mining Congress Journal, which came to my desk to-day.

Near the close of this article, on page 334, you may find a statement wherein Mr. Potts admits more than he orally admitted to Mr. Hewett at the time of their recent interview. This shows that the factor used by Mr. Potts in multiplying the survey's estimate of high-grade reserves is admittedly based upon the disparity between the survey's estimates of certain deposits and the tonnages subsequently proved for the same deposits. Not to again call attention to the flagrant errors in some of Mr. Potts's comparisons, it is sufficient to state that the danger of this method is well set forth in the memorandum accompanying my letter of yesterday.

On the same page in an earlier paragraph Mr. Potts reiterates his reference to the 1,800 tons of high-grade ore in the Butte district, with which he compares a many times larger tonnage of ore shipped from the same district, not specifying, however, the kind of the ore so shipped, the survey's distinction in its estimate between oxide and carbonate ores being either unnoticed by Mr. Potts, as he stated to Mr. Hewett, or disregarded by him in his very plain purpose to discredit the United States Geological Survey.

Yours, very cordially,

GEO. OTIS SMITH, *Director*.

COMMENT ON THE CHARGES OF C. W. POTTS.

Statement of policy.—Although the estimation of mineral reserves is naturally a part of the work of the United States Geological Survey, an exhaustive detailed examination of all the deposits that should enter into any final estimate involves such an extraordinary amount of careful work by highly qualified geologists that it has only been undertaken for a few substances, such as coal, iron, petroleum, etc. For a number of years the survey has been engaged in an exhaustive estimate of the coal resources of the United States, and highly dependable detailed estimates are now available. Recently it has seemed advisable to attempt to make such an estimate of the petroleum reserves. The distribution of the petroleum deposits of the country is such that in order to obtain even preliminary figures it has been necessary to enlist the aid of

many engineers and geologists throughout the United States as well as the geologists of the survey. Only the crisis of the war warranted the survey's attempt to make an estimate of the domestic reserves of a metal having such widespread distribution as occurring in such irregular and ill-defined deposits as manganese.

It is apparent to those familiar with the deposits of the common metals that dependable estimates of reserves must be based upon much detailed information obtained in mine explorations as well as upon the sound interpretation of the geological relations under which the materials exist. It is further well recognized that the estimates of highly qualified observers, even in individual mines, frequently differ appreciably, depending upon the emphasis placed upon certain kinds of geological facts. In other words, there is commonly a possibility for difference of opinion among qualified and straightforward observers. It was the survey's hope in attempting to estimate the manganese resources of the United States to have a conservative estimate of the reserves, in order that a wise program for imports could be put in force during the war. These estimates were needed because it was emphatically contended by the steel and alloy makers who constitute the consumers that there were no domestic resources worth considering in an import program. In order to have additional information, however, the geologists engaged in the work were requested to estimate the additional quantities that would probably be made available by exploration work in prospect. The survey's estimate, therefore, contains two figures—one, of dependably recoverable quantities and, the other, additional reserves in prospect. That there may be more manganese ore in the United States than the sum of these two quantities has not been denied by the survey. It has simply been stated that in the light of the work that was done during 1917 and 1918, including search, exploration, and examination, it is highly improbable that there is twice as much as the 1,800,000 tons of high-grade manganese ore included in this estimate.

The testimony and brief of C. W. Potts.—In the present instance, in conformity with the survey's policy, I sent Mr. Hewett, the geologist who had charge of manganese for the survey during the war, to confer with Mr. Potts, in the hope that a common understanding might be reached concerning domestic reserves. Mr. Hewett met Mr. Potts on September 29 and 30, and they discussed the situation at some length. It is sufficient to state at this point that Mr. Potts, beyond admitting that to obtain his estimate he multiplied the survey's estimate by a factor, flatly refused to show Mr. Hewett the data or to explain the methods by which he arrived at his own estimates of manganese reserves. Although Mr. Hewett is satisfied that Mr. Potts has some dependable data that would be helpful in revising in detail the estimate of manganese reserves, he withholds them, and consequently they can not be used in preparing this memorandum.

In the following statement answer will first be made to Mr. Potts's objections to the survey estimate of manganese reserves. Attention will then be called to some of the flagrant errors in Mr. Potts's brief and testimony before the Senate committee.

1. In the paper by Messrs. Harder and Hewett, to which reference is made a number of times, it is stated: "This part of the work (estimation of reserves) was approached with a certain apprehension, for it was recognized that for most districts neither the extent of explorations nor time available for the work would permit an order of accuracy that most mining companies require as guides in operating." This statement is clearly the basis for the charge by Mr. Potts that it is admitted that investigations were superficial (p. 1676) and that the work was not thorough (p. 1676).

For your information I attach hereto a brief summary of the estimate of reserves prepared by Messrs. Harder and Hewett, in which the work is classified as to whether it was detailed or reconnaissance and as to whether estimates might warrant revision or not. In this work 18 geologists, of whom 12 were members of this survey, were chosen because of previous experience and other fitness, devoted a total of about 10 months to field examinations during 1917 and 1918. Of the 1,181 deposits considered, 588 lie in districts where the work was of detailed character involving the preparation of geologic maps. It will be noted that the reserves of high-grade ore in these districts make up 80 per cent of the total in the United States and of the additional reserves in prospect almost the entire amount, if the carbonate ore of the Butte district be omitted. The reconnaissance work was done in districts that mostly offered some promise of reserves of high-grade ore, although a number of districts containing low-grade ore were considered in this manner only. The survey has never had any doubt that the reserves of low-grade manganese ore were adequate to meet any demand that the steel industry would impose for some years to come.

2. It is stated (pp. 1684 and 1694) that the data upon which the survey's estimate of reserves are based are obsolete, and to substantiate the claim a list of nine regions is given in which the work was done during 1917.

It should be stated that of the nine regions subsequent reports to the survey show at little or no exploration work was done after examination by the survey geologists the following: (1) Western Arkansas; (3) Colorado, other districts; (8) Oklahoma; (9) Montana, other districts. Two others, (3) Leadville district, Colo., and (5) Iron Range, Minn., contain only low-grade ore. In only two regions could further exploration have added to the reserves of high-grade ore—(6) Butte, Mont.; (7) Virginia, east side of valley.

An analysis of the table of reserves prepared by Messrs. Harder and Hewett shows that of the total estimate of high-grade reserves, 417,000 tons, or approximately 60 per cent of the proven total, is in districts where field work was completed as late as June, July, August, September, and October, 1918. After considering the table of reserves in the light of the reports submitted to the survey by mine operators up to the end of 1920, it appears that the estimates for the districts which contain more than half the reserve of high-grade ore are still reliable. In several of the districts containing the remainder of the reserve recent work has probably justified an increase in the estimates.

3. It is indicated by Mr. Potts (pp. 1690 and 1691) that the production reports are not consistent with the statements of reserves.

Although Mr. Potts stated that the survey has never changed an estimated reserve of 2,800 tons of high-grade ore in the Butte district, he admitted in conference with Mr. Hewett that in the table where this figure appears he has never read the following footnote: "All recorded deposits of oxide ores examined; estimate does not include large deposits of carbonate ore, 35 to 38 per cent manganese." Mr. Potts further stated that he has not read the original report from which Butte estimates are taken. In this report it is stated: "The known workable bodies of this ore (carbonate) aggregate several thousand tons, and there is reason to expect that further developments will disclose large additional amounts." (U. S. G. S. Bull. 690-E, p. 112, published Apr. 9, 1918.) A more recent report contains this statement: "The quantity of rhodochrosite ore reported as actually developed early in November, 1918, was more than 125,000 tons. To this reserve should be added an unknown and presumably very large amount in prospect. In addition the lodes contain an almost unlimited quantity of low-grade material, consisting of the carbonate and silicate of manganese and quartz mixed in different proportions. This constitutes a reserve from which, if the necessity arose, the country's needs might be largely supplied." (U. S. G. S. Bull. 725-C, p. 176, published Aug. 8, 1921.)

It should be noted in connection with any statement concerning the reserves in the Butte district that it was planned to have Mr. Pardee make an examination of the district in October, 1918, and that he was prevented from making this examination by illness. It should also be stated that it is adequately confirmed that Mr. Pardee at the time of his first examination of the Butte district in August, 1917, was the first to call to the attention of the officials in the Anaconda Copper Co. the possible use of this material. It was upon his advice that inquiries were first made concerning the marketing of the material. Although a definite estimate has not been assigned to the reserves of carbonate ore in the Butte district, the knowledge concerning these bodies has been taken into consideration in summary statements concerning the prospective production from domestic sources. Great dependence has never been placed by the survey on a large part of the reserves of the district, even at the prices prevailing during the war, because it has no record that any qualified engineer or geologist has stated that the bodies could be explored profitably for manganese ore alone. All of the production of carbonate ore from the Butte district to date has come from mines that have been thoroughly explored in advance to extract bodies of copper and zinc ore. No charges for development of the bodies have, therefore, had to be borne by the production of manganese ore.

Mr. Potts refers several times (pp. 1677, 1686, and 1692) to the fact that two mines in the Batesville district have produced more ore than the reserve assigned by the survey geologist to them. As this geologist is in Utah, the only explanation that can be offered at present is that the estimate for these particular mines was low. Such a discrepancy does not necessarily indicate, however, that the total estimate for the district was low. I still feel that the geologist was peculiarly competent to estimate reserves in that field. Certainly, before his estimate for the district is revised, he should be consulted.

4. Mr. Potts makes statements (pp. 1678 and 1684) purporting to show that recent reports of the Geological Survey concerning mineral production and reserves of manganese ore are old and out of date. To substantiate the claim he cites the World Atlas of Commercial Geology, published in 1921, and states that "the data upon which this report is based were compiled from information available in 1913." Not only does this publication, the first of its kind, contain practically complete information con-

cerning mineral production throughout the entire world for the year 1918, only available late in 1919, but Mr. Potts in conference with Mr. Hewett admits that he never read the text on manganese in this report and has never read a table in it. He made the statement on the basis of a reply by one of the clerks of the Geological Survey to a question of his. In the discussion of world production of minerals, the year 1918 was considered representative because it was the last normal year.

5. Mr. Potts states (p. 1690): "Apparently the Government geologists have approached investigation of domestic reserves with pessimism." As Mr. Potts stated in conference with Mr. Hewett that until midsummer of 1920 he never met a geologist of the Geological Survey who was engaged in the examination of manganese deposits during the war, his impression concerning the attitude of these geologists is worth nothing. There is abundant record in the form of summary reports to the Committee of National Defense, War Industries Board, and Shipping Board during 1917 and 1918, as well as the testimony of many producers of manganese ore, that the attitude of the geologists was quite the reverse and that they were constantly insisting upon provision for the use of the steadily rising production and upon dependence on domestic reserves.

6. Mr. Potts' brief states (p. 1691): "It has also been proved that the estimate of the period of time which these reserves would last this country is based only upon an estimate of high-grade ore which is belittled and that that estimate does not take into consideration lower grade manganese ores or the manganese ore associated with iron ore; nor does it take into consideration the metallurgical adaptability of all ores in steel making." This statement is made in spite of the following paragraph taken from one of the reports to which he refers several times: "The widespread utilization of low-grade in place of high-grade material undoubtedly presents important metallurgical problems. To the optimistic observer incompetent to consider these problems in detail the progress made to this end in 1917 and 1918 offers considerable encouragement. The large reserves of the low-grade material can probably be depended upon under stress to double the probable life of the high-grade ore."

A careful examination of Mr. Potts's testimony and brief to the Senate Finance Committee in the light of statements made above indicates that he is more concerned with discrediting the Geological Survey as a source of accurate and prompt information than he is in supplying evidence for the case which he presents. This attitude might be pardoned if there were not abundant evidence from his brief that in order to strengthen his argument he uses short cuts and questionable methods to support his own estimates, quotes partial statements which convey a meaning different from the original text, and has failed to understand some of the critical data used by the Geological Survey.

(1) At the time of his appearance before the Senate committee, August 26, 1920, Mr. Potts stated (p. 1693): "From the data already accumulated the evidence points to a reserve tonnage of domestic manganese ore as follows:

"High-grade manganese, 35 per cent and over.....	10,000,000
"Ferruginous manganese, 10 to 35 per cent.....	20,000,000
"Manganiferous iron ore, 5 to 10 per cent manganese.....	45,000,000

Also (p. 1694): "Up-to-date investigations prove that the reserves of high-grade manganese ore are approximately 10,000,000 tons."

In order to justify the estimate of 10,000,000 tons of high-grade ore, Mr. Potts in conference with Mr. Hewett, stated that this estimate is obtained by multiplying the total reserves as published by the Geological Survey by a factor considered by him to be dependable from his recent data concerning a few districts. He further admitted that he had no data other than that of the Geological Survey concerning several of the most productive districts.

(2) Concerning the estimates of reserves of domestic high-grade manganese ore, Mr. Potts quotes (p. 1687) a statement of Messrs. Harder and Hewett: "The estimates represent little more than the order of magnitude of minimum recoverable quantities," so as to suggest that it applies to the whole country. In the original statement the statement only applies to the estimates of reserves in Virginia, Georgia, and Tennessee.

(3) In calling attention to the small estimate of high-grade manganese ore in the Butte district, 2,800 tons (p. 1690), Mr. Potts quotes from a letter of Albert J. Schuman to the effect that 71,000 tons of manganese ore were produced by his company in 1918 and 63,000 tons in 1920. Mr. Potts admitted in conference with Mr. Hewett that he was ignorant of the fact that these quantities represent not high-grade manganese ore but low-grade oxide ore which had to be milled to yield a shipping

entrated. This material was part of the estimated 400,000 tons of low-grade material as figured by Mr. Pardee and which appears in the table of reserves:

Estimates of domestic manganese ore classified according to character of work done.

	Number deposits exam- ined, 1916-1918.	Manganese 35 per cent +.		Manganese 5 to 35 per cent, largely more than 20 per cent SiO ₂ , less than 30 per cent Fe.		Manganese 5 to 35 per cent, largely more than 30 per cent Fe, less than 20 per cent SiO ₂ .

-2. Detailed work: deposits such that further work may warrant revision.....	548	387, 000	280, 000	235, 000	250, 000	15, 000	100, 000
-1. Reconnaissance work: Es- timates highly dependable; little or no exploration since examinations.....	211	89, 750	(?)	507, 350	(?)	3, 800
-2. Reconnaissance work: De- posits such that further work may warrant revision.....	296	50, 000	(?)	460, 200	(?)	2, 508, 000	2, 050, 000
C. Not examined by survey....	25	13, 628.	(?)

INDEX TO SCHEDULE 3.

NAMES.

	Page.
Abbott, W. H., Wheeling, W. Va., iron and steel sheets.....	1783
American Brass and Copper Statistical Exchange, brass and copper.....	2047
American Manganese Manufacturing Co., Philadelphia, Pa., ferromanganese..	1649
American Mining Congress, digest of information relating to minerals.....	1607
American Zinc Institute, New York City, zinc ore and products of zinc.....	2067
Association of Tin Plate Manufacturers, tin plate.....	1800
Athletic Mining & Smelting Co., Webb City, Mo., zinc and zinc ore.....	2087
Atkins, H. C., Indianapolis, Ind., steel saws.....	1885
Balfour & Co. (Ltd.), Arthur, Sheffield, England, high-speed steel.....	1752
Bethlehem Steel Co., ferro-alloys.....	1739
Biddle, James G., Philadelphia, Pa., engineering and scientific instruments..	1968
Boker, J. R., New York City, metal sheets and plates.....	1787
Brewster, John H., New York City, crucible, electric, and alloy steels.....	1761
Brile, Lawrence M., New York City, aluminum.....	2031
Buck, C. A., Bethlehem, Pa., ferro-alloys.....	1739
Burton, Harold H., Cleveland, Ohio, silicon metal.....	1633
Central Scientific Co., scientific instruments.....	1976
Crosby, George H., Duluth, Minn., manganese ore.....	1669
Crucible Steel Co. of America, crucible tool steel.....	1706
Cutlery Importers' Association, cutlery.....	1907
Day, David S., Bridgeport, Conn., iron or steel chains.....	1830
Dette, William, New York City, ferromanganese.....	1641
Dinkey, A. C., New York City, manganese and manganese ore.....	1662
Douglas, John J., Brooklyn, N. Y., surgical instruments.....	1951
Franklin, Nelson, Denver, Colo., tungsten ore.....	1696
Frasse & Co., Peter A., New York City, ball bearings and sprocket chains....	1819
Frechette, C. J., Chicago, Ill., mechanical pencils.....	1892
Garvey, James A., scissors and surgical instruments.....	1952
Geneva Cutlery Corporation, Geneva, N. Y., razors.....	1945
Harley-Davidson Motor Co., Milwaukee, Wis., motor cycles.....	2023
Hendee Manufacturing Co., Springfield, Mass., motor cycles.....	2026
Henry, J. T., Manufacturing Co., Hamden, Conn., pruning shears and hair clippers.....	1941
Hope, Henry, & Sons, New York City, steel window sash.....	2088
Hurd, George F., Newark, N. J., welded metals.....	1795
Ingersoll-Rand Co., drill steel.....	1760
Kastor, Robert N., New York City, cutlery.....	1907
Jones & Laughlin Steel Co., Pittsburgh, Pa., structural steel.....	1780
Kny-Scheerer Corporation, New York City, surgical instruments.....	1956
Lavino Furnace Co., Philadelphia, Pa., ferromanganese.....	1653
Leigh & Butler, Boston, Mass., card clothing and carding machines.....	1839
McCulloch, R. C., Canton, Ohio:	
Ball bearings, roller bearings, and steel balls.....	1823
Enamel ware.....	1869
Watch movements, watchcases, and parts.....	2004
Mathews, John A., New York City, crucible tool steel.....	1706
Midvale Steel & Ordnance Co., manganese and manganese ore.....	1662
Milford Co., Milford, Del., shotguns, rifles, and automatic pistols.....	1984
Miller Bros.' Cutlery Co., Meriden, Conn., pocketknives.....	1901
Montgomery, George M., Windsor Locks, Conn., tinsel.....	2056
Moxham, Egbert, New York City, lead, tin, and tin foil.....	2057
Myers, Hon. Henry L., zinc and zinc ore.....	2087

National Aluminum Foundries' Association, aluminum.....	
National Dental Association, dental instruments.....	
Nicholson File Co., Providence, R. I., files.....	
Ontario Knife Co., Franklinville, N. Y., cutlery.....	
Potts, Charles W., Deerwood, Minn., manganese ore.....	
Republic Iron & Steel Co., ferro-alloys.....	
Ringrose, T. H., Jamestown, N. Y., steel window sash.....	
Ruhl, Otto, Joplin, Mo., zinc and zinc ore.....	
Sharon Steel Hoop Co., Sharon, Pa., hoop steel.....	
Sklar Manufacturing Co., Brooklyn, N. Y., surgical instruments.....	
Smiley, John B., New York City, crucible, electric, and alloy steels.....	
Smith, George Otis, Director of the Geological Survey, letter of, in answer to statement of Charles W. Potts, Deerwood, Minn.....	
Smith, Herbert W., Washington, D. C., minerals.....	
Spencerian Pen Co., New York City, steel pens.....	
Topping, John A., New York City, ferro-alloys.....	
Troxel Manufacturing Co., Elyria, Ohio, motor-cycle accessories and parts.....	
United States Gold Leaf Manufacturers' Association, gold leaf.....	
Voorhees, Campbell M., Columbus, Ohio, anvils.....	
Wallower, F. C., Joplin, Mo., zinc and zinc ore.....	
Wilmsen, B., Philadelphia, Pa., tinsel.....	
Wiss & Sons Co., J., Newark, N. J., scissors and shears.....	
Wood, Alan, Iron & Steel Co., Philadelphia, Pa., pig iron and steel scrap.....	
Youngstown Sheet & Tube Co., Youngstown, Ohio, steel pipe, tubing, and wire products.....	
Ziegler, B. C., West Bend, Ind., aluminum ware.....	
Zolla, Emil N., New York City, watch movements, watchcases, and parts...	

SUBJECTS.

	Page.		Page.
Aluminum.....	2031, 2041, 2044	Ferro-alloys.....	1710, 1727, 1730, 1731
Coils.....	2031	Ferromanganese.....	1632, 1641, 1644
Ware.....	1851, 1854, 1864		1649, 1653, 1659, 1728, 1730, 1731
Antimony.....	1614	Ferrosilicon.....	1634, 1637, 1727
Anvils.....	1826	Files.....	
Arsenic.....	1614	Fluorspar.....	1619, 1632, 1727, 1731
Asbestos.....	1615	Gold leaf.....	
Baling ties.....	1805	Graphite.....	
Ball bearings.....	1819, 1823	Gypsum.....	
Barbed wire.....	1727	Hair clippers.....	
Plain and galvanized.....	1809	Instruments:	
Barytes.....	1616	Engineering.....	
Bismuth.....	1616	Scientific.....	1968, 1969
Bottle caps.....	2059	Surgical.....	1951, 1952, 1954, 1955
Brass.....	2047	Iron sheets.....	
Brick, magnesite.....	1751	Kaolin.....	
Cadmium.....	1617	Lahn or lame.....	2055, 2056
Calamine.....	2082	Lead.....	1621, 1729, 1730
Card clothing.....	1839, 1846	Lime.....	
Carding machinery.....	1839, 1849	Machinery, carding.....	1839, 1849
Chains, iron or steel:		Magnesite.....	1623, 1727, 1731
Anchor.....	1830, 1836	Brick.....	
Commercial.....	1830, 1835	Calcined.....	
Sprocket.....	1819	Manganese.....	1622, 1662, 1712
Chromite.....	1617	Ore.....	1641, 1662, 1669, 1675, 1683, 1730
Chromium.....	1750	Marble.....	
Clippers, hair.....	1941	Mechanical pencils.....	1962
Copper.....	2047	Metal—	
Cotton ties.....	1805	Plates.....	1735
Crucible tool steel.....	1706	Sash.....	
Cutlery.....	1907, 1929	Sheets.....	1727
Dental instruments.....	1949	Metals:	
Electric storage batteries.....	1610	Thermostatic.....	
Enamel ware.....	1860, 1869	Welded.....	
Engineering instruments.....	1968	Mica.....	
Feldspar.....	1618
